RULES AND REGULATIONS FOR THE CONSTRUCTION AND CLASSIFICATION OF **STEEL SHIPS**

July 2024

General Information

1. This consolidated version of the ‘Rules and Regulations for the Construction and Classification of Steel Ships’ (July 2024) supersedes the July 2023 edition of the Rules and includes the amendments published in the following:

a) Rules Change Notice No.1 dated September 2023

b) Rules Change Notice No.2 dated December 2023

c) Rules Change Notice No.3 dated February 2024

d) Rules Change Notice No.4 dated March 2024

2. For ease of reference by the users, a summary of additions and amendments incorporated in the various Rules Change Notices (issued since July 2023) along with their effective dates are indicated in the respective tables.

3. This edition of the Rules also consists of amendments carried out subsequent to the publication of Rules Change Notice No. 4 of March 2024. Such amendments are indicated in **Table 1**.

4. Corrigenda issued subsequent to the publication of Rules Change Notice No.4 of March 2024 are given in **Table 2**.

RULES AND REGULATIONS FOR THE CONSTRUCTION AND CLASSIFICATION OF STEEL SHIPS – July 2023

RULES CHANGE NOTICE No. 1 – September 2023

TABLE – AMENDMENTS INCORPORATED IN THIS NOTICE

These amendments will come into force as indicated in the Table

Section / Clause	**Subject/ Amendments**
Part 3 Chapter 4: Design Loads *The amendments are applicable to ships contracted for construction on or after 1 January 2024.*	
3/ 3.3.2	Amendments are made to specify that the parameter 'p_0' is not to be taken less than the design vapour pressure for cargo oil tanks and fuel tanks.
Part 3 Chapter 15: Anchoring and Mooring Equipment *The amendments are applicable to ships contracted for construction on or after 1 January 2024.*	
3/ 3.2.5	Additional requirements for Offshore Support Vessels are deleted as they are shifted to Part 5, Chapter 8.
Part 3 Chapter 17: Welding *The amendments are applicable to ships contracted for construction on or after 1 January 2024.*	
2/ 2.4.3	It is specified that alternative welding sequences may be accepted provided distortions are kept to a minimum in accordance with recognized fabrication standards.
Part 3 Chapter 18: Hull Inspection, Workmanship & Testing *The amendments are applicable to ships contracted for construction on or after 1 January 2024.*	
3/ 3.1.2	Editorial changes are made for better clarity
3/ 3.3.3 (new)	The expression 'top of the overflow' is defined along with better clarity on overflow systems.
3/ 3.4.2.1	It is specified that alternative equivalent testing procedures may be considered for tanks manufactured from composite materials based on manufacturer's recommendations.
3/ 3.4.4.1.2	Test pressure restrictions for tanks designed for cargo densities greater than water are clarified.
Table 3.4.1	The requirement to test tanks based on the pressure relief valve setting has been replaced with a requirement to test tanks based on the design vapour pressure. Also, testing requirements for fuel oil overflow tanks not intended to hold fuel are now specified. Other editorial changes are made in the footnotes for better clarity.
Table 3.4.2	The requirement to test tanks based on the pressure relief valve setting has been replaced with a requirement to test tanks based on the design vapour pressure. Other editorial changes are made in the footnotes for better clarity.
4/ 4.1	Editorial changes are made for better clarity.
4/ 4.2.5 (new)	It is clarified that for tanks which are less than 2 m^3 in volume, structural testing may be replaced by leak testing.
4/ 4.2.6	Testing requirements for tanks and spaces in sister ships are clarified better.
Section 5 (new)	A new section is introduced that provides requirements for testing of tanks and tight boundaries for non-SOLAS ships.

Section / Clause	Subject/ Amendments
Part 4 Chapter 2: Piping Design Requirements *The amendments are applicable from 1 October 2023.*	
5/ 5.3.6 and Table 5.3.1	Amendments are made to delete certain requirements, as these are not relevant for plastic pipes.
Part 4 Chapter 3: Pumping and Piping *The amendments are applicable to ships constructed on or after 1 January 2024.*	
2/ 2.4.3, 2.4.4 (new) & 2.4.5 (new)	Arrangements to be provided (valve material, valve control etc.) if in case, the collision bulkhead is pierced by a pipe or by two pipes below the bulkhead deck/ freeboard deck of passenger/ cargo ships respectively, are specified.
MSC.1/ Circ. 864, Rev. 1 is already applicable from May 2019.	
4/ 4.3.11	Better clarity is provided on requirements for sampling points by aligning with MEPC.1/ Circ. 864, Rev.1.
Part 4 Chapter 4: Prime Movers and Propulsion Shafting Systems	
6/ 6.20.2.3	Version of the referred ISO standard is updated.
Part 5 Chapter 1: Dry Bulk Cargo Carriers *The amendments are applicable to ships constructed on or after 1 January 2024.*	
2/ IR 2.14.1.2	Relevant cross-references are updated as a result of changes made in Pt.4, Ch.3.
Part 5 Chapter 4: Liquefied Gas Carriers *The amendments are applicable to ships contracted for construction on or after 1 January 2024.*	
2/ 2.7.1	Amendments are made to align with revised Regulation 27(13)(a) of the 1988 Load Lines Protocol accepting hinged watertight doors.
6/ 6.5.3.5	The testing requirements are extended to materials other than Aluminium alloys.
18/ 18.10.2.4 (new)	Requirements for fail-close action of the hydraulically or pneumatically actuated ESD valves are specified.
Part 5 Chapter 8: Offshore Support Vessels *The amendments are applicable to ships contracted for construction on or after 1 January 2024.*	
2/ 2.7.1	Additional requirements for anchoring and mooring equipment in Offshore Support Vessels operating in the North Sea and not provided with dynamic positioning systems/ thrusters are specified.
Part 5 Chapter 35: Gaseous Fuel or other Low Flash Point Fueled Ships *The amendments are applicable to ships contracted for construction on or after 1 January 2024.*	
5/ 5.3.4	An error is corrected in the definition for f_v.
6/ 6.7.1.1	The requirement for pressure relief systems for tank cofferdams is deleted.
6/ 6.8.3 (new)	The option of allowing a higher loading limit based on tank insulation and tank location is given.
9/ 9.5.3 to 9.5.6 (all new)	Amendments are made to clarify that secondary enclosure and ventilation requirements (in Cl. 9.5.1) are only applicable to gaseous fuel pipes. It is also specified that the requirements in Cl. 9.5.4 need not be applied to fully welded fuel gas vent pipes led through mechanically vented spaces. A new Clause is added to clarify application of the secondary enclosure requirements for pipes with fuel in the liquefied state.
10/ 10.3.1.1.1 (new)	It is specified that the exhaust system is to be equipped with explosion relief systems unless designed to accommodate the worst-case overpressure due to ignited gas leaks or justified by the safety concept of the engine.

Section / Clause	Subject/ Amendments
11/ 11.3.3	Requirement to have a cofferdam or A 60 class division on the boundary between spaces containing the fuel containment system is deleted.
11/ 11.3.3.1 (new)	Qualifying requirements for a fuel storage hold space to be considered as a cofferdam are specified.
11/ 11.8 (new)	Fixed fire-fighting requirements for fuel preparation rooms containing pumps, compressors or other potential ignition sources are indicated.
16/ 16.3.3.5	The testing requirements are extended to materials other than Aluminium alloys.
Part 6 Chapter 2: Prevention of Fire and Explosion	
2/ 2.3.2.2	Amendments are made to align with SOLAS text.
Part 6 Chapter 8: Fire Safety Systems Code *The amendments are applicable to ships constructed on or after 1 January 2024.*	
9/ 9.2.1.8 (new)	Requirements for isolator modules in individually identifiable fire detection systems fitted in cargo and passenger ship balconies are specified.
15/ 15.2.2.3.2.1, 15.2.2.3.2.6, 15.2.2.4.2.1	The terminology is corrected (‘forward’ replaced by ‘downstream’).

RULES AND REGULATIONS FOR THE CONSTRUCTION AND CLASSIFICATION OF STEEL SHIPS – July 2023

RULES CHANGE NOTICE No. 2 – December 2023

TABLE – AMENDMENTS INCORPORATED IN THIS NOTICE

These amendments will come into force as indicated in the Table

Section / Clause	**Subject/ Amendments**
Part 1 Chapter 1: General *The amendments are applicable from 1 January 2024.*	
Appendix 1	Additional Class Notation '**SHUTTLE TANKER**' is added to the list of notations.
Part 1 Chapter 2: Periodical Surveys *The amendments are applicable to surveys carried out on or after 1 July 2024.*	
2/ 2.2.25	Requirement for examination of double skin void spaces for bulk carriers exceeding 20 years of age and ≥ 150m in length, as a consequence of the results of special and intermediate surveys is introduced.
2/ 2.3.2.1, 2.4.5.1	The criteria for examination of ballast tanks are revised from 'POOR' to 'less than GOOD' during annual and special surveys.
2/ 2.4.5.4	Conditions when double-side skin void spaces bounding cargo holds for bulk carriers exceeding 20 years of age and of 150 m in length and upwards, need to be examined at annual intervals, are specified.
3/ 3.4.7.6	Conditions for acceptance (by the Surveyor) of cargo tank testing carried out by the ship's crew are revised.
The amendments are applicable to surveys carried out on or after 1 January 2024.	
2/ 2.2.4.15, 3/ 3.2.3.16, 4/ 4.2.3.16, 5/ 5.2.3.15, 6/ 6.2.4.15.	It is specified that all non-metallic expansion joints fitted in piping systems which penetrate the ship's side and both the penetration and the expansion joint being located below the deepest load waterline, are to be visually examined and their service records are to be checked.
Part 4 Chapter 3: Pumping and Piping *The amendments are applicable to ships constructed on or after 1 January 2024.*	
3/ Note to 3.6.3	The title of the referred Classification Note on water level detectors is revised.
3/ 3.7 (new)	New subsection providing requirements for water level detectors on multiple hold cargo ships other than bulk carriers and tankers, is introduced.
Part 5 Chapter 1: Dry Bulk Cargo Carriers *The amendments are applicable to ships constructed on or after 1 January 2024.*	
2/ Note to 2.13.1	The title of the referred Classification Note on water level detectors is revised.
Part 5 Chapter 4: Liquefied Gas Carriers *The amendments are applicable to ships constructed on or after 1 January 2024.*	
4/ IR 4.20.4	Verifications and examinations at gas trials and /or at first full cargo loading and unloading are revised.

Section / Clause	Subject/ Amendments
Part 5 Chapter 6: Passenger Ships *The amendments are applicable to ships constructed on or after 1 January 2024.*	
4/ 4.1.5 & 4.1.6 (both new)	New Clauses are introduced to align with SOLAS Ch. II-1, Reg. 17 and 17-1.
4/ 4.3.1	Amendments are made to align with SOLAS Ch. II-1, Reg. 17, to clearly specify requirements for ships constructed before 1 January 2024.
4/ 4.3.2 & 4.3.3 (both new)	Requirements for internal watertight subdivision arrangements and doors in such arrangements in new ships are specified.
4.4 (new)	New sub-section providing requirements for watertight integrity below the bulkhead deck, in alignment with SOLAS Ch. II-1, Reg. 13 is introduced.
Part 5 Chapter 24: Dynamic Positioning *The amendments are applicable from 1 January 2024.*	
1/ 1.2.7	The definition for 'dynamically positioned vessel' is amended for better clarity.
Part 5 Chapter 26: Diving Support Vessels and Diving Systems *The amendments are applicable to ships constructed on or after 1 January 2024.*	
Complete Revision	The Chapter is revised in order to align with the requirements in the International Code of Safety for Diving Operations, 2023.
Part 6 Chapter 1: General	
1/ Table 1	The referenced IMO Circulars (i.e. MSC.1/Circulars 1276, 1395 & 1430) are updated with their latest versions.
Part 6 Chapter 3: Suppression of Fire *MSC.1/ Circ 1276, Rev.1 and MSC.1/Circ. 1395, Rev.6 are already applicable from June 2023.*	
4/ 4.5.6.2	Reference to the latest version of MSC.1/ Circ. 1276 is updated.
4/ 4.7.1.4 & IR 4.7.2.1	Reference to the latest version of MSC.1/ Circ. 1395 is updated.
Part 6 Chapter 7: Special Requirements *The amendments are applicable to ships constructed on or after 1 January 2024.*	
3/ 3.6.1.3	Reference to the latest version of MSC.1/ Circ. 1430 is updated.
Part 6 Chapter 8: Fire Safety Systems Code *The amendments are applicable to ships constructed on or after 1 January 2024.*	
7/ 7.2.4	Reference to the latest version of MSC.1/ Circ. 1430 is updated.

RULES AND REGULATIONS FOR THE CONSTRUCTION AND CLASSIFICATION OF STEEL SHIPS – July 2023

RULES CHANGE NOTICE No. 3 – February 2024

TABLE – AMENDMENTS INCORPORATED IN THIS NOTICE

Chapter No.	Title of Existing Chapter	Title of Revised Chapters
1	General, Definitions, Documentation	General, Definitions, Documentation
2	Materials of Construction	Materials of Construction and Corrosion Additions
3	Principles for Scantlings and Structural Details	General Arrangement and Structural Design Principles (1)
4	Design Loads	Stability (3)
5	Longitudinal Strength	Design Loads
6	Bar Keel, Stem and Stern frames (1)	Hull Girder Strength
7	Bottom Structure (1)	Hull Local Scantlings (1)
8	Side Structure (1)	Finite Element Analysis (3)
9	Deck Structure (1)	Buckling (3)
10	Bulkheads (1)	Fatigue (3)
11	Superstructures, Deckhouses and Bulwarks (1)	Special Hull Requirements (1)
12	Openings and Closing Appliances (2)	Openings and Closing Appliances (2)
13	Ventilators, Air Pipes and Discharges (2)	Rudders (4)
14	Rudders	Anchoring and Mooring Equipment (4)
15	Anchoring and Mooring Equipment	Masts and Rigging (4)
16	Masts and Rigging	Welding (4)
17	Welding	Hull Inspection, Workmanship and Testing (4)
18	Hull Inspection, Workmanship and Testing	

Note:
(1) Some contents of existing Chapters 6 to 11 moved to new Chapters 3, 7 and 11.
(2) Some contents of existing Chapters 12 and 13 moved to new Chapter 12.
(3) Entirely New Chapter.
(4) Unaltered Chapter: The Chapter number has been updated, but its contents remain unchanged. It is omitted from this Notice since there are no modifications to the Chapter compared to the previous Rules Change Notice/ Consolidated Edition.

RULES AND REGULATIONS FOR THE CONSTRUCTION AND CLASSIFICATION OF STEEL SHIPS – July 2023

RULES CHANGE NOTICE No. 4 – March 2024

TABLE – AMENDMENTS INCORPORATED IN THIS NOTICE

These amendments will come into force as indicated in the Table

Section / Clause	**Subject/ Amendments**
Part 1 Chapter 1: General *The amendments are applicable from 1 July 2024.*	
2/ 2.1.4	The Industrial Personnel Code (IP Code, effective from 1st July 2024) and the Polar Code, are added to the list of Conventions/ Codes that are a prerequisite for Classification.
2/ 2.18.11 & 2.18.15	Rule provisions related to laying up of vessels after being suspended are deleted.
Appendix 1	Additional Class Notations '**CyS-E**', '**FC (Main)**' and '**FC (Auxiliary)**' are added to the list of notations.
Part 1 Chapter 2: Periodical Surveys *The amendments are applicable to surveys on vessels contracted for construction on or after 1 July 2024.*	
25 (new)	A new section pertaining to '**Cyber Resilience Surveys**' is added.
Part 2 Chapter 2: Mechanical Testing Procedures *The amendments are applicable to application for certification of manufacturer approval for EH47 and brittle crack arrest steels dated on or after 1 July 2024.*	
Section 5	This Section is completely revised, wherein detailed requirements have been deleted and instead references are made to ISO 20064:2019 *"Metallic materials –Steel- Method of test for the determination of brittle crack arrest toughness, Kca".*
Section 6	Existing references to Section 5 are replaced with references to ISO 20064:2019.
Part 2 Chapter 3: Rolled Plates, Steels and Bars *The amendments are applicable to applications for certification of manufacturer approval for EH47 and brittle crack arrest steels dated on or after 1 July 2024.*	
3/ 3.15.2.1.2 (new) & 10/ 10.2.3.1.2 (new)	A new Clause is added specifying that the products tested must be at their maximum approved thickness. If the chemical composition varies with thickness, testing is to cover each composition at its maximum thickness.
3/ 3.15.2.2 (b)	Reference to industry standard for hydrogen crack test is revised to ISO 17642:2005.
10/ 10.2.3.1.1	It is clarified that for EH47 steels with brittle crack arrest properties, certain requirements of the IRS Classification Note: '*Approval Scheme for the Manufacturing Process of Normal and Higher Strength Hull Structural Steels'* are not applied.
10/ 10.2.3.3.4	Subject Clause is amended to clarify that if the initial Kca brittle crack arrest test fails, further tests can be done.
Annex 1 (new)	The new Annex outlines the approval process for small-scale test methods used in batch release testing of brittle crack arrest steels listed in Table 10.1.3.

Section / Clause	Subject/ Amendments
Part 3 Chapter 13: Rudders *The amendments are applicable to ships contracted for construction on or after 1 July 2024.*	
2/ 2.1.4	It is clarified that a seal or stuffing box is to be fitted above the waterline at scantling draft (without trim). When the top of the rudder is below the water line at scantling draught, two separate seals or stuffing boxes are to be provided.
3/ 3.1.1	It is clarified that the maximum astern speed as defined in SOLAS Regulation II-1/3.15 is to be used for astern condition.
4/ 4.1.2	A Figure showing the details of use of steel backing bar in way of full penetration welding of rudder side plating is introduced.
4/ 4.2.1	The formula for rudder plating thickness 't' is amended to cater for the scantling draught.
5/ 5.1.4	It is clarified that for a spade rudder with trunk extending inside the rudder, the rudder stock scantlings are to be checked against the two cases defined in Section 8.3.
5/ 5.2.3	The formulae for required push-up pressures for pintles in case of dry fitting or oil injection fitting are indicated. The method to calculate the required push up length is also specified.
5/ 5.3.1.1	It is clarified that for rudder stocks and pintles having diameter less than 200 [mm], liners in way of bushes may be provided optionally.
6/ 6.4.2	Editorial correction is made to the formula for push-up pressure. It is clarified that for a spade rudder with trunk extending inside the rudder, the rudder coupling is to be checked against the two cases defined in Section 8.3.
7/ 7.3.1	Better clarity is provided on the formula for the fillet shoulder radius of the rudder trunk.
8/ 8.2.2	It is clarified that the maximum moment, M_C, in top of the cone coupling as shown in Fig. 8.2.2 is applicable for the connection between the rudder and the rudder stock.
8/ Fig. 8.3.2 (a) & (b)	Two Figures are introduced that depict the strength checks for a spade rudder with trunk extending inside the rudder.
Part 4 Chapter 3: Pumping and Piping *The amendments are applicable to ships contracted for construction on or after 1 July 2024.*	
4/ Fig. 4.2.4 (A) & (B)	In the context of equivalent arrangements, it is clarified that any fuel oil which requires post service tank heating to achieve the required injection viscosity is not regarded as MDO.
Part 4 Chapter 4: Prime Movers and Propulsion Shafting Systems *The amendments are applicable to EGCS:* *i) when an application for installation, i.e. submission of plans, is made on or after 1 July 2024; or* *ii) which is installed in ships contracted for construction on or after 1 July 2024.*	
4/ 4.15.2.5, 4.15.2.6, 4.15.2.10 & 4.15.2.15	Editorial changes are made for better clarity.
4/ 4.15.3 (new)	Construction requirements for discharge water pipeline of EGCS are specified.
Part 4 Chapter 7: Control Engineering *The amendments are applicable to ships contracted for construction on or after 1 July 2024.*	
Section 6	This Section is completely revised to better clarify requirements for computer-based systems, including those for system integrator.
Section 7 (old)	Requirements for integrated systems are deleted as they are covered in Section 6.
Section 7 (new)	A new Section specifying the minimum set of requirements for cyber resilience of ships is introduced.

Section / Clause	Subject/ Amendments
Section 8 (new)	A new Section specifying the minimum set of requirements for cyber resilience of on-board systems and equipment is introduced.
Part 5 Chapter 3: Chemical Carriers *The amendments are applicable to ships constructed on or after 1 July 2024.*	
2/ 2.9.2	Amendments are made to align with revised Regulation 27(13)(a) of the 1988 Load Lines Protocol accepting hinged watertight doors.
Part 5 Chapter 8: Offshore Support Vessels *The amendments are applicable from 1 July 2024.*	
5/ 5.1.6	Reference to SOLAS Chapter XV (Safety Measures for Ships carrying Industrial Personnel) is made. Further, the term 'Industrial Personnel' is defined for better clarity.
Part 5 Chapter 32: Polar Class *The amendments are applicable to ships contracted for construction on or after 1 July 2024.*	
Section 3	Comprehensive amendments are undertaken in this Section, including introduction of requirements for icebreaker vessels.
Part 5 Chapter 35: Gaseous Fuel or other Low Flash Point Fueled Ships *The amendments are applicable to ships contracted for construction on or after 1 July 2024.*	
7/ 7.3.6.3, 9/ 9.2.1 & 9.6.1	Requirements for single common flange in fuel transfer piping are better clarified.
Part 6 Chapter 3: Suppression of Fire *The amendments are applicable to ships constructed on or after 1 July 2024.*	
3/ IR3.7.3.1.2	The requirement of 'fire insulation' in the referred Clause is better clarified.
3/ IR3.7.3.2	Requirements for ventilation ducts passing through 'B' class bulkheads are better clarified.

TABLE – CORRIGENDA INCORPORATED IN THIS NOTICE

Section / Clause	Subject/ Corrigenda
Part 5 Chapter 3: Chemical Carriers	
17/17.1.1	Requirements for "*Bio-fuel blends of Diesel/gas oil and FAME (>25% but <99% by volume)*", which were inadvertently missed out are now included in the table in accordance with the IBC Code.

RULES AND REGULATIONS FOR THE CONSTRUCTION AND CLASSIFICATION OF STEEL SHIPS – July 2024

TABLE 1 – AMENDMENTS INCORPORATED IN THIS EDITION

These amendments will come into force as indicated in the Table

Section / Clause	**Subject/ Amendments**
Part 1 Chapter 1: General *The amendments are applicable from 1 July 2024.*	
2/ 2.1.1	It is specified that verification of cyber resilience, where applicable, is also part of Ship Classification. Further, this will also include verification of cyber resilience, where applicable, of equipment and systems required by statutory regulations.
Appendix 1	Additional Class Notation '**SUPPLY-PLUS**' is added to the list of notations.
Part 1 Chapter 2: Periodical Surveys *The amendments are applicable to surveys carried out on or after 1 January 2025.*	
8/ 8.1.7	A cross reference to the new requirements in Pt.4 Ch.1, Sec. 3.8, 'Testing of the control system of controllable pitch propellers', is added.
Part 3 Chapter 12: Opening and Closing Appliances *The amendments are applicable to ships contracted for construction on or after 1 July 2024.*	
2/ 2.4.1.5 (new)	It is clarified that the requirements of this sub-section do not apply for small hatches on container ships giving access to a cargo hold, if these comply with certain conditions for non-weathertight hatch covers as outlined in Part 5, Chapter 5, Cl. 3.2 of the Rules.
Part 3 Chapter 14: Anchoring and Mooring Equipment *The amendments are applicable to ships contracted for construction on or after 1 July 2024.*	
1/ 1.2.7, 1.2.8 (both new)	Scope of the requirements is further amplified.
3/ 3.1.3	Permissible requirements for tugs less than 45m in length are specified.
3/ 3.1.4 (new)	It is clarified that requirements in sub-section 3.3 are not applicable to dredgers with an unusual design of the underwater part of the hull.
3/ 3.2.6 (new)	Requirements for fishing vessels are clarified.
3/ 3.2.7 (new)	Requirements for vessels other than fishing vessels are clarified.
3/ 3.3 (new)	This new sub-section provides requirements (for ships of length < 90m) for direct force calculation for anchoring equipment, as an alternative to the prescriptive approach.
6/ 6.2.4 & 6.2.6 (both deleted)	Requirements are deleted based on the introduction of Line Design Breaking force (LDBF) requirements in Cl. 6.3.1.
6/ 6.3.1	Requirements for Line Design Breaking force (LDBF) are clarified.
Part 4 Chapter 1: General Requirements for the Design and Construction of Machinery *The amendments are applicable to ships contracted for construction on or after 1 January 2025 except otherwise specified.*	
1/ 1.7.1	Ship accelerations and motions are included in the list of environmental conditions.

Section / Clause	Subject/ Amendments
1/ 1.7.5 (new)	The new sub-section details ship accelerations, motions and provides requirements to ensure that essential machinery operates effectively under the effects of ship accelerations and motions.
1/ 1.10	Cross reference is provided to the new subsection 3.2.8 'Testing of the control system of controllable pitch propellers'.
3/ 3.2.8 (new)	Requirements for testing of the pitch control system of controllable pitch propellers are specified. *These requirements are also applicable to vessels contracted for construction before 1 January 2025 and where testing is carried out according to Pt. 1 Ch.2, Cl. 8.1.7, on or after 1 January 2025.*
Part 4 Chapter 4: Prime Movers and Propulsion Shafting Systems	
The amendments are applicable to ships contracted for construction on or after 1 January 2025.	
4/ 4.9.2.1	It is clarified that the capacity of one independent compressor or the combined capacity of independent compressors is not to be less than 50% of the total required capacity.
4/ 4.13.1	Scope of application is expanded to marine engines using high pressure natural gas, including specifics for Dual Fuel and Gas Fuel engines, and integration with requirements of Pt. 5, Ch. 4 and Pt. 5, Ch. 35.
4/ 4.13.2	Definitions related to gas engines added/ amended such as 'Certified safe type equipment', 'Explosion Relief Device', 'High Pressure Gas', etc.
4/ 4.13.4.1	New text added which specifies that the strength of components related to explosion relief devices must be documented or demonstrated to effectively handle the maximum expected explosion scenario.
4/ 4.13.4.2	General requirements for gas piping are further clarified including aspects such as classification of various gas piping (Class I, Class II, etc.), flexible bellows, design pressures for gas pipes, etc.
4/ 4.13.4.4	Amendments made indicating that design requirements of "charge air system" in 4.3.4.1.2 are also applicable to "exhaust gas system".
4/ 4.13.4.5	Requirements for explosion relief devices are indicated.
4/ 4.13.4.6	Requirements for crankcase ventilation, where arranged, are added.
4/ 4.13.4.9	Amendments are made to differentiate requirements for electrically operated and hydraulically operated valves.
4/ Table 4.13.4.8	'Failure of crankcase ventilation system, if applicable' is added to the list of parameters to be monitored. Few notes are added in the Table for better clarity.
4/ 4.13.5.4	Requirements addressing two stroke engines (for scavenge air system and crankcase) are added.
4/ 4.13.6.2	It is clarified that 'pilot fuel temperature and pressure' is to be recorded during factory acceptance tests.
4/ 4.13.6.3	Requirements for shipboard trials are further amplified.
4/ 4.13.7 (new)	The certification process for engine components is clarified.
The amendments are applicable to ships contracted for construction on or after 1 July 2025.	
4/ 4.17 (new)	Requirements for the capacity and availability of compressed air required by systems, machinery and equipment providing essential services, other than for engine starting are specified.
Part 5 Chapter 1: Dry Bulk Cargo Carriers *The amendments are applicable to ships contracted for construction on or after 1 July 2024.*	
1/ 1.1	Editorial amendments are made for better clarity.
1/ 1.3 (new)	Design loads in cargo holds are specified.
1/ 1.4 (new)	The requirements in this sub-section are shifted from erstwhile 2.4
1/ 1.5 (new)	Requirements for transverse vertically corrugated watertight bulkheads in flooded conditions are specified.

Section / Clause	Subject/ Amendments
1/ 1.6 (new)	Design load scenarios and design load sets are specified.
1/ 1.12 (new)	Requirements for protection against loading/ discharge equipment are specified.
2/ 2.2 & 2.3	Editorial changes are made to provide reference to relevant requirements in Part 3.
2/ 2.4 (new)	Detailed requirements for double side structure are specified.
2/ 2.5, 2.6, 2.7, 2.8 & 2.9	Amendments are made to provide better clarity in structural requirements for single side structure, hopper side tank structure, topside tank structure, deck structure and corrugated bulkheads respectively.
3	Cross-references to new part 3 are updated and other editorial amendments are made for better clarity.
4	Section 4 is completely revised to provide reference to relevant requirements in new Part 3 of the Rules.
Section 5 (deleted)	This section is deleted, as its contents are covered in Chapter 12, Sections 5 to 10 of the new Part 3 of the Rules.
Part 5 Chapter 2: Oil Tankers *The amendments are applicable to ships constructed on or after 1 July 2024.*	
Sections 4 & 5	The sections are completely revised to provide cross-references to relevant requirements in Part 3 as well as provide design load sets for PSMs and finite element analysis criteria, as relevant and applicable.
Part 5 Chapter 4: Liquefied Gas Carriers *The amendments are applicable to ships contracted for construction on or after 1 January 2025.*	
4/ IR4.3.3.1 & IR4.3.3.2	Safety margins for the design of cargo containment systems are explicitly specified.
Part 5 Chapter 5: Container Ships *The amendments are applicable to ships contracted for construction on or after 1 July 2024*	
2 & 5	Cross-references to new part 3 are updated along with some editorial changes.
Part 5 Chapter 6: Passenger Ships *The amendments are applicable to ships contracted for construction on or after 1 July 2024*	
1, 3 & 4	Cross-references to new part 3 are updated along with some editorial changes.
Part 5 Chapter 8: Offshore Support Vessels *The amendments are applicable to ships contracted for construction on or after 1 January 2025.*	
1/ Table 1.2.2.	New notation **SUPPLY-PLUS** for vessels intended to operate in the North Sea is added. Further, some cross-references are updated.
Section 2	This section is completely revised to provide additional requirements for Offshore Support Vessels operating in the North Sea. Further, amendments are also made to provide cross-references to relevant requirements in Part 3 of the Rules.
Part 5 Chapter 10: Dredgers *The amendments are applicable to ships contracted for construction on or after 1 July 2024.*	
2	The thickness requirements for boundaries of hopper spaces and wells is deleted and instead cross-reference is provided to the relevant requirements of Part 3 of the Rules. Other cross-references to new part 3 are updated.
4	Cross-references to new part 3 are updated.
Part 5 Chapter 11: Barges and Pontoons *The amendments are applicable to ships contracted for construction on or after 1 July 2024*	

Section / Clause	Subject/ Amendments
2, 3 & 4	Cross-references to new part 3 are updated along with some editorial changes.
Part 5 Chapter 12: Floating Dry Docks *The amendments are applicable to ships contracted for construction on or after 1 July 2024.*	
2	Cross-references to new part 3 are updated.
Part 5 Chapter 35: Gaseous Fuel or other Low Flash Point Fueled Ships *The amendments are applicable to ships contracted for construction on or after 1 January 2025.*	
Introduction/ IR3.3	Amendments are made to provide reference to the IRS *Guidelines on LPG Fuelled Vessels.*
6/ IR6.4.1.5 (new)	Safety margins for the design of fuel containment systems are explicitly specified.

TABLE 2 – CORRIGENDA INCORPORATED IN THIS EDITION

Section / Clause	Subject/ Corrigenda
Part 3 Chapter 2: Materials of Construction and Corrosion Additions	
2/Table 2.2.1(e)	In Notes 1 & 2, nomenclature for span of the side frame is corrected from *h* to *l.*.
4/4.3.1	The term "*Hatches*" is deleted, as there is a separate chapter covering requirements for hatches.
4/ Note to 4.3.1	Editorial changes are made for better clarity.
5/Table 5.1.1	Unit [mm] is specified for Corrosion Addition (t_{c1} or t_{c2}) for clarity.
Part 3 Chapter 5: Design Loads	
2/Table 2.4.2.3	Typo error is corrected in LCF associated with Q_{WV} for load component OST-2P and OST-2S.
2/Table 5.1.2	Footnote 3 added in alignment with the existing footnote 8 of Table 3.4.2 of Part 3, Ch.17 "Hull Inspection, Workmanship and Testing".
Part 3 Chapter 12: Opening and Closing Appliances	
1/1.1.4 & 5/5.1.3	Subject clauses are deleted as the requirements are not covered here.
6/6.2.2.2 & 9/9.11.3.4	Cross reference associated with P_{Coam} corrected.
Part 5 Chapter 1: Dry Bulk Cargo Carriers	
1/1.3.3.1 & 1.4.3.4	Cross references corrected.

2.4 Special Surveys - Hull

2.5 Special Surveys - Machinery

Section 3 : Surveys - Oil Tankers, Ore or Oil Carriers, Oil or Bulk Carriers

3.1 Scope

3.2 Annual surveys

3.3 Intermediate Surveys

3.4 Special Surveys - Hull

3.5 Special Surveys - Machinery

3.6 Survey Requirements for vessels carrying Asphalt in Integral tanks

3.7 Survey Requirements for vessels carrying Asphalt in Independent tanks

Section 4 : Surveys - Chemical Tankers

4.1 Scope

4.2 Annual surveys

4.3 Intermediate Surveys

4.4 Special Surveys - Hull

4.5 Special Surveys - Machinery

Section 5 : Surveys - Liquefied Gas Carriers

5.1 Scope

5.2 Annual surveys

5.3 Intermediate Surveys

5.4 Special Surveys - Hull

5.5 Special Surveys - Machinery

5.6 Additional survey requirements for Liquefied Gas Carriers with RV(LNG) Notation

Section 6 : Surveys - Other Ship Types

6.1 Scope

6.2 Annual surveys

6.3 Intermediate surveys

6.4 Special Surveys - Hull

6.5 Special Surveys - Machinery

6.6 Surveys of Livestock Carriers

6.7 Surveys of Towing Winch Emergency Release Systems

Section 7 : Docking Surveys

7.1 General

7.2 In-water surveys

Section 8 : Machinery - Special Surveys

8.1 General

8.2 Continuous survey of machinery (CSM)

8.3 Survey requirements: Auxiliary engines

8.4 Survey requirements: Air compressors, receivers and starting air pipes

8.5 Survey requirements: Fresh water generators and evaporators

8.6 Survey requirements: Fuel tanks

8.7 Survey requirements: Pumps, heat exchangers, forced draught fans, etc.

8.8 Survey requirements: Pumping and piping system

8.9 Survey requirements: Reduction gears, flexible couplings and clutch arrangements

8.10 Survey requirements: Securing arrangements

8.11 Survey requirements: Shafting

8.12 Survey requirements: Sea connections

8.13 Survey requirements: Windlass and steering machinery

8.14 Survey requirements: Internal combustion engines for propulsion

8.15 Survey requirements: Steam turbines for propulsion

8.16 Survey requirements: Steam reciprocating engines for propulsion

8.17 Survey requirements: Gas turbines and free piston gas generators for propulsion

8.18 Survey requirements: Unattended machinery spaces/Remote control systems

8.19 Survey requirements : Electrical equipment survey

8.20 Survey requirements : Electrical propelling machinery

8.21 In service testing of large permanently installed breathing gas containers onboard diving vessels - Special Requirements

8.22 Surveys requirements : Fuel installations on ships utilizing gaseous fuels or other low flash point fuels

Section 9 : Boiler Surveys

9.1 General

9.2 Steam heated steam generator

Section 10 : Steam Pipes Surveys

10.1 General

10.2 Cylindrical boilers having smoke tube superheaters

10.3 Copper pipes

Section 11 : Surveys of Propeller Shafts, Tube Shafts and Propellers

11.1 General

11.2 Oil lubricated shafts or closed loop system fresh water lubricated shafts (closed system)

11.3 Water lubricated shafts (open systems)

11.4 Steerable and azimuth thrusters

11.5 Vertical axis propellers

11.6 Water jet systems

11.7 Controllable pitch propellers

Section 12 : Surveys of Inert Gas Systems

12.1 General

12.2 Annual surveys

12.3 Special surveys

Section 13 : Surveys of Vessels with Refrigerated Cargo Installations

13.1 General

13.2 Periodical surveys

13.3 Continuous special survey of refrigerating installation

13.4 Annual survey requirements

13.5 Requirements of first special survey

13.6 Subsequent special surveys

13.7 Loading port surveys

Section 14 : Planned Maintenance System

14.1 General

14.2 Machinery acceptable for survey by Chief Engineers under Planned Maintenance System

14.3 Machinery not acceptable for survey by Chief Engineers

14.4 System Administration

14.5 System implementation

14.6 System surveys

14.7 Damage and repairs

Section 15 : Surveys – Vapour Control Systems

15.1 For tankers and combination carriers with notations VCS1 and VCS2

15.2 For tankers and combination carriers with notations VCS1-B and VCS2-B

Section 16 : Surveys of Thermal Oil Heating Systems

16.1 General

16.2 Oil fired thermal oil heater and economiser

16.3 Circulating pumps

16.4 Dump cooler

16.5 Piping arrangement

16.6 Expansion tank

16.7 Alarms and safety devices

16.8 Thermal oil analysis

16.9 System operation test

16.10 Repairs

18.1 General Requirements for Diving Support Vessels

18.2 Annual surveys

18.3 Special Surveys

18.4 General requirements for diving systems

18.5 Annual Surveys

18.6 Additional requirements for Third Annual Survey

18.7 Special Surveys

18.8 Surveys of Hyperbaric Evacuation Systems (HES)

18.9 Surveys for Transit Damage

Section 19 : Surveys – Ballast Water Management

19.1 General

19.2 Vessels using ballast water exchange methods

19.3 Vessels using ballast water treatment systems

Section 20 : Surveys – Fuel Installations on Ships Utilizing Gaseous Fuel or other Low Flash Points Fuels

20.1 Application

20.2 Annual survey

20.3 Intermediate survey

20.4 Special survey

Section 21 : Condition Monitoring and Condition Based Maintenance

21.1 General

21.2 Procedures and conditions for approval of CM and CBM

21.3 Surveys

Section 22 : Surveys – Comfort On-board Ships

22.1 General

22.2 Annual surveys

22.3 Special surveys

Section 23 : Surveys of Floating Dry Docks

23.1.General

23.2 Intermediate Surveys

23.3 Special Surveys

Section 24 : Remote Surveys

24.1. Application

24.2 Definitions

24.3 Requirements for equivalency

24.4 Scope and Procedures of remote surveys

24.5 Hardware and ICT Solution

24.6 Recording of evidence (also see 24.3.4) and reporting of surveys

Section 25 : Cyber Resilience Surveys

25.1 General

25.2 Vessel asset inventory

25.3 Security Zones and Network Segmentation

25.4 Network protection safeguards

25.5 Antivirus, antimalware, antispam and other protections from malicious code

25.6 Access control

25.7 Wireless communication

25.8 Remote access control and communication with untrusted networks

25.9 Use of Mobile and Portable Devices

25.10 Network operation monitoring

25.11 Verification and diagnostic functions of CBS and networks

25.12 Incident Response Plan

25.13 Local, independent and/ or manual operation

25.14 Network isolation

25.15 Fallback to a minimal risk condition

25.16 Recovery plan

25.17 Backup and restore capability

25.18 Controlled shutdown, reset, roll-back and restart

25.19 Appendix 1 may be referred for summary of actions to be taken and documents to be maintained by various stakeholders.

Section 1

General Information

1.1 Indian Register of Shipping

1.1.1 Indian Register of Shipping (hereinafter referred to as "IRS") was incorporated in 1975 as a Public Limited Company under the Indian Companies Act for the purpose of providing amongst other things a faithful and accurate classification of mercantile shipping classed with it, to approve designs of, to survey and to issue reports on mercantile and non mercantile ships, hovercrafts, hydrofoils etc; all within the scope of classification described in the Rules. This Section contains General Regulations which have been adopted by IRS for its governance. The Classification Regulations are given in Section 2.

1.1.2 The management of the affairs of IRS are carried out by the Managing Director (MD) and Jt. Managing Director (JMD), under the direction and control of the Board of Directors (hereinafter referred to as the 'Board'), in accordance with the provisions of its Memorandum and Articles of Association.

1.1.3 The Board of Directors shall consist of representative of the interests of various members of the Company and those concerned with shipping in general as under:

3	Directors representing Indian Shipowners
2	Directors representing Indian Shipbuilders
1	Director representing General Insurance Corporation of India and other Indian underwriters
1	Director being the Director General of Shipping, Ministry of Surface Transport, Govt. of India
1	Director representing Ship Design Research and Development Institutions
1	Director representing Manufacturers of Marine Engines/General Engineering Goods
1	Director representing Indian Navy/Coast Guard
1	Director being a person of eminence from the field of Law
3	Directors being persons of eminence from any industry allied with maritime activities
1	Managing Director being full-time employee appointed by the Board of Directors
1	Jt. Managing Director, where so appointed, being full-time employee, appointed by the Board of Directors.

The composition of the Board as above is to be in accordance with the Articles of Association of IRS (as may be amended from time to time).

1.1.4 The Board shall consist of not less than six and not more than fifteen Directors. If the actual representation on the Board of Directors exceeds 15 Directors, the provisions of the Indian Companies Act would apply to approve the increase in the sanctioned strength of the Board beyond the limit specified in the Articles of Association of IRS. The Board of Directors shall elect one of its members to be Chairman of the Board of Directors. The reference to Chairman shall include Executive Chairman, where so appointed by the Board of Directors.

1.1.5 The Board is to appoint a Sub-Committee of Classification representing concerned interests.

1.1.6 The Board is to appoint the Chairman of the Sub-Committee of Classification and the Jt. Managing Director, IRS to be 'ex- officio' member of the Sub-Committee of Classification.

1.1.7 The employees of IRS are to be appointed by and be under the direction of the MD, except for Key Managerial Personnel (KMP), who would be appointed by the Board on the recommendation of the Nomination & Remuneration Committee.

1.1.8 The Surveyors of IRS are not to be permitted without the special sanction of the Board of Directors to receive any fee, gratuity or reward whatsoever, for their own use or benefit, for any service performed by them in their capacity as Surveyors to IRS, except on pain of immediate dismissal.

1.1.9 The Funds and Accounts are to be under the authority and control of the Board of Directors.

1.2 Fees

1.2.1 Fees will be charged for all surveys and for other services rendered by IRS or any of its publications in accordance with established scales. Traveling expenses incurred by the Surveyors in connection with such services are also chargeable.

1.3 Technical committee

1.3.1 The Board is to appoint a Technical Committee whose function will be to consider:-

a) Formulation of Technical Rules for Classification Surveys, building of ships, their machinery and equipment.

b) Important alterations to Rules once framed as may be required from time to time.

1.3.2 All decisions of the Technical Committee including amendments and/or additions to the Rules for classification surveys and building of ships' hull, their machinery and equipment to be reported to the Board of Directors.

1.3.3 The Technical Committee to be constituted as follows:

Number of Members of	**Nominees/Representatives**
3	Board of Directors of IRS
1	Marine Engine Unit of M/s. Garden Reach Ship-builders and Engineers Ltd.
1	Other Marine Engine Builders
6	Shipbuilders
2	Indian Institution of Naval Architects
2	Institute of Marine Engineers (India)
1	Company of Master Mariners
2	Directorate General of Shipping
1	IMU (Earlier NSDRC)
4	Indian National Shipowners Association
1	Institution of Engineers (India)
1	Ex-Officio – Executive Chairman of IRS or his nominee
1	Indian Coastal Conference Shipping Association
1	Oil Industry Safety Directorate
5	Indian Navy

2	Indian Coast Guard
1	Research Institutes
2	Indian Institute of Technology/ National Institute of Technology
2	Maritime Training Institutes
3	Other Flag Administrations
1	Inland Waterways Authority of India.

1.3.4 In addition to the foregoing, the Technical Committee may co-opt to the main body other members of high managerial positions in Shipping, Ship Building, Marine Engineering, Naval Architecture, Marine Insurance, Steel Making, etc.

1.3.5 Nomination of all members to the Technical Committee to be subject to confirmation by the Board.

1.3.6 The Technical Committee can appoint panels from amongst its body to which representatives of any organisation or industry or individuals specialised in relevant disciplines could be co-opted for the purpose of considering any particular Technical problem or area of Rules.

1.3.7 The Board of Directors to appoint biennially, the Chairman of the Technical Committee and the Technical Committee to appoint from their own body biennially a Vice-Chairman. The appointment of Vice-Chairman is to be confirmed by the Board of Directors.

1.3.8 The terms of office of all members is to be not more than four years, one-fourth of all members (including those co-opted) to retire at the end of each calender year. The members so retiring being those who have been longest in office since their last nomination and such members to be eligible for re-nomination for a second term. Unless specially so authorised by the Board of Directors, no member other than Chairman and/or Vice- Chairman, who has served for two periods of nomination, to be eligible for re-nomination. In the event of any vacancy occurring before the expiration of the normal term of office, a representative to be nominated to fill the vacancy from the same group/body/institution and for such nominee the date of his nomination by the respective body is to be considered as date of his joining the Technical Committee for purposes of his retirement by rotation.

1.3.9 The meeting of the Technical Committee is to be convened as often and at such time and place as may appear necessary, but there shall be at least two meetings in each year.

1.3.10 The members desiring to propose alterations in, or additions to the Rules for the classification, survey or building of ship (hull and machinery) shall give notice of such proposals to the Secretary. Every meeting to be convened by notice from the Secretary, if possible one month before the date of the meeting and the Secretary to send to each member an Agenda paper as soon as possible thereafter.
Proposals for changes to rules may also be given by Flag Administrations, shipowners, shipbuilders and other interested parties who may not be represented in the Technical Committee.

1.3.11 The quorum for any meeting of Technical committee will be six members, with at least 50% of the members present being those who do not represent shipowners, shipbuilders or others engaged commercially in the manufacture, equipping, repair or operation of ships.

1.3.12 In the event that any matter is not decided by unanimity, the same may be decided by a majority of votes cast in favor, with each member, including co-opted members, having one vote only. In the event of a parity of votes, the Chairman of the Technical Committee would be entitled to an additional casting vote.

1.3.13 When any discussion relates to an item of interest to those representing shipowners, shipbuilders or others engaged commercially in the manufacture, equipping, repair or operation of ships, such representatives would not be entitled to vote, if such matter is to be decided by voting.

1.3.14 In the event that any member of the Technical Committee absents himself for 3 consecutive meetings of the Technical Committee without seeking leave of absence, he would be deemed to have vacated office and his vacancy would be filled by seeking fresh nomination from concerned interest represented.

1.3.15 In the absence of the Chairman and the Vice Chairman of the Technical Committee, the members of the Technical committee shall elect a Chairman, by majority vote, to preside over that particular meeting only.

1.3.16 The Board of Directors reserves to themselves the right of altering, adding to or rescinding any/or all of the above terms of reference including the dissolution of the Technical Committee.

1.4 Survey reports

1.4.1 All reports of survey are to be made by the Surveyors according to the form prescribed and submitted for consideration of the Board or the Sub-Committee of Classification, but the character and notations assigned by the latter is to be reported to the Board. The Board may, in specified instances, vest in the Managing Director / Jt. Managing Director discretionary powers to act on its behalf, and all such actions being reported to the Board at its subsequent meeting.

1.4.2 The reports of the Surveyors shall, subject to the approval of the Managing Director / Jt. Managing Director, be open to inspection of the Owner and any other person authorised in writing by the Owner. Copies of the reports will, subject to the approval of the Managing Director / Jt. Managing Director, be supplied to Owners or their representatives.

1.5 Register of Ships

1.5.1 A Register of Ships is available on-line on IRCLASS Website which contains the names of ships, character of class and notations assigned together with other relevant useful information for ships classed with IRS.

1.6 Liability

1.6.1 Whilst Indian Register of Shipping, a Classification Society, along with its subsidiaries and associates (hereinafter referred to as the Society) and its Board/Committees use their best endeavours to ensure that the functions of the Society are properly carried out, in providing services, information or advice, neither the Society nor any of its servants or agents warrants the accuracy of any information or advice supplied. Except as set out herein, neither the Society nor any of its servants or agents (on behalf of each of whom the Society has agreed this clause) shall be liable for any loss damage or expense whatever sustained by any person due to any act or omission or error of whatsoever nature and howsoever caused of the Society, its servants or agents or due to any inaccuracy of whatsoever nature and howsoever caused in any information or advice given in any way whatsoever by or on behalf of the Society, even if held to amount to a breach of warranty. Nevertheless, if any person uses services of the Society, or relies on any information or advice given by or on behalf of the Society and suffers loss, damage or expenses thereby which is proved to have been due to any negligent act omission or error of the Society its servants or agents or any negligent inaccuracy in information or advice given by or on behalf of the Society then the Society will pay compensation to such person for his proved loss up to but not exceeding the amount of the fee charged by the Society for that particular service, information or advice.

1.6.2 Any notice of claim for loss, damage or expense as referred to in 1.6.1 shall be made in writing to Head Office within six months of the date when the service, information or advice was first provided, failing which all the rights to any such claim shall be forfeited and the Society shall be relieved and discharged from all liabilities.

1.7 Audits and assessments by external organizations

1.7.1 The surveys required by the regulations, and conducted by IRS may be subject to Audit by an independent Accredited Certification Body (ACB) as per the requirements of ISO 9001:2015 standard and Quality Management System Certification Scheme (QSCS) of IACS. For this purpose, ACB auditors are to be given the necessary access to the ship, shipyard or works when requested by IRS.

Access is also to be given to auditors or inspectors accompanying the Surveyors as required by other external organizations.

1.8 Access of Surveyor to ships, shipyards or works

1.8.1 The Surveyors are to be given free access to ships classed with IRS as well as to shipyards, works, etc. so as to perform their duties, and are to receive adequate assistance for this purpose.

1.9 Requirements for service suppliers

1.9.1 In general, the following categories of service suppliers are to be approved:

a) Classification and / or Statutory services

- Firms engaged in thickness measurements on ships.
- Firms engaged in tightness testing of closing appliances such as hatches, doors, etc. with ultrasonic equipment.
- Firms carrying out an in-water survey on ships and mobile offshore units by diver or Remotely Operated Vehicle (ROV).
- Firms engaged in the examination of Ro-ro ships, bow, stern, side and inner doors.
- Firms engaged in measurement of noise levels onboard ships.
- Firms engaged in tightness testing of primary and secondary barriers of gas carriers with membrane cargo containment systems for vessels in service.
- Firms engaged in inspections and maintenance of fire extinguishing equipment and systems.
- Firms engaged in testing of coating systems in accordance with the requirements of IMO performance standards for protective coatings.
- Firms engaged in survey using Remote Inspection Techniques (RIT) as an alternative means for close-up survey of the structure of ships and mobile offshore units. See Ch.2, 1.2.20 for definition of RIT.
- Firms providing non-destructive testing (NDT) services on ship and offshore structures/ components (Refer IRS Classification Note – *Requirements for NDT Suppliers*).
- Firms engaged in cable transit seal systems inspection on ships and mobile offshore units.

b) Statutory services

- Firms engaged in servicing inflatable liferafts, inflatable lifejackets, hydrostatic release units, marine evacuation systems, etc.
- Firms engaged in the inspections and testing of radio communication equipment
- Firms engaged in inspections and maintenance of self contained breathing apparatus
- Firms engaged in the annual performance testing of voyage data recorder and simplified voyage data recorders
- Firms engaged in the inspections of low location lighting systems using photo luminescent materials and evacuation guidance systems used as an alternative to low location lighting systems
- Firms engaged in sound pressure level measurements of public address and general alarm systems on board ships
- Firms engaged in maintenance, thorough examination, operational testing, overhaul and repair of lifeboats and rescue boats, launching appliances, and release gear
- Firms engaged in the inspection, performance testing and maintenance of Automatic Identification Systems (AIS)
- Firms engaged in commissioning testing of Ballast Water Management System (BWMS).

Note : In general, suppliers providing services other than those listed above are not required to be approved.

1.9.2 Where the results of the following service providers are used by a Surveyor of IRS in making decisions affecting Classification and/or Statutory services, then that service provider is to be approved and service performance verified by IRS:

- Firms engaged in thickness measurements on ships.

- Firms carrying out an in-water survey on ships and mobile offshore units by diver or Remotely Operated Vehicle (ROV).

- Firms engaged in tightness testing of closing appliances such as hatches, doors etc. with ultrasonic equipment.

- Firms engaged in survey using Remote Inspection Techniques (RIT) as an alternative means for close-up survey of the structure of ships and mobile offshore units.

IRS may accept the services of firms approved by other IACS member classification societies for such services other than those listed above.

1.9.3 Where services are used by the Surveyors in making decisions affecting statutory certification and services, the firms are subject to approval and performance verification by IRS, where IRS is so authorized by the relevant Flag Administration (i.e. the Flag of the ship on which the servicing is to be done or the service equipment is to be used). For such services, IRS may accept approvals done by:

I. The Flag Administration itself,
II. Duly authorized organisation acting on behalf of the Flag Administration, or
III. Other organizations those are acceptable to the Flag Administration (e.g. other governments etc).

1.9.4 Use of the approved service suppliers is not mandatory for the following services, unless instructed otherwise by the flag Administration with respect to statutory certification:

- Firms engaged in the inspections of low location lighting systems using photo luminescent materials and evacuation guidance systems used as an alternative to low location lighting systems

- Firms engaged in sound pressure level measurements of public address and general alarm systems on board ships

- Firms engaged in measurement of noise levels onboard ships

- Firms engaged in testing of coating systems in accordance with the requirements of IMO performance standards for protective coatings.

- Firms engaged in the examination of bow, stern, side and inner doors.

1.9.5 Requirements to be complied with, as a minimum, by various categories of service suppliers are specified in the IRS Classification Note '*Approval of Service Supplier*s'.

1.10 Responding to Port State Control

1.10.1 When requested by Port State and upon concurrence by the vessel's owner/master IRS Surveyors would attend onboard a ship in order to assist in the rectification of reported deficiencies or other discrepancies that affect or may affect classification or the statutory certificates issued by IRS. The owner and the vessel's flag state will be notified of such attendance and survey. IRS Surveyors will also cooperate with Port States by providing inspectors with background information.

Section 2

Classification Regulations

2.1 General

2.1.1 The objective of ship classification is to verify the structural strength and integrity of essential parts of the ship's hull and its appendages; stability of the ship; the reliability and function (including cyber resilience, where applicable) of the propulsion and steering systems, power generation and those other features and auxiliary systems which have been built into the ship in order to maintain essential services on board. This also includes verification of cyber resilience, where applicable, of equipment and systems required by statutory regulations.

2.1.2 When a ship is assigned a specific Character of Class by Indian Register of Shipping, it implies that IRS has been satisfied that the said ship meets, for this particular class, with these Rules and Regulations or requirements equivalent thereto. The ship will continue to be classed with IRS so long as she is found, upon examination at the prescribed annual and periodical surveys, to be maintained in a fit and efficient condition and in accordance with the Periodical Survey requirements of these Rules. Classification will be conditional upon compliance with IRS requirements and assignment of character of class for both hull and machinery.

2.1.3 The Rules are framed on the understanding that ships will be properly loaded and handled; they do not, unless stated in the class notation, provide for special distributions or concentrations of loading and that ships will not be operated in environmental conditions more severe than those agreed for design basis and approval.

2.1.4 Compliance with the following IMO conventions, codes and resolutions, as amended, and as applicable, is a pre-requisite of classification:

- International Convention on Loadlines (ILLC)
- International Convention for the Safety of Life at Sea (SOLAS)
- International Convention for the Prevention of Pollution from Ships (MARPOL)
- The International Convention for the Control and Management of Ships' Ballast Water and Sediments, 2004 (BWM 2004)
- International Convention on the Control of Harmful Antifouling Systems on Ships (AFS Convention)
- International Bulk Chemical Code (IBC Code) or Bulk Chemical Code (BCH Code)
- International Gas Carrier Code (IGC Code) or Gas Carrier Code (GC Code)
- Fire Test Procedures Code (FTP Code) of the International Maritime Organization (IMO)
- Codes on noise levels on board ships.
- International Code for Ships Operating in Polar Waters (Polar Code)
- International Code of Safety for Ships Carrying Industrial Personnel (IP Code)
- Related Resolutions of the IMO Assembly, the Maritime Safety Committee (MSC) and the Marine Environment Protection Committee (MEPC) of IMO.

In addition, the Unified Interpretations (UIs) of IACS (International Association of Classification Societies) related to the above IMO Conventions and Codes are also to be complied with unless provided with written instruction to apply a different interpretation by the flag Administration.

Note: In general, IACS UIs for the above IMO Conventions and Codes related to various aspects covered by the Rules are addressed in relevant Parts/Chapters. Those IACS UIs which are not included in the Rules are indicated on the IRS Website under the webpage for "*Rules, Classification Notes and Guidelines*". This list also includes the IACS UIs to other IMO Conventions (International Tonnage Convention and COLREG Convention), which are to be complied with for statutory certification, unless flag Administration has provided written instructions to apply a different interpretation.

2.1.5 Where a vessel holds dual classification with IRS and the periodical survey requirements of the corresponding Society differ from those of the Rules of IRS, IRS may permit the requirements of the corresponding Society being applied, in so far as they are equivalent in purpose or are no less stringent than the IRS rule requirement.

2.1.6 The classification of a ship with IRS does not exempt the owners from compliance with any additional and/or more stringent requirements issued by the Administration of the state whose flag the ship is entitled to fly and provision for their application.

2.1.7 It is the responsibility of the Owners to ensure that the operating and maintenance instructions/manuals for the ship machinery equipment essential to the safe operation of the ship are available in a language understandable by those officers and crew members who are required to understand such

information / instructions in the performance of their duties.

2.1.8 When a ship is detained by Port State Control, IRS is to be immediately notified by the owner / operator for arranging attendance by a Surveyor.

2.2 Application of Rules

2.2.1 Unless directed otherwise by IRS, no new Regulations or amendments to the Rules relating to the character of classification or class notation is to be applied to the existing vessels.

2.2.2 Unless directed otherwise by IRS, no new Rules and Regulations or amendments to the existing Rules & Regulations become applicable within 6 months after the date of issue.

2.3 Scope and process of classification

2.3.1 Classification covers ship's hull, appendages and machinery including electrical systems to the extent as specified in these Rules & Regulations. Classification does not guarantee the design or performance of a vessel except for those aspects covered by the Rule requirements and subject to the conditions of operation of the vessel mentioned in 2.1.3.

2.3.2 The classification process consists of :

- A technical review of the design plans and related documents for a new vessel to verify compliance with the applicable Rules;

- Attendance at the construction of the vessel in the shipyard by IRS surveyor(s) to verify that the vessel is constructed in accordance with the approved design plans and classification Rules;

- Attendance by IRS surveyor(s) at the relevant production facilities that provide key components such as the steel, engine, generators and castings to verify that the component conforms to the applicable Rule requirements;

- Attendance by IRS surveyor(s) at the sea trials and other trials relating to the vessel and its equipment prior to delivery to verify conformance with the applicable Rule requirements;

- Upon satisfactory completion of the above, the builder's/ shipowner's request for the issuance of a class certificate will be considered by IRS and, if deemed satisfactory, the assignment of class may be approved and a certificate of classification issued;

- Once in service, the owner is to submit the vessel to a clearly specified programme of periodical class surveys, carried out onboard the vessel, to verify that the ship continues to meet the relevant Rule requirements for continuation of class. A classification survey is a visual examination that normally consists of an overall examination of the items identified in the Rules for survey, detailed check of selected parts on a sampling basis and witnessing tests, measurements and trials where applicable.

- When a Surveyor identifies corrosion, structural defects or damage to hull, machinery and/ or equipment which, based on the Rules and in the opinion of the Surveyor, affects the Ship's class, remedial measures and/ or appropriate conditions of class are specified in order to retain class. Conditions of class are requirements to the effect that specific measures, repairs, surveys etc. are to be carried out within a specified time limit in order to retain class.

2.3.3 On application by Builder or Owner, certain installation, e.g. refrigerating machinery may be classed by IRS.

2.4 Interpretations of the Rules

2.4.1 The correct interpretation of the requirements contained in the Rules and other Regulations is the sole responsibility and at the sole discretion of IRS.

2.5 Definitions

2.5.1 **Clear water** : Water having sufficient depth to permit the normal development of wind generated waves.

2.5.2 **Fetch** : The extent of clear water across which a wind has blown before reaching the ship.

2.5.3 **Sheltered water** : Water where the fetch is six nautical miles or less.

2.5.4 **Reasonable weather** : Reasonable weather is assumed to exclude winds exceeding Beaufort force six associated with sea states resulting in green water being frequently taken on board the ship's deck. However, it is realised that this is largely a matter of judgment and good seamanship and can vary for particular ships.

2.5.5 **Type notation** : A notation indicating that the ship has been designed and constructed with applicable Rules to that type of ship, e.g. "Bulk Carrier", "Oil Tanker", etc.

2.5.6 **Cargo notation** : A notation indicating that the ship has been designed, modified or arranged to carry one or more particular cargoes, e.g. "Phosphoric Acid". Ships with one or more particular cargo notations are not thereby prevented from carrying other cargoes for which they are suitable.

2.5.7 **Special feature notation** : A notation indicating that the ship incorporates special features which significantly affect the design, e.g. "movable decks".

2.5.8 **Service restriction notation** : A notation indicating that a ship has been classed on the understanding that it will be operated only in suitable areas or conditions which have been agreed to by IRS e.g. "Sheltered Water Service".

2.5.9 **Description**: A ‘description’ may be assigned to indicate the purpose or role of a vessel. In general, there would be no specific rule requirements to be complied with for assignment of a description. E.g. “Cutter Suction Dredger” can be assigned to describe the vessel type dredger.

2.6 Character of classification

2.6.1 The following Characters and symbols are assigned by IRS to indicate classification of Steel Ships. (For explanation of abbreviations, see Appendix I).

2.6.2 **Character SUL** assigned to sea-going vessels indicates that the hull and its appendages and equipment (i.e. anchors, chain cable and hawsers) meet the Rule requirements for assignment of this Character of Class.

Guidance Note : Appendages to the hull referred to in 2.6.2, 2.6.3 and 2.6.4 means the rudder & rudder stock, rudder horn, sole pieces, propeller nozzles, shaft brackets, skeg etc. which are covered by the rule requirements.

2.6.3 **Character SU (-)** assigned to sea-going vessels indicates that the hull and its appendages meet the Rule requirements but equipment (i.e. anchors, chain cable and hawsers) is not supplied or maintained as per the relevant Rules but is considered by IRS to be acceptable for particular service.

2.6.4 **Character SU** assigned to sea-going vessels indicates that the hull and its appendages meet the Rule requirements but where special consideration has been given for reason of particular purpose of service and normal equipment may be unnecessary. In such cases letter 'L' is omitted from the Character SUL.

2.6.5 **Character IY** assigned to self-propelled seagoing vessels indicates that the machinery meets the Rule requirements for assignment of this Character of Class.

2.6.6 **The distinguishing mark** 卐 inserted before a Character of Class (SUL, SU (-), SU, IY as appropriate) is assigned to new ships where the hull and its appendages, equipment and the machinery, as appropriate, are constructed under special survey of IRS in compliance with the Rules to the satisfaction of IRS.

2.6.7 The distinguishing mark 卐 inserted before a Character of Class (SUL, SU (-), SU, IY as appropriate), is assigned to vessels admitted in to IRS Class during the course of construction and surveyed by an IACS Society.

2.6.8 The distinguishing mark 卐 inserted before a Character of Class (SUL, SU (-), SU, IY as appropriate), is assigned to vessels admitted into IRS Class at the time of delivery of the vessel and constructed under the survey of an IACS Society.

2.7 Class notations - Hull

2.7.1 When requested by an Owner and agreed to by IRS or when considered necessary by IRS, a class notation will be appended to the character of classification. This class notation will consist of one of, or a combination of - a type notation, a cargo notation, a special duties notation, a special features notation and/or a service restriction

notation, e.g. 卐 SUL CHEMICAL TANKER, "Sulphuric Acid", ESP, "Indian Coastal Service".

2.7.2 Details of the ship types and additional class notations are given in Appendix 1 and applicable Chapters in Pt.5 of the Rules.

2.7.3 Service restriction notation will generally be assigned in one of the forms given below, but this does not preclude the Owners or Shipbuilders from requesting special consideration for other forms of restrictions.

a) Sheltered Water Service : Service in sheltered water adjacent to sand banks, reefs, breakwaters or other coastal features, and in sheltered water between islands. The geographical limits will form part of the Class Notation.

b) Restricted Water Service : Service in sheltered waters and also for short distances (generally less than 15 nautical miles) beyond sheltered waters in 'reasonable weather'. The geographical limits will form part of the Class Notation.

c) Specified Coastal Service : Service along a coast, during the course of which the vessel does not go more than 20 nautical miles from the nearest land and may cross gulfs or similar features recognised by the local Administration as a part of the coastal service. The geographical limits will form part of the Class Notation, e.g. "Indian Coastal Service".

d) Specified Route Service : Service between two or more points or other geographical features which will form part of the Class Notation.

e) Specified Operating Area Service : Service within one or more geographical area(s) which will form part of the Class Notation.

2.8 Class notations - Machinery

2.8.1 The class notations that may be assigned by IRS are given in Appendix 1. IRS may prescribe additional notations as found necessary / expedient from time to time.

2.9 Materials, components, equipment and machinery

2.9.1 The materials used in the construction of hull and machinery intended for classification, or in the repair of ships already classed, are to be of good quality and free from defects and are to be tested in accordance with the relevant Rules. The steel is to be manufactured by an approved process at works recognized by IRS. Alternatively, tests to the satisfaction of IRS will be required to demonstrate the suitability of the steel.

Consideration may be given by IRS to accept the works approved by IACS Member Societies with whom IRS currently has Cooperation Agreements for this purpose.

2.9.2 Certification of materials, components, equipment and machinery is carried out on basis of the following, considering IRS and/or IMO requirements, as applicable:

a) Type approval carried out by IRS.

b) Unit certification by IRS.

c) Alternative Certification Scheme by IRS (see Section 4).

2.9.3 Mutual recognition of certificates, if type approved by an IACS Member Society or European Union recognized organization based on commonly agreed design requirements under Mutual Recognition Scheme between IRS and the recognized organization, may also be used as basis for certification of materials, components, equipment and machinery.

2.10 Request for surveys

2.10.1 It is the responsibility of the Builders or Owners, as applicable, to inform the Surveyors of IRS in the port at which the surveys for supervision during new construction or ships in service are to be undertaken and to ensure that all surveys for issue of class certificate for new construction, and maintenance of class for ships in service are carried out.

2.10.2 It is the responsibility of the Owner to ensure that all surveys necessary for the maintenance of class are carried out by due date. IRS will notify an Owner of upcoming surveys and outstanding Conditions of Class before their becoming overdue. The non-receipt of such notification, however, does not absolve the Owner from his responsibility to comply with survey requirements for maintenance of class.

2.11 Repairs

2.11.1 Any repairs to the hull, machinery and equipment either as a result of damage or wear and tear which are required for the maintenance of ship's class are to be carried out under the inspection of and to the satisfaction of the Surveyors.

2.11.2 Where a vessel is damaged to an extent resulting in towage outside port limits, it shall be the Owners' responsibility to notify IRS at the first practicable opportunity.

2.11.3 Where such repairs are effected at a port where there is no Surveyor of IRS, the ship is to be surveyed by one of its Surveyors at the earliest opportunity.

2.11.4 Where repairs to hull, machinery or equipment, which affect or may affect classification, are to be carried out by a riding crew, they are to be planned in advance. A complete repair procedure including the extent of proposed repairs and the need for Surveyor's attendance during the voyage is to be submitted to and agreed upon by the Surveyor reasonably in advance. Failure to notify IRS, in advance of the repairs, may result in suspension of the vessel's class.

Where in any emergency circumstance, emergency repairs are to be effected immediately, the repairs should be documented in the ship’s log and submitted thereafter to IRS for use in determining further survey requirements.

2.12 Alterations

2.12.1 Any alterations proposed to be carried out to approved scantlings and arrangements of the hull, machinery or equipment are to meet with the approval of IRS and for this purpose plans and technical particulars are to be submitted for approval in advance. Such approved alterations are to be carried out under the inspection of, and to the satisfaction of, the Surveyors. If such alterations are carried out on items which may affect the classification of the ship without informing IRS, the class of the vessel will be liable to be suspended except in the case of emergency repairs mentioned in 2.11.4.

2.13 Classification of new constructions

2.13.1 The request for classification of new constructions is to be submitted to IRS by the shipyard or shipowner in the form provided by IRS. The request is to include complete details regarding class notation and statutory certificates required, where applicable.

The IRS Rules in force on the date of contract for construction of the vessel (See 2.14) will be applicable for classification, in general. However, statutory requirements coming into force after the date of contract for construction may have to be complied with if they become applicable based on any other criteria such as the date on which vessel is constructed (keel laid).

2.13.2 Where orders for major machinery and equipment are placed on manufacturer or suppliers, IRS will have to be informed. Responsibility for compliance with IRS Rules and Regulations shall be with the manufacturers/suppliers.

Where relevant, the date of application for certification of specific major machinery will also be considered in addition to the date of contract for construction of the vessel, for determining the applicable rules for such machinery.

2.13.3 Plans and particulars as specified in the Rules will have to be submitted to IRS in triplicate sufficiently in advance of commencement of construction. One copy with stamp of approval will be returned. Any deviation from approved drawings will require to be approved by IRS prior to execution of work.

IRS reserves the right to request for additional plans, information or particulars to be submitted.

Where it is proposed to use existing previously approved plans for a new contract, written application is to be made to IRS.

Approval of plans and calculations by IRS does not relieve the Builders of their responsibility for the design, construction and installation of the various parts, nor does it absolve the Builders from their duty of carrying out any alterations or additions to the various parts on board deemed necessary by IRS during construction or installation on board or trials.

2.13.4 IRS will assess the production facilities and procedures of the shipyard and other

manufacturers as to whether they meet the requirements of the construction Rules.

Review of the construction facilities prior to any steel work or construction shall be carried out under the following circumstances:

a) Where IRS has none or no recent experience of the construction facilities – typically after a one year lapse – or when significant new infrastructure has been added.

b) Where there has been a significant management or personnel re-structuring having an impact on the ship construction process, or

c) Where the shipbuilder contracts to construct a vessel of a different type or substantially different in design.

2.13.5 During construction of a vessel, IRS will ensure by surveys that parts of hull and machinery requiring approval have been constructed in compliance with approved drawings, all required tests and trials are performed satisfactorily, workmanship is in compliance with current engineering practices and welded parts are produced by qualified welders.

2.13.6 All hull, machinery and electrical installations will be subjected to operational trials in the presence of IRS Surveyor.

2.13.7 On completion of the ship copies of as fitted plans showing the ship as built, essential certificates and records, loading manual etc. are to be submitted by the Builder generally prior to issuance of the Interim Certificate of Class.

2.13.8 For each new construction the shipbuilder is required to prepare and deliver a ship construction file containing documents / plans / manuals etc. for facilitating the future inspection of survey, repair and maintenance as detailed in Pt.3, Ch.1, Sec.3. Some of these documents may be directly supplied by other parties e.g. shipowner, for inclusion in the ship construction file. The ship construction file is to be maintained onboard each ship.

2.14 Date of contract for construction

2.14.1 The date of “contract for construction” of a vessel is the date on which the contract to build the vessel is signed between the prospective owner and the shipbuilder. This date and the construction numbers (i.e. hull numbers) of all the vessels included in the contract are to be declared to IRS by the party applying for the assignment of class to a new building.

2.14.2 The date of “contract for construction” of a series of vessels, including specified optional vessels for which the option is ultimately exercised, is the date on which the contract to build the series is signed between the prospective owner and the shipbuilder.
For the purpose of this requirement, vessels built under a single contract for construction are considered a “series of vessels” if they are built to the same approved plans for classification purposes. However, vessels within a series may have design alterations from the original design provided:

a) Such alterations do not affect matters related to classification, or

b) If the alterations are subject to classification requirements, these alterations are to comply with the classification requirements in effect on the date on which the alterations are contracted between the prospective owner and the shipbuilder or, in the absence of the alteration contract, comply with the classification requirements in effect on the date on which the alterations are submitted to IRS for approval.

The optional vessels will be considered part of the same series of vessels if the option is exercised not later than 1 year after the contract to build the series was signed.

2.14.3 If a contract for construction is later amended to include additional vessels or additional options, the date of “contract for construction” for such vessels is the date on which the amendment to the contract, is signed between the prospective owner and the shipbuilder. The amendment to the contract is to be considered as a “new contract” to which 2.14.1 and 2.14.2 above apply.

2.14.4 If a contract for construction is amended to change the ship type, the date of “contract for construction” of this modified vessel, or vessels, is the date on which revised contract or new contract is signed between the Owner, or Owners, and the shipbuilder.

2.15 Date of build

2.15.1 The date of completion of the special survey inspection will normally be taken as the date of build to be entered in the Register Book.

Where there is a substantial delay between completion of construction survey and the ship commencing service, the date of commissioning may be specified on the classification certificate.

When modifications are carried out on a ship, the initial date of build remains assigned to the ship.

2.15.2 When a complete replacement or addition of a major portion of the ship (e.g. fwd. section, midship section or aft section) is involved, the following applies:

- Date of build assigned to each portion of the ship will be indicated on the classification certificate, and the date of modification will be indicated in the Register Book.

- Survey requirements shall be based on the date of build associated with each major portion of the ship.

2.16 Appeal from Surveyors' recommendations

2.16.1 If the recommendations of the Surveyors are considered in any case to be unnecessary or unreasonable, appeal may be made to IRS, who may direct a special examination to be held.

2.17 Certificates

2.17.1 Certificates of Class will be issued to Builders or Owners when the required reports on completion of Special Surveys of new ships or of existing ships submitted for classification have been received from the Surveyors and approved by IRS.

2.17.2 The Surveyors are permitted to issue Interim Certificates to enable a ship, classed with IRS, to proceed on her voyage provided that, in their opinion, she is in a fit and efficient condition. Such Certificates will contain Surveyors' recommendations for continuance of Class, but in all cases are subject to confirmation by IRS.

2.17.3 Individual Certificates can also be issued for propelling machinery, boilers, equipments and fittings which have been manufactured under IRS Survey and in accordance with these Regulations.

2.17.4 It is the responsibility of the owner to ensure that the validity of class and statutory certificates is maintained.

2.18 Suspension, withdrawal and deletion of class

2.18.1 Suspension

2.18.1.1 The class of a vessel will be automatically suspended from the expiry date of the Certificate of Class or by the expiry date of any extension granted, if the special survey has not been completed by the due date and an extension (See Ch.2, 1.11) has not been agreed to, or the vessel is not under attendance by the Surveyor with a view to complete the surveys prior to resuming service.

2.18.1.2 The class of a vessel will also be automatically suspended if the annual, intermediate survey become overdue unless the vessel is under attendance by the surveyor for completion of survey. (See Pt.1 Ch.2, Table 1.1.1 for due dates and window period). Where any ship proceeds to sea without having completed Surveyor’s recommendations which were required to be dealt with before leaving port, the ship’s class will be suspended.

2.18.1.3 When the surveys relating to specific additional notations of hull or equipment or machinery have not been complied with and thereby the ship is not entitled to retain that notation, then the specific notation will be suspended till the related surveys are completed.

2.18.1.4 The class of a vessel will be subject to a suspension procedure if an item of continuous survey is overdue at the time of annual survey, unless the item is dealt with or postponed by agreement.

2.18.1.5 The class of the vessel will also be subject to a suspension procedure if conditions of class are not dealt with by the due date or postponed by agreement, by the due date.

2.18.1.6 The class of a ship is liable to be withheld or, if already granted, may be withdrawn in case of any non-payment of fees or expenses chargeable for the service rendered.

2.18.1.7 Where any ship proceeds to sea with less freeboard than that approved by IRS or when the freeboard marks are placed higher on the ship's sides than the position assigned or approved by IRS, the ship's class will be suspended.

2.18.1.8 When it is found that a ship is being operated in a manner contrary to that agreed at the time of classification, or is being operated in conditions or in areas more onerous than those agreed, the class will be suspended.

2.18.1.9 The class of a vessel will be liable to be suspended if the Owner fails to notify IRS of any damage to the ship‘s hull, machinery or equipment, which may adversely affect classification of the vessel or subsequently fails to arrange for the survey as may be advised by IRS.

2.18.1.10 The class of a vessel will be suspended after a major casualty to the ship, such as grounding, sinking or breaking up, if the Owner is unable to arrange for the ship’s survey by IRS and commence repairs within a reasonable period of the occurrence of the casualty, unless otherwise agreed to with IRS. Procedures for withdrawal of class could be initiated unless the Owner is able to arrange for the ship’s survey by IRS and commence repairs within the agreed time period.

2.18.1.11 Vessels laid up in accordance with the Rules prior to surveys becoming overdue will not be suspended when surveys addressed above become overdue.

2.18.1.12 The ship’s class may be suspended if the owner does not implement the lay-up maintenance program and /or lay-up surveys (Ch.2, Sec. 1.3) are not carried out by due date.

2.18.1.13 When a vessel is intended for a demolition voyage with any periodical survey overdue, the vessel’s class will not be suspended till completion of a single direct ballast voyage from the lay up or final discharge port to the demolition yard.

2.18.1.14 Force Majeure : If, due to circumstances defined in Chapter 2, 1.11.3, the vessel is in a port where the overdue surveys cannot be completed at the expiry of the periods allowed above, IRS may allow the vessel to sail, in class, directly to an agreed discharge port, and if necessary, thereafter in ballast, to an agreed port at which the survey will be completed, provided:

a) Re-examination of the ship’s record is carried out by IRS,

b) IRS carries out the due and/or overdue surveys and examination of Conditions of Class at the first port of call when there is an unforeseen inability of IRS to attend the vessel in the present port, and

c) IRS is satisfied that the vessel is in condition to sail for one trip to a discharge port and subsequent ballast voyage to a repair facility if necessary (where there is unforeseen inability of IRS to attend the vessel in the present port, the master is to confirm that the ship is in condition to sail to the nearest port of call).

The scope of the overdue surveys will be based on the survey requirements applicable to the vessel at the original due date and not based on the age of the vessel when the survey is carried out. Such surveys will be credited from the date originally due.

If class has already been automatically suspended in such cases, it may be reinstated subject to the conditions prescribed above.

2.18.1.15 When a vessel is intended for a single voyage from laid-up position to a repair yard or another place of lay-up with any periodical survey overdue, the vessel’s class suspension may be held in abeyance and consideration may be given to allow the vessel to proceed on a single direct ballast voyage from the site of lay up to a repair yard or another place of lay-up, upon agreement with the Flag Administration and Port authorities, provided IRS finds the vessel in satisfactory condition after surveys, the extent of which are to be based on surveys overdue and duration of lay-up. A short-term Class Certificate with conditions for the intended voyage may be issued.

2.18.1.16 Classification will be reinstated upon satisfactory completion of overdue survey. The scope of the overdue surveys will be based on the survey requirements applicable to the vessel at the original due date and not based on the age of the vessel when the survey is

carried out. Such surveys will be credited from the date originally due. Such surveys will be credited from the date originally due. However, the vessel will remain dis-classed from the date of suspension until the date class is reinstated.

2.18.1.17 The Owners and the Flag State, where applicable, would be informed in writing, of the suspension and reinstatement of Classification.

2.18.2 Withdrawal

2.18.2.1 Ship's class will be withdrawn, at the end of six months of suspension, if the Owner has not commenced any action to reinstate the ship's class. A longer suspension period may be granted in the following cases when the vessel is:

a) not trading and awaiting attendance for reinstatement of class; or

b) laid up; or

c) awaiting disposal, in the event of a casualty.

2.18.2.2 When the class of a ship holding IRS class, is withdrawn by IRS in consequence of a request from the Owners, the notation "Class withdrawn at Owners' request" (with date) will be made in the subsequent reprints of the Register Of Ships. This entry will continue till the ship's class is reinstated or deleted.

2.18.2.3 When the Regulations as regards surveys on the hull or equipment or machinery have not been complied with and the ship thereby is not entitled to retain her class, the class will be withdrawn and the notation "Class withdrawn" (with date) will be made in the subsequent reprints of the Register Of Ships. This entry will continue till the ship's class is reinstated or deleted.

2.18.2.4 In case the vessel is not maintained satisfactorily and there are repeated failures, e.g. multiple PSC/FSI detentions, procedure for withdrawal of class could be initiated. In addition, procedure for withdrawal of class could also be initiated subsequent to a detention, if the vessel is not offered for additional examination(s), as requested by IRS.

Withdrawal of class may be extended to other vessels of a particular Owner based on overall failures/ PSC performance of the fleet. In case it is decided to withdraw the class of the vessel, the Owner will be provided with a time period not exceeding 3 months to enable vessel to change class. During this period, IRS may impose additional conditions such as restricting the area of operations, additional examinations, etc.

2.18.2.5 Procedure for withdrawal of class may be initiated if the vessel is found to be in breach of international sanctions or engaged in unlawful trading activities.

2.18.2.6 The withdrawal of a vessel will be confirmed in writing to the Owner and the Flag State, where applicable.

2.18.3 Deletion of Class

2.18.3.1 A ship will be considered to "cease to exist" when it is destroyed by scrapping or by sinking to unsalvageable depths or abandoned by the owner.

2.18.3.2 A ship can also be considered to "cease to exist" when it is broken up either by grounding or due to structural failure or due to actions of war or sabotage.

2.18.3.3 Ship's class will be deleted when it ceases to exist.

2.19 Reclassification of ships

2.19.1 When Owners request for reclassification of a ship for which the class previously assigned has been withdrawn, IRS will require a Special Survey for Reclassification to be held by the Surveyors. The extent of the survey will depend upon the age of the ship and the circumstances of each case.

2.19.2 If the ship is found or placed in good and efficient condition in accordance with the requirements of the Rules and Regulations at the Special Survey for Reclassification, IRS may decide to reinstate her original class or assign such other class as considered appropriate.

2.19.3 The date of reclassification will appear in the supplement to the Register Of Ships and the subsequent issue of Register Of Ships.

2.20 Fleet Quality Monitoring

2.20.1 The Fleet Quality Monitoring system of IRS is aimed at maintaining and improving the

quality of the classed fleet by according special attention to certain vessels. .

2.20.2 Vessels requiring special attention are identified either for 'condition monitoring' or 'condition improvement' based on multiple risk criteria through a computer program. Vessels may also be identified manually based upon feedback from the attending surveyors.

2.20.3 Vessels identified for 'condition monitoring' would not be subjected to any additional survey, but would be monitored during the class/ statutory surveys.

2.20.4 Vessels identified for 'condition improvement' would be subjected to additional surveys for which owners are to make necessary arrangements. Additional surveys are intended to identify areas requiring attention and to ensure that corrective actions are taken to improve the condition of the vessel and brought back to satisfactory condition to the satisfaction of the surveyor.

2.20.5 Vessels which have undergone additional surveys towards 'condition improvement' would be kept under 'condition monitoring', till the next class/ statutory periodical survey and removed from the list, once effectiveness of upkeep and maintenance is verified.

2.20.6 Procedures for withdrawal of class could be initiated in the cases mentioned in 2.18.2.4.

2.21 Transparency of classification and statutory information

2.21.1 The classification and statutory information which may be released to Shipowners, Flag State, Port state, Insurance company and Shipyards as relevant and the conditions for their release are indicated in Table 2.21.1. For oil tankers and bulk carriers subject to SOLAS Chapter II-1, Part A-1, Regulation 3-10, refer to IRS Rules for Bulk Carriers and Oil Tankers, Volume 1, Part 1, Chapter 1. In general, information on items which are not restricted are freely available on the IRS website 'www.irclass.org'.

Note : The European Commission (EC)/ European Maritime Safety Agency (EMSA) may be provided with Classification and Statutory information, when requested, as available to the flag state (as in Table 2.21.1.).

Table 2.21.1 : Transparency of information

		Information available to:				
	Information in Question	**Owners**	**Flag State**	**Port State**	**Insurance Company***	**Ship Yards**
1.	**Class Societies Standing Documents:**					
	Rules and Guidelines (Class and statutory requirements)	1	1	1	1	1
	Instructions to Surveyors		1			
	Quality Manual	1	1	1	1	1
	Register Book	1	1	1	1	1
2.	**Ship Related Information:**					
A.	**New Buildings**					
	Approved Drawings	6	1			7
	Formal Approval Letters	1				7
	Certificates of Important Equipment	2				7
B.	**Ships in Operation:**					
	Date (month and year) of all class surveys	7	1	1	1	
	Expiry Date of Class Certificate	7	7	1	1	
	Certificates/Reports	7	1	6	5	
	Overdue Surveys	7	7	1	1	
	Text of Conditions of Class	7	1	1	5	
	Text of Overdue Conditions of Class	7	1	1	1	
	Executive Hull Summary	7	3	3	3	
	Statutory Services					
	Due Dates of Statutory Surveys	7	7	1	1	
	Expiry Date of Statutory Certificates	7	7	1	1	
	Registered Statutory Conditions	7	7	1	5**	
	Overdue Statutory Conditions	7	7	1	1**	
3.	**Other Information:**					
	Correspondence File with Yard and/or Owner	6	6		5&6	
	Audit of Class Societies QA System	4	4	4	4	
	Class Transfer Reporting	7	7	7	7	
	Class Withdrawal Information	7	7	7	7	

* Insurance Company means P&I Clubs and Hull Underwriters

** Unless prevented by the agreement with the Flag State

KEY:

1. Available upon request
2. At delivery of the ship by Shipyard
3. Available under visit on board
4. Result of audit available on request
5. When accepted by Owners – or through special clause in insurance contract
6. When accepted by Owner (Master) or Shipyard as applicable
7. Automatically available

Section 3

Classification of Ships not Built under the Survey of Indian Register of Shipping

3.1 General procedure for classification of ships not built under survey of IRS

3.1.1 Plans of hull and machinery, as listed in 3.2.1 to 3.2.5 or equivalent, together with torsional vibration calculations, where applicable, are to be submitted for approval. Alternative technical data in lieu of specific plans or items may be accepted. It is preferable to have the plans approved before the classification survey is commenced. In case of transfer of class from an IACS member society/ adding dual class with an IACS member society, only copies of plans or equivalent (as listed in 3.2.1 to 3.2.5) are to be submitted to IRS.

3.1.2 Full special classification surveys would require to be carried out by IRS Surveyors in order to satisfy themselves regarding the workmanship and condition of the ship and to verify the approved scantlings and arrangements. The scope of these surveys may, however, be modified in the case of vessels built under the Special Survey and holding valid certificates of class of classification societies subject to verification of compliance with IACS QSCS and the vessels are in full compliance with all applicable and relevant IACS resolutions. Prior to commencement of survey by IRS, documentary evidence of all hull and machinery classification surveys held by the other society subsequent to last special survey carried out are to be produced. In such cases, a special survey notation will not be assigned in conjunction with the classification survey. The next special survey therefore would become due five years from the special survey held by the other society and not five years from classification with IRS.

In cases of transfer of class from another society to single class of IRS, the interim certificate of class or any other documents enabling the ship to trade, can be issued :

a) In case of vessels less than 15 years of age

   – only after IRS has completed all overdue surveys and overdue conditions of class issued earlier, as specified to the Owner by the previous society.

b) In case of vessels 15 years of age and over

   – only after the previous society has completed all overdue surveys and all overdue conditions of class issued earlier.

3.1.3 For vessels not built under survey of IRS but subsequently taken in class with the above procedure, the mark signifying the survey during construction will be omitted.

3.1.4 Once a vessel has been taken into IRS class, periodical surveys are subsequently to be held as per these rules.

3.2 Plans and data to be furnished

3.2.1 Plans of hull and equipment showing the main scantlings and arrangements of the actual ship and any proposed alterations are to be submitted. These should normally comprise of the following plans:

For information

- General arrangement
- Capacity plan
- Hydrostatic Curves

For approval

- Midship section
- Longitudinal section and decks
- Shell expansion plan
- Transverse Bulkheads
- Sternframe
- Rudder and Rudder Stock
- Loading manual, where required

- Loading instrument details
- Stability booklet
- Damage stability calculations, where required
- Hatch Covers
- Fire detection, fighting and extinction and such other plans as may be requested.

3.2.2 It would normally be expected that particulars of the process of manufacture and testing of material of construction are furnished. Consideration will however be given to waiving this where such particulars are not readily available, provided it can be established that the relevant vessel has been originally built under special survey of an established classification society and continues to be so classed with an established classification society. In the case of vessels which have been originally built under the special survey of an established classification society but subsequently not maintaining class, it should additionally be possible to reasonably ascertain that no changes that would significantly affect the material specifications have taken place.

3.2.3 Following machinery plans together with the particulars of the materials used in the construction of the boilers, air receivers and important forgings should be furnished:

For information

- General machinery lay-out

For approval

- Thrust, intermediate and propeller shafting
- Propeller
- Main engines, propulsion gears and clutch systems (or manufacturer make, model and rating information)
- For steam turbine engines, main boilers, superheaters and economisers (or manufacturer make, model and rating information) and steam piping
- Bilge and ballast piping system
- Wiring diagram
- Steering gear systems, piping and arrangements and steering gear manufacturer make and model information

- Additional plans for oil tankers
  - Pumping arrangements at the forward and after ends and drainage of cofferdams and pump rooms
  - General arrangement of cargo piping in tanks and on decks
- Additional plans for vessels with Unattended Machinery Spaces
  - Description and/or block diagram of method of operation of the control system
  - Line diagrams of the control system for :

    main propelling machinery and essential auxiliaries

    bilge level systems

    cargo pumping for tankers

    boiler controls

    fire detection

    fire prevention, including details in way of fuel oil pressure pipes

    overall alarm system including test schedule
- Additional plans for vessels with Ice Class notations:
  - Plans for flexible couplings and/or torque limiting shafting devices in the propulsion line shafting (or manufacturer make, model and rating information)

3.2.4 Calculations of torsional vibration characteristics of the main propelling machinery are to be furnished specially for ships which have been in service for less than about 2 years.

3.2.5 In addition to the requirements of 3.2.1 to 3.2.4, additional plans would require to be submitted in accordance with applicable Chapters of Pt.5 of the Rules for vessels with additional class notations.

3.2.6 In cases where the vessel has been previously classed by IRS or a Classification Society subject to verification of compliance with IACS QSCS and the vessel is in full compliance with all applicable and relevant IACS resolutions, the approval of plans may be specially considered subject to confirmation of no alteration/ modification to the vessel. In such cases, it is to be also verified that the vessel complies with any retroactively applicable classification or statutory requirements which came into effect subsequently.

Section 4

Alternative Certification Scheme based upon Quality Management Systems

4.1 General

4.1.1 Alternative Certification Scheme (ACS) is a certification scheme involving a manufacturer (and associated sub-suppliers, if needed) in the inspection, testing and certification of the manufacturer's products.

4.1.2 An ACS will clarify:

- The extent of the required inspection and testing;

- To which extent and under which conditions the manufacturer may perform all or parts of the required inspection and testing without the presence of a Surveyor from IRS when an IRS Certificate is required.

4.1.3 The extent to which the manufacturer is given permission to carry out inspections and testing without the presence of a Surveyor would be agreed on a case by case basis, e.g. for a specific product production line or for specific parts.

4.2 Scope

4.2.1 An ACS may be arranged with product manufacturers and/ or sub-suppliers.

4.2.2 An ACS with a manufacturer would define the handling of subcontracted parts (those that require IRS or work certificates or in any other way are addressed in the Rules). The sub-supplier may be included in the ACS of the manufacturer or have his own ACS or deliver parts that are inspected and certified by the IRS.

4.2.3 An ACS that permits the manufacturer to carry out all or parts of required inspection and testing without the presence of a Surveyor may be arranged in two versions with regard to traceability:

- The ACS describes inspection, testing and certification additional to the manufacturer's standard quality control procedures in order to meet the Rules. The components are to be stamped with a special stamp supplied by IRS or identified as required by IRS.

- The manufacturer has a standard quality control that covers all required inspection, testing and certification in compliance with the Rules. Traceability and the required type of product document for components or products will be defined in the ACS.

4.3 Conditions for approval

4.3.1 The conditions for the manufacturer to be granted the permission to carry out inspection and testing without the presence of a Surveyor are as follows:

- The manufacturer has an implemented Quality System according to a national or international standard (like ISO 9000 series of standards) approved by an accredited certification body or recognized by IRS.

- The manufacturer has a quality control system, current drawings, and

Rules and standards that cover the product to be certified.

- The inspection and testing required by the Rules are either standard procedures in the Quality System and recognized by IRS or specified in detail in the ACS.

- The manufacturer is to demonstrate that the firm has experience consistent with technology and complexity of the product for which approval is sought and that firm's products have been of a consistently high standard.

- IRS would initially ascertain the manufacturer's compliance with the ACS requirements by verifying the required product and process approvals and performing an initial audit. Follow-up and renewal audits would be conducted by IRS on a regular basis to verify that conditions of the ACS are continuously maintained by the manufacturer.

- If work certificates (W) or test reports (TR) are found not to fulfill the standards agreed with IRS, the component may not be accepted.

- The agreed ACS may be suspended or cancelled when/ if found justified by IRS.

- IRS may carry out unscheduled inspections at the manufacturer and/or subcontractor at its own discretion.

- The manufacturers (and designers, if producing under license) are to commit themselves to involve IRS when changes to the design, manufacturing process or testing are made as well as when any major production problems or any major product delivery problems have occurred.

4.4 Information to be submitted

4.4.1 For admission to an alternative certification scheme for a product, the manufacturer is to submit an application enclosing the following documentation/ information:

- Description of the products for which certification is required including, where applicable, model or type number;

- Applicable plans, details of materials used and procedures relevant to the manufacturing process;

- An outline description of all important manufacturing equipment and plant;

- A list of suppliers of materials with an indication of their class approval (as far as required by the Rules) and the type of material certification in each case;

- The list of main components of the product, including certificates.

- Existing class approvals of the manufacturer's products as far as required;

- Quality control plans relevant to the products and relevant components to be certified through the alternative certification scheme. Said plans are to detail the inspections and tests required by the Rules with an indication of which inspections and tests are delegated to the manufacturer and which are to be done in the presence of an IRS Surveyor.

- The procedures relevant to the quality control and inspections, their methods, frequency and certification;

- The quality system details;

- The system used for identification and traceability;

- List of nominated personnel for:

  - Marking/stamping of products;

  - Tests and Inspection (responsible);

  - Provision of data and information (e.g. declaration of conformity, test reports etc.).

- Any other additional documents that IRS may require in order to evaluate the manufacturing processes and product quality control.

4.5 Approval and maintenance of approval

4.5.1 After receipt and appraisal of the information required by 4.4, an initial audit of the Works would be carried out by the Surveyors. This audit is to verify that the manufacture of the product and the relevant controls are performed in accordance with the documents submitted and are in compliance with the requirements laid down in the Rules.

4.5.2 The ACS validity is for 5 years. At least one intermediate audit would be carried out by IRS during the validity of the ACS. Annual surveillance audits would be carried out as necessary, depending upon the complexity of the products and experience with the firms. The ACS may be renewed subject to an audit. The scope of the renewal audit would be as follows:

- verify the conditions of the ACS are still met;

- verify that the current products and processes are appropriately controlled.

4.5.3 A Quality Assurance Certificate would be issued by IRS on satisfactory completion of the initial/ renewal audit.

Appendix 1 **Table of characters of class and type notations of IRS, their expanded form and significance**		
Abbreviation	**Expanded Form**	**Significance**
Characters of Class		
SUL	SARVOUTAM LANGER	Denotes vessels which are classed with Indian Register of Shipping where the hull and its appendages and equipment (i.e. anchors, chain cables, hawsers) meet the Rule requirements.
SU (-)	SARVOUTAM (-)	Denotes vessels which are classed with IRS where the hull and its appendages meet the rule requirements but when the equipment of ship is not supplied or maintained as per the relevant Rules but is considered by IRS to be acceptable for particular service
SU	SARVOUTAM	Denotes vessels which are classed with IRS where the hull and its appendages meet the rule requirements but where for reason of their particular purpose or service normal equipment may be unnecessary
IY	INDIAN YANTRA	Denotes that for self propelled seagoing vessels, the machinery installation complies with the applicable requirements of Indian Register of Shipping
卐	SWASTIKA	This distinguishing mark inserted before a Character of Class is assigned to new ships where the hull and its appendages, equipment and the machinery as appropriate, are constructed under special survey of IRS in compliance with the Rules to the satisfaction of IRS
卐		The distinguishing mark inserted before a Character of Class (SUL, SU (-), SU, IY as appropriate), is assigned to vessels admitted in to IRS Class during the course of construction and surveyed by an IACS Society.
卐		The distinguishing mark inserted before a Character of Class (SUL, SU (-), SU, IY as appropriate), is assigned to vessels admitted into IRS Class at the time of delivery of the vessel and constructed under the survey of an IACS Society.
[ ]		When a Class Notation is enclosed within brackets, it indicates that applicable arrangements exist on board but the notation has been temporarily suspended

Abbreviation	Expanded Form	Significance
Class Notations - Hull		
Sheltered Water Service		Service in sheltered water adjacent to sand banks, reefs, breakwaters or other coastal features, and in sheltered water between islands
Restricted Water Service		Service in sheltered waters and also for short distances (generally less than 15 nautical miles) beyond sheltered waters in 'reasonable weather'
Specified Coastal Service		Service along a coast, during the course of which the vessel does not go more than 20 nautical miles from the nearest land and may cross gulfs or similar features recognised by the local Administration as a part of the coastal service. The geographical limits will form part of the Class Notation, e.g. "Indian Coastal Service"
Specified Route Service		Service between two or more points or other geographical features which will form part of the Class Notation
Specified Operating Area Service		Service within one or more geographical area(s) which will form part of the Class Notation
HAT(B)	HIMA ATITIVRA (B)	Denotes that the ship is strengthened for first year ice conditions in Northern Baltic in winter or areas of similar ice with condition equivalent to unbroken level ice with a maximum thickness of 1.0 metre
HT(B)	HIMA TIVRA (B)	Denotes that the ship is strengthened for first year ice conditions in Northern Baltic in winter or areas of similar ice with condition equivalent to unbroken level ice with a maximum thickness of 0.8 metre
HM(B)	HIMA MADHYAM (B)	Denotes that the ship is strengthened for first year ice conditions in Northern Baltic in winter or areas of similar ice with condition equivalent to unbroken level ice with a maximum thickness of 0.6 metre
Ha(B)	HIMA ALPA (B)	Denotes that the ship is strengthened for first year ice conditions in Northern Baltic in winter or areas of similar ice with condition equivalent to unbroken level ice with a maximum thickness of 0.4 metre
Ha	HIMA ALPA	Denotes that the ship is strengthened for light first year ice conditions in areas other than Northern Baltic
PC1	Polar Class 1	Denotes that the ship is strengthened for year-round operation in all polar waters according to Pt.5, Ch.32
PC2	Polar Class 2	Denotes that the ship is strengthened for year-round operation in moderate multi-year ice conditions according to Pt.5, Ch.32
PC3	Polar Class 3	Denotes that the ship is strengthened for year-round operation in second-year ice which may include multi-year ice inclusions according to Pt.5, Ch.32
PC4	Polar Class 4	Denotes that the ship is strengthened for year-round operation in thick first-year ice which may include old ice inclusions according to Pt.5, Ch.32

Abbreviation	Expanded Form	Significance
PC5	Polar Class 5	Denotes that the ship is strengthened for year-round operation in medium first-year ice which may include old ice inclusions according to Pt.5, Ch.32
PC6	Polar Class 6	Denotes that the ship is strengthened for summer / autumn operation in medium first-year ice which may include old ice inclusions according to Pt.5, Ch.32
PC7	Polar Class 7	Denotes that the ship is strengthened for summer / autumn operation in thin first-year ice which may include old ice inclusions according to Pt.5, Ch.32
ESP		Vessel complies with requirements of enhanced survey programme
STS	SAMATARANA STHIRATVA	Denotes that the ship complies with the requirements for survival capability (floatability in damaged condition) in accordance with Chapter 3 of IMO Resolution MSC 235(82)
"Strengthened for heavy cargoes"		This will be entered in the Register of Ships where the scantlings and arrangements have been approved for heavier cargo loadings in any hold filled up to the top of the hatch coaming with cargo at a stowage rate of $\leq$ 1 [m^3/tonne], when the draught in way of the hold is 80 per cent of the maximum permissible draught or more
"Hold(s) ...(to be specified)..... may be empty"		This will be entered in the Register of Ships when in association with the carriage of heavy cargoes, specified holds are permitted to be empty with the ship in the fully loaded condition
HELDK		This will be entered in the Register Of Ships for vessels with erected platforms or landing area designed for helicopter landings in accordance with applicable requirements of Part 5, Chapter 27 of the Rules
ETA	EMERGENCY TOWING ARRANGEMENT	Denotes that the ship is equipped with emergency towing arrangements in accordance with the requirements given in Part.5, Chapters 2, 3 or 4 of the Rules
Load Comp (1)	LOADING COMPUTER (1)	Denotes that the ship is equipped with a loading computer capable of ascertaining and comparing with the permissible limits, the hull girder loads in still water in any loading condition as required by Pt.3, Ch.5 and Pt.5, as applicable, of the Rules
Load Comp (2)	LOADING COMPUTER (2)	Denotes that in addition to the requirements for Load Comp (1) mentioned above, the ship's loading computer is capable of performing intact stability calculations for any loading condition to verify compliance with the applicable requirements indicated in Pt.3, Ch.1 of the Rules
Load Comp (3)	LOADING COMPUTER (3)	Denotes that in addition to the requirements for Load Comp (2) mentioned above, the ship's loading computer is capable of performing the stability calculations in damaged condition

Abbreviation	Expanded Form	Significance
Load Comp (4)	LOADING COMPUTER (4)	Denotes that in addition to the requirement for Load Comp (2) mentioned above, the ship's loading computer is capable of performing both stability and strength calculations in damaged condition
INWATER SURVEY		Denotes that the examination of the ship's bottom and related items may be carried out while the ship is afloat in accordance with the applicable requirements indicated in Pt.1, Ch.2, Sec.7.2
EDD (X)		Denotes that the vessel complies with the requirements of the IRS Classification Note “Extended Dry-Docking Scheme”, and is fit for service with an extended interval of ‘X’ years between successive dry-dockings.
"For carriage of cement in bulk"		This will be entered in the Register of Ships for vessels which are designed and constructed solely for carriage of cement in bulk and the scantlings and arrangements have been approved accordingly
DWA		This notation will be assigned to ships complying with the requirements of Pt.3, Ch.15, Sec.8 for anchoring in deep and unsheltered waters.
CLS	CONTAINER LASHING SOFTWARE	This additional notation will be assigned to Container Ships provided with IRS approved container lashing software in accordance with Part 5, Chapter 5 of the Rules.
CM	CONSTRUCTION MONITORING	This additional class notation will be assigned to ships, whose quality of construction is closely monitored by IRS in accordance with the relevant requirements of Pt. 3, Ch. 18.
Class Notations - Machinery		
SPM	SINGLE POINT MOORING	Denotes that the vessel is fitted with standard arrangements for single point mooring as per Pt.5, Ch.28 of the Rules
DOUBLE HULL		When bulk carriers, oil tankers, oil or ore carriers and oil or bulk carriers are of double hull construction, in the entire cargo area (See Ch.2, Sec.1), the main class notations described above will be appended by notation ‘DOUBLE HULL’
CCS	CENTRALIZED CONTROL STATION	Denotes that the propulsion and auxiliary machinery can be controlled and monitored with continuous supervision from a Centralized Control Station as detailed in Pt.4, Ch.7. It also denotes that the control engineering equipment has been arranged, installed and tested in accordance with Rules.
SYJ	SWACHALIT YANTRIK JAHAZ	Denotes that the ship can be operated with the machinery spaces unattended in accordance with the applicable requirements of Part 5, Chapter 22 of the Rules
HY	HIMIKAR YANTRA	Denotes that the refrigerated cargo installation of a ship complies with the applicable requirements of Part 5, Chapter 23 of the Rules

Abbreviation	Expanded Form	Significance
HY*	HIMIKAR YANTRA*	Denotes that the refrigerated cargo installation is capable of cooling down fruit in general or a catch of fish and complies with the applicable requirements of Part 5, Chapter 23 of the Rules
HY(LGC)	HIMIKAR YANTRA (LGC)	Denotes that the reliquefaction or refrigeration installation fitted on a classed liquefied gas carrier for cargo temperature and pressure control complies with the applicable requirements of Part 5, Chapter 4 of the Rules
NV	NIPRABHAV VASHPA	This notation is assigned to ships classed with Indian Register of Shipping intended for (i) carriage of oil in bulk or (ii) carriage of liquid chemicals in bulk. It denotes that the cargo spaces can be inerted by means of an inert gas system which has been approved, installed and tested in accordance with the relevant Rules
AGNI 1	AGNI SHAMAK	Denotes that the ship is equipped for early stage fire fighting and rescue operations close to structures including means for self protection of the vessel
AGNI 2		Denotes that the ship is equipped for continuous fighting of large fires and for cooling of structures on fire including means for self protection of the vessel
AGNI 3		Denotes that the ship is equipped for continuous fighting of large fires and for cooling of structures on fire and of greater capacity than for "AGNI 2"
DP (0)	DYNAMIC POSITIONING (0)	Denotes that the ship is fitted with automatic controls for position keeping and/or heading without joystick system back-up as per Pt. 5, Ch. 24 of the Rules
DP (1)	DYNAMIC POSITIONING (1)	Denotes that the ship is fitted with automatic controls for position keeping and/or heading, an independent joystick system back-up and a position reference back-up as per Pt.5, Ch.24 of the Rules
DP (2)	DYNAMIC POSITIONING (2)	Denotes that the ship is fitted with automatic controls of position keeping and/or heading with automatic standby controls and redundancy in design and equipment as required by Pt.5, Ch.24 of the Rules
DP (3)	DYNAMIC POSITIONING (3)	Denotes that the ship is fitted with automatic controls for position keeping and/or heading with automatic standby controls, redundancy in design and equipment and physical separation of components in different compartments as per Pt.5, Ch.24 of the Rules
BD	Bridge Design	The additional class notation ‘BD’ will be assigned to ships which comply with the requirements of ergonomic bridge design and layout in accordance with Pt.5 Ch.31 of the Rules
BDS	Bridge Design and Systems	The additional class notation ‘BDS’ will be assigned to ships which comply with the requirements of ergonomic bridge design and layout, navigation equipment and related systems in accordance with Pt.5 Ch.31 of the Rules

Abbreviation	Expanded Form	Significance
IBS	Integrated Bridge System	The additional class notation 'IBS' will be assigned to ships fitted with an Integrated Bridge System in accordance with the requirements given in Pt.5, Ch.31 of the Rules. Integrated Bridge System allows simplified and centralized bridge operation of the main functions of navigation, manoeuvring and communication, as well as monitoring from the bridge of other functions such as: - Passage execution - Communication system - Monitoring of the machinery installation - Pollution monitoring - Monitoring of HVAC for passenger ships - Safety and security.
DSV	DIVING SUPPORT VESSEL	Denotes that the ship has diving support capability and is equipped with diving systems in accordance with the requirements of Pt. 5, Ch. 26 of the Rules.
DIV-SURF	DIVING SYSTEMS-SURFACE	The additional notation DIV-SURF will be assigned to surface diving systems in accordance with Pt. 5, Ch. 26 of the Rules.
DIV-SAT	DIVING SYSTEMS-SATURATION	The additional notation DIV-SAT will be assigned to saturation diving systems in accordance with Pt. 5, Ch. 26 of the Rules.
PMS	PLANNED MAINTENANCE SYSTEM	Denotes that the machinery is subject to a system of planned maintenance and surveys in accordance with Part 1, Chapter 2, Section 14 of the Rules
PMS-CM	PLANNED MAINTENANCE SYSTEM – CONDITION MONITORING	Denotes that the machinery is subject to condition monitoring as part of the planned maintenance system and surveys in accordance with Part 1, Chapter 2, Section 21 of the Rules
PMS-CBM	PLANNED MAINTENANCE SYSTEM – CONDITION BASED MAINTENANCE	Denotes that the machinery is subject to condition based maintenance as part of the planned maintenance system and surveys in accordance with Part 1, Chapter 2, Section 21 of the Rules
TCM	TAILSHAFT CONDITION MONITORING	Denotes that the tail shaft condition is regularly monitored based on service records, oil and fresh water sample analysis, as applicable, in accordance with the survey requirements of Pt.1, Ch.2 and arrangements are provided for this purpose in accordance with Pt.4, Ch.4 of the Rules.
FT		This notation will be assigned to ships fitted with fuel oil treatment system and equipment complying with the relevant requirements of IRS Classification Note "Fuel Oil Treatment System".
BATTERY PROP	BATTERY PROPULSION	The additional notation BATTERY PROP will be assigned to vessels where the battery systems are used for propulsion and are in accordance with the *'Guidelines on Battery Powered Vessels'*.

Abbreviation	Expanded Form	Significance
LFPF	LOW FLASH POINT FUEL	This additional class notation will be assigned to a vessel, which is designed and constructed primarily for using low flash point fuel, in accordance with the applicable requirements of Part 5, Chapter 35 of the Rules. The following additional qualifiers may be assigned to the vessel depending upon the type of fuel or engine being used : (NG) – Natural Gas (EG) – Ethane (LPG) – Liquefied Petroleum Gas (ML) – Methanol (EL) - Ethanol (AM) - Ammonia (SFE) – Single Fuel Engines (DFE) – Dual Fuel Engines
LFPF BUNKERING VESSEL ([fuel name]) LFPF BUNKERING BARGE ([fuel name])		This additional class notation will be assigned to a vessel, which is designed and constructed in accordance with the applicable requirement of Part 5, Chapter 14, and primarily intended for carrying low flash point fuel to transfer to ships using such fuel. 'LFPF BUNKERING BARGE ([fuel name])' will be assigned to nonself- propelled vessels. The following qualifiers may be assigned to the vessel carrying LNG bunker and equipped with additional features complying with the relevant requirements in Section 2 of the Chapter: RE - where the vessel is designed to receive LNG from a gas fueled vessel whose LNG fuel tanks have to be emptied. ICD - where the vessel is designed for initial cooling down of the gas fueled vessel's LNG fuel tank. IGS - where the vessel is designed to supply inert gas and dry air, to ensure gas freeing and aeration, to a gas fueled vessel complying with Pt.5, Ch.35, 6.10.4. VR - where the vessel is designed to recover and manage the boiloff gas generated during the bunkering operation.
FC (Main) FC (Auxiliary)	Fuel Cell (Main) Fuel Cell (Auxiliary)	Vessels provided with fuel cell installations for propulsive power and auxiliary purposes in accordance with IRS Guidelines on Vessels with Fuel Cell Power Installations (Provisional), may be assigned additional class notation FC (Main) and FC (Auxiliary) respectively. A qualifier indicating the fuel (e.g. methanol, ethanol, hydrogen, etc) used in the fuel cell will be added to the notation, e.g: FC (Main) – Hydrogen.

Abbreviation	Expanded Form	Significance
RV(LNG)	REGASSIFICATI ON VESSEL (LIQUIEFIED NATURAL GAS)	This notation will be assigned to LNG Carriers fitted with regasification systems, complying with the requirements of Part 5, Chapter 38 of the Rules. These ships are also to comply with the applicable requirements of Part 5, Chapter 4 for liquefied gas carriers.
Pollution Prevention Notations		
VCS1 VCS2 VCS1-B VCS2-B	VAPOUR CONTROL SYSTEM	The additional notation VCS1 will be assigned to oil tankers, combination carriers (ore or oil/oil or bulk) and chemical tankers equipped with vapour control system complying with the requirements of Part 5, Chapter 29 of the Rules, except those given in 3.2.2 and Section 4 of that Chapter. The additional notation VCS2 will be assigned to oil tankers, combination carriers (ore or oil/oil or bulk and chemical tankers equipped with vapour control system meeting the requirements of USCG's regulations CFR46 Part 39 and those in Part 5, Chapter 29 of the Rules, except Section 4 of that Chapter. Vessels complying with requirements of Section 4 "Vapour Balancing" of Part 5, Chapter 29, in addition to other requirements in that Chapter will be eligible to be assigned class notation 'VCS1-B' or 'VCS2-B', as relevant and applicable.
CLEAN-SEA		The additional class notation CLEAN-SEA is assigned to ships provided with construction and procedural means to prevent pollution of sea. This is achieved by complying with the applicable requirements of Annexes I, II, III, IV, V of MARPOL Convention, as well as additional requirements related to prevention of sea pollution as follows: • Prevention of accidental pollution by locating fuel and lub.oil tanks above the double bottom and away from side shell. • Prevention of operational pollution by means of bilge water separation and filtering, holding tanks for treated sewage and grey water • Prevention of transfer of harmful organisms and pathogens in the ballast water • Prevention of pollution by tributyltin by means of TBT free antifouling paints • Prevention of pollution by solid garbage (resulting from the compacting device and incinerators) by means of proper storage of such waste The requirements for the assignment of this notation are given in Part 5, Chapter 30 of Rules.

Abbreviation	Expanded Form	Significance
CLEAN-AIR		The additional class notation CLEAN-AIR is assigned to ships provided with construction and procedural means to prevent pollution of the air. This is achieved by complying with the applicable requirements of Annex VI of MARPOL convention as well as following additional requirements related to emissions to the air: • Prevention of air pollution by exhaust gas (NOx, SOx, etc.) by means of low emission engines • Use of low sulphur content fuels and incinerators • Use of refrigerants and fixed fire fighting means with zero ozone depleting potential and low global warming potential • Control of release of refrigerants to the atmosphere by means of leak detection and evacuation systems • Recovery of vapours emitted from cargo systems of ships carrying dangerous liquid cargoes in bulk Note 1 : For ships with the service notation of oil tanker, oil or bulk carrier, ore or oil carrier, chemical tanker or liquefied gas carrier, the assignment of the notation VCS1 or VCS2 is a pre-requisite for assigning the notation CLEAN-AIR. The requirements for the assignment of this notation are given in Part 5, Chapter 30 of Rules.
EP	Environmental Protection	The additional class notation EP is assigned to ships provided with equipment and procedural means to prevent pollution of the sea and of air. This is achieved by complying with the requirements of Annexes I to VI of MARPOL Convention and additional requirements relevant to ship's liquid, solid and gas releases as detailed in Part 5, Chapter 30 of Rules. Additionally the vessel should have developed an Environmental Management Plan considering the IMO requirements for recycling. Note 1 : For ships with the service notation of oil tanker, oil or bulk carrier, ore or oil carrier, chemical tanker or liquefied gas carrier, the assignment of the notation VCS1 or VCS2 is a prerequisite for assigning the notation Environment Protection – EP. The requirements for the assignment of this notation are given in Part 5, Chapter 30 of Rules.
BFM	Biofouling Management	Ships complying with the requirements in IRS '*Guidelines on Biofouling Management*' will be assigned additional class notation BFM.

Ballast Water Convention		
Abbreviation	**Expanded Form**	**Significance**
BWE ( )	BALLAST WATER EXCHANGE	The additional class notation BWE is assigned to ships complying with the International Convention for the Control and Management of Ships' Ballast Water and Sediments, 2004, the relevant IMO Guidelines, and performing ballast water exchange in accordance with Part 5, Chapter 37 of the Rules.
BWT	BALLAST WATER TREATMENT	The additional class notation BWT is assigned to ships fitted with an IMO Member State approved ballast water treatment system complying with the International Convention for the Control and Management of Ships' Ballast Water and Sediments, 2004, the relevant IMO Guidelines and Part 5, Chapter 37 of the Rules.

Ship Type Notation	
Ship Type Notation	**Significance**
ASPHALT CARRIER (INTEGRAL TANK, MAX. CARGO TEMP ≤ XXX℃),	This additional notation will be assigned to oil tankers intended primarily to carry asphalt/ bitumen in integral cargo tanks in accordance with the applicable requirements of Part 5, Chapter 2 of the Rules. Such vessels will also be assigned notation ESP.
ASPHALT CARRIER (INDEPENDENT TANKS, MAX. CARGO TEMP ≤ XXX℃),	This additional notation will be assigned to oil tankers intended primarily to carry asphalt/ bitumen in independent cargo tanks in accordance with the applicable requirements of Part 5, Chapter 2 of the Rules. Structural analysis for such vessels is to be carried out in accordance with the requirements of '*Guidelines on Structural Assessment of Ships carrying Asphalt in Independent Cargo Tanks'*
BULK CARRIER	This notation will be assigned to ships designed primarily for the carriage of dry cargo in bulk and built in accordance with the applicable requirements of Part 5, Chapter 1 of the Rules for carriage of cargoes of density of at least 0.8 t/m^3
BULK CARRIER(BC-XII)	This notation will be assigned to Bulk carriers which are in accordance with the definition of SOLAS Ch XII and its construction features not being as per the definition of SOLAS Ch IX, Reg 1.6. (i.e. not fitted with hopper and topside tanks)
SELF UNLOADER	This notation will be assigned to Bulk carriers with single deck, double bottom, hopper side tanks and topside tanks and with single or double side skin construction in cargo length area and intended to carry and self-unload dry cargoes in bulk.
ORE CARRIER	This notation will be assigned to ships specially designed primarily to carry ore and built in accordance with applicable requirements of Part 5, Chapter 1 of the Rules
OIL TANKER	This notation will be assigned to tankers intended primarily to carry oil in bulk and built in accordance with applicable requirements of Part 5, Chapter 2 of the Rules. Where the scantlings and arrangements have been approved for the carriage of oil having a flash point of 60°C or above (closed cup test) or other liquid cargoes in bulk, the class notation will be suitably modified to show the nature of the cargo

Ship Type Notation	Significance
SHUTTLE TANKER	This notation will be assigned to an oil tanker which is equipped with dynamic positioning (in accordance with the applicable requirements of Part 5, Chapter 24) and specialized cargo handling equipment making it capable of loading crude oil at offshore installations (in accordance with Part 5, Chapter 29).
ORE OR OIL CARRIER OIL OR BULK CARRIER	These notations will be assigned to combination carriers specially designed primarily to carry dry bulk cargoes (bulk carriers and ore carriers) and alternatively, oil in bulk, in accordance with Pt.5, Ch.2, Sec.12 of the Rules. In such ships, simultaneous carriage of dry bulk cargo and oil is prohibited.
CHEMICAL TANKER	This notation will be assigned to ships specially designed primarily to carry chemicals in bulk and built in accordance with applicable requirements of Part 5, Chapter 3 of the Rules
LIQUEFIED GAS CARRIER	This notation will be assigned to ships specially designed for the carriage of liquefied petroleum, natural or other gases and built in accordance with applicable requirements of Part 5, Chapter 4 of the Rules
CONTAINER SHIP	This notation will be assigned to vessels built for the exclusive carriage of containers in holds and on deck in accordance with the applicable requirements of Part 5, Chapter 5 of the Rules
PASSENGER SHIP	This notation will be assigned to vessels intended for carrying more than 12 passengers and built in accordance with Part 5, Chapter 6 of the Rules
FERRY	This notation will be assigned to vessels intended for carriage of passengers and/or vehicles on regular scheduled service and built in accordance with Part 5, Chapter 6 of the Rules
Ro-Ro FERRY TRAIN FERRY	This notation will be assigned to ferries intended for carriage of passengers, vehicles and cargo in pallet form or in containers and loaded/unloaded by wheeled vehicles and built in accordance with Part 5, Chapter 6 of the Rules
TUG	This notation will be assigned to all ships built in accordance with applicable requirements of Part 5, Chapter 7 of the Rules
STERN TRAWLER	This notation will be assigned to ships built in accordance with applicable requirements of Part 5, Chapter 9 of the Rules and engaged in stern trawling
TRAWLER	This notation will be assigned to ships built in accordance with applicable requirements of Part 5, Chapter 9 of the Rules and engaged in side trawling
FISHING VESSEL	This notation will be assigned to ships built in accordance with applicable requirements of Part 5, Chapter 9 of the Rules and not equipped with trawling gear
DREDGER, HOPPER DREDGER, RECLAMATION CRAFT, HOPPER BARGE, SPLIT HOPPER BARGE	These notations will be assigned to self propelled or non self propelled vessels engaged in dredging or reclamation operation in accordance with applicable requirements of Part 5, Chapter 10 of the Rules

Ship Type Notation	Significance
BARGE	This notation will be assigned to non self- propelled, manned or unmanned ships carrying dry cargo in cargo holds and built in accordance with applicable requirements of Part 5, Chapter 11 of the Rules. For special purpose vessels, the Notation will be suitably modified, e.g. Shipborne Barge
OIL BARGE	This notation will be assigned to non self- propelled, manned or unmanned ships intended to carry oil in bulk and built in accordance with the applicable requirements of Part 5, Chapters 2 & 11 of the Rules. Where the scantlings and arrangements have been approved by IRS for the carriage of oil having a flash point of 60°C or above (closed cup test), or for other liquid cargoes in bulk, the class notation affixed to the Character will be suitably modified to show the nature of the cargo (e.g. water barge, molasses barge, etc.)
PONTOON	This notation will be assigned to non self- propelled, manned or unmanned ships designed specifically for the carriage of non-perishable cargo or equipment on deck and built in accordance with the applicable requirements of Part 5, Chapter 11 of the Rules. For special purpose vessels, the Notation will be suitably modified, e.g. Crane Pontoon
FLOATING DOCK	This notation will be assigned to floating dry docks built in accordance with the applicable requirements of Part 5, Chapter 12 of the Rules.
WELL STIMULATION VESSEL	This notation will be assigned to well stimulation vessels built in accordance with the applicable requirements of Part 5, Chapter 33.
OIL RECOVERY VESSEL	This notation will be assigned to oil recovery vessels built in accordance with the applicable requirements of Part 5, Chapter 34.
Ro-Ro CARGO SHIP	This notation will be assigned to a vessel designed and constructed to carry roll-on/roll-off cargoes, equipped for carriage of vehicles, on exposed or enclosed single deck or multiple exposed/ enclosed decks. The requirements of Part 3, Chapters 9 & 12 of the Rules are to be complied with for decks with wheel loading and opening and closing appliances (bow doors) respectively. The requirements of Part 6 are also to be complied with for fire safety requirements of ro-ro spaces and vehicle spaces.
SPECIAL PURPOSE SHIP	This notation will be assigned to vessels that comply with the requirements in the IMO Code of Safety for Special Purpose Ships (SPS Code).
MOORED OIL STORAGE TANKER at (Location)	This notation would be assigned to an existing Double Hull Oil Tanker that is intended to be used as a storage vessel moored at a specified fixed location, with the IY notation either maintained or suspended and the ESP notation suspended.
LIVESTOCK CARRIER	This notation will be assigned to vessels that comply with the requirements in Part 5, Chapter 40 of the Rules.

Ship Type Notation		**Significance**
OFFSHORE SUPPORT VESSEL		This notation will be assigned to all ships built in accordance with applicable requirements of Part 5, Chapter 8 of the Rules.
MULTIPURPOSE OFFSHORE SUPPORT VESSEL		Vessels intended for several roles/services related to offshore support will be assigned notation MULTIPURPOSE OFFSHORE SUPPORT VESSEL
	SUPPLY	This additional notation will be assigned to Offshore Support Vessels engaged in the transport of stores, materials, equipment and/or personnel to, from and between offshore installations. This notation is not applicable to Crew boats.
	SUPPLY-PLUS	This additional notation will be assigned to Offshore Support Vessels designed for operating in North Sea, engaged in the transport of stores, materials, equipment and/or personnel to, from and between offshore installations. This notation is not applicable to Crew boats.
	STS	This additional notation will be assigned to Offshore Support Vessels complying with the requirements for Survival Capability (Floatability in damaged condition) of Ch.3 of the IMO Resolution MSC 235(82).
	LHNS	This additional notation will be assigned to Offshore Support Vessels complying with the requirements of Pt.5, Ch.8, Sec. 2.8, intended to carry limited amounts of hazardous and noxious liquid substances in bulk.
	OCC	This additional notation will be assigned to Offshore Support Vessels complying with Pt. 5, Ch.8, Sec. 2.8; and intended to transport, handle hazardous and noxious liquid substances in bulk in compliance with the OSV Chemical Code (IMO Resolution A.1122 (30)).
	AH	This additional notation will be assigned to Offshore Support Vessels equipped for anchor handling operations and complying with the requirements of Pt.5, Ch.8, Sec.3.
	TOW	This additional notation will be assigned to Offshore Support Vessels equipped for towing operations and complying with the requirements of Pt.5, Ch.7
	SSR	This additional notation will be assigned to Offshore Support Vessels equipped to carry out rescue and standby services for offshore installations and complying with the requirements of Pt.5, Ch.8, Sec.4
	AGNI 1 AGNI 2 AGNI 3	These additional notations will be assigned to Offshore Support Vessels equipped for firefighting operations and complying with the relevant requirements of Pt.5, Ch.25.
	DSV	This additional notation will be assigned to Offshore Support Vessels equipped for providing diving support operations and complying with the relevant requirements of Pt.5, Ch.26
	WSV	This additional notation will be assigned to Offshore Support Vessels equipped for performing well stimulation operations and complying with the relevant requirements of Pt.5, Ch.33
	OIL RECOVERY	This additional notation will be assigned to Offshore Support Vessels equipped to recover oil spills from sea at a safe distance, handle, store and transport the recovered oil, and complying with the relevant requirements of Pt.5, Ch.34

Ship Type Notation		Significance
	WFSV	This additional notation will be assigned to Offshore Support Vessels equipped to serve and support wind farm service activities and complying with the requirements of Pt. 5, Ch. 8, Sec. 5.
	WFSV – HSC	This additional notation will be assigned to wind farm service vessels which comply with the requirements applicable to high speed crafts, as given in the Rules and Regulations for Construction and Classification of High Speed Crafts and Light Crafts, in addition to the requirements of Pt. 5, Ch. 8, Sec. 5.
PASSENGER SUBMERSIBLE WITH MAX. OPERATING DEPTH OF ___[m]		This notation will be assigned to submersibles designed and constructed for carriage of passengers (normally tourists) in accordance with MSC/Circ.981. The maximum safe operating depth of the submersible is to be indicated in the notation.
PIPE LAYING VESSEL		This notation will be assigned to vessels that are primarily engaged in installation of pipelines and are in compliance with Part 5 Chapter 13.
PIPE LAYING BARGE		This notation will be assigned to non self-propelled pipe laying vessels complying with the requirements for the class notation BARGE (i.e. Part 5, Chapter 11) and which comply with the relevant requirements of Part 5 Chapter 13
CABLE LAYING VESSEL		This notation will be assigned to vessels that are primarily engaged in installation of cables and are in compliance with Part 5 Chapter 13.
CABLE LAYING BARGE		This notation will be assigned to non self-propelled cable laying vessels complying with the requirements for the class notation BARGE (Part 5, Chapter 11) and which comply with the relevant requirements of Part 5 Chapter 13
ESCORT (Fs, Fb, V)		This notation will be assigned to tugs mainly intended for escort services such as for steering, braking and assisting in the maneuvering of escorted ships. The values of design maximum steering force (Fs), design maximum braking force (Fb), and design maximum escort speed (V), are to be supplemented to the class notation.
ACCOMMODATION BARGE ACCOMMODATION PONTOON		These notations will be assigned to non self-propelled vessels used for accommodation of personnel engaged in offshore work on other vessels, rigs, platforms etc. For ACCOMMODATION PONTOONS, all accommodation/storage/auxiliary machinery spaces are provided above main deck. For ACCOMMODATION BARGES, spaces below the deck may also be used for accommodation / storage / auxiliary machinery etc. In addition to the rule requirements for assignment of class notations 'BARGE'/ 'PONTOON', these vessels are to additionally comply with the requirements applicable to vessels carrying industrial personnel, as specified by the Flag Administration. Additional class notations for comfort, station-keeping, etc., may be provided at the request of the owner.

Passenger and Crew Comfort Notations		
Abbreviation	**Expanded Form**	**Significance**
CMF(Px) CMF(Px-c) CMF(Px-l) CMF(Px-c-l)	PASSENGER COMFORT	Denotes that passenger spaces have been evaluated and certified in accordance with the applicable requirements of Part 5, Chapter 39 of the Rules, for passenger comfort. '**x**' denotes the comfort rating related to noise and vibration in passenger spaces. Ships which additionally comply with the requirements for indoor climate and/ or lighting in passenger spaces will be assigned additional qualifiers '**c**' and/ or '**l**', respectively.
CMF(Cy) CMF(Cy-c) CMF(Cy-l) CMF(Cy-c-l)	CREW COMFORT	Denotes that crew spaces have been evaluated and certified in accordance with the applicable requirements of Part 5, Chapter 39 of the Rules, for crew comfort. '**y**' denotes the comfort rating related to noise and vibration in crew spaces. Ships which additionally comply with the requirements for indoor climate and/ or lighting in crew spaces will be assigned additional qualifiers '**c**' and/ or '**l**', respectively.
CMF(Px, Cy) CMF(Px-c-l, Cy-c-l) etc.	PASSENGER AND CREW COMFORT	Denotes that both passenger and crew spaces have been evaluated and certified in accordance with the applicable requirements of Part 5, Chapter 39 of the Rules, for passenger and crew comfort. '**x**' and '**y**' denote the comfort rating related to noise and vibration for passenger spaces and crew spaces respectively. Ships which additionally comply with the requirements for indoor climate and/ or lighting will be assigned additional qualifiers '**c**' and/ or '**l**', respectively.
Cyber Safety Notations		
CyS-I	INFORMED CYBER SAFETY	Vessels complying with the applicable requirements of 'Guidelines on Maritime Cyber Safety' may be assigned this notation. This notation is assigned where the organisation assesses the issues related to cyber safety, cyber risks and have documented policies. The organization implements minimum cyber safety practices.
CyS-E	ESSENTIAL CYBER SAFETY	The additional class notation CyS-E will be assigned to vessels that are in compliance with the requirements for essential cyber safety specified in Part 4, Chapter 7, Section 7 of the Rules.
CyS-II	ADVANCED CYBER SAFETY	This notation will be assigned to vessels which comply with the requirements for CyS-E notation and additionally also comply with the applicable requirements of 'Guidelines on Maritime Cyber Safety'. This notation is assigned where the cyber safety policies and procedures are reviewed periodically for continual improvement. The organisation implements advanced cyber safety practices.

Class Notation : General		
Abbreviation	**Expanded Form**	**Significance**
ADE	ALTERNATIVE DESIGN EVALUATION	The additional class notation ADE will be assigned to vessels where alternative design is used in lieu of complying with the prescriptive requirements of the Rules. The relevant details, aspects where alternative design is used would be suitably indicated in the Class Certificate. Alternative design approach may be used in accordance with the '*Guidelines on Alternative and Risk Based Design Evaluation'.*
RA	RISK ASSESSMENT	The additional class notation RA will be assigned to vessels where the design is risk based and the same has been accepted based on risk assessment. However, if risk based design approach has been used for a particular aspect, then the relevant details, aspects would be suitably indicated in the Class Certificate. Risk based design approach may be used in accordance with the '*Guidelines on Alternative and Risk Based Design Evaluation'.*
SFA ( )	SPECTRAL FATIGUE ANALYSIS (NUMBER OF YEARS)	The additional class notation SFA ( ) will be assigned to vessels where the design fatigue life has been assessed in accordance with the *'Guidelines on Spectral Fatigue Analysis of Ship Structures'*. The figures in parentheses would indicate the number of years for which the design fatigue life has been assessed.
HVSCS	HIGH VOLTAGE SHORE CONNECTION SYSTEMS	The additional class notation HVSCS would be assigned to vessels designed to be powered with shore power alone at port/ berth in accordance with the '*Guidelines on High Voltage Shore Connection Systems' (applicable to voltages > 1 kV)*.
DSA	DIRECT STRENGTH ASSESSMENT	The additional class notation DSA will be assigned to vessels where a direct strength assessment has been carried out in accordance with the 'Guidelines on Application of Direct Seakeeping Loads in Structural Analysis of Ships' and the 'Guidelines on Structural Assessment of Ships based on Finite Element Method'.
FDA	FATIGUE DESIGN ASSESSMENT	The additional class notation FDA will be assigned to vessels where a fatigue design assessment has been carried out in accordance with the relevant requirements of the Rules and the 'Guidelines on Fatigue Design Assessment of Ship Structures'. FDA notation is mandatory for ships of length greater than or equal to 150 m and may be optionally applied for ships of length greater than 90 m. If fatigue assessment is carried out for vessels for a number of years >25 and/ or restricted service, then the class notation FDA (N, specific area of operation), would be assigned; where 'N' denotes the number of years.
ERS	EMERGENCY RESPONSE SERVICE	This additional class notation will be assigned to ships which have opted for the emergency response service of IRS, under a prior agreement with the Ship Owner / Ship Manager. IRS will provide a computer assisted analysis of a damaged ship's stability and longitudinal strength in the event of a casualty to the ship.

Abbreviation	Expanded Form	Significance
REMOTE SURVEY		This additional class notation will be assigned to ships which are in compliance with the relevant requirements of Pt. 1, Ch. 2, Sec. 24 for remote surveys

Section 1

General Requirements

1.1 General

1.1.1 All vessels are to be subjected to Periodical Surveys for the purpose of maintenance of class. Survey notations and Survey intervals are given in Table 1.1.1 for main class Surveys. Where additional class notations have been assigned, Surveys are to be carried out at intervals given in Table 1.1.2.

1.1.2 Vessels with additional class notations for which there are no specific Survey requirements defined in this Chapter are to have the equipment and/or construction related to this additional class notation examined to the Surveyor's satisfaction at each Special Survey. However, at the time of continued effectiveness, of operational features, safety devices and control systems are to be verified.

1.1.3 Annual, intermediate and special surveys are to be held concurrently with the relevant statutory surveys under the various IMO conventions, in accordance with the Harmonised System of Survey and Certification of IMO. For cargo ships not subject to enhanced surveys under SOLAS Ch. XI-1/2, notwithstanding any other provisions, the intermediate and renewal surveys may be carried out and completed over the corresponding periods as specified in the 2011 ESP Code, as amended.

1.1.4 Special consideration may be given in the application of relevant requirements of this chapter to commercial vessels owned or chartered by Governments, which are utilized in support of military operations or service.

Table 1.1.1 : Periodical survey intervals for class survey notations

(Any specific requirements of the flag Administration are also to be complied with)

Survey	Class survey notation	Survey interval in years
Hull : Special Survey	SSH	5
Hull : Continuous Survey	CSH	5[5]
Machinery : Special Survey	SSM	5
Machinery : Continuous Survey	CSM	5
Intermediate Survey	IS	See Note 4, 9
Annual Survey	AS	1[1, 9,10]
Docking Survey	DS	2.5[2]
Shaft Survey		
Oil Lubricated	SH (OL)	
Fresh Water Lubricated Closed Loop System	SH (FW-C)	
Single Shaft Fresh Water Lubricated Open System	SH (S-FW-O)	
Single Shaft Corrosion Protected or Corrosion Resistant Material Water Lubricated Open System	SH (S-CP-O)	
Multiple Shaft, Water Lubricated Open System	SH (M-O)	See Note 3, 7
Single Shaft, Water Lubricated Open System	SH (S-O)	
Tailshaft Condition Monitoring	TCM	See Note 8

Table 1.1.1 (Contd.)		
Survey	**Class survey notation**	**Survey interval in years**
Directional propellers, water jet units, or athwartship thrust propellers	DPROP	5[3]
Main boilers	MBS	2.5[6]
Auxiliary boilers	ABS	2.5[6]
Thermal oil heating systems	TOH	2.5[6]
Exhaust gas steam generators and economisers	EGES	2.5[6]

Notes:

1 Survey is to be carried out within 3 months on either side of the anniversary date.

2 At least 2 Surveys are to be carried out within any 5 year special survey cycle, but the interval between two consecutive surveys is not to exceed 3 years and one of these two docking surveys should coincide with the Special Survey. Proposals for alternative means for providing underwater inspection equivalent to drydocking survey would be considered by IRS as detailed in Sec.7. However, for vessels operating solely in fresh-water only one docking survey coinciding with the special survey need be carried out till special survey no. IV provided the interval between consecutive docking surveys does not exceed 5 years. Survey requirements for floating dry docks are indicated in Section 23.

3 Upon request, IRS may extend the survey period to harmonise with docking survey and in accordance with the requirements of Section 11.

4 Survey is to be carried out either at or between the second or third Annual Survey. Those items, which are additional to the requirements of the Annual Surveys, may be surveyed either at or between the second and third Annual Survey.

5 At the request of the Owner, IRS may agree that the special survey of the hull, for ships other than bulk carriers, oil tankers, combination carriers, chemical tankers, liquefied gas carriers and general dry cargo ships, be carried out on the continuous basis.

6 At least 2 surveys are to be carried out within any 5 year special survey cycle. The interval between two consecutive surveys is not to exceed 3 years.

7 See Tables 11.2.3 and 11.3.3 for survey intervals of closed and open systems respectively.

8 Condition monitoring records are to be verified at the time of annual surveys. Survey intervals are to be as per Table 11.2.3.

9 If an annual / intermediate survey is completed before the period specified in Note 1 / 4 :

(a) The anniversary date shown on the class certificate will be amended by endorsement to a date which is not more than 3 months later than the date on which the survey was completed.

(b) The subsequent annual / intermediate surveys are to be completed at the prescribed intervals using the new anniversary date.

(c) The expiry date of the class certificate may remain unchanged provided one or more annual / intermediate surveys, as appropriate, are carried out so that the prescribed maximum intervals between the surveys are not exceeded.

10 (a) Annual surveys are not applicable to floating dry docks.

(b) Survey requirements for floating dry docks are indicated in Section 23.

Table 1.1.2 : Periodical survey intervals for additional class notations

Survey of	Additional class notation / corresponding class survey notation	Survey interval in years
Planned Maintenance System of Machinery	**PMS** **PMS-CM** **PMS-CBM**	See Note 5
Annual Audit	AA(PMS) AA (PMS-CM) AA (PMS-CBM)	1[3,4,6]
Diving support vessels	**DSV**	
Annual Survey Special Survey	AS(DSV) SS(DSV)	1[1] 5
Diving system	**DIV-SAT, DIV-SURF**	
Annual Survey Special Survey	AS(DIV) SS(DIV)	1[1] 5
Cargo refrigerating plant	**HY**	
Annual Survey Special Survey Continuous Survey	AS(HY) SS(HY) CS(HY)	1[1] 5 5
Dynamic positioning system	DP(1), (2) and (3)	
Annual Survey Special Survey	AS(DP) SS(DP)	1[1] 5
External fire fighting	**AGNI 1, 2 & 3**	
Annual survey Special survey	AS(AGNI) SS(AGNI)	1[1] 5
Inert gas installation	**NV**	
Annual Survey Special Survey	AS(NV) SS(NV)	1[1] 5
Un-attended Machinery Spaces	**SYJ**	
Annual Survey Special Survey	AS(SYJ) SS(SYJ)	1[1] 5

Notes:

1 May be carried out within 3 months on either side of anniversary date.

2 Survey may be carried out either at or between the second or third annual survey.

3 To be carried out in conjunction with annual survey.

4 See Section 14 for details of Planned Maintenance System

5 PMS denotes vessel with approved Planned Maintenance System (PMS) only. PMS-CM denotes vessel with approved PMS and Condition Monitoring (CM). PMS-CBM denotes vessel with approved PMS, CM and carrying out Condition Based Maintenance (CBM).

6 See Section 21 for details of CM and CBM systems. In general, requirements for CM/ CBM can be applied only to vessels operating on approved PMS survey scheme.

1.2 Definitions

1.2.1 A **Ballast tank** is a tank which is being used primarily for salt water ballast.

In the case of oil tankers and chemical tankers, combined cargo/ballast tanks which are used for the carriage of cargo or ballast water as a routine part of the vessel's operation, are to be treated as ballast tanks. Cargo tanks in which water may be carried only in exceptional cases as per MARPOL I/18(3), are to be treated as cargo tanks. In any case, when substantial corrosion is found in a tank used for both cargo and ballast, the tank is to be considered as a ballast tank for the purpose of application of survey requirements

In the case of bulk carriers, a space used for both cargo and salt water ballast is to be treated as a ballast tank for the purpose of application of survey requirements when substantial corrosion is found in that space. Further in the case of double skin bulk carrier a double side tank is to be considered as a separate tank even if it is in connection to either the topside tank or the hopper side tank.

1.2.2 A **Close-up survey** is a survey where the details of structural components are within the close visual inspection range of the Surveyor, i.e. normally within reach of hand.

1.2.3 An **Overall survey** is a survey intended to report on the overall condition of the hull structure and determine the extent of additional Close-up Surveys.

1.2.4 A **Transverse section** includes all longitudinal members such as plating, longitudinals and girders at the deck, side, bottom, inner bottom and hopper side plating, longitudinal bulkheads and bottom plating in top wing tanks. Where transversely framed, the transverse section is to include adjacent transverse stiffeners and their end connections.

1.2.5 **Representative spaces/tanks** are those which are expected to reflect the condition of other spaces/tanks of similar type and service and with similar corrosion prevention systems. When selecting Representative Spaces/Tanks account is to be taken of the service and repair history onboard and identifiable Critical Structural Areas and/or Suspect Areas.

1.2.6 **Suspect areas** are locations showing Substantial Corrosion and/or considered by the Surveyor to be prone to rapid wastage.

1.2.7 **Critical structural areas** are locations which have been identified from calculations to require monitoring or from the service history of the subject ship or sister ships (if available) to be sensitive to cracking, buckling or corrosion which would impair the structural integrity of the ship.

1.2.8 **Substantial corrosion** is an extent of corrosion such that assessment of corrosion

pattern indicates a wastage in excess of 75 per cent of allowable margins, but within acceptable limits.

For vessels built under the IACS Common Structural Rules, substantial corrosion is an extent of corrosion such that the assessment of the corrosion pattern indicates a gauged (or measured) thickness between t_{ren} + 0.5 [mm] and t_{ren}.

't_{ren}' is the renewal thickness, which is defined as the minimum allowable thickness [mm], below which renewal of structural members is to be carried out.

1.2.9 **Corrosion prevention system** is normally to be of a full hard protective coating. Hard protective coatings are to usually be epoxy coating or equivalent. Soft or semi-hard coatings are not acceptable. Other coating systems may be considered acceptable as alternatives provided they are applied and maintained in compliance with the manufacturer's specifications.

1.2.10 **Coating condition** is defined as follows :

GOOD - Condition with only minor spot rusting;
FAIR - Condition with local breakdown at edges and weld connections and/or light rusting over 20 per cent or more of areas under consideration, but less than as defined for POOR condition;
POOR - Condition with general breakdown of coating over 20 per cent or more of areas or hard scale at 10 per cent or more of areas under consideration.

1.2.11 **Cargo area** in case of oil tankers and chemical tankers is that part of the ship which contains cargo tanks, slop tanks and cargo/ballast pump rooms, cofferdams, ballast tanks and void spaces adjacent to cargo tanks and also deck areas throughout the entire length and breadth of the part of the ship over the above mentioned spaces.

In the case of liquefied gas carriers, cargo area is that part of the ship which contains the cargo containment system, cargo/ballast pump rooms and compressor rooms, cofferdams, ballast tanks and void spaces adjacent to the cargo containment spaces and also deck areas throughout the entire length and breadth of the part of the ship over the above mentioned spaces.

In the case of bulk carriers and general dry cargo ships, cargo area is that part of the ship which contains all cargo holds and adjacent areas including fuel tanks, cofferdams, ballast tanks and void spaces etc. within the longitudinal extent from the aft bulkhead of the aft-most cargo hold to the fwd bulkhead of the foremost cargo hold.

Note: The definitions for cargo area given above are applicable only for the purpose of identifying spaces for examination during hull surveys as required by this chapter of the Rules. For the purpose of design and construction requirements, the definitions given in respective chapters of Part 5 of the rules would apply.

1.2.12 **Spaces** are separate compartments including holds, tanks, cofferdams and void spaces bounding cargo holds, decks and the outer hull.

1.2.13 **A prompt and thorough repair** is a permanent repair completed at the time of survey to the satisfaction of the Surveyor, therein removing the need for the imposition of any associated condition of classification.

1.2.14 **Anniversary date** means the day and month of each year corresponding to the expiry date of the classification certificate.

1.2.15 **A Double Hull Oil Tanker** is a ship which is constructed primarily for the carriage of oil (See Pt.5, Ch.2, for list of oils) in bulk, which has the cargo tanks protected by a double hull which extends for the entire length of the cargo area, consisting of double sides and double bottom spaces for the carriage of water ballast or as void spaces.

1.2.16 For the purpose of application of these requirements, a '**double skin bulk carrier'** is a ship which is constructed generally with single deck, top side tanks, hopper side tanks & double bottom in cargo spaces and is intended primarily to carry dry cargo in bulk, including such types as ore carriers and combination carriers, in which all cargo holds are bounded by double-side skin (regardless of the width of the wing space).

1.2.17 'General dry cargo ship' means ships carrying solid cargoes other than:

a) bulk carriers and ore carriers which are subject to the requirements of Sec.2;

b) following ship types which are subject to the requirements of Sec. 6

- dedicated Container carriers;
- ro-ro cargo ships;
- refrigerated cargo ships;
- dedicated wood chip carriers;
- dedicated Cement carriers;
- livestock carriers;
- ships carrying exclusively deck cargo;
- General dry cargo ships of double skin construction, with double skin extending for the length of the cargo area and for the height of the cargo hold to the upper deck. (Note: For ships with hybrid cargo hold arrangements, also see Section 6.1.2).

1.2.18 **Special consideration or specially considered** (in connection with close-up surveys and thickness measurements) means that sufficient close-up inspection and thickness measurements are to be taken to confirm the actual average condition of the structure under the coating.

1.2.19 **Air pipe heads** installed on the exposed decks are those extending above the freeboard deck or superstructure decks.

1.2.20 **Remote Inspection Techniques (RIT)** is a means of survey that enables visual examination of any part of the structure without the need for direct physical access of the surveyor.

1.2.21 A **ro-ro Ship** is a ship which utilizes a loading ramp to enable wheeled vehicles to be rolled-on and rolled-off the ship,

1.2.22 **Pitting corrosion** is defined as scattered corrosion spots/areas with local material reductions which are greater than the general corrosion in the surrounding area.

1.2.23 **Edge corrosion** is defined as local corrosion at the free edges of plates, stiffeners, primary support members and around openings. An example of edge corrosion is shown in Fig.1.2.23.

1.2.24 **Grooving corrosion** is typically local material loss adjacent to weld joints along abutting stiffeners and at stiffener or plate butts or seams. An example of groove corrosion is shown in Fig.1.2.24.

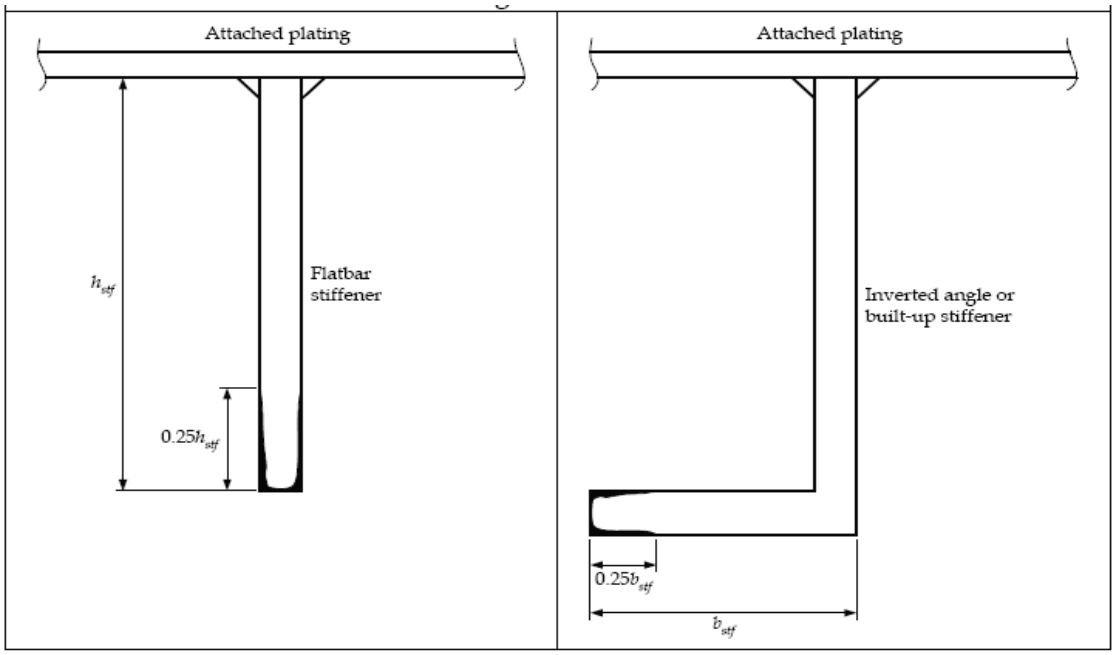

Fig.1.2.23 : Edge corrosion

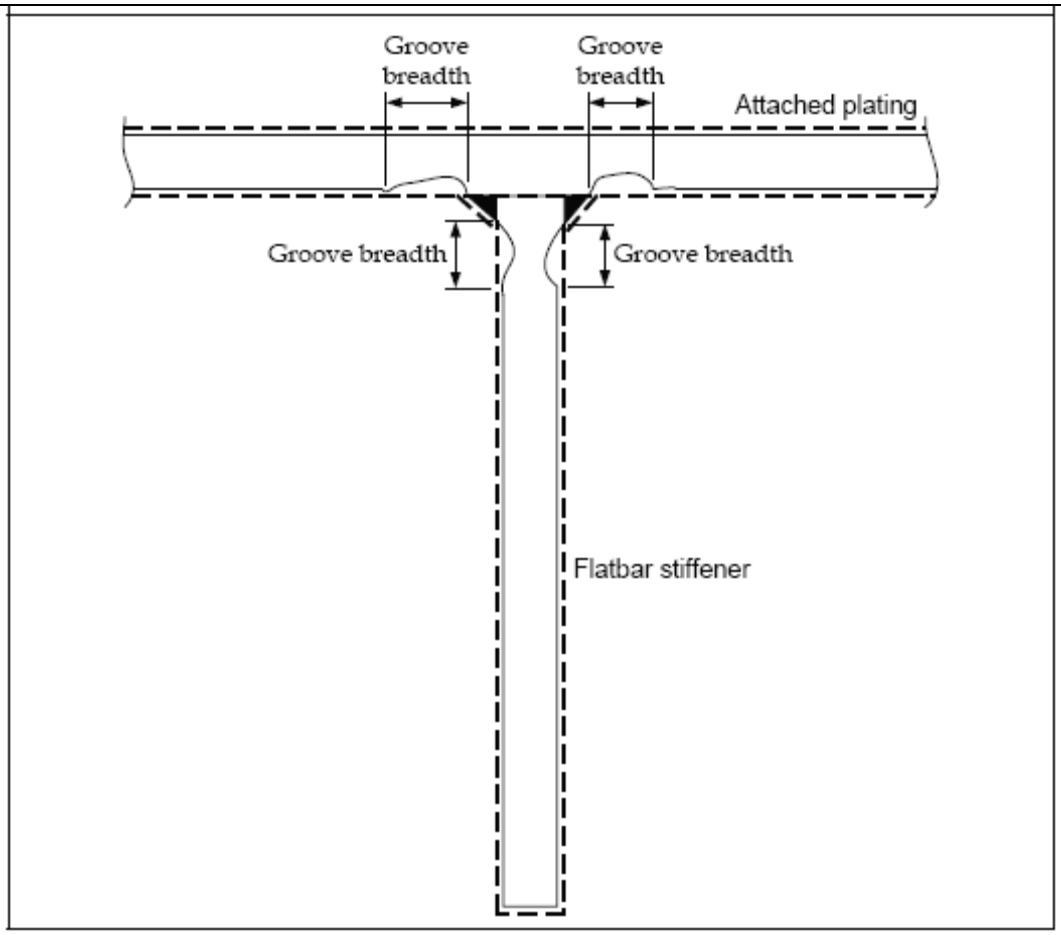

Fig. 1.2.24 : Grooving corrosion

1.3 Laid up vessels

1.3.1 Survey during lay-up

1.3.1 General

1.3.1.1 Vessels may be laid up when not carrying any cargo and not engaged in any commercial operation.

1.3.1.2 '*Hot lay-up*' means that the vessel is non-operational, with some of the machinery kept in operation for fast re-activation. This lay-up condition is relatively short term and may extend upto 12 months.

1.3.1.3 '*Cold lay-up*' means that the vessel is non-operational, with the machinery being shut down and the vessel being unable to be reactivated or brought to a state of readiness at short notice. This lay-up condition is relatively long term and may extend over 12 months.

1.3.1.4 When a ship is laid-up, the normal survey requirements may no longer apply provided that IRS is notified by the Owner in advance and requirements for lay up as advised by IRS are complied with. The Owner is also to submit a lay-up maintenance program and details to IRS for approval.

1.3.1.5 A record of lay-up preparations, maintenance and preservation actions is to be maintained throughout the vessel's lay-up and re-activation. Humidity levels in machinery spaces are to be recorded on a regular basis during the lay-up period, together with scheduled equipment maintenance and operation.

1.3.1.6 The requirements of flag Administrations and port or maritime authorities regarding lay-up are also to be complied with

1.3.1.7 During lay-up, the vessel is also to comply with the following:

a) The vessel is to be adequately manned in accordance with the statutory

requirements prevailing at the location of lay-up.

b) Adequate power is to be available on board to meet the following requirements, as applicable: -

- firefighting;
- bilge pumping;
- lighting;
- communication with shore;
- needs of crew on board, and
- operating anchor and mooring winches within a reasonable time.

The listed items are generally applicable for hot lay-up. For cold lay-up, arrangements may be specially considered.

1.3.2 Surveys during lay-up

1.3.2.1 Lay-up survey

.1 A lay-up survey is to be carried out at the beginning of the lay-up period to verify that the safety conditions, preservation measures, lay-up site and mooring arrangements are in accordance with the lay-up program approved by IRS.

.2 On successful completion of the survey, a lay-up status will be assigned by IRS.

1.3.2.2 Annual lay-up condition surveys

.1 A general examination of the hull and machinery is to be carried out in lieu of annual survey. An underwater examination is to be carried out in lieu of docking survey coinciding with special survey.

The purpose of the annual lay-up condition survey is to ascertain that the lay-up maintenance program is being continuously complied with and recorded in the lay-up record.

.2 The annual lay-up condition survey is to cover examination of hull integrity, firefighting arrangements, mooring arrangements, and other equipment in use depending on the type of lay-up.

1.3.3 Survey at re-activation

1.3.3.1 Vessels are to be surveyed and tested before re-entering service. On completion of the lay-up period, all outstanding class and statutory surveys are to be completed before the vessel returns to normal operation.

1.3.3.2 For vessels in hot lay-up, the scope of the reactivation survey is to include:

- a general examination of the hull, deck fittings, safety systems, machinery installations (including boilers whose survey is not due) and steering gear;

- all periodical surveys due at the date of re-activation or which became overdue during the lay-up period;

- dealing with the Conditions of Class due at the date of re-activation or which became due during the lay-up period.

Function testing of equipment would be specially considered.

1.3.3.3 The extent of the surveys and tests for vessels in cold lay-up will be considered in each case by IRS depending upon the time out of service, the maintenance and preservative measures taken during lay-up and the extent of surveys carried out during this time but, will at least include a sea trial for function testing of the machinery installation.

1.3.3.4 Upon satisfactory completion of the re-activation survey, the Class of the vessel will be revalidated.

1.4 Surveys by Chief Engineers

1.4.1 Continuous machinery Surveys of some machinery items may be carried out, subject to certain conditions, under the supervision of the Chief Engineer of the ship at ports where IRS is not represented and where practicable, at sea.

1.4.2 A limited confirmatory Survey should be carried out at the next port of call by an exclusive Surveyor of IRS. Where IRS Surveyor is not available, such Survey may be carried out by the exclusive Surveyor of a Society with whom IRS has collaboration agreement in force with prior information given to IRS.

1.4.3 Detailed procedure of this scheme may be obtained from IRS.

1.5 Surveys for damage or alteration

1.5.1 At any time when a ship is undergoing alterations or damage repairs, any exposed parts of the structure normally difficult for access are to be specially examined by the Surveyor.

1.6 Unscheduled surveys

1.6.1 In the event that IRS has reason to believe that its Rules and Regulations are not being complied with, IRS reserves the right to perform unscheduled surveys of the hull or machinery.

1.7 Provision for surveys

1.7.1 The Surveyors are to be provided with necessary facilities for a safe execution of survey.

In order to enable the attending surveyors to carry out the survey, provisions for proper and safe access, are to be agreed between the owner and IRS in accordance with confined space safe entry procedure of IRS and IMO Resolution A1050(27) 'Revised recommend-dations for entering enclosed spaces abroad ships', as amended.

Details of the means of access are to be provided in the survey planning questionnaire.

In cases where the provisions of safety and required access are judged by the attending surveyor(s) as not adequate, the survey of the spaces concerned would not be carried out.

1.7.2 The surveys at sea or at anchorages may be carried out provided necessary precautions are taken while carrying out the survey and adequate assistance is provided.

1.7.3 Cargo holds, tanks and spaces are to be safe for access. Cargo holds, tanks and spaces are to be gas free and properly ventilated. Prior to entering a tank, void or enclosed space, it is to be verified that the atmosphere in the tank is free from hazardous gas and contains sufficient oxygen. All spaces are to be cleaned and loose accumulated corrosion scale is to be removed from all surfaces. They are to be sufficiently clean and free from water, scale, dirt, oil residues, etc. to reveal any significant corrosion, deformation, fractures, damages and other structural deterioration as well as the condition of the coating. However, those areas of structure whose renewal has already been decided by the owner need only be cleaned and descaled to the extent necessary to determine the limits of the renewal areas.

1.7.4 Sufficient illumination is to be provided to reveal corrosion, deformation, fractures, damages or other structural deterioration as well as the condition of the coating.

1.7.5 Where soft coatings have been applied, safe access is to be provided for the Surveyor to verify the effectiveness of the coating and to carry out an assessment of the conditions of the internal structures which may include spot removal of the coating. When safe access cannot be provided, the soft coating is to be removed.

1.7.6 For overall examination, means are to be provided to enable the Surveyor to examine the structure in a safe and practical way.

1.7.7 For Close-up Examination of the hull structure, other than cargo hold shell frames of bulk carriers, one or more of the following means of access to Surveyors satisfaction is to be provided, in general:

- Permanent staging and passages through structures
- Temporary staging and passages through structures
- Hydraulic arm vehicles such as conventional cherry pickers, lifts and movable platforms
- Portable ladders
- Boats or rafts
- Other equivalent means.

1.7.8 For Surveys conducted by use of a remote inspection technique, one or more of the following means for access, acceptable to the Surveyor, is to be provided:

- Unmanned robot arm
- Remotely Operated Vehicles (ROV)
- Unmanned Aerial Vehicles / Drones
- Other means acceptable to IRS.

1.7.9

a) For close-up surveys of the cargo hold shell frames of bulk carriers less than cape size (i.e. less than 100,000 dwt) one or more of the following means for access, acceptable to the Surveyor, is to be provided:

    - Permanent staging and passage through structures;

- Temporary staging and passages through structures;
- Portable ladder restricted to not more than 5 [m] in length may be accepted for surveys of lower section of a shell frame including bracket;
- Hydraulic arm vehicles such as conventional cherry pickers, lifts and movable platforms;
- Boats or rafts, provided the structural capacity of the hold is sufficient to withstand static loads at all levels of water;
- Other equivalent means.

b) For close-up surveys of the cargo hold shell frames of cape size bulk carriers (100,000 dwt and above), the use of portable ladders is not accepted and one or more of the following means for access, acceptable to the surveyor, is to be provided:

i) Annual surveys, intermediate survey under 10 years of age and Special Survey No.1

- permanent staging and passage through structures;
- temporary staging and passages through structures;
- hydraulic arm vehicles such as conventional cherry pickers, lifts and movable platforms;
- boats or rafts provided the structural capacity of the hold is sufficient to withstand static loads at all levels of water;
- other equivalent means.

ii) Subsequent intermediate surveys and special surveys:

- either permanent or temporary staging and passage through structures for close-up surveys of at least the upper part of hold frames;
- hydraulic arm vehicles such as conventional cherry pickers for surveys of lower and middle part of shell frames as alternative to staging:
- lifts and moveable platforms;
- boats or rafts provided the structural capacity of the hold is sufficient to withstand static loads at all levels of water;
- other equivalent means.

Notwithstanding the above requirements:

c) The use of a portable ladder fitted with a mechanical device to secure the upper end of the ladder is acceptable for the “close-up examination of sufficient extent, minimum 25% of frames, to establish the condition of the lower region of the shell frames including approx. lower one third length of side frame at side shell and side frame end attachment and the adjacent shell plating of the forward cargo hold” at annual survey, required in 2.2.2.9b) and the “one other selected cargo hold” required in 2.2.2.10.b).

d) The use of hydraulic arm vehicles or aerial lifts (“Cherry picker”) may be accepted by the attending surveyor for the close-up survey of the upper part of side shell frames or other structures in all cases where the maximum working height is not more than 17 [m].

1.7.10 For bulk carriers and oil tankers constructed on or after 1 Jan 2005, the access requirements for surveys in the cargo area and forward spaces are given in Pt.5, Ch.1, Sec.1.6 & 1.7 and Pt.5, Ch.2, Sec.2.3 & 2.4 respectively. The means of access are to be surveyed prior to, or in conjunction with its use for carrying out surveys.

1.7.11 During surveys of oil tankers, ore or oil carriers, oil or bulk carriers, chemical tankers and liquefied gas carriers, explosimeter, oxygen-meter, breathing apparatus, life line and whistles are to be at hand during the survey.

1.7.12 In order to ascertain the structural strength of ship's hull and machinery, thickness measurements as specified in subsequent sections, as applicable, are to be carried out normally by means of ultrasonic equipment. The accuracy of the equipment is to be proven to the Surveyor as required.

1.7.13 One or more of the following fracture detection procedures may be required if deemed necessary by the Surveyor:

- radiographic equipment
- ultrasonic equipment
- magnetic particle equipment
- dye penetrant.

1.7.14 Explosimeter, oxygen-meter, breathing apparatus, lifelines, riding belts with rope and hook and whistles together with instructions and guidance on their use are to be made available during the survey. A safety check-list should be provided.

1.7.15 Adequate and safe lighting is to be provided for the safe and efficient conduct of the survey.

1.7.16 Adequate protective clothing is to be made available and used (e.g. safety helmet, gloves, safety shoes, etc.) during the survey.

1.7.17 If breathing apparatus and/or other equipment is used as “Rescue and emergency response equipment” then the equipment is to be suitable for the configuration of the space being surveyed.

1.7.18 Remote Inspection Techniques (RIT) for Surveys

1.7.18.1 The RIT is to provide the information normally obtained from a close-up survey. RIT surveys are to be carried out in accordance with the following requirements. These considerations are to be included in the proposals for use of a RIT which are to be submitted in advance of the survey so that satisfactory arrangements can be agreed with IRS.

1.7.18.2 The equipment and procedure for observing and reporting the survey using a RIT are to be discussed and agreed with the parties involved prior to the RIT survey, and suitable time is to be allowed to set-up, calibrate and test all equipment beforehand.

1.7.18.3 When using a RIT as an alternative to close-up survey, if not carried out by IRS itself, it is to be conducted by a firm approved as a service supplier and is to be witnessed by an attending surveyor of IRS.

1.7.18.4 The structure to be examined using a RIT is to be sufficiently clean to permit meaningful examination. Visibility is to be sufficient to allow for a meaningful examination. IRS is to be satisfied with the methods of orientation on the structure.

1.7.18.5 The Surveyor is to be satisfied with the method of data presentation including pictorial representation, and a good two-way communication between the Surveyor and RIT operator is to be provided.

1.7.18.6 If the RIT reveals damage or deterioration that requires attention, the Surveyor may require traditional survey to be undertaken without the use of a RIT.

1.7.18.7 Remote inspection techniques may include the use of:

- Divers
- Unmanned robot arm
- Remote Operated Vehicles (ROV)
- Climbers
- Drones
- Other means acceptable to IRS

1.7.18.8 When permitted remote inspection techniques may be used to facilitate the required external and internal examination, including close-up surveys and gauging. The methods applied for remote inspection techniques are to provide the survey results normally obtained for/by the surveyor. The results of the surveys by remote inspection techniques when being used towards the crediting of surveys are to be acceptable to the attending Surveyor. Inspection should be carried out in the presence of the Surveyor.

1.7.18.9 Confirmatory surveys/close-up surveys may be carried out by the Surveyor at selected locations to verify the results of the remote inspection technique. Confirmatory thickness measurements may be requested by the attending Surveyor appropriately.

1.7.18.10 An inspection plan for the use of remote inspection technique(s), including any confirmatory survey/close-up survey/thickness measurements, is to be submitted for review and acceptance in advance of the survey.

1.7.18.11 Conditions

a) Use of remote inspection technique may be restricted or limited where there is a record or indication of abnormal deterioration or damage to structure or to items to be inspected. The remote inspection technique may not be applicable if there are recommendations for repairs.

b) It may also be inapplicable if conditions, affecting the class of the vessel, are found during the course of the inspection.

c) If the remote inspection technique reveals damage or deterioration that requires attention, the Surveyor may require close-up survey/thickness measurements without the

use of remote inspection technique to be undertaken.

1.7.18.12 Procedures

a) The inspection is to be carried out by a qualified technician with adequate knowledge of the items to be inspected. Prior to the commencement of surveys a pre-meeting is to be held between the technician(s), the owner's representative(s) and the attending Surveyors(s) for the purpose to ascertain that all arrangements in the inspection plan are in place, so as to ensure the safe and efficient conduct of the inspection work to be carried out.

b) Means of thickness gauging and non-destructive testing may be required in conjunction with the use of remote inspection technique.

c) Items to be examined using remote inspection technique are to be sufficiently clean to permit meaningful examination.

d) Visibility is to be sufficient to allow for a meaningful examination.

1.8 Surveys at sea or at anchorage

1.8.1 Survey at sea or at anchorage may be accepted provided the Surveyor is given the necessary assistance from the personnel onboard. Necessary precautions and procedures for carrying out the survey are to be in accordance with 1.7.

1.8.2 A communication system is to be arranged between the survey party in the tank and the responsible officer on deck. This system must also include the personnel in charge of ballast pump handling if boats or rafts are used.

1.8.3 Surveys of tanks or applicable holds by means of boats or rafts may only be undertaken with the agreement of the Surveyor, who is to take into account the safety arrangements provided, including weather forecasting and ship response under foreseeable conditions and provided the expected rise of water within the tank due to ship motion does not exceed 0.25 [m].

1.8.4 When rafts or boats will be used for close-up survey the following conditions are to be observed:

a) Only rough duty, inflatable rafts or boats, having satisfactory residual buoyancy and stability even if one chamber is ruptured, are to be used;

b) The boat or raft is to be tethered to the access ladder and an additional person is to be stationed down the access ladder with a clear view of the boat or raft;

c) Appropriate lifejackets are to be available for all participants;

d) The surface of water in the tank or hold is to be calm (under all foreseeable conditions the expected rise of water within the tank should not exceed 0.25 m) and the water level stationary. On no account is the level of the water to be rising while the boat or raft is in use;

e) The tank, hold or space must contain clean ballast water only. Even a thin sheen of oil on the water is not acceptable; and

f) At no time is the water level to be allowed to be within 1 m of the deepest under deck web face flat so that the survey team is not isolated from a direct escape route to the tank hatch. Filling to levels above the deck transverses is only to be contemplated if a deck access manhole is fitted and open in the bay being examined, so that an escape route for the survey party is available at all times. Other effective means of escape to the deck may be considered.

g) If the tanks (or spaces) are connected by a common venting system, or inert gas system, the tank in which the boat or raft is used should be isolated to prevent a transfer of gas from other tanks (or spaces).

   The tank being examined is to be isolated also to prevent transfer of liquids/gas through cargo or ballast piping.

1.8.5 For the under deck areas in tanks, survey by means of boats or rafts will be allowed if the depth of the webs is 1.5 [m] or less.

If the depth of the webs is more than 1.5 [m], boats or rafts may be allowed only when:

i) the coating of the under deck structure is in GOOD condition and there is no evidence of wastage; or

ii) a permanent means of access is provided in each bay to allow safe entry and exit, which means the following:

a) access direct from the deck via a vertical ladder and a small platform fitted approximately 2 [m] below the deck in each bay; or

b) access to deck from a longitudinal permanent platform having ladders to deck in each end of the tank. The platform shall, for the full length of the tank, be arranged in level with, or above, the maximum water level needed for rafting of under deck structure. For this purpose, the ullage corresponding to the maximum water level is to be assumed not more than 3 [m] from the deck plate measured at the midspan of deck tranverses and in the middle length of the tank.

If neither of the above conditions are met, then staging or an “other equivalent means” is to be provided for the survey of the under deck areas.

See also IRS Classification Notes “Guidelines for approval / acceptance of alternative means of access to spaces in oil tankers, bulk carriers, ore carriers and combination carriers”.

1.8.6 The requirements regarding the usage of boats or rafts in 1.8.5 does not preclude their use for moving about within a tank during a survey.

1.9 Repairs

1.9.1 Any damage in association with wastage over the allowable limits (including buckling, grooving, detachment or fracture), or extensive areas of wastage over the allowable limits, which affects or, in the opinion of the Surveyor, will affect the vessel's structural, watertight or weathertight integrity, is to be repaired promptly and thoroughly as defined in 1.2.13. Areas to be considered as relevant, include:

- side structure and side plating;
- deck structure and deck plating;
- bottom structure and bottom plating;
- inner bottom structure and inner bottom plating;
- inner side structure and inner side plating;
- longitudinal bulkhead(s) plating and structure;
- transverse watertight or oiltight bulkheads, plating and structure; and
- hatch covers and hatch coamings.
- weld connection between air pipes and deck plating;
- air pipe heads;
- ventilators including closing devices;
- bunker and vent piping systems in bulk carriers, ore carriers and combination carriers.

Where adequate repair facilities are not available, consideration may be given to allow the vessel to proceed directly to a repair facility. This may require discharging the cargo and/or temporary repairs for the intended voyage.

1.9.2 Additionally, when a survey results in the identification of corrosion or structural defects, either of which, in the opinion of the Surveyor, will impair the vessel's fitness for continued service, remedial measures are to be implemented before the ship continues in service.

1.9.3 Where the damage found on structure mentioned in 1.9.1 is isolated and of a localized nature which does not affect the ship’s structural integrity, consideration may be given by the surveyor to allow an appropriate temporary repair to restore watertight or weather tight integrity and impose a Condition of Class with a specific time limit.

1.9.4 Extended thickness measurements when required by the rules are to be carried out and necessary repairs completed before the survey is credited as complete.

1.10 Thickness measurements and close-up surveys

1.10.1 In any kind of survey, i.e. special, intermediate, annual or any other surveys having the scope of the foregoing ones thickness measurements of structures in areas where close-up surveys are required are to be carried out simultaneously with close-up surveys.

1.10.2 Consideration may be given by the attending Surveyor to allow use of Remote Inspection Techniques (RIT) as an alternative to close-up survey. Surveys conducted using a RIT are to be completed to the satisfaction of the attending Surveyor. When RIT is used for a close-up survey, temporary means of access for the corresponding thickness measurements is to be provided unless such RIT is also able to carry out the required thickness measurements.

1.10.3 In case of vessels to which IMO ESP Code is applicable, usage of Remote Inspection Techniques (RIT) as an alternative to close-up survey is subject to prior approval from Flag Administration.

1.11 Extension of special surveys

1.11.1 Under “exceptional circumstances”, IRS may grant an extension not exceeding three (3) months to allow for completion of the special survey provided that the vessel is attended and the attending surveyor(s) so recommend(s) after the following has been carried out:

a) Annual Survey;
b) Re-examination of Conditions of Class;
c) In the case where dry docking is due prior to the end of the class extension, an underwater examination is to be carried out by an approved diving company. An underwater examination by an approved company may be dispensed with in the case of extension of dry-docking survey not exceeding 36 months interval provided the ship is without outstanding Condition of Class regarding underwater parts.

“Exceptional circumstances” means unavailability of dry-docking facilities; unavailability of repair facilities; unavailability of essential materials, equipment or spare parts; or delays incurred by action taken to avoid severe weather conditions. It is the responsibility of the Owner to sufficiently plan in advance for repairs and/ or dry-docking to avoid occurrences of such “exceptional circumstances”.

1.11.2 In the case that the Class Certificate will expire when the vessel is expected to be at sea, an extension to allow for completion of the Special Survey may be granted provided there is documented agreement to such an extension prior to the expiry date of the certificate and provided that positive arrangements have been made for attendance of the Surveyor at the first port of call and provided that IRS is satisfied that there is technical justification for such an extension. Such an extension is to be granted only until arrival at the first port of call after the expiry date of the certificate. However, if owing to “exceptional circumstances” the special survey cannot be completed at the first port of call, 1.11.1 may be followed, but the total period of extension shall in no case be longer than three months after the original due date of the special survey.

1.11.3 In case of force majeure as defined below, the completion of survey may be specially considered.

“Force Majeure” means damage to the ship; unforeseen inability of IRS to attend the vessel due to the governmental restrictions on right of access or movement of personnel; unforeseeable delays in port or inability to discharge cargo due to unusually lengthy periods of severe weather, strikes or civil strife; acts of war; or other similar circumstances.

Section 2

Surveys - Bulk Carriers and Ore Carriers

2.1 Scope

2.1.1 This section gives the requirements for periodical surveys of vessels which have been assigned the class notations :

Bulk Carrier ESP
BC-A, B or C ESP (from July 2003)
Ore Carrier ESP

2.1.2 The requirements that are applicable only to double skin bulk carriers and those applicable only to other bulk carriers have been indicated in the relevant clauses. For bulk carrier with hybrid cargo hold arrangements, e.g. with some cargo holds of single side skin and others of double side skin, the appropriate requirements are to applied to the individual cargo holds depending on their type of side skin construction.

2.2 Annual surveys

2.2.1 General

2.2.1.1 Annual Surveys are to be carried out within 3 months before or after the anniversary date each year. (Also refer to Note 9 of Sec.1, Table 1.1.1). These should be held concurrently with statutory annual or other relevant statutory Surveys, where practicable.

2.2.1.2 At Annual Surveys, the Surveyor is to examine the hull and machinery, so far as necessary and practicable, in order to be satisfied as to their general condition.

2.2.1.3 It is to be confirmed that no new installation of material containing asbestos was carried out since last survey.

2.2.1.4 Where applicable, examination of alternative design and arrangement for machinery or electrical installations or fire safety, in accordance with the test, inspection and maintenance requirements, if any, specified in the approved documentation is to be carried out.

2.2.2 Hull

2.2.2.1 The survey is to consist of an examination for the purpose of ensuring, as far as practicable, that the hull, weather decks; hatch coamings, hatch covers including their securing arrangement, other closing appliances, equipment and related piping are maintained in satisfactory and efficient condition and should take into account the service history, condition and extent of the corrosion prevention system of ballast tanks and areas identified in the survey report file. Special attention is to be paid to the following :

a) Weather deck, shipside plating above waterline.

b) Hatchways on freeboard and superstructure decks; exposed casings; skylights and fiddley openings; deck houses; companionways and superstructure bulkheads; side scuttles and dead lights; flush deck scuttles; ash shoots and other openings.

c) Weld connection between air pipes and deck plating; air pipe heads on exposed decks (external examination); flame screens on vents to all bunker tanks; ventilators and closing devices.

d) Scuppers and sanitary discharges as far as practicable together with valves and their controls.

e) Guard rails, bulwarks, freeing ports, gangways, walkways and life lines, fittings and appliances for timber deck cargo.

f) Watertight bulkheads and their penetrations as far as practicable.

2.2.2.2 Cargo hatch covers and coamings are to be examined to ensure that no alterations have been made to the approved arrangements :

A thorough survey of cargo hatch covers and coamings is to be carried out by examination in the open as well as closed positions and should include verification of proper opening and closing operation. The hatch cover sets within the forward 25% of the ship’s length and at least one additional set, such that all sets on the ship are assessed at least once in every 5-year period, are to be surveyed open, closed

and in operation to the full extent on each direction at each annual survey, including:

i) stowage and securing in open condition;

ii) proper fit and efficiency of sealing in closed condition; and

iii) operational testing or hydraulic and power components, wires, chains and link drives.

The closing of the covers is to include the fastening of all peripheral and cross joint cleats or other securing devices. Particular attention is to be paid to the condition of the hatch covers in the forward 25% of the ship's length, where sea loads are normally greatest.

2.2.2.3 If there are indications of difficulty in operating and securing hatch covers, sets in addition to those required by 2.2.2.2, at the discretion of the surveyor, are to be tested in operation. Where hatch covers or coamings undergo substantial repairs, the strength of securing devices should be upgraded to comply with Pt.5, Ch.1, 5.5

Where the cargo hatch securing system does not function properly, repairs are to be carried out under the supervision of the Surveyors.

2.2.2.4 For each cargo hatch cover set the following items are to be surveyed:

a) Cover panels, including side plates and stiffener attachments that may be accessible in the open position by close-up survey (for corrosion, cracks, deformation);

b) Sealing arrangements of perimeter and cross joints (gaskets for condition and permanent deformation, flexible seals on combination carriers, gasket lips, compression bars, drainage channels and non return valves);

c) Clamping devices, retaining bars, cleating (for wastage, adjustment and condition of rubber components);

d) Closed cover locating devices (for distortion and attachments);

e) Chain or rope pulleys;

f) Guides;

g) Guide rails and track wheels;

h) Stoppers;

i) Wires, chains, tensioners and gypsies;

j) Hydraulic system, electrical safety devices and interlocks; and

k) End and interpanel hinges, pins and stools where fitted.

2.2.2.5 At each hatchway the coamings, with plating stiffeners and brackets are to be subjected to a close-up survey and checked for corrosion, cracks and deformation, especially of the coaming tops.

2.2.2.6 Where considered necessary, the effectiveness of sealing arrangements may be proved by hose or chalk testing supplemented by dimensional measurements of seal compressing components.

2.2.2.7 Cargo hatch covers of the portable type (i.e. wood or steel pontoons) are to be examined to confirm the satisfactory condition of:

- wooden covers and portable beams, carriers or sockets for the portable beams and their securing devices;
- steel pontoons;
- tarpaulins;
- cleats, battens and wedges;
- hatch securing bars and their securing devices;
- loading pads/bars and the side plate edge;
- guide plates and chocks;
- compression bars, drainage channels and drain pipes, if any.

2.2.2.8 All watertight doors in watertight bulkheads, to be examined and tested (locally and remotely) as far as practicable.

2.2.2.9 Suspect areas identified at previous special or intermediate surveys are to be close-up surveyed. Thickness measurements

are to be taken of the area of substantial corrosion identified at previous surveys.

For vessels built under the IACS Common Structural Rules, the annual thickness gauging may be omitted where a protective coating has been applied in accordance with the coating manufacturer's requirements and is maintained in good condition. In this case, it is recommended that the necessary documentation of coating is available on board.

Where annual gauging is required as per 2.4.12.3, thickness measurement of aft bulk-head of the forward cargo hold is to be carried out.

2.2.2.10 Examination of ballast tanks is to be carried out when required as a consequence of the results of the special and intermediate surveys. (See 2.4.5.1, 2.4.5.2 and 2.3.2.1). When considered necessary by the Surveyor or where extensive corrosion exists, thickness measurement is to be carried out. If the results of these thickness measurements indicate substantial corrosion additional thickness measurements are to be carried out to the extent given in Table 2.4.10.2(a) or Table 2.4.10.2(b).

2.2.2.11 Anchoring and mooring equipment is to be examined as far as is practicable. It is to be confirmed that the towing and mooring equipment is properly marked with any restriction associated with its safe operation.

2.2.2.12 Where applicable Surveyor should satisfy himself regarding the freeboard marks on the ship's side.

2.2.2.13 The Surveyor is to confirm that, where required, an approved loading instrument together with its operation manual is available on board, See Pt.3, Ch.5. It is to be verified by the Surveyor that the loading instrument is checked for accuracy at regular intervals by the ship's staff by applying test loading conditions.

2.2.2.14 On bulk carriers of over 10 years of age the following are to be carried out in addition to the requirements in 2.2.2.1 to 2.2.2.13:

a) Overall survey of two selected cargo holds in double skin bulk carriers and all cargo holds in the case of other bulk carriers.

b) For single side skin bulk carriers, close-up survey of sufficient extent, minimum 25 per cent of frames, to establish the condition of the lower region of the shell frames including approximately lower one third length of side frame at side shell and side frame end attachment and the adjacent shell plating in a forward cargo hold. Where this level of survey reveals the need for remedial measures, the survey is to be extended to include a close-up survey of all of the shell frames and adjacent shell plating of that cargo hold as well as a close-up survey of sufficient extent of all remaining holds.

c) When considered necessary by the Surveyor, thickness measurement is to be carried out. If the results of these thickness measurements indicate substantial corrosion additional thickness measure-ments are to be carried out to the extent given in Table 2.4.10.2(a) or Table 2.4.10.2(b).

d) Where a hard protective coating in cargo holds is found to be in GOOD condition, the extent of close-up surveys may be specially considered.

e) All piping and penetrations in cargo holds, including overboard piping are to be examined.

2.2.2.15 On bulk carriers of over 15 years of age the following are to be carried out in addition to the requirements given in 2.2.2.1 to 2.2.2.14:

a) Overall survey of all cargo holds.

b) Close-up examination of a selected cargo hold in addition to the forward cargo hold as required in 2.2.2.14b) and c).

c) Examination of all piping and penetrations in cargo holds, including overboard piping.

d) Where a hard protective coating in cargo holds is found to be in GOOD condition, the extent of close-up surveys may be specially considered.

2.2.2.16 Accommodation ladders are to be examined at annual surveys. Satisfactory condition of the following items is to be checked, in particular :

a) steps;
b) platforms;
c) all support points such as pivots, rollers, etc.;
d) all suspension points such as lugs, brackets, etc.;
e) stanchions, rigid handrails, hand ropes and turntables;
f) davit structure, wire and sheaves, etc.

2.2.2.17 Gangways are to be examined at annual surveys. Satisfactory condition of the following items is to be checked, in particular :

a) treads;
b) side stringers, cross-members, decking, deck plates, etc.;
c) all support points such as wheel, roller, etc.;
d) stanchions, rigid handrails, hand ropes.

2.2.2.18 Winches of accommodation ladders and gangways are to be examined to verify the satisfactory condition of the following items:

a) brake mechanism including condition of brake pads and band brake, if fitted;
b) remote control system, and
c) power supply system for electric motor.

2.2.2.19 Davits and fittings on the ship's deck associated with accommodation ladders and gangways are to be examined for satisfactory condition at annual surveys. Fittings or structures for means of access to deck such as handholds in a gateway or bulwark ladder and stanchions are also to be examined.

2.2.2.20 The maintenance and inspection records of accommodation ladders and gangways are to be verified. It is to be confirmed that supporting wires are being renewed at intervals not exceeding 5 years.

2.2.2.21 When examining internal spaces as far as practicable, the permanent means of access where appropriate, are to be verified that they remain in good condition.

2.2.2.22 For vessels subject to IMO PSPC (See Pt.3, Ch.2, 3.6), it is to be confirmed that the maintenance, repair and partial recoating of dedicated ballast tanks and double side skin spaces, as appropriate, are recorded in the coating technical file.

2.2.2.23 Watertight cable transit seal systems register is to be reviewed to confirm that it is being maintained and as far as practicable the transits are to be examined to confirm their satisfactory condition. Where there are records entered since last annual survey of any disruption to the cable transits or installation of new cable transits, the satisfactory condition of those transits is to be confirmed by review of records and, if deemed necessary, by examination. The results are to be recorded in the Register against the specific cable transit.

2.2.2.24 In case the cable transits have been examined by an approved service supplier, the attending surveyor is to review the Register in order to ascertain that it has been properly maintained by the owner and correctly endorsed by the service supplier.

2.2.2.25 Examination of double-side skin void spaces, for bulk carriers exceeding 20 years of age and of 150 m in length and upwards, are to be carried out when required as a consequence of the results of the renewal survey (as required by para 2.4.5.4) and intermediate survey (as required by 2.3.4.1). When considered necessary, or when extensive corrosion exists, thickness measurements are to be carried out. If the results of these thickness measurements indicate that substantial corrosion is found, the extent of thickness measurements should be increased in accordance with Table 2.4.10.2b. These extended thickness measurements should be carried out before the survey is credited as completed. Suspect areas identified at previous surveys are to be examined. Areas of substantial corrosion identified at previous surveys are to have thickness measurements taken. The annual thickness gauging may be omitted where a protective coating has been applied in accordance with the coating manufacturer's requirements and is maintained in good condition.

2.2.3 Additional annual survey requirements for ships subject to SOLAS XII/9:

2.2.3.1 For ships subject to SOLAS XII/9 i.e.:

- Bulk Carriers of 150 [m] in length and upwards of single side skin construction as defined in Pt.5, Ch.1, 1.1.4; and

- Carrying solid bulk cargoes having a density of 1780 [kg/m3] and above; and

- Contracted for construction before 1 July, 1999 and

- Constructed with an insufficient number of transverse watertight bulkheads to enable them to withstand flooding of the foremost cargo hold in all loading conditions and remain afloat in a satisfactory condition of equilibrium as specified in SOLAS XII/4.3.

2.2.3.2 In accordance with SOLAS XII/9.1 for the foremost cargo hold of such ships, the additional survey requirements listed in 2.2.3.3 to 2.2.3.6 shall apply.

2.2.3.3 For bulk carriers of 5 - 15 years of age:

a) An overall survey of the foremost cargo hold, including close-up survey of sufficient extent, minimum 25% of frames, is to be carried out to establish the condition of:

    - Shell frames including their upper and lower end attachments, adjacent shell plating, and transverse bulkheads.

    - Suspect areas found at the previous special survey.

b) Where considered necessary by the surveyor as a result of the overall and close-up survey as described in a) above, the survey is to be extended to include a close-up survey of all of the shell frames and adjacent shell plating of the cargo hold.

2.2.3.4 For bulk carriers exceeding 15 years of age:

a) An overall survey of the foremost cargo hold, including close-up survey is to be carried out to establish the condition of:

    - All shell frames including their upper and lower end attachments, adjacent shell plating and transverse bulkheads.

    - Suspect areas found at the previous special survey.

2.2.3.5 Extent of thickness measurement:

a) Thickness measurement is to be carried out to an extent sufficient to determine both general and local corrosion levels at areas subject to close-up survey, as described in 2.2.3.3a) and 2.2.3.4a) above. The minimum requirement for thickness measurements are areas found to be suspect areas at the previous special survey.

    Where substantial corrosion is found, the extent of thickness measurements is to be increased with the requirements of Table 2.4.10.2(a) or Table 2.4.10.2(b).

b) The thickness measurement may be dispensed with provided the surveyor is satisfied by the close-up survey, that there is no structural diminution and the protective coating where provided remains effective.

2.2.3.6 Where the protective coating in the foremost cargo hold is found to be in GOOD condition, the extent of close-up surveys and thickness measurements may be specially considered.

For existing bulk carriers, where owners may elect to coat or recoat cargo holds as noted above, consideration may be given to the extent of the close-up and thickness measurement surveys. Prior to the coating of cargo holds of existing ships, scantlings should be ascertained in the presence of a surveyor.

2.2.3.7 Bilge well alarms to all cargo holds and conveyor tunnels are to be verified to confirm their functionality.

2.2.4 Machinery and systems

2.2.4.1 A general examination of the machinery, boilers, all pressurised systems (steam, pneumatic, hydraulic) and their associated fittings, propulsion system and auxiliary machinery to see whether they are being properly maintained and with particular attention to the fire and explosion hazards.

2.2.4.2 Confirmation that machinery, boilers and other pressure vessels, associated piping systems and fittings are so installed and protected as to reduce to a minimum any danger to persons on board, due regard being given to moving parts, hot surfaces and other hazards.

2.2.4.3 Confirm that Periodical Surveys of boilers and other pressure vessels have been carried out as required by the Rules and the safety devices have been tested.

2.2.4.4 Confirmation that the normal operation of the propulsion machinery can be sustained

or restored even though one of the essential auxiliaries becomes inoperative.

2.2.4.5 Confirmation that means are provided so that machinery can be brought into operation from the dead ship condition without external aid.

2.2.4.6 All main and auxiliary steering arrangements and their associated equipment and control systems are to be examined and tested. Where applicable, Surveyors are to verify that log entries have been made in accordance with statutory requirements.

2.2.4.7 Steering chains are to be cleaned for ascertaining wear and tear and lengths of chain worn in mean diameter by more than 12 per cent of the original rule diameter are to be renewed.

2.2.4.8 All the means of communication between the navigating bridge and the machinery control positions, as well as the bridge and the main alternative steering position, if fitted, are to be tested. It is to be confirmed that means of indicating the angular position of the rudder are operating satisfactorily.

2.2.4.9 Confirmation that with ships having emergency steering positions there are means of relaying heading information and, when appropriate, supplying visual compass readings to the emergency steering positions.

2.2.4.10 Confirmation that various alarms required for hydraulic power operated, electric and electro-hydraulic steering gears are, operating satisfactorily and that the recharging arrangements for hydraulic power operated steering gears are being maintained.

2.2.4.11 Examining the means for the operation of the main and auxiliary machinery essential for propulsion and the safety of the ship, including when applicable, the means of remotely controlling the propulsion machinery from the navigating bridge and the arrangements to operate the main and other machinery from a machinery control room.

2.2.4.12 Confirmation that the engine room telegraph, the second means of communication between the navigation bridge and the machinery space and the means of communication with any other positions from which the engines are controlled are operating satisfactorily.

2.2.4.13 Examination and testing of the general emergency alarm system and confirmation that the engineer's alarm is clearly audible in the engineer's accommodation.

2.2.4.14 It is to be confirmed that ballasting and de-ballasting arrangements are satisfactory. The bilge pumping systems and bilge wells including operation of each bilge pump, extended spindles and level alarms, where fitted, are to be examined as far as is practicable. It is also to be confirmed that bilge pumping system for each watertight compartment is satisfactory.

It is also to be confirmed that drainage from enclosed cargo spaces situated on freeboard deck is satisfactory.

2.2.4.15 Examining visually the condition of non-metallic expansion joints where fitted in piping systems which penetrate the ship’s side, with both the penetration and the expansion joint located below the deepest load waterline, and checking the service record.

2.2.4.16 General examination visually and in operation, as feasible, of the main electrical machinery, the emergency sources of electrical power, the switch gear, other electrical equipment including the lighting system is to be carried out.

2.2.4.17 Confirmation as far as practicable, the operation of the emergency source(s) of electrical power, including their starting arrangement, the systems supplied, and when appropriate, their automatic operation.

2.2.4.18 Examining in general, that the precautions provided against shock, fire and other hazards of electrical origin are being maintained.

2.2.4.19 A General Examination of automation equipment is to be carried out. Satisfactory operation of safety devices, bilge level detection and alarm systems and control systems is to be verified.

2.2.4.20 Examination of bunker and vent piping systems.

2.2.4.21 For ships complying with the requirements of SOLAS XII/12 for hold, ballast and dry space water level detectors (See 2.4.14), the annual survey is to include an examination and a test, at random, of the

water ingress detection systems and of their alarms.

2.2.4.22 For ships complying with the requirements of SOLAS XII/13 for the availability of pumping systems (See 2.4.15), the annual survey is to include an examination and a test, of the means for draining and pumping ballast tanks forward of the collision bulkhead and bilges of dry spaces any part of which extends forward of the foremost cargo hold and of their controls.

2.2.4.23 Confirmation that machinery space ventilation systems are in good working condition.

2.2.4.24 For Ships constructed before 01 July 2017 and fitted with harmonic filters; following are to be verified at each survey:

a) Records of annual measurement of harmonic distortion levels of main bus bar under seagoing conditions and log entries showing which equipment was running and / or filters in service at the time of measurement. Harmonic distortion readings are to be carried out when the greatest amount of distortion is indicated by the measuring equipment.

b) Records of measurement of distortion levels, after any modification to the ship's electrical distribution system.

2.2.4.25 For Ships constructed on or after 01 July 2017 and fitted with harmonic filters; or for ships retrofitted with harmonic filters, on or after 01 July 2017; following are to be verified at each survey:

a) Engine log book containing distortion monitoring readings/ automatic records of same

b) Documentation of any approved relaxation on allowable distortion limits.

2.2.4.26 For ships contracted for construction on or after 01 Jan 2017 following are to be verified in emergency generator rooms at each survey:

a) Hand operated ventilation louvres, closing appliances, if fitted, are kept open and corresponding instruction plates are visible near the louvres.

b) Power operated ventilation louvres and closing appliances, if fitted, are fail-to-open type and capable of opening automatically whenever emergency generator is starting / in operation.

c) It is to be possible to close ventilation openings by a manual operation from a clearly marked safe position outside the space where the closing operation can be easily confirmed. Further, such closing is not possible from any other remote position. The louvre status (open/closed) is indicated at this position.

2.2.4.27 For vessels fitted with ICCP system, proper functioning of the system is to be checked and records of system operation are to be verified. It is to be verified that all maintenance as per manufacturer's instructions are carried out.

2.2.5 Fire protection, detection and extinction

2.2.5.1 The arrangements for fire protection, detection and extinction are to be examined and are to include confirmation that no changes have been made in the structural fire protection. Following are to be examined / verified:

a) verification that fire control plans are properly posted;

b) examination as far as possible and testing as feasible of, any fire detection and alarm system and any sample extraction smoke detection system;

c) examination of the fire main system and verification that each fire pump including the emergency fire pump can be operated separately so that the two required powerful jets of water can be produced simultaneously from different hydrants at any part of the ship whilst the required pressure is maintained in the fire main.;

d) verification that fire hoses, nozzles, applicators and spanners are in good working condition and situated at their respective locations;

e) examination of fire-fighting system (including fixed fire-fighting system for the

machinery spaces) controls, piping, instructions and marking, checking for evidence of proper maintenance and servicing including date of last systems tests;

f) verification that all semi-portable and portable fire extinguishers are in their stowed positions, checking for evidence of proper maintenance and servicing, conducting random check for evidence of discharged containers;

g) verification, as far as practicable, that the remote controls for stopping fans and machinery in machinery spaces are in working order. Examination of the arrangements for oil fuel, lubricating oil and other flammable oils and testing the remote closing of valves for oil fuel, lubricating oil and other flammable oils and, the operation of the remote means of closing the valves on the tanks that contain oil fuel, lubricating oil and other flammable oils;

h) examination of the closing arrangements of ventilators, funnel annular spaces, skylights, doorways and tunnel, where applicable;

i) confirmation that the fire fighters' outfits including its self-contained compressed air breathing apparatus and emergency escape breathing devices (EEBDs) are complete and in good condition and that the cylinders, including the spare cylinders, of any required self-contained breathing apparatus are suitably charged and that on board means of recharging apparatus cylinders used during drills or a suitable number of spare cylinders to replace those used are provided, and provision of two-way portable radiotelephone apparatus of an explosion-proof type or intrinsically safe.

j) examination of any manual and automatic fire doors and proving their operations.

k) examination of the fire-extinguishing systems for spaces containing paint and/or flammable liquids and deep fat cooking equipment in accommodation and service spaces;

l) examination of the fire safety requirements of helicopter facilities, including foam firefighting appliances ;

m) examination of the fire protection arrangements in cargo spaces, as far as practicable and as appropriate, the operation of the means of control provided for closing the various openings;

n) examination, when appropriate of the special arrangements for carrying dangerous goods, including checking the electrical equipment and wiring, ventilation, provision of protective clothing and portable appliances and testing of the water supply, bilge pumping and any water spray system.

o) Examination of the fixed carbon dioxide fire-extinguishing systems for the protection of machinery spaces, where applicable, are provided with two separate controls, one for opening of the gas piping and one for discharging the gas from the storage container, each of them located in a release box clearly identified for the particular space.

p) testing the fire dampers of ventilation ducts and the means of closing the main inlets and outlets of all ventilation systems and testing the means of stopping power ventilation systems from outside the space served.

2.2.5.2 For ships designed to carry containers on or above weather deck, as applicable, examining the water mist lance, and as appropriate, the mobile water monitors and all necessary hoses, fittings and required fixing hardware.

Surveys carried out by the National Authority of the country in which the ship is registered would normally be accepted as meeting these requirements, at the discretion of the Surveyor.

2.2.5.3 Confirmation that the means of escape from accommodation, machinery spaces and other spaces are satisfactory.

2.2.5.4 Examination of the arrangements for gaseous fuel for domestic purposes.

2.3 Intermediate Surveys

2.3.1 General

2.3.1.1 Intermediate surveys are to be carried out at or between the second or third Annual

Survey. (Also refer to Note 9 of Sec.1, Table 1.1.1).

However, only those items which are additional to the requirements of annual survey may be examined between the second or third Annual Survey.

Concurrent crediting to both Intermediate survey and Special survey for surveys and thickness measurements of spaces is not acceptable.

2.3.1.2 The following requirements are applicable for vessels over five years of age. For vessels below 5 years of age additional examination over and above the requirements of Annual survey may be required at the discretion of the Surveyors.

2.3.1.3 For vessels over 10 years of age a specific survey program is to be worked out by the owner in cooperation with the Surveyors considering the requirements of the previous special survey, executive hull summary of that survey, later relevant survey records and taking account of any amendments to the survey requirements after the last special survey. The survey program is to be submitted in written format for approval and kept on board until the intermediate survey has been completed. (See 2.4.2 for guidance on preparation of the survey program).

2.3.1.4 Prior to the commencement of any part of the intermediate survey, a survey planning meeting is to be held between the attending Surveyor(s), the owner's representative in attendance and where involved, the thickness measurement company representative and the master of ship or an appropriately qualified representative appointed by the master or Company for the purpose to ascertain that all the arrangements envisaged in the survey programme are in place, so as to ensure the safe and efficient conduct of the survey work to be carried out.

2.3.2 Vessels of between 5 and 10 years of age

2.3.2.1 Ballast tanks

a) An overall survey of representative ballast tanks is to be carried out. The selection of representative tanks is to include the fore and aft peak tanks and a number of other tanks, taking into account the total number and type of ballast tanks. When extensive corrosion is found, thickness measurements are to be carried out. If the overall survey reveals no visible structural defects, the examination may be limited to a verification that the corrosion prevention system remains efficient.

b) Where a hard protective coating is found to be in less than GOOD condition, corrosion or other defects are found in ballast tanks or where a hard protective coating was not applied from the time of construction, the examination is to be extended to other ballast tanks of the same type.

c) For ballast tanks other than double bottom tanks, where a hard protective coating is found to be in less than GOOD condition and is not renewed or where a soft or semi-hard coating has been applied or where a hard protective coating was not applied from the time of construction, the tank(s) in question are to be examined and thickness measurements carried out as necessary at subsequent annual surveys.

When such breakdown of hard protective coating is found in double bottom ballast tanks, or where a soft or semi-hard coating has been applied or where a hard protective coating has not been applied, the tanks in question may be examined at annual intervals. When considered necessary by the Surveyor, or where extensive corrosion exists, thickness measurements are to be carried out.

d) Suspect areas identified at previous surveys are to be overall and close-up surveyed.

2.3.2.2 Cargo holds

a) Overall survey of all cargo holds. For single side skin bulk carriers, close-up survey of sufficient extent, minimum 25 per cent of frames, is to be carried out to establish the condition of :

- Shell frames including their end attachments, adjacent shell plating and transverse bulkheads in the forward cargo hold and one other selected cargo hold.

- Areas found suspect at the previous Special Survey.

b) For single side skin bulk carriers, where considered necessary by the Surveyor as a result of the overall and close-up survey, the survey is to be extended to include a close-up survey of all of the shell frames and adjacent shell plating of that cargo hold as well as a close-up survey of sufficient extent of all remaining cargo holds.

For double skin bulk carriers, as a result of overall survey, the survey may be extended to include a close-up survey of those areas of structure in the cargo holds selected by the Surveyor.

2.3.2.3 Extent of thickness measurements

a) Thickness measurements are to be carried out to an extent sufficient to determine both general and local corrosion levels at areas subject to close-up survey as per 2.3.2.2a). The minimum requirements for thickness measurement are the areas found to be suspect areas at the previous survey. The extent of thickness measurement may be specially considered provided the Surveyor is satisfied by the close-up survey, that there is no structural diminution and the hard protective coatings are found to be in GOOD condition.

b) Where substantial corrosion is found, the extent of thickness measurements is to be increased in accordance with the requirements of Table 2.4.10.2. Suspect areas identified at previous surveys are to be examined. Areas of substantial corrosion identified at previous surveys are to have thickness measurements taken.

For vessels built under IACS Common Structural Rules, the identified substantial corrosion areas may be:

i) protected by coating applied in accordance with the coating manufacturer's requirements and examined at annual intervals to confirm the coating in way is still in good condition, or alternatively

ii) required to be gauged at annual intervals.

In this case of i) above, it is recommended that the necessary documentation of coating is available on board.

c) Where the hard protective coating in cargo holds is found to be in GOOD condition, the extent of close-up surveys may be specially considered.

For existing bulk carriers, where owners may elect to coat or recoat cargo holds as noted above, consideration may be given to the extent of the close-up and thickness measurement surveys. Prior to the coating of cargo holds of existing ships, scantlings should be ascertained in the presence of a surveyor.

2.3.3 Vessels of between 10 and 15 years of age

2.3.3.1 The requirements of the intermediate survey are to be to the same extent as the previous special survey as required in 2.4 for hull structure and piping systems in way of the cargo holds cofferdams, pipe tunnels, void spaces and fuel oil tanks in the cargo area and all ballast tanks. However, tank testing specified in 2.4.8, survey of automatic air pipe heads specified in 2.4.6.9 and internal examination of fuel oil, lub.oil and fresh water tanks specified in Table 2.4.6.1 need not be carried out unless deemed necessary by the attending Surveyor. Thickness measurement is to be carried out for items 1) to 6) of Table 2.4.10.1.

A survey programme as per 2.4.2 is to be worked out prior to commencement of survey.

2.3.3.2 The intermediate survey may be commenced at the second annual survey and be progressed during the succeeding year with a view to completion by the third annual survey in lieu of the application of 2.4.1.4.

2.3.3.3 An in-water survey complying with the requirements of Sec.7.2 may be accepted in lieu of docking survey required by 2.4.1.9.

2.3.4 Vessels of over 15 years of age

2.3.4.1 The requirements of the intermediate survey are to be to the same extent as the previous special survey as required in 2.4 for hull structure and piping systems in way of the

cargo holds cofferdams, pipe tunnels, void spaces and fuel oil tanks in the cargo area and all ballast tanks. However, tank testing specified in 2.4.8, survey of automatic air pipe heads specified in 2.4.6.9 and internal examination of fuel oil, lub.oil and fresh water tanks specified in Table 2.4.6.1 need not be carried out unless deemed necessary by the attending Surveyor. Thickness measurement is to be carried out for items 1) to 6) of Table 2.4.10.1.

A survey programme as per 2.4.2 is to be worked out prior to commencement of survey.

2.3.4.2 The intermediate survey may be commenced at the second annual survey and be progressed during the succeeding year with a view to completion by the third annual survey in lieu of the application of 2.4.1.4.

2.3.4.3 A survey in dry dock is to be part of the intermediate survey. Any remaining work in respect of the overall and close-up surveys and thickness measurements and repairs applicable to the lower portions of cargo holds and ballast tanks (i.e. parts below light ballast water line), are to be completed in the dry-dock.

2.4 Special Surveys - Hull

2.4.1 General

2.4.1.1 All ships classed with IRS are to undergo Special Surveys at 5 yearly intervals. The first Special Survey is to be completed within 5 years from the date of the initial classification survey and thereafter 5 years from the assigned date of the previous Special Survey. However, an extension of class of 3 months maximum beyond the 5th year may be granted in exceptional circumstances in accordance with 1.11. In such cases, the next period of class will start from the expiry date of the Special Survey before extension was granted.

2.4.1.2 The interval between the Special Surveys may be reduced at the request of the parties concerned or by IRS if considered appropriate.

2.4.1.3 For surveys completed within 3 months before the expiry date of the Special Survey, the next period of class will start from the expiry date of the Special Survey. For surveys completed more than 3 months before the expiry date of the Special Survey, the period of class will start from the survey completion date. In cases where the vessel has been laid up or has been out of service for a considerable period because of a major repair or modification and the owner elects to only carry out the overdue surveys, the next period of class will start from the expiry date of the special survey. If the owner elects to carry out the next due special survey, the period of class will start from the survey completion date. Any requirement of the Flag Administration in this regard is also to be complied with.

2.4.1.4 The Special Survey may be commenced at the 4th Annual Survey and be progressed with a view to completion by the 5th anniversary date. When the special survey is commenced prior to the fourth annual survey, the entire survey is to be completed within 15 months if such work is to be credited to the special survey and in this case the next period of class will start from the survey completion date.

Concurrent crediting to both Intermediate survey and Special survey for surveys and thickness measurements of spaces is not acceptable.

2.4.1.5 As part of the preparation for Special Survey, the proposed Survey Programme (See 2.4.2) including the schedule for thickness measurements (See 2.4.10) are to be submitted at least 3 months in advance of the intended commencement of the Special Survey.

2.4.1.6 Record of Special Survey will not be assigned until the Machinery Survey has been completed or postponed in agreement with IRS.

2.4.1.7 Ships which have satisfactorily passed a Special Survey will have a record entered in the Supplement to the Register Book indicating the assigned date of Special Survey. In addition a notation "ESP" will be entered for bulk carriers, ore carriers and combination carriers.

2.4.1.8 The special survey is to include, in addition to the requirements of the Annual Survey, examination, tests and checks of sufficient extent to ensure that the hull, equipment and related piping as indicated in 2.4.6.3 are in satisfactory condition and that the ship is fit for its intended purpose for the new period of class of five years to be assigned subject to proper maintenance and

operation and the periodical surveys being carried out at the due dates.

2.4.1.9 A Docking Survey in accordance with the requirements of Sec.7 is to be carried out as part of the Special Survey. Any remaining work in respect of the overall and close-up surveys and thickness measurements and repairs applicable to the lower portions of cargo holds and ballast tanks (i.e. parts below light ballast water line) are to be completed in the dry-dock.

2.4.2 Planning and preparation for survey

2.4.2.1 A specific Survey Programme is to be worked out in advance of the Survey by the Owner in cooperation with the Surveyors and submitted to IRS for approval. The Survey Programme is to be in a written format based on IMO Resolution MSC197(80). The survey is not to commence until the survey programme has been agreed. Prior to the development of the survey programme, the survey planning questionnaire based on IMO Resolution MSC197(80) is to be completed by the owner and forwarded to IRS. The Survey Programme at Intermediate Survey may consist of the Survey Programme at the previous Special Survey supplemented by the Executive Hull Summary of that Special Survey and later relevant survey reports. The survey program is to be worked out taking into account any amendments to the survey requirements after the last special survey.

2.4.2.2 In developing the Survey Programme, the following documentation is to be collected and consulted with a view to selecting tanks, areas and structural areas for examination :

- Survey status and basic ship information
- Documentation on board as per 2.4.3
- Main structural plans (scantling drawings), including information regarding use of high strength steels, clad steel and stainless steel
- Relevant previous survey and inspection reports of IRS and the Owners
- Information regarding the use of the ship's holds and tanks, typical cargoes and other relevant data
- Information regarding corrosion prevention level at the time of construction
- Information regarding the relevant maintenance level during operation.

2.4.2.3 The Survey Programme submitted for approval is to account for and comply, as a minimum, with the requirements of close-up survey, thickness measurement and tank testing respectively, and to include relevant information including at least :

- Basic ship information and particulars
- Main structural plans (scantling drawings), including information regarding use of high strength steels, clad steel and stainless steel
- Plan of holds and tanks
- List of holds and tanks with information on use, corrosion prevention and condition of coating
- Conditions for survey (e.g. information like holds and tank cleaning, gas freeing, ventilation, lighting, etc.)
- Provisions and methods of access to structures
- Equipment for survey
- Nomination of holds and tanks and areas for close-up survey (As per Table 2.4.9.1)
- Nomination of sections for thickness measurement (As per Table 2.4.10.1)
- Nomination of tanks for testing
- Damage experience related to the ship in operation.

2.4.2.4 IRS will advise the Owner of the maximum acceptable structural corrosion diminution levels applicable to the vessel.

2.4.2.5 The ship is to be prepared for overall survey in accordance with the requirements of Table 2.4.2.5. The preparation is to be of sufficient extent to facilitate an examination to ascertain any excessive corrosion, deformation, fractures, damages and other structural deterioration.

2.4.2.6 Proper preparation and the close co-operation between the attending surveyor(s) and the owner’s representatives onboard prior to and during the survey are an essential part

in the safe and efficient conduct of the survey. During the survey on board safety meetings are to be held regularly.

Table 2.4.2.5 : Survey preparation			
Special Survey No. I Age ≤ 5	**Special Survey No. II 5 < Age ≤ 10**	**Special Survey No. III 10 < Age ≤ 15**	**Special Survey No. IV and subsequently Age > 15**
1) The holds, deep tanks, peaks, bilges and drain wells, engine and boiler spaces and other spaces are to be cleared out and cleaned as necessary for examination. Floor plates in engine and boiler spaces are to be lifted as may be necessary for examination of the structure underneath. Where necessary ceiling, lining, casings and loose insulation are to be removed as required by the Surveyor for examination of the structure. Compositions on the plating are to be examined and sounded, but need not be disturbed if found satisfactorily adhering to the plating.	1) Requirements of Special Survey I to be complied with 2) The chain locker is to be cleaned internally. The chain cables are to be ranged for inspection. The anchors are to be cleaned and placed in an accessible position for inspection.	1) Requirements of Special Survey II to be complied with 2) Portions of wood sheathing, or other covering, on steel decks are to be removed, as considered necessary by the Surveyor, in order to ascertain the condition of the plating.	1) Requirements of Special survey III to be complied with
2) The steelwork is to be exposed and cleaned as may be required for its proper examination by the Surveyor and close attention is to be paid to the parts of the structure which are particularly liable to excessive corrosion or to deterioration due to other causes. 3) All tanks are to be cleaned as necessary to permit examination. 4) Casings or covers of air, sounding, steam and other pipes, spar ceiling and lining in way of the side scuttles are to be removed, as required by the Surveyor.			

2.4.2.7 Prior to commencement of any part of the special survey, a survey planning meeting is to be held between the attending surveyor(s), the owner's representative in attendance, the thickness measurement firm representative and the master of the ship or an appropriately qualified representative appointed by the master or Company for the purpose to ascertain that all the arrangements envisaged in the survey programme are in place, so as to ensure the safe and efficient conduct of the survey work to be carried out.

2.4.2.8 The following is an indicative list of items that are to be addressed in the meeting:

a) Schedule of the vessel (i.e. the voyage, docking and undocking manoeuvres, periods alongside, cargo and ballast operations, etc.);

b) Provisions and arrangements for thickness measurements (i.e. access, cleaning/de-scaling, illumination, ventilation, personal safety);

c) Extent of the thickness measurements;

d) Acceptance criteria (refer to the list of minimum thicknesses);

e) Extent of close-up survey and thickness measurement considering the coating condition and suspect areas/areas of substantial corrosion;

f) Execution of thickness measurements;

g) Taking representative readings in general and where uneven corrosion / pitting is found;

h) Mapping of areas of substantial corrosion; and

i) Communication between attending surveyor(s) the thickness measurement firm operator(s) and owner representative(s) concerning findings.

2.4.3 Documentation on board

2.4.3.1 The Owners are to obtain, supply and maintain on board documentation as specified in 2.4.3.3, which is to be readily available for the Surveyor.

2.4.3.2 The documentation is to be kept on board for the life time of the ship.

2.4.3.3 A Survey Report File is to be a part of the documentation on board consisting of

- Reports of structural surveys
- Executive Hull Summary
- Thickness measurement reports.

2.4.3.4 The Survey Report File is to be available also in the Owners and the Classification Society's management offices.

2.4.3.5 The following additional supporting documentation is to be available on board:

Main structural plans of cargo holds and ballast tanks (for CSR ships these plans are to include for each structural element both the as-built and renewal thickness. Any thickness for voluntary addition is also to be clearly indicated on the plans. The midship section plan to be supplied on board the ship is to include the minimum allowable hull girder sectional properties for hold transverse section in all cargo holds)

- Previous repair history
- Cargo and ballast history
- Inspection by ship's personnel with reference to
    - structural deterioration in general
    - leakages in bulkheads and piping
    - condition of coating or corrosion prevention system, if any
- Any other information that will help identify critical structural areas and/or Suspect Areas requiring inspection.
- Survey Programme as required by 2.4.2 until such time as the Special Survey has been completed.

2.4.3.6 Prior to survey, the Surveyor is to examine the completeness of the documentation on board, and its contents as a basis for the survey.

2.4.4 Surveys at sea or at anchorage

2.4.4.1 See Sec.1.8.

2.4.5 Space protection

2.4.5.1 Where provided, the condition of coating or corrosion protection of cargo holds and ballast tanks is to be examined. For ballast tanks excluding double bottom tanks where a hard protective coating is found to be in less than GOOD condition and it is not renewed or the tanks in question are to be examined at annual surveys. Thickness measurements are to be carried out as deemed necessary by the Surveyor.

2.4.5.2 When such breakdown of hard protective coating is found in double bottom ballast tanks and it is not renewed, where a soft or semi-hard coating has been applied, or where a hard protective coating has not been applied from the time of construction, the tanks in question may be examined at annual intervals. When considered necessary by the Surveyor or where extensive corrosion exists, thickness measurements are to be carried out.

2.4.5.3 Areas in spaces where a hard protective coating is provided and found in GOOD condition, the extent of close-up surveys and thickness measurements may be specially considered.

Areas in tanks where a hard protective coating is provided and found in GOOD condition, the extent of thickness measurements may be specially considered.

2.4.5.4 For double-side skin void spaces bounding cargo holds for bulk carriers exceeding 20 years of age and of 150 m in length and upwards, where provided, the condition of the corrosion prevention system of void spaces are to be examined. Where a hard protective coating is found to be in POOR condition, and it is not renewed, or where a soft or semi-hard coating has been applied, or where a hard protective coating has not been applied from the time of construction, the void spaces in question are to be examined at annual intervals. Thickness measurements are to be carried out as deemed necessary by the surveyor.

2.4.6 Survey and examination

2.4.6.1 All spaces within the hull and superstructure are to be examined. The special survey is to include examination of underwater parts as per Section 7.

2.4.6.2 All tanks other than water ballast tanks are to be examined internally in accordance with the requirements of Table 2.4.6.1.

2.4.6.3 All spaces including cargo holds and their ‘tween decks where fitted; double bottom, deep, ballast, peak tanks; pipe tunnel, duct keels, machinery spaces, dry spaces, cofferdams and voids are to be internally examined including the plating and framing, bilge and drain wells, sounding, venting, pumping and drainage arrangements. This examination is to be supplemented by testing and thickness measurement as required by 2.4.8 and 2.4.10 to ensure that the structural integrity remains effective. The aim of the examination is to discover Substantial Corrosion, significant deformation, fractures, damages or other structural deterioration and if deemed necessary by the Surveyor, a suitable non-destructive examination may be required.

All piping systems within the above spaces are to be examined and operationally tested to working pressure to attending Surveyors satisfaction to ensure that the tightness and condition remains satisfactory. At special survey No.3 and subsequent special surveys, structural downflooding ducts and structural ventilation ducts are to be internally examined.

Table 2.4.6.1 : Requirements for internal examination of tanks

Tank	Special Survey No. I Age ≤ 5	Special Survey No. II 5 < Age ≤ 10	Special Survey No. III 10 < Age ≤ 15	Special Survey No. IV and subsequent Age > 15
Fuel oil bunker tanks				
- Engine room	None	None	One	One
- Cargo area	None	One	Two	Half the number of tanks, minimum 2
- If no tanks in Cargo Area, additional fuel tank(s) outside of Engine Room (if fitted)	None	One	One	Two
Lub.oil	None	None	None	One
Fresh water	None	One	All	All

Notes:

1) These requirements apply to tanks of integral (structural) type.
2) If a selection of tanks is accepted to be examined, then different tanks are to be examined at each special survey, on a rotational basis.
3) Peak tanks (all uses) are subject to internal examination at each special survey.
4) At special survey No.III and subsequent special surveys, one deep tank for fuel oil in the cargo area is to be included, if fitted.

2.4.6.4 Where ballast tanks have been converted to void spaces, the survey extent is to be based upon ballast tank requirements.

2.4.6.5 All watertight bulkheads and watertight doors are to be examined. All decks, casings and superstructures are to be examined. Attention is to be given to the corners of openings and other discontinuities in way of the strength decks and top sides.

2.4.6.6 The masts, standing rigging and anchors are to be examined.

The Surveyor should satisfy himself that there are sufficient mooring ropes on board and also that a tow line is provided when this is a Rule requirement.

2.4.6.7 The steering gear, and its connections and control systems (main and alternative) are to be examined. The auxiliary steering gear with its various parts are to be examined in working condition.

2.4.6.8 The hand pumps and suctions, air and sounding pipes are to be examined. The Surveyors are to ensure that striking plates are fitted under the sounding pipes whilst examining the tanks internally

Automatic air pipe heads are to be internally examined at special surveys as indicated in Table 2.4.6.8. For designs where the inner parts cannot be properly inspected from outside, the head is to be removed from the air pipe. Particular attention is to be paid to the condition of the zinc coating in heads constructed from galvanised steel.

2.4.6.9 The Surveyor should satisfy himself regarding the efficient condition of the following :

- Means of escape from machinery spaces, crew and passenger spaces and spaces in which crew are normally employed;
- Means of communication between bridge and engine room and between bridge and alternative steering position;
- Helm indicator;
- Protection to the aft steering wheel and the gear.

Table 2.4.6.8 : Requirements for internal examination of automatic air pipe heads

Location	Special survey No.I Age ≤ 5	Special survey No.II 5 < Age ≤ 10	Special survey No.III and subsequent Age > 10
forward 0.25L	Two air pipe heads[1,2] one port and one starboard on exposed decks	All air pipe heads on exposed decks	All air pipe heads[3] on exposed decks
aft of 0.25L from the forward perpendicular	Two air pipe heads[1,2] one port and one starboard on exposed decks	At least 20% of air pipe heads[1,2] on exposed decks	

Notes:

1. Preferably air pipes serving ballast tanks.
2. The selection of air pipe heads is to be made by the attending Surveyor. According to the results of the inspection, the Surveyor may require additional air pipe heads to be examined.
3. When there is substantiated evidence of replacement within the previous five years, individual air pipe heads may not be examined.

2.4.6.10 The chain cables are to be ranged and the anchors and the chain cables are to be examined. At special survey no. II and subsequent special surveys, the chain cables are to be gauged. Any length of chain cable which is found to have reduced in mean diameter at its most worn part by more than 12 per cent of its original rule diameter is to be renewed.

2.4.6.11 The windlass is to be examined.

2.4.6.12 The chain locker, hold fasts, hawse pipes and chain stoppers are to be examined and pumping arrangements of the chain locker tested.

2.4.6.13 Engine room structure is to be examined. Particular attention being given to tank tops, shell plating in way of tank tops, brackets connecting side shell frames and tank tops and engine room bulkheads in way of tank tops and bilge wells. Where excessive areas of wastage are found, thickness measurements are to be carried out and renewals of repairs made when wastage exceeds allowable limits.

2.4.6.14 The loading instrument is to be checked for accuracy by applying test load conditions in presence of the Surveyor.

2.4.6.15 For ships complying with the requirements of SOLAS XII/12 for hold, ballast and dry space water level detectors, the special survey is to include an examination and a test of the water ingress detection systems and of their alarms.

2.4.6.16 For ships complying with the requirements of SOLAS XII/13 for the availability of pumping systems, the special survey is to include an examination and a test of the means for draining and pumping ballast tanks forward of the collision bulkhead and bilges of dry spaces any part of which extends forward of the foremost cargo hold and of their controls.

2.4.6.17 Examination of accommodation ladders, gangways and their winches are to be carried out as required for annual surveys. In addition, the accommodation ladders and gangways are to be operationally, tested with the specified maximum operation load.

The tests are to be carried out with the load applied as uniformly as possible along the length of the accommodation ladder or gangway, at an angle of inclination corresponding to the maximum bending moment on the accommodation ladder or gangway.

Accommodation ladder winch is to be operationally tested at special surveys. The brake system of the winch is to be tested for holding the maximum operational load on the ladder.

For existing installations on board ships constructed prior to 01 Jan 2010 where the

maximum operational load is not known, load nominated by the shipowner or operator may be considered as the test load.

2.4.7 Hatch covers and coamings

The hatch covers and coamings are to be surveyed as follows:

2.4.7.1 A thorough inspection of the items listed in 2.2.2.2 is to be carried out in addition to all hatch covers and coamings.

2.4.7.2 Checking of the satisfactory operation of all mechanically operated hatch covers is to be made, including:

- stowage and securing in open condition;
- proper fit and efficiency of sealing in closed condition;
- operational testing of hydraulic and power components, wires, chains and link drives.

2.4.7.3 Checking the effectiveness of sealing arrangements of all hatch covers by hose testing or equivalent.

2.4.7.4 Close up survey and thickness measurement of the hatch cover and coaming plating and stiffeners is to be carried out as given in the relevant tables.

2.4.8 Tank testing

2.4.8.1 Boundaries of double bottom, deep, ballast, peak and other tanks including holds adapted for the carriage of water ballast, are to be tested with a head of liquid to the top of air pipes or nearabout to the top of hatches for ballast/cargo holds. Boundaries of fuel oil, lub.oil and fresh water tanks are to be tested with a head of liquid to the highest point that liquid will rise under service conditions. Tank testing of fuel oil, lub.oil and fresh water tanks may be specially considered based on a satisfactory external examination of the tank boundaries and a confirmation from the Master stating that the pressure testing has been carried out according to the requirement with satisfactory results.

2.4.8.2 The testing of double bottom tanks and other spaces not designed for the carriage of liquid may be omitted, provided a satisfactory internal examination together with an examination of the tank top is carried out.

2.4.9 Close-up surveys

2.4.9.1 The minimum requirements for Close-up survey are given in Table 2.4.9.1(a) or Table 2.4.9.1(b) or Table 2.4.9.1(c).

2.4.9.2 The Surveyor may extend the close-up survey as deemed necessary taking into account the maintenance of the spaces under survey, the condition of the corrosion prevention system and where spaces have structural arrangements or details which have suffered defects in similar spaces or on similar ships according to available information.

2.4.9.3 For areas in tanks and cargo holds where hard protective coatings are found in GOOD condition, the extent of Close-up survey may be specially considered.

Table 2.4.9.1a : Requirements of close-up survey - Dry bulk cargo ships other than double skin bulk carriers

Special Survey No. I Age ≤ 5	**Special Survey No. II 5 < Age ≤ 10**	**Special Survey No. III 10 < Age ≤ 15**	**Special Survey No. IV and subsequently Age > 15**
A) 25% of frames in the forward cargo hold at representative positions	A) All shell frames in the forward cargo hold and 25% of frames in remaining cargo holds including upper and lower end attachments and adjacent shell plating	A) All shell frames in the forward cargo hold and one other selected cargo hold and 50% of frames in remaining cargo holds including upper and lower end attachments and adjacent shell plating	A) All shell frames including their upper and lower end attachments and adjacent shell plating in all cargo holds.
A) Selected frames in all cargo holds	For bulk carriers of 100,000 dwt and above all shell frames in the forward cargo hold and 50% of shell frames in each of the remaining cargo holds, including upper and lower end attachments and adjacent shell plating		
B) One transverse web with associated plating and longitudinals in two representative ballast tanks of each type (i.e. topside or hopper side tank)	B) One transverse web with associated plating and longitudinals in each ballast tank	B) All transverse webs with associated plating and longitudinals in each ballast tank	B) All transverse webs with associated plating and longitudinals in each ballast tank
	B) Forward and aft transverse bulkhead in one ballast tank, including stiffening system	B) All transverse bulkheads in ballast tanks, including stiffening system	B) All transverse bulkheads in ballast tanks, including stiffening system
C) Two selected cargo hold transverse bulk-heads including internal structure of upper and lower stools, where fitted	C) All cargo hold trans-verse bulkheads including internal structure of upper and lower stools, where fitted	C) All cargo hold transverse bulkheads including internal structure of upper and lower stools, where fitted	C) All cargo hold transverse bulkheads including internal structure of upper and lower stools, where fitted
D) All cargo hold hatch covers and coamings (plating and stiffeners)	D) All cargo hold hatch covers and coamings (plating and stiffeners)	D) All cargo hold hatch covers and coamings (plating and stiffeners)	D) All cargo hold hatch covers and coamings (plating and stiffeners)
	E) All deck plating and underdeck structure inside line of hatch openings between all cargo hold hatches	E) All deck plating and underdeck structure inside line of hatch openings between all cargo hold hatches	E) All deck plating and underdeck structure inside line of hatch openings between all cargo hold hatches

Table 2.4.9.1a : (Contd.)

A) Cargo hold transverse frames	B) Transverse web frame or watertight transverse bulkhead in ballast tanks	C) Cargo hold transverse bulkheads plating, stiffeners and girders
D) Cargo hold hatch covers and coamings. Close up survey/thickness measurement is to be carried out for accessible parts of hatch cover structures. For cargo hold hatch covers of approved design which have no access to internal structures, close up survey/thickness measurements of such inaccessible structural members need not be carried out.	E) Deck plating and underdeck structure inside line of hatch openings, between cargo hold hatches	

Note : Close-up survey of transverse bulkheads to be carried out at four levels -

Level (a)	Immediately above the inner bottom and immediately above the line of gussets (if fitted) and shedders for ships without lower stool.
Level (b)	Immediately above and below the lower stool shelf plate (for those ships fitted with lower stools) and immediately above the line of the shedder plates.
Level (c)	About mid-height of the bulkhead.
Level (d)	Immediately below the upper deck plating and immediately adjacent to the upper wing tank and immediately below the upper stool shelf plate for those ships fitted with upper stools, or immediately below the topside tanks.

Table 2.4.9.1b : Minimum requirements for close-up survey at special hull survey of double skin bulk carriers other than ore carriers			
Special Survey No. I Age ≤ 5	**Special Survey No. II 5 < Age ≤ 10**	**Special Survey No. III 10 < Age ≤ 15**	**Special Survey No. IV and subsequently Age > 15**
One transverse web with associated plating and longitudinals in two representative ballast tanks of each type (This is to include the foremost topside and double side ballast tanks on either side) **(A)**	One transverse web with associated plating and longitudinals as applicable in each ballast tank **(A)**	All transverse webs with associated plating and longitudinals as applicable in each ballast tank **(A)**	All transverse webs with associated plating and longitudinals as applicable in each ballast tank **(A)**
	Forward and aft transverse bulkheads including stiffening system in the topside, hopper side and double side ballast tanks on one side of the ship (i.e. port or starboard) that fall in one transverse section **(A)**	All transverse bulkheads including stiffening system in each ballast tank **(A)**	All transverse bulkheads including stiffening system in each ballast tank **(A)**
	25% of ordinary transverse frames for transverse framing system or 25% of longitudinals for longitudinal framing system on side shell and inner side plating at forward, middle and aft parts,in the foremost double side tanks **(B)**	25% of ordinary transverse frames for transverse framing system or 25% of longitudinals for longitudinal framing system on side shell and inner side plating at forward, middle and aft parts,in all double side tanks **(B)**	All ordinary transverse frames for transverse framing system or all of longitudinals for longitudinal framing system on side shell and inner side plating at forward, middle and aft parts,in all double side tanks **(B)**
Two selected cargo hold transverse bulkheads, including internal structure of upper and lower stools, where fitted **(C)**	One transverse bulkhead in each cargo hold, including internal structure of upper and lower stools, where fitted **(C)**	All cargo hold transverse bulkheads, including internal structure of upper and lower stools, where fitted **(C)**	Areas **(C)** - **(E)** as for SS No.III

Table 2.4.9.1b (Contd.)

Special Survey No. I Age ≤ 5	**Special Survey No. II 5 < Age ≤ 10**	**Special Survey No. III 10 < Age ≤ 15**	**Special Survey No. IV and subsequently Age > 15**
All cargo hold hatch covers and coamings (plating and stiffeners) **(D)**	All cargo hold hatch covers and coamings (plating and stiffeners) **(D)**	All cargo hold hatch covers and coamings (plating and stiffeners) **(D)**	
	All deck plating and under deck structure inside line of hatch openings between all cargo hold hatches **(E)**	All deck plating and under deck structure inside line of hatch openings between all cargo hold hatches **(E)**	

(A), (B), (C), (D) and **(E)** are areas to be subjected to close-up surveys and thickness measurements.

(A) : Transverse web frame or watertight transverse bulkhead in topside, hopper side and double side ballast tanks. In fore and aft peak tanks transverse web frame means a complete transverse web frame ring including adjacent structural members.
(B) : Ordinary transverse frame in double side tanks.
(C) : Cargo hold transverse bulkheads plating, stiffeners and girders.
(D) : Cargo hold hatch covers and coamings. Close up survey/thickness measurement is to be carried out for accessible parts of hatch cover structures. For cargo hold hatch covers of approved design which have no access to internal structures, close up survey/thickness measurements of such inaccessible structural members need not be carried out.
(E) : Deck plating inside line of hatch openings between cargo hold hatches.

Note : Close-up survey of transverse bulkheads to be carried out at four levels.

Level (a) : Immediately above the inner bottom and immediately above the line of gussets (if fitted) and shedders for ships without lower stool.

Level (b) : Immediately above and below the lower stool shelf plate (for those ships fitted with lower stools) and immediately above the line of the shedder plates.

Level (c) : About mid-height of the bulkhead.

Level (d) : Immediately below the upper deck plating and immediately adjacent to the upper wing tank and immediately below the upper stool shelf plate for those ships fitted with upper stools, or immediately below the topside tanks.

Table 2.4.9.1c : Minimum requirements for close-up survey at special hull survey of ore carriers			
Special Survey No. I Age ≤ 5	**Special Survey No. II 5 < Age ≤ 10**	**Special Survey No. III 10 < Age ≤ 15**	**Special Survey No. IV and subsequently Age > 15**
One web frame ring complete including adjacent structural members in a ballast wing tank **(A)** One transverse bulkhead lower part – including girder system and adjacent structural members – in a ballast tank **(A)**	All web frame rings complete including adjacent structural members in a ballast wing tank **(A)** One deck transverse including adjacent deck structural members in each remaining ballast tank **(A)** Forward and aft transverse bulkheads complete – including girder system and adjacent structural members – in a ballast wing tank **(A)**	All web frame rings complete including adjacent structural members in each ballast wing tank **(A)** All transverse bulkheads complete – including girder system and adjacent structural members – in each ballast tank **(A)** One web frame ring complete including adjacent structural members in each wing void space **(A)**	As for special survey for age from 10 to 15 years
	One transverse bulkhead lower part – including girder system and adjacent structural members – in each remaining ballast tank **(A)**	Additional web frame rings in void spaces as deemed necessary by the Surveyor **(A)**	
Two selected cargo hold transverse bulkheads, including internal structure of upper and lower stools, where fitted **(C)**	One transverse bulkhead in each cargo hold, including internal structure of upper and lower stools, where fitted **(C)**	All cargo hold transverse bulkheads, including internal structure of upper and lower stools, where fitted **(C)**	Areas **(C) – (E)** as for age interval 10 to 15 years
All cargo hold hatch covers and coamings (plating and stiffeners) **(D)**	All cargo hold hatch covers and coamings (plating and stiffeners) **(D)**	All cargo hold hatch covers and coamings (plating and stiffeners) **(D)**	
	All deck plating and under deck structure inside line of hatch openings between all cargo hold hatches **(E)**	All deck plating and under deck structure inside line of hatch openings between all cargo hold hatches **(E)**	
(A), (C), (D) and **(E)** are areas to be subjected to close-up surveys and thickness measurements			
(A) :	Transverse web frame or watertight transverse bulkhead in ballast wing tanks and void spaces. In fore and aft peak tanks transverse web frame means a complete transverse web frame ring including adjacent structural members		
(C) :	Cargo hold transverse bulkheads plating, stiffeners and girders		
(D) :	Cargo hold hatch covers and coamings. Close up survey/thickness measurement is to be carried out for accessible parts of hatch cover structures. For cargo hold hatch covers of approved design which have no access to internal structures, close up survey/thickness measurements of such inaccessible structural members need not be carried out.		
(E) :	Deck plating and under deck structure inside line of hatch openings between cargo hold hatches		

Table 2.4.9.1c (Contd.)	
Note : Close-up survey of transverse bulkheads to be carried out at four levels:	
Level (a) :	Immediately above the inner bottom and immediately above the line of gussets (if fitted) and shedders for ships without lower stool.
Level (b) :	Immediately above and below the lower stool shelf plate (for those ships fitted with lower stools) and immediately above the line of the shedder plates.
Level (c) :	About mid-height of the bulkhead.
Level (d) :	Immediately below the upper deck plating and immediately adjacent to the upper wing tank and immediately below the upper stool shelf plate for those ships fitted with upper stools, or immediately below the topside tanks.

2.4.10 Thickness measurement

2.4.10.1 The minimum requirement for thickness measurement at special survey are given in Table 2.4.10.1.

2.4.10.2 Provisions for extended measurements for areas with Substantial Corrosion in case of dry bulk cargo ships are given in Table 2.4.10.2(a) and Table 2.4.10.2(b) and may be additionally specified in the survey programme as required by 2.4.2. Areas of substantial corrosion identified at the previous surveys are to have thickness measurements taken.

For vessels built under IACS Common Structural Rules, the identified substantial corrosion areas may be:

a) Protected by coating applied in accordance with the coating manufacturer's requirements and examined at annual intervals to confirm the coating in way is still in good condition, or alternatively

b) Required to be gauged at annual intervals.

In this case of a) above, it is recommended that the necessary documentation of coating is available on board.

The Surveyor may further extend the thickness measurements as deemed necessary.

2.4.10.3 Transverse sections are to be chosen where the largest reductions are suspected to occur or are revealed from deck plating measurements, one of which is to be in the amidships area.

2.4.10.4 Representative thickness measurement to determine both general and local levels of corrosion in the shell frames and their end attachments in all cargo holds and ballast tanks is to be carried out.

Thickness measurement is also to be carried out to determine the corrosion levels on the transverse bulkhead plating.

The extent of thickness measurements may be specially considered provided the Surveyor is satisfied by the close-up survey, that there is no structural diminution and the hard protective coating where applied remains efficient.

Table 2.4.10.1 : Thickness measurement at special hull survey of dry bulk cargo ships (including double skin bulk carriers)

Special Survey No. I **Age ≤ 5**	**Special Survey No. II** **5 < Age ≤ 10**	**Special Survey No. III** **10 < Age ≤ 15**	**Special Survey No. IV and subsequently** **Age > 15**
1) Suspect areas throughout the vessel	1) Suspect areas throughout the vessel	1) Suspect areas throughout the vessel	1) Suspect areas throughout the vessel
	2) Within the cargo area: a) 2 transverse sections of deck plating outside line of cargo hatch opening b) Wind and water strakes in way of the transverse sections considered in item (a) above	2) Within the cargo area: a) Each deck plate outside line of cargo hatch openings b) 2 transverse sections, one in the amidship area, outside line of cargo hatch openings c) All wind and water strakes	2) Within the cargo area: a) Each deck plate outside line of cargo hatch openings b) 3 transverse sections, one in the amidship area, outside line of cargo hatch openings c) All wind and water strakes d) Each bottom plate e) Duct keel or pipe tunnel plating and internals
	3) Measurement, for general assessment and recording of corrosion pattern, of those structural members subject to Close-up Survey according to Table 2.4.9.1(a) or Table 2.4.9.1(b), as applicable	3) Measurement, for general assessment and recording of corrosion pattern, of those structural members subject to Close-up Survey according to Table 2.4.9.1(a) or Table 2.4.9.1(b), as applicable	3) Measurement, for general assessment and recording of corrosion pattern, of those structural members subject to Close-up Survey according to Table 2.4.9.1(a) or Table 2.4.9.1(b), as applicable
	4) For vessels where UR S31 applies as mentioned in Table 2.4.13.1, additional thickness measurement of side shell frames and brackets for verifying compliance with UR S31.	4) Same as for special survey II	4) Same as for special survey II
	5) Selected wind and water strakes outside the cargo area	5) Selected wind and water strakes outside the cargo area	5) All wind and water strakes outside the cargo area
		6) For vessels subject to compliance of IMO standards as mentioned in 2.4.12 thickness measurement applicable to the vertically corrugated aft transverse bulkhead of the foremost cargo hold is to be carried out as per Table 2.4.12 and Fig.2.4.12	6) Same as for Special Survey III

Table 2.4.10.1 (Contd.)			
Special Survey No. I Age ≤ 5	**Special Survey No. II 5 < Age ≤ 10**	**Special Survey No. III 10 < Age ≤ 15**	**Special Survey No. IV and subsequently Age > 15**
		7) Internals in forepeak and after peak ballast tanks	7) Internals in forepeak and after peak ballast tanks
			8) All exposed main deck plating outside cargo area
			9) Representative exposed superstructure deck plating (poop, bridge, forecastle deck)
			10) All keel plates, additional bottom plates in way of machinery space, aft end of tanks and cofferdams outside cargo area
			11) a) Plating of sea chests. b) Shell plating in way of overboard discharges as considered necessary by the Surveyor.

Table 2.4.10.2a : Requirements for extent of thickness measurement on areas of substantial corrosion in dry bulk cargo ships other than double skin bulk carriers

Structural Member		Extent of Measurement	Pattern of Measurement
Deck Structure including Cross Strips, Main Cargo Hatchways, Hatch Covers, Coamings and Topside Tanks			
1	Cross deck strip plating	Suspect cross deck strip plating	5 point pattern between underdeck stiffeners over 1 metre in length
2	Underdeck stiffeners	Transverse members	5 point pattern at each end and mid span
		Longitudinal members	5 point pattern on both web and flange
3	Hatch covers	Side and end skirts, each 3 locations	5 point pattern at each location
		3 longitudinal bands, 2 outboard strakes and centreline strake	5 point measurement each band
4	Hatch coaming	Each side and end of coaming, one band lower 1/3, one band upper 2/3 of coaming	5 point measurement of each band, i.e. end or side coaming
5	Topside ballast tanks	a) Watertight transverse bulkheads	
		i) lower 1/3 of bulkhead	i) 5 point pattern over 1 sq. metre of plating
		ii) upper 2/3 of bulkhead	ii) 5 point pattern over 1 sq. metre of plating
		iii) stiffeners	iii) 5 point pattern over 1 metre length
		b) 2 Representative swash transverse bulkheads	
		i) lower 1/3 of bulkhead	i) 5 point pattern over 1 sq. metre of plating
		ii) upper 2/3 of bulkhead	ii) 5 point pattern over 1 sq. metre of plating
		iii) stiffeners	iii) 5 point pattern over 1 metre length
		c) 3 Representative bays of slope plating	
		i) lower 1/3 of tank	i) 5 point pattern over 1 sq. metre of plating
		ii) upper 2/3 of tank	ii) 5 point pattern over 1 sq. metre of plating
		d) Longitudinals, suspect and adjacent areas	5 point pattern both web and flange over 1 metre length
6	Main deck plating	Suspect plates and adjacent areas	5 point pattern over 1 metre length of plating
7	Main deck longitudinals	Minimum of 3 longitudinals where plating measured	5 point pattern both web and flange over 1 metre length
8	Web frames/transverses	Suspect plates	5 point pattern over 1 sq. metre
Double Bottom and Hopper Structure			
1	Inner/double bottom plating	Suspect plates plus all adjacent plates	5 point pattern for each panel between longitudinals over 1 metre length
2	Inner/double bottom longitudinals	Three longitudinals where plates measured	3 measurements in line across web and 3 measurements on flange
3	Longitudinal girders or transverse floors	Suspect plates	5 point pattern over about 1 sq. metre
4	Watertight bulkheads (WT floors)	a) lower 1/3 of tank	a) 5 point pattern over 1 sq. metre of plating
		b) upper 2/3 of tank	b) 5 point pattern alternate plates over 1 sq. metre of plating
5	Web frames	Suspect plates	5 point pattern over 1 sq. metre of plating
6	Bottom/side shell longitudinals	Minimum of three longitudinals in way of suspect areas	3 measurements in line across web
			3 measurements on flange

Table 2.4.10.2a (Contd.)			
Structural Member		**Extent of Measurement**	**Pattern of Measurement**
Cargo Holds			
1	Side shell frames	Suspect stiffener and each adjacent area	a) At each end and mid span: 5 point pattern of both web and flange
			b) 5 point pattern within 25 mm of welded attachment to both shell and lower slope plate
Shell Structures			
1	Bottom and side shell plating	a) Suspect plate, plus four adjacent plates	a) 5 point pattern for each panel between longitudinal
		b) See other tables for particulars on gauging in way of tanks and cargo holds	
2	Bottom/side shell longitudinals	Minimum of three longitudinals in way of suspect areas	3 measurements in line across web 3 measurements on flange
Transverse Bulkheads in Cargo Holds			
1	Lower stool	a) Transverse band within 25 mm of welded connection to inner bottom	a) 5 point between stiffeners over 1 metre length
		b) Transverse band within 25 mm of welded connection to shelf plate	b) 5 point between stiffeners over 1 metre length
2	Transverse bulkhead	a) Transverse band at approximately mid height	a) 5 point between stiffeners over 1 sq. metre of plating
		b) Transverse band at part of bulkhead adjacent to upper deck or below upper stool shelf plate (for those ships fitted with upper stools)	b) 5 point between stiffeners over 1 sq. metre of plating

Table 2.4.10.2b : Requirements for extent of thickness measurements on areas of substantial corrosion of double skin bulk carriers		
Structural member	**Extent of measurement**	**Pattern of measurement**
Bottom, inner bottom and hopper structure		
Bottom, inner bottom and hopper structure plating	Minimum of three bays across double bottom tank, including aft bay	5-point pattern for each panel between longitudinals and floors
	Measurements around and under all suction bell mouths	
Bottom, inner bottom and hopper structure longitudinals	Minimum of three longitudinals in each bay where bottom plating measured	Three measurements in line across flange and three measurements on vertical web
Bottom girders, including the watertight ones	At fore and aft watertight floors and in centre of tanks	Vertical line of single measurements on girder plating with one measurement between each panel stiffener or a minimum of three measurements
Bottom floors, including the watertight ones	Three floors in bays where bottom plating measured, with measurements at both ends and middle	5-point pattern over two square meter area
Hopper structure web fame ring	Three floors in bays where bottom plating measured	5-point pattern over one square metre of plating. Single measurements on flange

Table 2.4.10.2b : (Contd.)		
Structural member	**Extent of measurement**	**Pattern of measurement**
Hopper structure transverse watertight bulkhead or swash bulkhead	Lower 1/3 of bulkhead	5-point pattern over one square metre of plating
	Upper 2/3 of bulkhead	5-point pattern over two square metre of plating
	Stiffeners (minimum of three)	For web, 5-point pattern over span (two measurements across web at each end and one at centre of span). For flange, single measurements at each end and centre of span
Panel stiffening	Where applicable	Single measurements
Deck structure including cross strips, main cargo hatchways, hatch covers, coamings and topside tanks		
Structural member	**Extent of measurement**	**Pattern of measurement**
Cross deck strip plating	Suspect cross deck strip plating	5 point pattern between underdeck stiffeners over 1 metre length
Underdeck stiffeners	Transverse members	5 point pattern at each end and mid span
	Longitudinal members	5 point pattern on both web and flange
Hatch covers	Side and end skirts, each 3 locations	5 point pattern at each location
	3 longitudinal bands, 2 outboard strakes and centerline strake	5 point measurement each band
Hatch coamings	Each side and end of coaming, one band lower 1/3, one band upper 2/3 of coaming	5 point measurement each band i.e. end or side coaming
Topside ballast tanks	a) watertight transverse bulkheads:	
	- Lower 1/3 of bulkhead	5 point pattern over 1 sq. metre of plating
	- Upper 2/3 of bulkhead	5 point pattern over 1 sq. metre of plating
	- Stiffeners	5 point pattern over 1 metre length
	b) two representative swash transverse bulkheads:	
	- Lower 1/3 of bulkhead	5 point pattern over sq. metre of plating
	- Upper 2/3 of bulkhead	5 point pattern over 1 sq. metre of plating
	- stiffeners	5 point pattern over 1 metre length
	c) three representative bays of slope plating:	
	- Lower 1/3 of tank	5 point pattern over 1 sq. metre of plating
	- Upper 2/3 of tank	5 point pattern over 1 sq. metre of plating
	d) Longitudinals, suspect and adjacent	5 point pattern on both web and flange over 1 metre length

Table 2.4.10.2b (Contd.)		
Structural member	**Extent of measurement**	**Pattern of measurement**
Main deck plating	Suspect plates and four adjacent plates	5 point pattern over 1 sq. metre of plating
Main deck longitudinals	Suspect plates	5 point pattern on both web and flange over 1 metre length
Web frames / transverses	Suspect plates	5 point pattern over 1 sq. metre
Structure in double side spaces of double skin bulk carriers including wing void spaces of ore carriers		
Structural member	**Extent of measurement**	**Pattern of measurement**
Side shell and inner side plating:	a) upper strake and strakes in way of horizontal girders plating between each pair of transverse frames / longitudinals in a minimum of three bays (along the tank)	single measurement
	b) all other strakes plating between every third pair of longitudinals in same three bays	single measurement
Side shell and inner side transverse frames / longitudinals on:	a) upper strake each transverse frame / longitudinal in same three bays	3 measurements across web and 1 measurement on flange
	b) all other strakes every third transverse frame / longitudinal in same three bays	3 measurements across web and 1 measurement on flange
Transverse frames / longitudinals – brackets	Minimum of three at top, middle and bottom of tank in same three bays	5-point pattern over area of brackets
Vertical web and transverse bulkheads:	a) strakes in way of horizontal girders minimum of two webs and both transverse bulkheads	5-point pattern over approx. two square metre area
	b) other strakes minimum of two webs and both transverse bulkheads	two measurements between each pair of vertical stiffeners
Horizontal girders	Plating on each girder in a minimum of three bays	Two measurements between each pair of longitudinal girder stiffeners
Panel stiffening	Where applicable	Single measurements

Table 2.4.10.2b (Contd.)

Structural member	Extent of measurement	Pattern of measurement
Transverse bulkheads in cargo holds		
Structural member	**Extent of measurement**	**Pattern of measurement**
Lower stool, where fitted	Transverse band within 25 [mm] of welded connection to inner bottom	5-point pattern between stiffeners over one metre length
	Transverse band within 25 [mm] of welded connection to shelf plate	5-point pattern between stiffeners over one metre length
Transverse bulkheads	Transverse band at approximately mid height	5-point pattern over one square metre of plating
	Transverse band at part of bulkhead adjacent to upper deck or below upper stool shelf plate (for those ships fitted with upper stools)	5-point pattern over one square metre of plating

2.4.10.5 The thickness measurements are to be carried out by a qualified company certified by IRS.

2.4.10.6 In order to ensure necessary control during the process of thickness measurements, these are normally to be carried out under the supervision of the Surveyor. The Surveyor has the right to re-check the measurements as deemed necessary to ensure acceptable accuracy.

2.4.10.7 In all cases the extent of thickness measurements is to be sufficient as to represent the actual average condition.

2.4.10.8 A thickness measurement report is to be prepared. The report is to give the location of measurements, the thickness measured as well as corresponding original thickness. Furthermore, the report is to give the date when the measurements were carried out, type of measuring equipment, names of personnel and their qualifications and has to be signed by the operator. The Surveyor is to review the report of the final thickness measurement after repairs have been carried out and countersign the cover page.

2.4.11 Reporting and evaluation of survey

2.4.11.1 The data and information on the structural condition of the vessel collected during the survey is to be evaluated for acceptability and continued structural integrity of the vessel.

2.4.11.2 For CSR bulk carriers, the ship's longitudinal strength is to be evaluated by using the thickness of structural members measured, renewed and reinforced, as appropriate, during the special surveys carried out after the ship reached 15 years of age (or during the special survey No.3, if this is carried out before the ship reaches 15 years) in accordance with the criteria for longitudinal strength of the ship's hull girder for CSR bulk carriers specified in Ch.13 of CSR.

2.4.11.3 The final result of evaluation of the ship's longitudinal strength required in 2.4.11.2 after renewal or reinforcement work of structural members, if carried out as a result of initial evaluation, is to be reported as a part of the Executive Hull Summary.

2.4.11.4 An Executive Hull Summary of the survey and results is to be issued to the Owner and placed on board the vessel for reference at future surveys. The Executive Hull Summary is to be endorsed by IRS Head Office.

2.4.12 Compliance with IMO standards for scantlings of aft transverse bulkhead of the foremost cargo hold and allowable hold loading for foremost cargo hold

2.4.12.1 These requirements apply to all bulk carriers of 150 [m] in length and above, intending to carry cargoes having bulk density of 1.78 [t/m^3] or above where:

a) The foremost hold is bounded by the side shell only in ships which were contracted for construction prior to 1 July 1998 and

b) The foremost hold is of double skin construction of less than 760 [mm] in breadth, measured perpendicular to the side shell, in ships, the keel of which were laid or were at a similar stage of construction, before 1 July 1999.

2.4.12.2 For existing bulk carriers of the type as mentioned in 2.4.12.1 a) and b) above which have not yet complied with the IMO standards, the compliance is to be achieved within the following time limits:

i) for ships which were 15 years of age or more on 1 July 1998, immediately before continuance in service;

ii) for ships which were 10 years of age or more but less than 15 years of age on 1 July 1998, by the due date of the first intermediate or special survey to be held after the date on which the ship reaches 15 years of age but not later than the date on which the ship reaches 17 years of age;

iii) for ships which were 5 years of age or more but less than 10 years of age on 1 July 1998, on or before the due date, after 1 July 2003, of the first intermediate or special survey after the date on which the ship reaches 10 years of age; and

iv) for ships which were less than 5 years of age on 1 July 1998, on or before the date on which the ship reaches 10 years of age.

Completion prior to 1 July 2003 of an intermediate or special survey with a due date after 1 July 2003, can not be used to postpone compliance.

2.4.12.3 For bulk carriers described in 2.4.12.2, thickness measurement of vertically corrugated aft transverse bulkhead of the foremost cargo hold is to be carried out to determine the general condition of the structure and to define the extent of possible repairs and/or reinforcements required to meet the above mentioned IMO standards. As a minimum, the thickness measurement is to be carried out at the critical locations given in Table 2.4.12 and Fig.2.4.12.

In addition, thickness measurement is to be carried out at subsequent intermediate surveys (for ships over 10 years of age) and special surveys for the purpose of verifying continuing compliance with the above standards.

Where annual gauging has been adopted as an alternative to steel renewal in accordance with the IMO standards, thickness measurement is also to be carried out at subsequent annual surveys.

2.4.13 Compliance with IACS requirements for existing vessels

2.4.13.1 Compliance with the standards mentioned in Table 2.4.13.1, as applicable, is to be achieved by the due date indicated in 2.4.13.2.

2.4.13.2 Compliance with the requirements indicated in Table 2.4.13.1, as applicable is to be achieved within the following time limits:

i) For ships which will be 15 years of age or more on 1 January 2004 by the due date of the first intermediate or special survey after that date;

ii) For ships which will be 10 years of age or more on 1 January 2004 by the due date of the first special survey after that date;

iii) For ships which will be less than 10 years of age on 1 January 2004 by the date on which the ship reaches 10 years of age.

Completion prior to 1 January 2004 of an intermediate or special survey with a due date after 1January 2004 cannot be used to postpone compliance. However, completion prior to 1 January 2004 of an intermediate survey the window for which straddles 1 January 2004 can be accepted.

2.4.13.3 Ships which are required to comply with UR S31 as indicated in Table 2.4.13.1 are subject to additional thickness measurements with respect to the side shell frames and brackets for the purpose of determining compliance, prior to the due dates as mentioned in 2.4.13.2 and at subsequent intermediate and special surveys for verifying continuing compliance with UR S31.

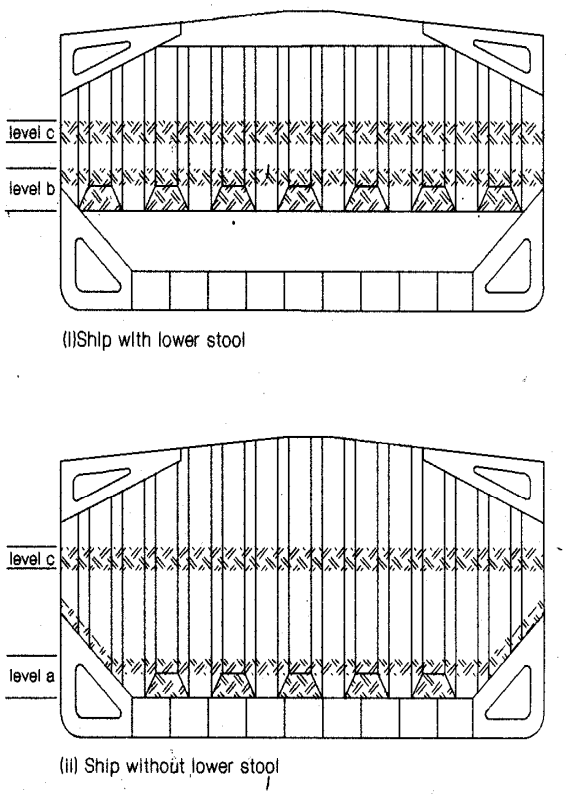

Fig.2.4.12 : Locations for thickness measurement for verification of IMO standard compliance

Table 2.4.12 : Critical levels at which thickness measurement is to be carried out for the vertically corrugated aft transverse bulkhead of the foremost cargo hold of existing bulk carriers to determine compliance with IMO standard

Level as per Fig.2.4.12	**Locations where thickness is to be measured in Zone 2 (P&S) and Zone 1**
	Ships with or without lower stool
Level (a) OR Level (b)	1) mid breadth of each corrugation flange at about 200 [mm] above line of shedder plates
	2) middle of gusset plates between corrugation flanges, where fitted
	3) middle of each shedder plate
	4) mid breadth of each corrugation web at approximately 200 [mm] above the line of each shedder plate
Level (c)	1) mid breadth of each corrugation flange and web at about the mid-height of the corrugation

Notes:

1. To adequately assess the scantlings of each individual vertical corrugation, each corrugation flange, web, shedder plate and gusset plate within each of the levels given above are to be gauged.
2. Where the thickness changes within the horizontal levels, the thinner plate is to be gauged.
3. Steel renewal/reinforcement is to comply with IMO standard.

2.4.14 Compliance with SOLAS regulation 12, Ch.XII : Hold, ballast and dry space water level detectors

Bulk carriers constructed before 1st July, 2004 are to be fitted with water level detectors as described in Pt.5, Ch.1, 2.13 of the Rules, not later than the date of the annual, intermediate or special survey of the ship to be carried out after 1st July, 2004, whichever comes first.

2.4.15 Compliance with SOLAS regulation 13, Ch.XII : Availability of pumping systems (for dewatering of forward spaces)

Bulk carriers constructed before 1st July, 2004 are to comply with this SOLAS regulation in accordance with details given in Pt.5, Ch.1, 2.14 of the Rules, not later than the date of the first intermediate or special survey of the ship to be carried out after 1st July, 2004, but in no case later than 1st July, 2007.

2.4.16 Watertight Cable Transits

2.4.16.1 The requirements for Special Survey may be undertaken by the attending Surveyor or by a firm approved as a service supplier according to Pt.1 Ch.1, Sec 1.9.

2.4.16.2 All transits are to be examined to confirm their satisfactory condition and the Cable Transit Seal System Register is to be reviewed to confirm that it is being maintained. The Special Survey is to be recorded in the Register, in which a single record entry will be sufficient to record the survey of all transits.

2.4.16.3 From review of the Register, where there are records entered since the last special survey of any disruption to the cable transits or installation of new cable transits (except which are reviewed and examined at previous annual surveys), the satisfactory condition of those transits is to be confirmed by the attending Surveyor by review of records and examination of the transits; the results are to be recorded in the Register against each of those cable transits.

2.4.16.4 In case the cable transits have been examined by an approved service supplier, the attending surveyor is to review the Register in order to ascertain that it has been properly maintained by the owner and correctly endorsed by the service supplier.

2.5 Special Surveys – Machinery

2.5.1 Requirements for examination of machinery and piping are given in Sec.8.

Table 2.4.13.1 : Compliance with new IACS unified requirements

Item	Applicable types of vessels	Reference IACS unified requirement	Applicable locations on the ship
Renewal criteria for side shell frames and brackets	Bulk carriers with side frames and/or brackets not meeting the requirements of Pt.5, Ch.1 of the 1998 or subsequent rules	S31	Cargo holds bounded by single side shell

Section 3

Surveys - Oil Tankers, Ore or Oil Carriers, Oil or Bulk Carriers

3.1 Scope

3.1.1 This section gives the requirements for periodical surveys of vessels which have been assigned the following class notations, in general:

Oil Tanker ESP
Ore or Oil Carrier ESP
Oil or Bulk Carrier ESP

3.1.2 For vessels with class notation Ore or Oil Carrier ESP and Oil or Bulk Carrier ESP, the relevant requirements given in Sec.2 are also to be applied.

3.1.3 For vessels with notation "Moored Oil Storage Tanker at (location)", the requirements of this section apply except that special consideration may be given for carrying out in- water surveys instead of docking surveys, taking into account the condition of the vessel. In this case the IY notation may be either maintained or suspended and the ESP notation will be suspended. The mooring arrangements are to be approved considering the environmental parameters and water depth at the specified location.

This is subject to the acceptance and compliance with any additional requirements of the Flag Administration.

3.1.4 For vessels with additional class notation **ASPHALT CARRIER (INTEGRAL TANK, MAX. CARGO TEMP ≤ XXX℃),ESP** requirements of 3.6 are to be applied.

3.1.5 For vessels with additional class notation **ASPHALT CARRIER (INDEPENDENT TANK, MAX. CARGO TEMP ≤ XXX℃),** requirements of 3.7 are to be applied.

3.2 Annual surveys

3.2.1 General

3.2.1.1 Annual Surveys are to be carried out within 3 months before or after the anniversary date each year. (Also refer to Note 9 of Sec.1, Table 1.1.1). These should be held concurrently with statutory annual or other relevant statutory Surveys, where practicable.

3.2.1.2 At Annual Surveys, the Surveyor is to examine the hull and machinery, so far as necessary and practicable, in order to be satisfied as to their general condition.

3.2.1.3 Access to cargo tanks or other spaces within the cargo area, necessitating gas freeing will normally not be required unless necessary for checking items of equipment and installations for correct functioning.

3.2.1.4 It is to be confirmed that no new installation of material containing asbestos was carried out since last survey.

3.2.1.5 Where applicable, examination of alternative design and arrangement for machinery or electrical installations or fire safety, in accordance with the test, inspection and maintenance requirements, if any, specified in the approved documentation is to be carried out.

3.2.2 Hull and weather deck

3.2.2.1 The survey is to consist of an examination for the purpose of ensuring, as far as practicable, that the hull, equipment, closing appliances and related piping are maintained in satisfactory and efficient condition and should take into account the service history, condition and extent of the corrosion prevention system of ballast tanks and areas identified in the survey report file. Special attention is to be paid to the following:

a) Weather deck, ship side plating above water line.

b) Openings on freeboard and superstructure decks; exposed casings; skylights and fiddley openings; deck houses; companionways and superstructure bulkheads; side scuttles and dead lights; flush deck scuttles; ash shoots and other openings.

c) Weld connection between air pipes and deck plating; air pipe heads on exposed

decks (external examination); ventilators and closing devices.

d) Watertight bulkheads and their penetrations as far as practicable.

e) Scuppers and sanitary discharges as far as practicable together with valves and their controls.

f) Guard rails, bulwarks, freeing ports, gangways, walkways and life lines.

g) Cargo tank openings including gaskets, covers, coamings and flame screens.

h) Cargo tanks pressure/vacuum valves, secondary means to prevent over or under pressure and devices to prevent passage of flame.

i) Examination of devices to prevent the passage of flame on vents to all bunker, oily-ballast and oily-slop tanks and void spaces, as far as practicable

j) Examination of cargo, crude oil washing, bunker and vent piping systems, including vent masts and headers.

3.2.2.2 Examination of pump room and pipe tunnel, if fitted, is to be carried out including:

a) Examination of all pump room bulkheads for signs of oil leakage or fractures and, in particular, the sealing arrangements of all penetrations of pump room bulkheads.

b) Examination of the condition of all piping systems.

3.2.2.3 All watertight doors in watertight bulkheads, to be examined and tested (locally and remotely) as far as practicable.

3.2.2.4 Suspect areas identified at previous special or intermediate surveys are to be close-up surveyed. Thickness measurements are to be taken in the area of substantial corrosion identified at previous surveys.

3.2.2.5 Examination of Ballast Tank is to be carried out when required as a consequence of the results of the Special Survey or Intermediate Survey. (See 3.4.5.1 and 3.3.3.3 respectively). When considered necessary by the Surveyor or where extensive corrosion is found, thickness measurement is to be carried out. When examination of ballast tanks reveals substantial corrosion, additional thickness measurements are to be carried out to the extent given in Table 3.4.9.2a) or Table 3.4.9.2b).

For vessels built under IACS Common Structural Rules, the identified substantial corrosion areas are required to be examined and additional thickness measurements are to be carried out.

3.2.2.6 Anchoring and mooring equipment is to be examined as far as is practicable. A general examination of emergency towing arrangements is to be carried out to ensure their ready availability. It is to be confirmed that the towing and mooring equipment is properly marked with any restriction associated with its safe operation.

For vessels with single point mooring arrangements where 'SPM' notation is assigned, the following are to be generally examined:

a) Components of the single point mooring system (bow chain stoppers, bow fairleads, pedestal roller fairleads, winches and capstans), to verify their satisfactory condition.

b) Hull structures supporting and adjacent to the components of the single point mooring system, to verify that there is no deformation or fracture.

3.2.2.7 Where applicable Surveyor should satisfy himself regarding the freeboard marks on the ship's side.

3.2.2.8 The Surveyor is to confirm that, where required, an approved loading instrument together with its operation manual are available on board, See Pt.3, Ch.5. It is to be verified by the Surveyor that the loading instrument is checked for accuracy at regular intervals by the ship's staff by applying test loading conditions.

3.2.2.9 Accommodation ladders are to be examined at annual surveys. Satisfactory condition of the following items is to be checked, in particular :

a) steps;
b) platforms;
c) all support points such as pivots, rollers, etc.;

d) all suspension points such as lugs, brackets, etc.;
e) stanchions, rigid handrails, hand ropes and turntables;
f) davit structure, wire and sheaves, etc.

3.2.2.10 Access to bow arrangements are to be examined. Gangways are to be examined at annual surveys. Satisfactory condition of the following items is to be checked, in particular :

a) treads;
b) side stringers, cross-members, decking, deck plates, etc.;
c) all support points such as wheel, roller, etc.;
d) stanchions, rigid handrails, hand ropes.

3.2.2.11 Winches of accommodation ladders and gangways are to be examined to verify the satisfactory condition of the following items:

a) brake mechanism including condition of brake pads and band brake, if fitted;

b) remote control system, and

c) power supply system for electric motor.

3.2.2.12 Davits and fittings on the ship's deck associated with accommodation ladders and gangways are to be examined for satisfactory condition at annual surveys. Fittings or structures for means of access to deck such as handholds in a gateway or bulwark ladder and stanchions are also to be examined.

3.2.2.13 The maintenance and inspection records of accommodation ladders and gangways are to be verified. It is to be confirmed that supporting wires are being renewed at intervals not exceeding 5 years.

3.2.2.14 When examining internal spaces, as far as practicable, the permanent means of access where appropriate, are to be verified that they remain in good condition.

3.2.2.15 For vessels subject to IMO PSPC (See Pt.3, Ch.2, 3.6) it is to be confirmed that the maintenance, repair and partial re-coating of dedicated ballast tanks when appropriate are recorded in the coating technical file.

3.2.2.16 Confirmation that in-service maintenance and repair activities of coating systems in cargo oil tanks are recorded in the coating technical file.

3.2.2.17 Watertight cable transit seal systems register is to be reviewed to confirm that it is being maintained and as far as practicable the transits are to be examined to confirm their satisfactory condition. Where there are records entered since last annual survey of any disruption to the cable transits or installation of new cable transits, the satisfactory condition of those transits is to be confirmed by review of records and, if deemed necessary, by examination. The results are to be recorded in the Register against the specific cable transit.

3.2.2.18 In case the cable transits have been examined by an approved service supplier, the attending surveyor is to review the Register in order to ascertain that it has been properly maintained by the owner and correctly endorsed by the service supplier.

3.2.3 Machinery and systems

3.2.3.1 A general examination of the machinery, boilers, all pressurised systems (steam, pneumatic, hydraulic) and their associated fittings, propulsion system and auxiliary machinery to see whether they are being properly maintained and with particular attention to the fire and explosion hazards.

3.2.3.2 Confirmation that machinery, boilers and other pressure vessels, associated piping systems and fittings are so installed and protected as to reduce to a minimum any danger to persons on board, due regard being given to moving parts, hot surfaces and other hazards.

3.2.3.3 Confirmation that Periodical Surveys of boilers and other pressure vessels have been carried out as required by the Rules and the safety devices have been tested.

3.2.3.4 Confirmation that the normal operation of the propulsion machinery can be sustained or restored even though one of the essential auxiliaries becomes inoperative.

3.2.3.5 Confirmation that means are provided so that machinery can be brought into operation from the dead ship condition without external aid.

3.2.3.6 All main and auxiliary steering arrangements and their associated equipment and control systems are to be examined and tested. Where applicable, Surveyors are to verify that log entries have been made in accordance with statutory requirements.

3.2.3.7 Confirming, when appropriate, that requisite arrangements to regain steering capability in the event of the prescribed single failure are being maintained.

3.2.3.8 Steering chains are to be cleaned for ascertaining wear and tear and lengths of chain worn in mean diameter by more than 12 per cent of the original rule diameter are to be renewed.

3.2.3.9 All the means of communication between the navigating bridge and the machinery control positions, as well as the bridge and the main alternative steering position, if fitted, are to be tested. It is to be confirmed that means of indicating the angular position of the rudder are operating satisfactorily.

3.2.3.10 Confirmation that with ships having emergency steering positions there are means of relaying heading information and, when appropriate, supplying visual compass readings to the emergency steering positions.

3.2.3.11 Confirmation that various alarms required for hydraulic power operated, electric and electro-hydraulic steering gears are, operating satisfactorily and that the recharging arrangements for hydraulic power operated steering gears are being maintained.

3.2.3.12 Examining the means for the operation of the main and auxiliary machinery essential for propulsion and the safety of the ship, including when applicable, the means of remotely controlling the propulsion machinery from the navigating bridge and the arrangements to operate the main and other machinery from a machinery control room.

3.2.3.13 Confirmation that the engine room telegraph, the second means of communication between the navigation bridge and the machinery space and the means of communication with any other positions from which the engines are controlled are operating satisfactorily.

3.2.3.14 Examination and testing of the general emergency alarm system and confirmation that the engineer's alarm is clearly audible in the engineer's accommodation.

3.2.3.15 It is to be confirmed that ballasting and de-ballasting arrangements are satisfactory. The bilge pumping systems and bilge wells including operation of each bilge pump, extended spindles and level alarms, where fitted, are to be examined as far as is practicable. It is also to be confirmed that bilge pumping system for each watertight compartment is satisfactory.

It is also to be confirmed that drainage from enclosed cargo spaces situated on freeboard deck is satisfactory.

3.2.3.16 Examining visually the condition of non-metallic expansion joints where fitted in piping systems which penetrate the ship's side, with both the penetration and the expansion joint located below the deepest load waterline, and checking the service record.

3.2.3.17 General examination visually and in operation, as feasible, of the main electrical machinery, the emergency sources of electrical power, the switch gear, other electrical equipment including the lighting system is to be carried out.

3.2.3.18 Confirmation as far as practicable, the operation of the emergency source(s) of electrical power, including their starting arrangement, the systems supplied, and when appropriate, their automatic operation.

3.2.3.19 Examining in general, that the precautions provided against shock, fire and other hazards of electrical origin are being maintained.

3.2.3.20 General Examination of automation equipment is to be carried out. Satisfactory operation of safety devices, bilge level detection and alarm systems and control systems is to be verified.

3.2.3.21 Confirmation that machinery space ventilation systems are in good working condition.

3.2.3.22 Examination so far as is possible of cargo, bilge, ballast and stripping pumps for excessive gland seal leakage, verification of proper operation of electrical and mechanical remote operating and shutdown devices and operation of pump room bilge system, and checking that pump foundations are intact.

3.2.3.23 Checking the protection of cargo pump room and in particular:

a) Checking temperature sensing devices for bulkhead glands and alarms;

b) Checking interlock between lighting and ventilation.

c) Checking gas detection system.

d) Checking bilge level monitoring devices and alarms.

3.2.3.24 Verification that installed pressure gauges on cargo discharge lines and level indicating systems are operational.

3.2.3.25 Examination of emergency lighting in all cargo pump rooms of tankers constructed after 1 July 2002.

3.2.3.26 For Ships constructed before 01 July 2017 and fitted with harmonic filters; following are to be verified at each survey:

a) Records of annual measurement of harmonic distortion levels of main bus bar under seagoing conditions and log entries showing which equipment was running and / or filters in service at the time of measurement. Harmonic distortion readings are to be carried out when the greatest amount of distortion is indicated by the measuring equipment.

b) Records of measurement of distortion levels, after any modification to the ship's electrical distribution system.

3.2.3.27 For Ships constructed on or after 01 July 2017 and fitted with harmonic filters; or for ships retrofitted with harmonic filters, on or after 01 July 2017; following are to be verified at each survey:

a) Engine log book containing distortion monitoring readings/ automatic records of same

b) Documentation of any approved relaxation on allowable distortion limits.

3.2.3.28 For ships contracted for construction on or after 01 Jan 2017 following are to be verified in emergency generator rooms at each survey:

a) Hand operated ventilation louvres, closing appliances, if fitted, are kept open and corresponding instruction plates are visible near the louvres.

b) Power operated ventilation louvres and closing appliances, if fitted, are fail-to-open type and capable of opening automatically whenever emergency generator is starting / in operation.

c) It is to be possible to close ventilation openings by a manual operation from a clearly marked safe position outside the space where the closing operation can be easily confirmed. Further, such closing is not possible from any other remote position. The louvre status (open/closed) is indicated at this position.

3.2.3.29 For vessels fitted with ICCP system, proper functioning of the system is to be checked and records of system operation are to be verified. It is to be verified that all maintenance as per manufacturer's instructions are carried out.

3.2.4 Fire protection, detection and extinction

3.2.4.1 The arrangements for fire protection, detection and extinction are to be examined and are to include confirmation that no changes have been made in the structural fire protection. Following are to be examined / verified:

a) verification that fire control plans are properly posted;

b) examination as far as possible and testing as feasible, any fire detection and alarm system and any sample extraction smoke detection system;

c) examination of the fire main system and verification that each fire pump including the emergency fire pump can be operated separately so that the two required powerful jets of water can be produced simultaneously from different hydrants at any part of the ship whilst the required pressure is maintained in the fire main;

d) verification that fire hoses, nozzles, applicators and spanners are in good working condition and situated at their respective locations;

e) examination of fire-fighting system (including fixed fire-fighting system for the machinery spaces) controls, piping,

instructions and marking, checking for evidence of proper maintenance and servicing including date of last systems tests;

f) verification that all semi-portable and portable fire extinguishers are in their stowed positions, checking for evidence of proper maintenance and servicing, conducting random check for evidence of discharged containers;

g) verification, as far as practicable, that the remote controls for stopping fans and machinery in machinery spaces are in working order. Examination of the arrangements for oil fuel, lubricating oil and other flammable oils and testing the remote closing of valves for oil fuel, lubricating oil and other flammable oils and , the operation of the remote means of closing the valves on the tanks that contain oil fuel, lubricating oil and other flammable oils;

h) examination of the closing arrangements of ventilators, funnel annular spaces, skylights, doorways and tunnel, where applicable;

i) confirmation that the fire fighters' outfits including its self-contained compressed air breathing apparatus and emergency escape breathing devices (EEBDS) are complete and in good condition and that the cylinders, including the spare cylinders, of any required self-contained breathing apparatus are suitably charged and that on board means of recharging breathing apparatus cylinders used during drills or a suitable number of spare cylinders to replace those used are provided, and provision of two-way portable radiotelephone apparatus of an explosion-proof type or intrinsically safe;

j) examination of any manual and automatic fire doors and proving their operations;

k) verification that the pump room ventilation system is operational, ducting intact, dampers operational and screens are clean;

l) external examination of piping and cut-out valves of cargo tank and cargo pump room fixed fire-fighting system. Confirming, as far as practicable and when appropriate, the operation of the remote means for closing the various openings;

m) verification that the deck foam system and deck sprinkler system are in good operating condition so far as is practicable;

n) verification that all electrical equipment in dangerous zones is in good condition and has been properly maintained so far as is practicable;

o) checking the deck foam system, including the supplies of foam concentrate and testing that minimum number of jets of water at the required pressure in the fire main is obtained when the system is in operation;

p) examination of the fire-extinguishing systems for spaces containing paint and/or flammable liquids and deep fat cooking equipment in accommodation and service spaces;

q) examination of the fire safety requirements of helicopter facilities, including foam firefighting appliances ;

r) Examination of the fixed carbon dioxide fire-extinguishing systems for the protection of machinery spaces and cargo pump-rooms, where applicable, are provided with two separate controls, one for opening of the gas piping and one for discharging the gas from the storage container, each of them located in a release box clearly identified for the particular space;

s) Examination of the fire protection arrangements in cargo spaces and confirming, as far as practicable and as appropriate, the operation of the means of control provided for closing the various openings;

t) Checking the provision of at least one portable instrument for measuring oxygen and one for measuring flammable vapour concentrations, together with a sufficient set of spares and suitable means for the calibration of these instruments;

u) Examination of arrangements for gas measurement in double-hull spaces and double bottom spaces, including the fitting of permanent gas sampling lines, where appropriate;

v) Examination, as far as possible, and testing the fixed hydrocarbon gas detection system;

w) Confirmation that potential sources of ignition in or near the cargo pump room are eliminated, such as loose gear, combustible materials, etc., that there are no signs of undue leakage of cargo and that access ladders are in good condition;

x) Testing the fire dampers of ventilation ducts and the means of closing the main inlets and outlets of all ventilation systems and testing the means of stopping power ventilation systems from outside the space served.

Surveys carried out by the National Authority of the country in which the ship is registered would normally be accepted as meeting these requirements, at the discretion of the Surveyor.

3.2.4.2 For tankers fitted with inert gas system, examination of the inert gas system as detailed in Section 12, Para 12.2.1 is to be carried out.

3.2.4.3 Confirmation that the means of escape from accommodation, machinery spaces and other spaces are satisfactory.

3.2.4.4 Examination of the arrangements for gaseous fuel for domestic purposes.

3.3 Intermediate Surveys

3.3.1 General

3.3.1.1 Intermediate surveys are to be carried out at or between the second or third Annual Survey. (Also refer to Note 9 of Sec.1, Table 1.1.1). However, only those items which are additional to the requirements of annual survey may be examined between the second or third annual survey.

Concurrent crediting to both Intermediate survey and Special survey for surveys and thickness measurements of spaces is not acceptable.

3.3.1.2 The following requirements are applicable for vessels over five years of age. For vessels below 5 years of age additional examination over and above the requirements of Annual survey may be required at the discretion of the Surveyors.

3.3.1.3 For vessels over 10 years of age a specific survey program is to be worked out by the owner in cooperation with the Surveyors considering the requirements of the previous special survey, executive hull summary of that survey, later relevant survey records and taking account of any amendments to the survey requirements after the last special survey. The survey program is to be submitted in written format for approval and kept on board until the intermediate survey has been completed. (See 3.4.2 for guidance on preparation of survey program).

3.3.1.4 Prior to the commencement of any part of the intermediate survey, a survey planning meeting is to be held between the attending Surveyor(s), the owner's representative in attendance and where involved, the thickness measurement firm representative and the master of ship or an appropriately qualified representative appointed by the master or Company for the purpose to ascertain that all the arrangements envisaged in the survey programme are in place, so as to ensure the safe and efficient conduct of the survey work to be carried out.

3.3.2 Examination and testing

3.3.2.1 The following are to be carried out:

a) The survey to the extent specified in 3.3.3 to 3.3.5 depending on the age and type of the tanker.

b) For weather decks, an examination as far as applicable of cargo, crude oil washing, bunker, ballast, steam and vent piping systems as well as vent masts and headers. If upon examination there is any doubt as to the condition of the piping, the piping may be required to be pressure tested, thickness measured or both.

c) For vessels built under IACS Common Structural Rules, the identified substantial corrosion areas are required to be examined and additional thickness measurements are to be carried out.

d) A general examination of electrical equipment in dangerous zones and testing of insulation resistance of the circuits. In cases where a proper record of testing is maintained, consideration may be given to accepting recent readings. These measurements are not to be attempted until the ship is in gas free condition and

are to be carried out within an acceptable time period.

3.3.3 Oil tankers between 5 and 10 years of age

3.3.3.1

a) Single hull oil tankers:

All ballast tanks are to be examined. When considered necessary by the Surveyor, thickness measurement and testing are to be carried out to ensure that the structural integrity remains effective.

b) Double hull oil tankers:

For tanks used for water ballast, an Overall Survey of Representative Tanks selected by the Surveyor is to be carried out. If such inspections reveal no visible structural defects, the examination may be limited to a verification that the hard Protective Coating remains in GOOD condition.

3.3.3.2 In addition to the requirements above, suspect areas identified at previous surveys are to be close-up surveyed.

3.3.3.3 A ballast tank is to be examined at subsequent annual intervals where:

a) a hard protective coating has not been applied from the time of construction, or

b) a soft or semi-hard coating has been applied, or

c) substantial corrosion is found within the tank, or

d) the hard protective coating is found to be in less than GOOD condition and the hard protective coating is not repaired to the satisfaction of the Surveyor.

3.3.4 Oil tankers between 10 and 15 years of age

3.3.4.1 The requirements of the intermediate survey are to be to the same extent as the previous special survey as required in 3.4 for hull structure and piping systems in way of cargo tanks, pump rooms, cofferdams, pipe tunnels, void spaces within the cargo area and all ballast tanks. However, pressure testing of cargo and ballast tanks, survey of automatic air pipe heads and specified in 3.4.6.10 and the requirements for longitudinal strength evaluation of hull girder required in 3.4.10.2 are not required unless deemed necessary by the attending surveyor. Thickness measurement is to be carried out for items 1) to 4) of Table 3.4.9.1.

3.3.4.2 The intermediate survey may be commenced at the second annual survey and be progressed during the succeeding year with a view to completion by the third annual survey in lieu of the application of 3.4.1.4.

3.3.4.3 An in-water survey complying with the requirements of Sec.7.2 may be accepted in lieu of the requirements of 3.4.1.9.

3.3.5 Oil tankers exceeding 15 years of age the following is to apply:

3.3.5.1 The requirements of the intermediate survey are to be to the same extent as the previous special survey as required in 3.4 for hull structure and piping systems in way of cargo tanks, pump rooms, cofferdams, pipe tunnels, void spaces within the cargo area and all ballast tanks. However, pressure testing of cargo and ballast tanks, survey of automatic air pipe heads as specified in 3.4.6.10 and the longitudinal strength evaluation of hull girder required in 3.4.10.2 need not be carried out unless deemed necessary by the attending surveyor. Thickness measurement is to be carried out for items 1) to 4) of Table 3.4.9.1.

3.3.5.2 The intermediate survey may be commenced at the second annual survey and be progressed during the succeeding year with a view to completion by the third annual survey in lieu of the application of 3.4.1.4.

3.3.5.3 A survey in dry dock is to be part of the intermediate survey. Any remaining work in respect of the overall and close-up surveys and thickness measurements and repairs applicable to the lower portions of cargo tanks and ballast tanks (i.e. parts below light ballast water line) are to be completed in the dry-dock.

3.4 Special Surveys - Hull

3.4.1 General

3.4.1.1 All ships classed with IRS are to undergo Special Surveys at 5 yearly intervals. The first Special Survey is to be completed within 5 years from the date of the initial classification survey and thereafter 5 years

from the assigned date of the previous Special Survey. However, an extension of class of 3 months maximum beyond the 5th year may be granted in exceptional circumstances in accordance with 1.11. In such cases, the next period of class will start from the expiry date of the Special Survey before extension was granted.

3.4.1.2 The interval between the Special Surveys may be reduced at the request of the parties concerned or by IRS if considered appropriate.

3.4.1.3 For surveys completed within 3 months before the expiry date of the Special Survey, the next period of class will start from the expiry date of the Special Survey. For surveys completed more than 3 months before the expiry date of the Special Survey, the period of class will start from the survey completion date. In cases where the vessel has been laid up or has been out of service for a considerable period because of a major repair or modification and the owner elects to only carry out the overdue surveys, the next period of class will start from the expiry date of the special survey. If the owner elects to carry out the next due special survey, the period of class will start from the survey completion date. Any requirement of the Flag Administration in this regard is also to be complied with.

3.4.1.4 The Special Survey may be commenced at the 4th Annual Survey and be progressed with a view to completion by the 5th anniversary date. When the special survey is commenced prior to the fourth annual survey, the entire survey is to be completed within 15 months if such work is to be credited to the special survey and in this case the next period of class will start from the survey completion date.

Concurrent crediting to both Intermediate survey and Special survey for surveys and thickness measurements of spaces is not acceptable.

3.4.1.5 As part of the preparation for Special Survey, the proposed Survey Programme (See 3.4.2) including the schedule for thickness measurements (See 3.4.9) are to be submitted in advance of the Special Survey.

3.4.1.6 Record of Special Survey will not be assigned until the Machinery Survey has been completed or postponed in agreement with IRS.

3.4.1.7 Ships which have satisfactorily passed a Special Survey will have a record entered in the Supplement to the Register Book indicating the assigned date of Special Survey. In addition, a notation "ESP" will be entered for oil tankers.

3.4.1.8 The special survey is to include, in addition to the requirements of the Annual Survey, examination, tests and checks of sufficient extent to ensure that the hull, equipment and related piping are in satisfactory condition and that the ship is fit for its intended purpose for the next five (5) year class period, subject to proper maintenance and operation and the periodical surveys being carried out at the due dates.

3.4.1.9 A Docking Survey in accordance with the requirements of Sec.7 is to be carried out as part of the Special Survey. Any remaining work in respect of the overall and close-up surveys and thickness measurements and repairs applicable to the lower portions of cargo tanks and ballast tanks (i.e. parts below light ballast water line) are to be completed in the dry-dock.

3.4.2 Planning and preparation for survey

3.4.2.1 A specific Survey Programme is to be worked out in advance of the Survey by the Owner in cooperation with the Surveyors and submitted to IRS for approval. The Survey Programme is to be in a written format based on IMO Resolution MSC197(80). The survey is not to commence until the survey programme has been agreed. Prior to the development of the survey programme, the survey planning questionnaire based on IMO Resolution MSC197(80) is to be completed by the owner and forwarded to IRS. The Survey Programme at Intermediate Survey may consist of the Survey Programme at the previous Special Survey supplemented by the Executive Hull Summary of that Special Survey and later relevant survey reports. The survey program is to be worked out taking into account any amendments to the survey requirements after the last special survey.

3.4.2.2 In developing the Survey Programme, the following documentation is to be collected and consulted with a view to selecting tanks, areas and structural areas for examination :

a) Survey status and basic ship information;

b) Documentation on board as per 3.4.3;

c) Main structural plans (scantling drawings), including information regarding use of high strength steels, clad steel and stainless steel;

d) Executive Hull Summary;

e) Relevant previous damage and repair history;

f) Relevant previous survey and inspection reports of IRS and the Owners;

g) Cargo and ballast history for the last 3 years, including carriage of cargo under heated conditions;

h) Details of the inert gas plant and tank cleaning procedures;

i) Information and other relevant data regarding conversion or modification of the ship's cargo and ballast tanks since the time of construction.

j) Description and history of the coating and corrosion protection system (including previous class notations), if any;

k) Inspections by the Owner's personnel during the last 3 years with reference to structural deterioration in general, leakages in tank boundaries and piping and condition of the coating and corrosion protection system if any;

l) Information regarding the relevant maintenance level during operation including port state control reports of inspection containing hull related deficiencies. Safety Management System non-conformities relating to hull maintenance, including the associated corrective action(s); and

m) Any other information that will help identify suspect areas and critical structural areas.

3.4.2.3 The Survey Programme submitted for approval is to account for and comply, as a minimum, with the requirements of close-up survey, thickness measurement and tank testing respectively, and to include relevant information including at least :

a) Basic ship information and particulars;

b) Main structural plans (scantling drawings), including information regarding use of high strength steels, clad steel and stainless steel;

c) Plan of tanks;

d) List of tanks with information on use, extent of coatings and corrosion protection systems;

e) Conditions for survey (e.g. information like tank cleaning, gas freeing, ventilation, lighting, etc.);

f) Provisions and methods of access to structures;

g) Equipment for survey; and

h) Identification of tanks and areas for close-up survey (As per Table 3.4.8.1a or Table 3.4.8.1b)

i) Identification of sections for thickness measurement (As per Table 3.4.9.1)

j) Identification of tanks for testing

k) Identification of the thickness measurement firm.

l) Damage experience related to the ship in question.

m) Critical structural areas and suspect areas, where relevant.

3.4.2.4 IRS will advise the Owner of the maximum acceptable structural corrosion diminution levels applicable to the vessel.

3.4.2.5 The ship is to be prepared for overall survey in accordance with the requirements of Table 3.4.2.5. The preparation is to be of sufficient extent to facilitate an examination to ascertain any excessive corrosion, deformation, fractures, damages and other structural deterioration.

3.4.2.6 Proper preparation and the close co-operation between the attending surveyor(s) and the owner's representatives onboard prior to and during the survey are an essential part in the safe and efficient conduct of the survey. During the survey on board safety meetings are to be held regularly

3.4.2.7 Prior to commencement of any part of the special survey, a survey planning meeting is to be held between the attending surveyor(s), the owner's representative in attendance, the thickness measurement firm representative and the master of the ship or an

appropriately qualified representative appointed by the master or Company for the purpose to ascertain that all the arrangements envisaged in the survey programme are in place, so as to ensure the safe and efficient conduct of the survey work to be carried out.

Table 3.4.2.5 : Survey preparation

Special Survey No. I **Age ≤ 5**	**Special Survey No. II** **5 < Age ≤ 10**	**Special Survey No. III** **10 < Age ≤ 15**	**Special Survey No. IV and subsequently** **Age > 15**
1) All tanks, peaks, bilges and drain wells, engine and boiler spaces and other spaces are to be cleared out and cleaned as necessary for examination. Floor plates in engine and boiler spaces are to be lifted as may be necessary for examination of the structure underneath. Where necessary ceiling, lining, casings and loose insulation are to be removed as required by the Surveyor for examination of the structure. Compositions on the plating are to be examined and sounded, but need not be disturbed if found satisfactorily adhering to the plating 2) The steelwork is to be exposed and cleaned as may be required for its proper examination by the Surveyor and close attention is to be paid to the parts of the structure which are particularly liable to excessive corrosion or to deterioration due to other causes. 3) All tanks are to be cleaned as necessary to permit examination. 4) Casings or covers of air, sounding, steam and other pipes, spar ceiling and lining in way of the side scuttles are to be removed, as required by the Surveyor.	1) Requirements of Special Survey I to be complied with 2) The chain locker is to be cleaned internally. The chain cables are to be ranged for inspection. The anchors are to be cleaned and placed in an accessible position for inspection.	1) Requirements of Special Survey II to be complied with 2) Portions of wood sheathing, or other covering, on steel decks are to be removed, as considered necessary by the Surveyor, in order to ascertain the condition of the plating.	1) Requirements of Special survey III to be complied with

3.4.2.8 The following is an indicative list of items that are to be addressed in the meeting:

a) Schedule of the vessel (i.e. the voyage, docking and undocking manoeuvres, periods alongside, cargo and ballast operations, etc.);

b) Provisions and arrangements for thickness measurements (i.e. access, cleaning/de-scaling, illumination, ventilation, personal safety);

c) Extent of the thickness measurements;

d) Acceptance criteria (refer to the list of minimum thicknesses);

e) Extent of close-up survey and thickness measurement considering the coating condition and suspect areas/areas of substantial corrosion;

f) Execution of thickness measurements;

g) Taking representative readings in general and where uneven corrosion / pitting is found;

h) Mapping of areas of substantial corrosion; and

Communication between attending surveyor(s) the thickness measurement firm operator(s) and owner representative(s) concerning findings.

3.4.3 Documentation on board

3.4.3.1 The Owners are to obtain supply and maintain on board documentation as specified in 3.4.3.3, which is to be readily available for the Surveyor.

3.4.3.2 The documentation is to be kept on board for the life time of the ship.

3.4.3.3 A Survey Report File is to be a part of the documentation on board consisting of

- Reports of structural surveys
- Executive Hull Summary
- Thickness measurement reports.

3.4.3.4 The Survey Report File is to be available also in the Owners management offices and with IRS.

3.4.3.5 The following additional supporting documentation is to be available on board:

- Main structural plans of cargo and ballast tanks (for CSR ships these plans are to include for each structural element both the as-built and renewal thickness. Any thickness for voluntary addition is also to be clearly indicated on the plans. The midship section plan to be supplied on board the ship is to include the minimum allowable hull girder sectional properties for the tank transverse section in all cargo tanks)
- Previous repair history
- Cargo and ballast history
- Extent of use of inert gas plant and tank cleaning procedures
- Inspection by ship's personnel with reference to
  - structural deterioration in general
  - leakages in bulkheads and piping
  - condition of coating or corrosion prevention system, if any
- Any other information that will help identify critical structural areas and/or Suspect Areas requiring inspection.
- Survey Programme as required by 3.4.2 until such time as the Special Survey has been completed.

3.4.3.6 Prior to survey, the Surveyor is to examine the completeness of the documentation on board, and its contents as a basis for the survey.

3.4.4 Surveys at sea or at anchorage

3.4.4.1 See Sec.1.8.

3.4.5 Space protection

3.4.5.1 Where provided, the condition of coating or corrosion protection of cargo tanks and ballast tanks is to be examined.

A ballast tank is to be examined at subsequent annual intervals where:

a) a hard protective coating has not been applied from the time of construction, or

b) a soft or semi-hard coating has been applied, or

c) substantial corrosion is found within the tank, or

d) the hard protective coating is found to be in less than GOOD condition and the hard protective coating is not repaired to the satisfaction of the Surveyor.

3.4.5.2 Where the hard protective coating in tanks is found to be in GOOD condition, the extent of close-up surveys and thickness measurements may be specially considered.

3.4.6 Survey and examination

3.4.6.1 All spaces within the hull and superstructure are to be examined. The special survey is to include examination of underwater parts as per Section 7.

3.4.6.2 All tanks other than cargo and water ballast tanks are to be examined internally in accordance with the requirements of Table 3.4.6.2.

3.4.6.3 All spaces including double bottom, deep, ballast, peak and cargo tanks; pump rooms, pipe tunnels, duct keels, machinery spaces, dry spaces, cofferdams and voids are

to be internally examined including the plating and framing, bilges and drain wells, sounding, venting pumping and drainage arrangements. This examination is to be supplemented by testing and thickness measurement as required by 3.4.7 and 3.4.9 to ensure that the structural integrity remains effective. The aim of the examination is to discover Substantial Corrosion, significant deformation, fractures, damages or other structural deterioration and if deemed necessary by the Surveyor, a suitable non-destructive examination may be required. At special survey No.3 and subsequent special surveys, structural downflooding ducts and structural ventilation ducts are to be internally examined.

3.4.6.4 Cargo piping on deck including crude oil washing (COW) piping and cargo and ballast piping systems within the above tanks and spaces are to be examined and operationally tested to working pressure to attending Surveyor's satisfaction to ensure that tightness and condition remain satisfactory. Special attention is to be given to ballast piping in cargo tanks and cargo piping in Ballast Tanks and void spaces and Surveyors are to be advised on all occasions when the piping, including valves and fittings are open during repair periods and can be examined internally.

Table 3.4.6.2 : Requirements for internal examination of tanks

Tank	Special Survey No. I Age ≤ 5	Special Survey No. II 5 < Age ≤ 10	Special Survey No. III 10 < Age ≤ 15	Special Survey No. IV and subsequent Age > 15
Fuel oil bunker tanks				
- Engine room	None	None	One	One
- Cargo area	None	One	Two	Half the number of tanks, minimum 2
- If no tanks in Cargo Area, additional fuel tank(s) outside of Engine Room (if fitted)	None	One	One	Two
Lub.oil	None	None	None	One
Fresh water	None	One	All	All

Notes:

1) These requirements apply to tanks of integral (structural) type.

2) If a selection of tanks is accepted to be examined, then different tanks are to be examined at each special survey, on a rotational basis.

3) Peak tanks (all uses) are subject to internal examination at each special survey.

4) At special survey No.III and subsequent special surveys, one deep tank for fuel oil is to be included, if fitted.

3.4.6.5 Where ballast tanks have been converted to void spaces, the survey extent is to be based upon ballast tank requirements.

3.4.6.6 All watertight bulkheads and watertight doors are to be examined. All decks, casings and superstructures are to be examined. Attention is to be given to the corners of openings and other discontinuities in way of the strength decks and top sides.

3.4.6.7 The masts, standing rigging and anchors are to be examined.

The Surveyor should satisfy himself that there are sufficient mooring ropes on board and also

that a tow line is provided when this is a Rule requirement.

3.4.6.8 The steering gear, and its connections and control systems (main and alternative) are to be examined. The auxiliary steering gear with its various parts are to be examined in working condition.

3.4.6.9 The hand pumps and suctions, air and sounding pipes are to be examined. The Surveyors are to ensure that striking plates are fitted under the sounding pipes whilst examining the tanks internally.

Automatic air pipe heads are to be internally examined at special surveys as indicated in Table 3.4.6.10. For designs where the inner parts cannot be properly inspected from outside, the head is to be removed from the air pipe. Particular attention is to be paid to the condition of the zinc coating in heads constructed from galvanised steel.

3.4.6.10 The Surveyor should satisfy himself regarding the efficient condition of the following :

- Means of escape from machinery spaces, crew and passenger spaces and spaces in which crew are normally employed;

- Means of communication between bridge and engine room and between bridge and alternative steering position;

- Helm indicator;

- Protection to the aft steering wheel and the gear.

3.4.6.11 The chain cables are to be ranged and the anchors and the chain cables are to be examined. At special survey no. II and subsequent special surveys, the chain cables are to be gauged. Any length of chain cable which is found to have reduced in mean diameter at its most worn part by more than 12 per cent of its original rule diameter is to be renewed.

3.4.6.12 The windlass is to be examined.

Table 3.4.6.10 : Requirements for internal examination of automatic air pipe heads

Location	Special survey No.I Age ≤ 5	Special survey No.II 5 < Age ≤ 10	Special survey No.III and subsequent Age > 10
forward 0.25L	Two air pipe heads[1,2] one port and one starboard on exposed decks	All air pipe heads on exposed decks	All air pipe heads[3] on exposed decks
aft of 0.25L from the forward perpendicular	Two air pipe heads[1,2] one port and one starboard on exposed decks	At least 20% of air pipe heads[1,2] on exposed decks	

Notes:

1. Preferably air pipes serving ballast tanks.
2. The selection of air pipe heads is to be made by the attending Surveyor. According to the results of the inspection, the Surveyor may require additional air pipe heads to be examined.
3. When there is substantiated evidence of replacement within the previous five years, individual air pipe heads may not be examined.

3.4.6.13 A thorough examination of aft and forward emergency towing arrangements is to be carried out to ensure its ready availability and satisfactory condition.

- examination of pick-up gear, towing pennant and chafing gear for possible deterioration;

- examination of strong points, fairleads, pedestal roller and their attachment to hull structure.

The survey is to confirm that one of the towing arrangements (aft or forward) are pre-rigged.

3.4.6.14 For vessels with single point mooring arrangements where 'SPM' notation is assigned, the following is to be carried out:

a) A thorough examination of the components of the single point mooring system (bow chain stoppers, bow fairleads, pedestal roller fairleads, winches and capstans) to verify their satisfactory condition.
b) A close-up examination of the hull structures supporting and adjacent to the components of the single point mooring system to verify that there is no deformation or fracture. Thickness determination and non-destructive tests are to be carried out if required by the Surveyor.

3.4.6.15 The chain locker, hold fasts, hawse pipes and chain stoppers are to be examined and pumping arrangements of the chain locker tested

3.4.6.16 Engine room structure is to be examined. Particular attention being given to tank tops, shell plating in way of tank tops, brackets connecting side shell frames and tank tops and engine room bulkheads in way of tank tops and bilge wells. Where excessive areas of wastage are found, thickness measurements are to be carried out and renewals of repairs made when wastage exceeds allowable limits.

3.4.6.17 The attachment to the structure and condition of anodes in tanks is to be examined.

3.4.6.18 Where fitted, the strums of the cargo suction pipes are to be removed or lifted to facilitate examination of the shell plating and bulkheads in the vicinity, unless other means for visual inspection of these parts are provided.

3.4.6.19 The loading instrument is to be checked for accuracy by applying test load conditions in presence of the Surveyor.

3.4.6.20 Examination of accommodation ladders, gangways and their winches are to be carried out as required for annual surveys. In addition, the accommodation ladders and gangways are to be operationally, tested with the specified maximum operation load.

The tests are to be carried out with the load applied as uniformly as possible along the length of the accommodation ladder or gangway, at an angle of inclination corresponding to the maximum bending moment on the accommodation ladder or gangway.

Accommodation ladder winch is to be operationally tested at special surveys. The brake system of the winch is to be tested for holding the maximum operational load on the ladder.

For existing installations on board ships constructed prior to 01 Jan 2010 where the maximum operational load is not known, load nominated by the shipowner or operator may be considered as the test load.

3.4.7 Extent of tank testing

3.4.7.1 The minimum requirements for tank testing for oil tankers (including ore/oil and ore/bulk/oil ships) in the cargo area are given in Table 3.4.7.1.

Table 3.4.7.1 : Table of minimum requirements for tank testing at special survey of oil tankers, ore/oil ships and ore/bulk/oil ships (including double hull oil tankers)

Special Survey No. I Age ≤ 5	Special Survey No. II and subsequent Age > 5
1 All ballast tank boundaries	1 All ballast tank boundaries
2 Cargo tank boundaries facing ballast tanks, void spaces, pipe tunnels, pump rooms or cofferdams	2 All Cargo tank bulkheads

3.4.7.2 All double bottom and peak tanks are to be tested in addition. The Surveyor may extend the tank testing as deemed necessary.

3.4.7.3 Boundaries of ballast tanks are to be tested with a head of liquid to the top of air pipes. Boundaries of cargo tanks are to be tested to the highest point that liquid will rise under service conditions.

3.4.7.4 Boundaries of fuel oil, lub.oil and fresh water tanks are to be tested with a head of

liquid to the highest point that liquid will rise under service conditions. Tank testing of fuel oil, lub.oil and fresh water tanks may be specially considered based on a satisfactory external examination of the tank boundaries and a confirmation from the Master stating that the pressure testing has been carried out according to the requirement with satisfactory results

3.4.7.5 For double hull oil tankers the testing of double bottom tanks and other spaces not designed for the carriage of liquid may be omitted, provided a satisfactory internal examination together with an examination of the tank top is carried out.

3.4.7.6 Cargo tank testing carried out by the ship's crew under the direction of the Master may be accepted by the surveyor provided the following conditions are complied with:

a) the tank testing procedure, specifying fill heights, tank being filled and bulkheads being tested, taking into account the guidelines provided in the ESP Planning document, has been submitted by the owner and reviewed by IRS prior to the testing being carried out;

b) the tank testing is carried out prior to overall survey and close-up survey;

c) the tank testing is carried out within the special survey window and not more than 3 months prior to the date on which the overall and close up survey is completed;

d) the tank testing has been satisfactorily carried out and there is no record of leakage, distortion or substantial corrosion that would affect the structural integrity of the tank;

e) the satisfactory results of the testing is recorded in the vessel's logbook; and

f) the internal and external condition of the tanks and associated structure are found satisfactory by the surveyor at the time of the overall and close up survey.

3.4.8 Close-up survey requirements

3.4.8.1 The minimum requirements for Close-up Surveys at Special Survey are given in Table 3.4.8.1a and Table 3.4.8.1b as applicable.

3.4.8.2 The Surveyor may extend the Close-up Survey as deemed necessary taking into account the maintenance of the tanks under survey, the condition of the corrosion prevention system and also in the following cases:

a) In particular, tanks having structural arrangements or details which have suffered defects on similar tanks or on similar ships according to available information.
b) In tanks which have structures approved with reduced scantlings due to an approved corrosion control system.

3.4.8.3 For areas in tanks where coatings are found to be in a GOOD condition, the extent of Close-up Surveys according to Tables 3.4.8.1a and Table 3.4.8.1b may be specially considered by the Surveyor.

Table 3.4.8.1a : Minimum requirements to close-up surveys at special survey of oil tankers, ore/oil ships, ore/bulk/oil ships other than double hull oil tankers

Special Survey No. I **Age ≤ 5**	**Special Survey No. II** **5 < Age ≤ 10**	**Special Survey No. III** **10 < Age ≤ 15**	**Special Survey No. IV and subsequently** **Age > 15**
A) One Web Frame Ring - in a ballast wing tank, if any, or a cargo wing tank used primarily for water ballast	**A) All Web Frame Rings** - in a ballast wing tank, if any, or a cargo wing tank, used primarily for water ballast	**A) All Web Frame Rings** - in all ballast tanks	As Special Survey No.3
B) One Deck Transverse - in a cargo oil tank	B) **One Deck Transverse** - in each of the remaining ballast tanks, if any	**A) All Web Frame Rings** - in a cargo wing tank	Additional transverses as deemed necessary by the Surveyor
D) **One Transverse Bulkhead** - in a ballast tank	B) **One Deck Transverse** - in a cargo wing tank	**A)**. A minimum of 30% of web frame rings [1)] in each remaining cargo wing tank	
D) **One Transverse Bulkhead** - in a cargo oil wing tank	B) **One Deck Transverse** - in two cargo centre tanks	**C) All Transverse Bulkheads** - in all cargo and ballast tanks	
D) **One Transverse Bulkhead** - in a cargo oil centre tank	C) **Both Transverse Bulkheads** - in a wing ballast tank, if any, or a cargo wing tank used primarily for water ballast	**E**) A minimum of 30% of deck and bottom transverses [1)] including adjacent structural members in each cargo centre tank	
	D) **One Transverse Bulkhead** - in each remaining ballast tank	**F)** As considered necessary by the Surveyor	
	D) **One Transverse Bulkhead** - in a cargo oil wing tank D) **One Transverse Bulkhead** - in two cargo centre tanks		

A) Complete transverse web frame ring including adjacent structural members

B) Deck transverse including adjacent deck structural members

C) Transverse bulkhead complete - including girder system and adjacent members

D) Transverse bulkhead lower part - including girder system and adjacent structural members

E) Deck and bottom transverse including adjacent structural members

F) Additional complete transverse web frame ring

Note : 1) The 30% is to be rounded up to the next whole integer.

Table 3.4.8.1b : Minimum requirements for close-up survey at special survey of Double Hull Oil Tankers			
Special Survey No. I Age ≤ 5	**Special Survey No. II 5 < Age ≤ 10**	**Special Survey No. III 10 < Age ≤ 15**	**Special Survey No. IV and subsequently Age > 15**
One web frame **(1)**, in a complete ballast tank (see Note 1)	All web frames **(1)**, in a complete ballast tank (see Note 1) The knuckle area and the upper part (5 metres approximately) of one web frame in each remaining ballast tank **(6)**	All web frames **(1)**, in all ballast tanks	As for Special Survey for age from 10 to 15 years Additional transverse areas as deemed necessary by IRS
One deck transverse, in a cargo oil tank **(2)**	One deck transverse, in two cargo oil tanks **(2)**	All web frames **(7)**, including deck transverse and cross ties, if fitted, in a cargo oil tank One web frame **(7)**, including deck transverse and cross ties, if fitted, in each remaining cargo oil tank	
One transverse bulkhead **(4)**, in a complete ballast tank (see Note 1)	One transverse bulkhead **(4)**, in each complete ballast tank (see Note 1)	All transverse bulkheads, in all cargo oil **(3)** and ballast **(4)** tanks	
One transverse bulkhead **(5)** in a cargo oil centre tank One transverse bulkhead **(5)**, in a cargo oil wing tank (see Note 2)	One transverse bulkhead **(5)**, in two cargo oil centre tanks One transverse bulkheads **(5)**, in a cargo oil wing tank (see Note 2)		

(1), (2), (3), (4), (5), (6) and **(7)** are areas to be subjected to close-up surveys and thickness measurements (see Fig.3.4.8).

(1) : Web frame in a ballast tank means vertical web in side tank, hopper web in hopper tank, floor in double bottom tank and deck transverse in double deck tank (where fitted), including adjacent structural members. In fore and aft peak tanks web frame means a complete transverse web frame ring including adjacent structural members.

(2) : Deck transverse, including adjacent deck structural members (or external structure on deck in way of the tank, where applicable).

(3) : Transverse bulkhead complete in cargo tanks, including girder system, adjacent structural members (such as longitudinal bulkheads) and internal structure of lower and upper stools, where fitted.

(4) : Transverse bulkhead complete in ballast tanks, including girder system and adjacent structural members, such as longitudinal bulkheads, girders in double bottom tanks, inner bottom plating, hopper side, connecting brackets.

(5) : Transverse bulkhead lower part in cargo tank, including girder system, adjacent structural members (such as longitudinal bulkheads) and internal structure of lower stool, where fitted.

(6) : The knuckle area and the upper part (5 metres approximately), including adjacent structural members. Knuckle area is the area of the web frame around the connections of the slope hopper plating to the inner hull bulkhead and the inner bottom plating, upto 2 metres from the corners both on the bulkhead and the double bottom.

(7) : Web frame in a cargo oil tank means deck transverse, longitudinal bulkhead structural elements and cross ties, where fitted, including adjacent structural members.

Note 1 : Ballast tank : Apart from the fore and aft peak tanks, the term “ballast tank” has the following meaning:

.1 all ballast compartments (hopper tank, side tank and double-deck tank, if separate from double-bottom tank) located on one side, i.e. portside or starboard side, and additionally double-bottom tank on portside plus starboard side, when the longitudinal central girder is not watertight and, therefore, the doublebottom tank is a unique compartment from portside to starboard side; or

.2 all ballast compartments (double-bottom tank, hopper tank, side tank and double-deck tank) located on one side, i.e. portside or starboard side, when the longitudinal central girder is watertight and, therefore, the portside double-bottom tank separate from the starboard-side double-bottom tank.

Note 2 : Where no centre cargo tanks are fitted (as in the case of centre longitudinal bulkhead), transverse bulkheads in wing tanks are to be surveyed.

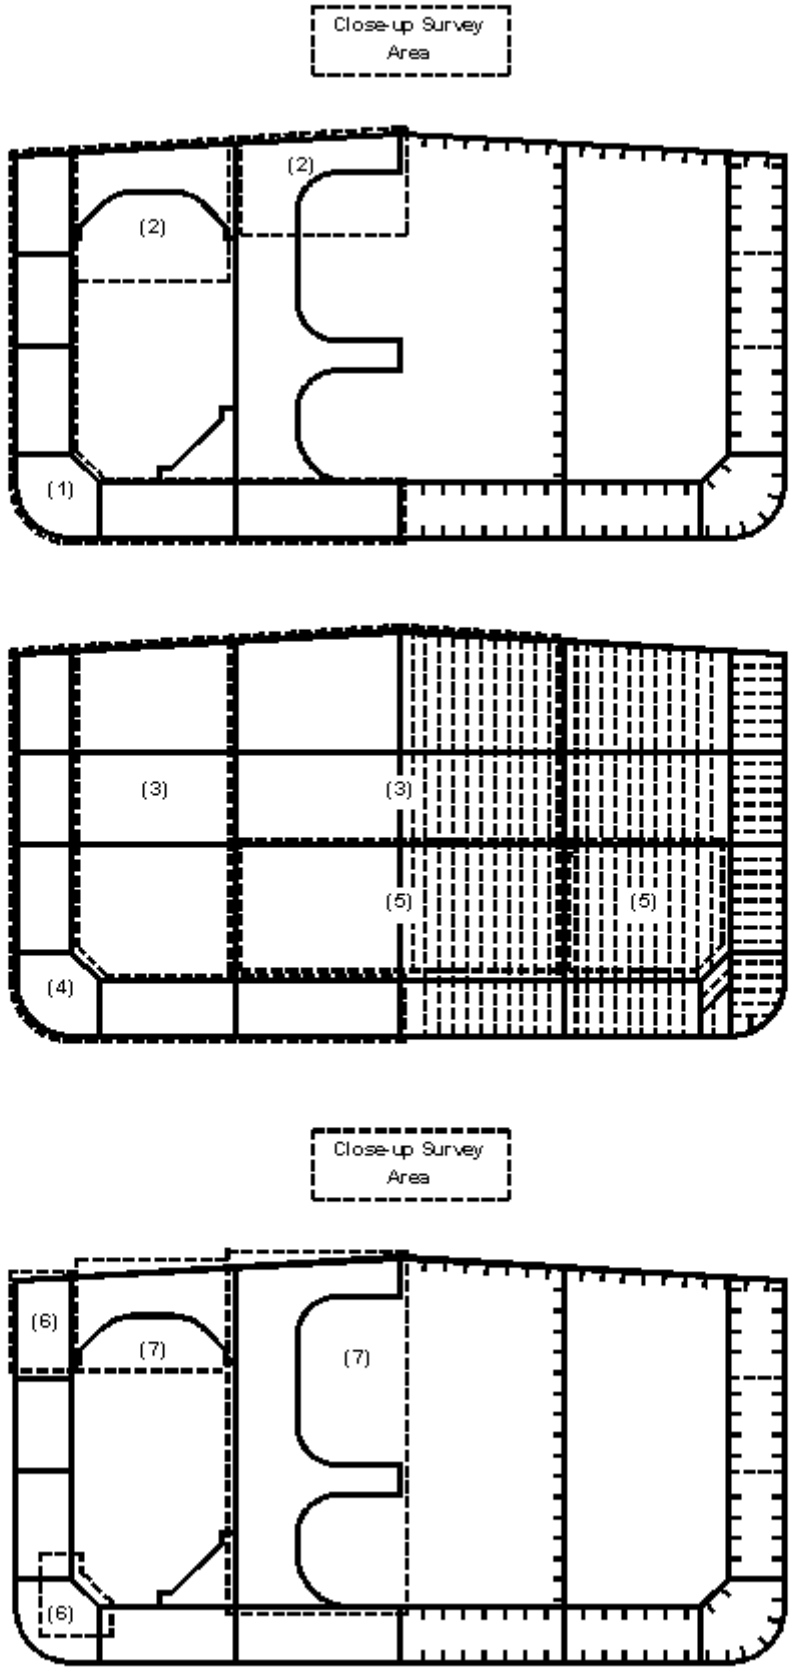

Fig.3.4.8 : Close-up survey requirements for double hull oil tankers areas (1) to (7)

3.4.9 Thickness measurement

3.4.9.1 The minimum requirements for thickness measurements at Special Survey are given in Table 3.4.9.1.

3.4.9.2 Provisions for extended measurements for areas with Substantial Corrosion in case of Oil Tankers, Ore/oil and Ore/Bulk/Oil Ships are given in Table 3.4.9.2a) and Table 3.4.9.2b).

For vessels built under IACS Common Structural Rules, the identified substantial corrosion areas are required to be examined and additional thickness measurements are to be carried out at annual and intermediate surveys.

The Surveyor may further extend the thickness measurements as deemed necessary.

3.4.9.3 In cases where two or three sections are to be measured in Oil Tankers, Ore/oil and Ore/Bulk/Oil Ships at least one is to include a Ballast Tank within 0.5L amidships.

Transverse sections are to be chosen where the largest reductions are suspected to occur or are revealed from deck plating measurements.

3.4.9.4 The thickness measurements are to be carried out by a qualified firm certified by IRS.

3.4.9.5 In order to ensure necessary control during the process of thickness measurements these are normally to be carried out under the supervision of the Surveyor. The Surveyor has the right to re-check the measurements as deemed necessary to ensure acceptable accuracy.

3.4.9.6 In all cases the extent of thickness measurements is to be sufficient as to represent the actual average condition.

3.4.9.7 A thickness measurement report is to be prepared. The report is to give the location of measurements, the thickness measured as well as corresponding original thickness. Furthermore, the report is to give the date when the measurements were carried out, type of measuring equipment, names of personnel and their qualifications and has to be signed by the operator. The Surveyor is to review the report of the final thickness measurement after repairs have been carried out and countersign the cover page.

Table 3.4.9.1 : Table of minimum requirements to thickness measurements at special survey of oil tankers, ore/oil ships and ore/bulk/oil ships (including double hull oil tankers)

Special Survey No. I Age ≤ 5	Special Survey No. II 5 < Age ≤ 10	Special Survey No. III 10 < Age ≤ 15	Special Survey No. IV and subsequently Age > 15
1) Suspect areas throughout the vessel	1) Suspect areas throughout the vessel	1) Suspect areas throughout the vessel	1) Suspect areas throughout the vessel
2) Within the cargo area: One section of deck plating for the full beam of the ship (in way of a ballast tank, if any, or a cargo tank used primarily for water ballast) (See Note 1)	2) Within the cargo area: a) Each deck plate b) One Transverse section	2) Within the cargo area: a) Each deck plate b) Two Transverse sections c) All wind and water strakes	2) Within the cargo area: a) Each deck plate b) Three Transverse sections c) All wind and water strakes d) Each bottom plate
3) Measurements of structural members subject to close-up survey according to Table 3.4.8.1a, for general assessment and recording of corrosion pattern(See Note 1)	3) Measurements of structural members subject to close-up survey according to Table 3.4.8.1a and Table 3.4.8.1b, for general assessment and recording of corrosion pattern	3) Measurements of structural members subject to close-up survey according to Table 3.4.8.1a and Table 3.4.8.1b, for general assessment and recording of corrosion pattern	3) Measurements of structural members subject to close-up survey according to Table 3.4.8.1a and Table 3.4.8.1b, for general assessment and recording of corrosion pattern

Table 3.4.9.1 (Contd.)

Special Survey No. I Age ≤ 5	Special Survey No. II 5 < Age ≤ 10	Special Survey No. III 10 < Age ≤ 15	Special Survey No. IV and subsequently Age > 15
	4) Selected wind and water strakes outside the cargo area	4) Selected wind and water strakes outside the cargo area	4) All wind and water strakes outside the cargo area
		5) Internals in forepeak and after peak ballast tanks	5) Internals in forepeak and after peak ballast tanks
			6) All exposed main deck plating outside cargo area
			7) Representative exposed superstructure deck plating (poop, bridge, forecastle deck)
			8) All keel plates, additional bottom plates in way of machinery space, aft end of tanks and cofferdams outside cargo area
			9) a) Plating of sea chests. b) Shell plating in way of overboard discharges as considered necessary by the Surveyor.

Note:

1. Not applicable to Double Hull Oil Tankers

Table 3.4.9.2a : Requirements for extent of thickness measurement on areas of substantial corrosion in oil tankers, ore/oil ships and ore/bulk/oil ships other than double hull oil tankers

Structural Member		Extent of Measurement	Pattern of Measurement
Bottom Structure			
1	Bottom plating	Minimum of 3 bays across tank including aft bay. Measurements around and under all bell mouths	5 point pattern between stiffeners over 1 metre in length
2	Bottom longitudinal	Minimum of 3 longitudinals in each bay where bottom plating measured	3 measurements in line across flange and 3 measurements on vertically web
3	Bottom girders and brackets	At fore and after transverse bulkhead bracket toes and in centre of tanks	Vertical line of single measurements on web plating with one measurement between each panel stiffener, or a minimum of three measurements. Two measurements across face flat. 5 point pattern on girder/bulkhead brackets
4	Bottom transverse webs	3 webs in bays where bottom plating measured, with measurements at both ends and middle	5 point pattern over 2 square metre area. Single measurements on face flat
5	Panel stiffening	Where provided	Single measurements

Table 3.4.9.2a (Contd.)

Structural Member		Extent of Measurement	Pattern of Measurement
Deck Structure			
1	Deck plating	Two bands across tank	Minimum of three measurements per plate per band
2	Deck longitudinals	Minimum of 3 longitudinals in each of two bays	3 measurements in line vertically on webs and 2 measurements on flange (if fitted)
3	Deck girders and brackets	At fore and after transverse bulkhead bracket toes and in centre of tanks	Vertical line of single measurements on web plating with one measurement between each panel stiffener, or a minimum of three measurements. Two measurements across face flat. 5 point pattern on girder/bulkhead brackets
4	Deck transverse webs	Minimum of two webs with measurements at middle and both ends of span	5 points pattern over 2 square metre area. Single measurements on face flat
5	Panel stiffening	Where provided	Single measurements
Shell and Longitudinal Bulkheads			
1	Deckheads and bottom strakes and strakes in way of stringer platforms	Plating between each pair of longitudinals in a minimum of 3 bays	Single measurement
2	All other strakes	Plating between every 3rd pair of longitudinals in same 3 bays	Single measurement
3	Longitudinals - deckhead and bottom strakes	Each longitudinal in same 3 bays	3 measurements across web and 1 measurement on flange
4	Longitudinals - all others	Every 3rd longitudinal in same 3 bays	3 measurements across web and 1 measurement on flange
5	Longitudinals - brackets	Minimum of 3 at top, middle and bottom of tank in same 3 bays	5 point pattern over area of bracket
6	Web frames and cross ties	3 webs with minimum of three locations on each web, including in way of cross tie connections	5 points pattern over about 2 sq. metre area, plus single measurements on web frame and across tie face flats
Transverse Bulkheads and Swash Bulkheads			
1	Deckhead and bottom strakes and strakes in way of stringer platforms	Plating between pair of stiffeners at three locations - approx. 1/4, 1/2 and 3/4 width of tank	5 points pattern between stiffeners over 1 metre length
2	All other strakes	Plating between pair of stiffeners at middle location	Single measurement
3	Strakes in corrugated bulkheads	Plating for each change of scantling at centre of panel and at flange or fabricated connection	5 point pattern over about 1 sq. metre of plating
4	Stiffeners	Minimum of three typical stiffeners	For web, 5 point pattern over span between bracket connections (2 measurements across web at each bracket connection and one at centre of span). For flange, single measurements at each bracket toe and at centre of span
5	Brackets	Minimum of three at top, middle and bottom of tank	5 point pattern over areas of bracket
6	Deep webs and girders	Measurements at toe of bracket and at centre of span	For web, 5 point pattern over about 1 sq. metre. 3 measurements across face flat
7	Stringer platforms	All stringers with measurements at both ends and middle	5 point pattern over 1 sq. metre of area plus single measurements near bracket toes and on face flats

Table 3.4.9.2b : Requirements for extent of thickness measurements at those areas of substantial corrosion - Special Survey of Double Hull Oil Tankers

Structural Member		Extent of Measurement	Pattern of Measurement
Bottom, Inner Bottom and Hopper Structure			
1	Bottom, inner bottom and hopper structure plating	Minimum of 3 bays across double bottom tank including aft bay.	5 point pattern for each panel between longitudinals and floors
		Measurements around and under all suction bell mouths	
2	Bottom, inner bottom and hopper structure longitudinals	Minimum of 3 longitudinals in each bay where bottom plating measured	3 measurements in line across flange and 3 measurements on vertical web
3	Bottom girders, including the watertight ones	At fore and aft watertight floors and in centre of tanks	Vertical line of single measurements on girder plating with one measurement between each panel stiffener, or a minimum of three measurements
4	Bottom floors, including the watertight ones	3 floors in bays where bottom plating measured, with measurements at both ends and middle	5 points pattern over 2 square metre area
5	Hopper structure web frame ring	3 floors in bays where bottom plating measured	5 point pattern over one square metre of plating. Single measurements on flange
6	Hopper structure transverse watertight bulkhead or swash bulkhead	Lower 1/3 of bulkhead	5 point pattern over two square metre of plating
		Upper 2/3 of bulkhead	5 point pattern over two square metre of plating
		Stiffeners (minimum of three)	For web, 5 point pattern over span (two measurements across web at each end and one at centre of span). For flange, single measurements at each end and centre of span
7	Panel stiffening	Where provided	Single measurements
Deck Structure			
1	Deck plating	Two transverse bands across tank	Minimum of three measurements per plate per band
2	Deck longitudinals	Every third longitudinal in each of two bands with a minimum of one longitudinal	3 measurements in line vertically on webs and 2 measurements on flange (if fitted)
3	Deck girders and brackets (usually in cargo tanks only)	At fwd and aft transverse bulkhead, bracket toes and in centre of tanks	Vertical line of single measurements on web plating with one measurement between each panel stiffener, or a minimum of three measurements. Two measurements across flange. 5 point pattern on girder/bulkhead brackets
4	Deck transverse webs	Minimum of two webs with measurements at both ends and middle of span	5 points pattern over one square metre area. Single measurements on face flat
5	Vertical web and transverse bulkhead in wing ballast tank (two metres from deck)	Minimum of two webs and both transverse bulkheads	5 point pattern over one square metre area
6	Panel stiffening	Where applicable	Single measurements

Table 3.4.9.2b (Contd.)

	Structural Member	Extent of Measurement	Pattern of Measurement
Structure in Wing Ballast Tanks			
1	Side shell and longitudinal bulkhead plating: - Upper strake and strakes in way of horizontal girders - All other strakes	 - Plating between each pair of longitudinals in a minimum of 3 bays (along the tank) - Plating between every third pair of longitudinals in same 3 bays	 - Single measurement - Single measurement
2	Side shell and longitudinal bulkhead longitudinals on: - Upper strake - All other strakes	 - Each longitudinal in same 3 bays - Every third longitudinal in same 3 bays	 - 3 measurements across web and 1 measurement one flange - 3 measurements across web and 1 measurement on flange
3	Longitudinals - brackets	Minimum of three at top, middle and bottom of tank in same three bays	5 point pattern over area of bracket
4	Vertical web and transverse bulkheads (excluding deckhead area): - Strakes in way of horizontal girders - Other strakes	 - Minimum of two webs and both transverse bulkheads - Minimum of two webs and both transverse bulkheads	 - 5 point pattern over approx. two square metre area - two measurements between each pair of vertical stiffeners
5	Horizontal girders	Plating on each girder in a minimum of three bays	2 measurements between each pair of longitudinal girder stiffeners
6	Panel stiffening	Where applicable	Single measurements
Longitudinal Bulkheads in Cargo Tanks			
1	Deckheads and bottom strakes and strakes in way of the horizontal stringer of transverse bulkheads	Plating between each pair of longitudinals in a minimum of 3 bays	Single measurement
2	All other strakes	Plating between every 3rd pair of longitudinals in same 3 bays	Single measurement
3	Longitudinals on deckhead and bottom strakes	Each longitudinal in same 3 bays	3 measurements across web and 1 measurement on flange
4	All other longitudinals	Every third longitudinal in same three bays	3 measurements across web and 1 measurement on flange
5	Longitudinals - brackets	Minimum of 3 at top, middle and bottom of tank in same 3 bays	5 point pattern over area of bracket
6	Web frames and cross ties	3 webs with minimum of three locations on each web, including in way of cross tie connections	5 points pattern over approximately 2 sq. metre area of webs, plus single measurements on flanges of web frame and cross ties
7	Lower end brackets (opposite side of web frame)	Minimum of three brackets	5 points pattern over approximately 2 sq. metre area of brackets, plus single measurements on bracket flanges
Transverse Watertight and Swash Bulkheads in Cargo Tanks			
1	Upper and lower stool, where fitted	- Transverse band within 25 mm of welded connection to inner bottom/deck plating - Transverse band within 25 mm of welded connection to shelf plate	5 point pattern between stiffeners over one metre length
2	Deckhead and bottom strakes and strakes in way of horizontal stringers	Plating between pair of stiffeners at three locations - approx. 1/4, 1/2 and 3/4 width of tank	5 points pattern between stiffeners over 1 metre length
3	All other strakes	Plating between pair of stiffeners at middle location	Single measurement
4	Strakes in corrugated bulkheads	Plating for each change of scantling at centre of panel and at flange of fabricated connection	5 point pattern over about 1 sq. metre of plating

Table 3.4.9.2b (Contd.)			
Structural Member		**Extent of Measurement**	**Pattern of Measurement**
5	Stiffeners	Minimum of three typical stiffeners	For web, 5 point pattern over span between bracket connections (2 measurements across web at each bracket connection and one at centre of span). For flange, single measurements at each bracket toe and at centre of span
6	Brackets	Minimum of three at top, middle and bottom of tank	5 point pattern over areas of bracket
7	Horizontal stringer	All stringers with measurements at both ends and middle	5 point pattern over 1 sq. metre of area plus single measurements near bracket toes and on flange

3.4.10 Reporting and evaluation of survey

3.4.10.1 The data and information on the structural condition of the vessel collected during the survey is to be evaluated for acceptability and continued structural integrity of the vessel.

3.4.10.2 In case of oil tankers of 130 [m] in length and upwards (as defined in ILLC), the ship's longitudinal strength is to be evaluated using the thickness of the structural members measured, renewed, reinforced, as appropriate, during the renewal survey of cargo ship safety construction certificate or the cargo ship safety certificate carried out after the ship reached 10 years of age in accordance with the criteria for longitudinal strength of the ship's hull girder

3.4.10.3 Where any structural renewal or reinforcement work is carried out as a result of the initial evaluation of the ship's longitudinal strength as required by 3.4.10.2, the final result of the evaluations is to be included as a part of the Executive hull summary.

3.4.10.4 An Executive Hull Summary of the survey and results is to be issued to the Owner and placed on board the vessel for reference at future surveys. The Executive Hull Summary is to be endorsed by IRS Head Office.

3.4.11 Watertight Cable Transits

3.4.11.1 The requirements for Special Survey may be undertaken by the attending Surveyor or by a firm approved as a service supplier according to Pt.1 Ch.1, Sec 1.9.

3.4.11.2 All transits are to be examined to confirm their satisfactory condition and the Cable Transit Seal System Register is to be reviewed to confirm that it is being maintained. The Special Survey is to be recorded in the Register, in which a single record entry will be sufficient to record the survey of all transits.

3.4.11.3 From review of the Register, where there are records entered since the last special survey of any disruption to the cable transits or installation of new cable transits (except which are reviewed and examined at previous annual surveys), the satisfactory condition of those transits is to be confirmed by the attending Surveyor by review of records and examination of the transits; the results are to be recorded in the Register against each of those cable transits.

3.4.11.4 In case the cable transits have been examined by an approved service supplier, the attending surveyor is to review the Register in order to ascertain that it has been properly maintained by the owner and correctly endorsed by the service supplier.

3.5 Special Surveys - Machinery

3.5.1 Requirements for examination of machinery and systems are given in Sec.8.

3.6 Survey Requirements for vessels carrying Asphalt in Integral tanks

3.6.1 General

3.6.1.1 In addition to the relevant requirements in subsection 3.1 to 3.5 (as applicable), the following requirements are applicable to vessels with class notation**:**

OIL TANKER, ESP, ASPHALT CARRIER (INTEGRAL TANK, MAX. CARGO TEMP ≤ XXX℃)

3.6.2 Annual Surveys

3.6.2.1 Hull

.1 The Survey is to include:

a) confirmation that wheelhouse doors and windows, side scuttles and windows in superstructure and deckhouse ends facing the cargo area are in satisfactory condition

3.6.2.2 Cargo Machinery

.1 The survey is to include:

a) confirmation that electrical equipment in cargo pump rooms and other spaces is in satisfactory condition and has been properly maintained

b) confirmation that the remote operation of the cargo pump room bilge system is satisfactory

c) examination of the cargo heating system (Refer Sec 16)

d) examination of the cargo-transfer arrangement and confirmation that any hoses are suitable for their intended purpose

e) confirmation that devices provided for measuring the temperature of the cargo, if any, operate satisfactorily.

3.6.3 Intermediate Surveys

3.6.3.1 The survey (in addition to Annual Survey Requirements) is to include:

a) examination, so far as is possible, bunker, ballast, steam and vent piping systems. If upon examination, there is any doubt as to the condition of the piping, pressure testing and/ or, thickness measurement may be required.

3.6.4 Special Surveys

3.6.4.1 The Survey (in addition to the Intermediate Survey Requirements) is to include:

.1 All safety valves on cargo piping and of cargo tanks are to be dismantled for examination, adjusted and, as applicable, resealed.

.2 A general examination of all cargo pump room boundaries is to be carried out. All gas-tight shaft-sealing devices are to be examined. The bottom of cargo pump rooms is to be presented clean for the examination of stripping devices and gutters.

.3 Ballast and stripping pumps are to be internally examined and their prime movers checked. A functional test of the pumps is to be carried out. Maintenance records of cargo pumps are to be made available to the Surveyor.

.4 The satisfactory condition of the cargo heating system including clamping and piping is to be verified and, the system is to be pressure tested, if deemed necessary by the Surveyor.

3.7 Survey Requirements for vessels carrying Asphalt in Independent tanks

3.7.1 General

3.7.1.1 In addition to the relevant requirements in subsection 3.1 to 3.5 (as applicable), the following requirements are applicable to vessels with class notation**:**

OIL TANKER, ASPHALT CARRIER (INDEPENDENT TANK, MAX. CARGO TEMP ≤ XXX°C)

3.7.1.2 ESP requirements are not applicable to these vessels. Accordingly, hull survey requirements, for the cargo region, in sub-section 3.1 to 3.5 are not applicable to such vessels. In general, hull surveys are to be carried out in accordance with the requirements in Section 6 for “other ship types’.

3.7.1.3 Requirements in 3.6.2 to 3.6.4 are also to be complied with, for these vessels.

3.7.2 Independent Cargo Tanks

3.7.2.1 Annual Survey

.1 The survey is to include, as far as practicable, a general external examination of the structure surrounding the independent cargo tanks for damage, cracks or wastage, including the thermal isolating material and elements supporting and/ or securing the cargo tanks.

3.7.2.2 Special Survey

.1 All independent cargo tanks are to be internally examined including internal mountings and equipment. The tanks are to be thoroughly cleaned and made gas-free before entry, and all precautions are to be taken to ensure safety during examination.

.2 Foundations, chocks, sway braces and anti-flotation arrangements are to be examined.

.3 Venting systems for the cargo containment systems are to be examined. All relief valves are to be opened, examined, tested, and readjusted as necessary. Liquid-level indicators are to be proven to be satisfactory. Where a proper record of continuous overhaul and retesting of individually identifiable relief valves is maintained, consideration will be given to acceptance on the basis of opening, internal examination, and testing of a representative sampling of valves including each size of each type of relief valve in use, provided there is logbook evidence that the remaining valves have been overhauled and tested since the crediting of the previous Special Survey. The testing and setting of relief valves may be carried out in-situ or after removal.

.4 All piping, machinery, and equipment for loading, venting, heating or otherwise handling the cargo are to be generally examined. All valves in the cargo piping systems are to be examined and tested.

.5 Insulation is to be removed in way of any distorted or suspect part in the cargo containment system and elsewhere, as required by the Surveyor. Insulation may be required to be removed to carry out any survey, at the discretion of the Surveyor.

.6 Thickness gauging of the independent tank is to be carried as deemed necessary by the Surveyor.

.7 Tanks are to be tested with a head of liquid to the overflow or by an alternative method with the approval of the attending surveyor. Testing may be omitted if the tanks are found without corrosion and other damages and in acceptable condition.

.8 At Special Surveys after Special Survey No. 3, the plating of all independent cargo tanks (shell, heads, and domes) is to be thickness gauged.

Section 4

Surveys - Chemical Tankers

4.1 Scope

4.1.1 This section gives the requirements for periodical surveys of vessels which have been assigned the class notation:

Chemical Tanker ESP

For vessels which also carry products covered by the IGC Code it may be necessary in accordance with Pt.5, Ch.4, Sec.1 to apply the survey requirements given in Sec.5 of this chapter.

4.2 Annual surveys

4.2.1 General

4.2.1.1 Annual Surveys are to be carried out within 3 months before or after the anniversary date each year. (Also refer to Note 9 of Sec.1, Table 1.1.1). These should be held concurrently with statutory annual or other relevant statutory Surveys, where practicable.

4.2.1.2 At Annual Surveys, the Surveyor is to examine the hull and machinery, so far as necessary and practicable, in order to be satisfied as to their general condition.

4.2.1.3 Access to cargo tanks or other spaces within the cargo area, necessitating gas freeing will normally not be required unless necessary for checking items of equipment and installations for correct functioning.

4.2.1.4 It is to be confirmed that no new installation of material containing asbestos was carried out since last survey.

4.2.1.5 Where applicable, examination of alternative design and arrangement for

machinery or electrical installations or fire safety, in accordance with the test, inspection and maintenance requirements, if any, specified in the approved documentation is to be carried out.

4.2.2 Hull and weather deck

4.2.2.1 The survey is to consist of an examination for the purpose of ensuring, as far as practicable, that the hull, equipment, closing appliances and related piping are maintained in satisfactory and efficient condition and should take into account the service history, condition and extent of the corrosion prevention system of ballast tanks and areas identified in the survey report file. Special attention is to be paid to the following:

a) Weather decks, ships side plating above waterline.

b) Openings on freeboard and superstructure decks; exposed casings; skylights and fiddley openings; deck houses; companionways and superstructure bulkheads; side scuttles and dead lights; flush deck scuttles; ash shoots and other openings.

c) Weld connection between air pipes and deck plating; air pipe heads on exposed decks (external examination); ventilators and closing devices.

d) Watertight bulkheads and their penetrations as far as practicable.

e) Scuppers and sanitary discharges as far as practicable together with valves and their controls.

f) Guard rails, bulwarks, freeing ports, gangways, walkways and life lines.

g) Examination of cargo tank openings including gaskets, covers, coamings and flame screens.

h) Examination of cargo tank pressure/vacuum valves, secondary means to prevent over or under pressure and devices to prevent passage of flame and the arrangements of cargo tank purging with inert gas, as applicable.

i) Examination of devices to prevent the passage of flame on vents to all bunker, oily-ballast and oily-slop tanks and void spaces, as far as practicable.

j) Examination of cargo, bunker and vent piping systems, including vent masts and headers.

k) Verification that wheelhouse doors and windows, side scuttles and windows in superstructure and deckhouse ends facing the cargo area are in good condition.

4.2.2.2 Examination of pump room and pipe tunnel, if fitted:

a) Examination of all pump room bulkheads for signs of chemical leakage or fractures and in particular, the sealing arrangements of all penetrations of pump room bulkheads.

b) Examination of the condition of all piping systems.

4.2.2.3 All watertight doors in watertight bulkheads, to be examined and tested (locally and remotely) as far as practicable.

4.2.2.4 Suspect areas identified at previous special or intermediate surveys are to be close-up surveyed. Thickness measurements are to be taken in the area of substantial corrosion identified at previous surveys.

4.2.2.5 Examination of Ballast Tanks is to be carried out when required as a consequence of the results of the Special Survey or Intermediate Survey. (See 4.4.5.1 and 4.3.3.3 respectively). When considered necessary by the Surveyor or where extensive corrosion is found, thickness measurement is to be carried out. When examination of ballast tanks reveals substantial corrosion, additional thickness measurements is to be carried out to the extent given in Table 4.4.9.2.

4.2.2.6 Anchoring and mooring equipment is to be examined as far as is practicable. A general examination of the emergency towing arrangements is to be carried out to ensure their ready availability. It is to be confirmed that the towing and mooring equipment is properly marked with any restriction associated with its safe operation

For vessels with single point mooring arrangements where 'SPM' notation is assigned, the following are to be generally examined:

a) Components of the single point mooring system (bow chain stoppers, bow

fairleads, pedestal roller fairleads, winches and capstans), to verify their satisfactory condition.

b) Hull structures supporting and adjacent to the components of the single point mooring system, to verify that there is no deformation or fracture.

4.2.2.7 Where applicable, Surveyor should satisfy himself regarding the freeboard marks on the ship's side.

4.2.2.8 The Surveyor is to confirm that, where required, an approved loading instrument together with its operation manual are available on board, See Pt.3, Ch.5. It is to be verified by the Surveyor that the loading instrument is checked for accuracy at regular intervals by the ship's staff by applying test loading conditions.

4.2.2.9 Accommodation ladders are to be examined at annual surveys. Satisfactory condition of the following items is to be checked, in particular :

a) steps;
b) platforms;
c) all support points such as pivots, rollers, etc.;
d) all suspension points such as lugs, brackets, etc.;
e) stanchions, rigid handrails, hand ropes and turntables;
f) davit structure, wire and sheaves, etc.

4.2.2.10 Access to bow arrangements are to be examined. Gangways are to be examined at annual surveys. Satisfactory condition of the following items is to be checked, in particular :

a) treads;

b) side stringers, cross-members, decking, deck plates, etc.;

c) all support points such as wheel, roller, etc.;

d) stanchions, rigid handrails, hand ropes.

4.2.2.11 Winches of accommodation ladders and gangways are to be examined to verify the satisfactory condition of the following items:

a) brake mechanism including condition of brake pads and band brake, if fitted;

b) remote control system, and

c) power supply system for electric motor.

4.2.2.12 Davits and fittings on the ship's deck associated with accommodation ladders and gangways are to be examined for satisfactory condition at annual surveys. Fittings or structures for means of access to deck such as handholds in a gateway or bulwark ladder and stanchions are also to be examined.

4.2.2.13 The maintenance and inspection records of accommodation ladders and gangways are to be verified. It is to be confirmed that supporting wires are being renewed at intervals not exceeding 5 years.

4.2.2.14 When examining internal spaces, as far as practicable, the permanent means of access where appropriate, are to be verified that they remain in good condition.

4.2.2.15 For vessels subject to IMO PSPC (See Pt.3, Ch.2, 3.6) it is to be confirmed that the maintenance, repair and partial re-coating of dedicated ballast tanks, as appropriate, are recorded in the coating technical file.

4.2.2.16 Watertight cable transit seal systems register is to be reviewed to confirm that it is being maintained and as far as practicable the transits are to be examined to confirm their satisfactory condition. Where there are records entered since last annual survey of any disruption to the cable transits or installation of new cable transits, the satisfactory condition of those transits is to be confirmed by review of records and, if deemed necessary, by examination. The results are to be recorded in the Register against the specific cable transit.

4.2.2.17 In case the cable transits have been examined by an approved service supplier, the attending surveyor is to review the Register in order to ascertain that it has been properly maintained by the owner and correctly endorsed by the service supplier.

4.2.3 Machinery and systems

4.2.3.1 A general examination of the machinery, boilers, all pressurised systems (steam, pneumatic, hydraulic) and their associated fittings, propulsion system and auxiliary machinery to see whether they are being properly maintained and with particular attention to the fire and explosion hazards.

4.2.3.2 Confirmation that machinery, boilers and other pressure vessels, associated piping systems and fittings are so installed and protected as to reduce to a minimum any danger to persons on board, due regard being given to moving parts, hot surfaces and other hazards.

4.2.3.3 Confirmation that Periodical Surveys of boilers and other pressure vessels have been carried out as required by the Rules and the safety devices have been tested.

4.2.3.4 Confirmation that the normal operation of the propulsion machinery can be sustained or restored even though one of the essential auxiliaries becomes inoperative.

4.2.3.5 Confirmation that means are provided so that machinery can be brought into operation from the dead ship condition without external aid.

4.2.3.6 All main and auxiliary steering arrangements and their associated equipment and control systems are to be examined and tested. Where applicable, Surveyors are to verify that log entries have been made in accordance with statutory requirements.

4.2.3.7 Confirming, when appropriate, that requisite arrangements to regain steering capability in the event of the prescribed single failure are being maintained.

4.2.3.8 Steering chains are to be cleaned for ascertaining wear and tear and lengths of chain worn in mean diameter by more than 12 per cent of the original rule diameter are to be renewed.

4.2.3.9 All the means of communication between the navigating bridge and the machinery control positions, as well as the bridge and the main alternative steering position, if fitted, are to be tested. It is to be confirmed that means of indicating the angular position of the rudder are operating satisfactorily.

4.2.3.10 Confirmation that with ships having emergency steering positions there are means of relaying heading information and, when appropriate, supplying visual compass readings to the emergency steering positions.

4.2.3.11 Confirmation that various alarms required for hydraulic power operated, electric and electro-hydraulic steering gears are, operating satisfactorily and that the recharging arrangements for hydraulic power operated steering gears are being maintained.

4.2.3.12 Examining the means for the operation of the main and auxiliary machinery essential for propulsion and the safety of the ship, including when applicable, the means of remotely controlling the propulsion machinery from the navigating bridge and the arrangements to operate the main and other machinery from a machinery control room.

4.2.3.13 Confirmation that the engine room telegraph, the second means of communication between the navigation bridge and the machinery space and the means of communication with any other positions from which the engines are controlled are operating satisfactorily.

4.2.3.14 Examination and testing of the general emergency alarm system and confirmation that the engineer's alarm is clearly audible in the engineer's accommodation.

4.2.3.15 It is to be confirmed that ballasting and de-ballasting arrangements are satisfactory. The bilge pumping systems and bilge wells including operation of each bilge pump, extended spindles and level alarms, where fitted, are to be examined as far as is practicable. It is also to be confirmed that bilge pumping system for each watertight compartment is satisfactory.

It is also to be confirmed that drainage from enclosed cargo spaces situated on freeboard deck is satisfactory.

4.2.3.16 Examining visually the condition of non-metallic expansion joints where fitted in piping systems which penetrate the ship's side, with both the penetration and the expansion joint located below the deepest load waterline, and checking the service record.

4.2.3.17 General examination visually and in operation, as feasible, of the main electrical machinery, the emergency sources of electrical power, the switch gear, other electrical equipment including the lighting system is to be carried out.

4.2.3.18 Confirmation as far as practicable, the operation of the emergency source(s) of electrical power, including their starting arrangement, the systems supplied, and when appropriate, their automatic operation.

4.2.3.19 Examining in general, that the precautions provided against shock, fire and other hazards of electrical origin are being maintained.

4.2.3.20 General Examination of automation equipment is to be carried out. Satisfactory operation of safety devices, bilge level detection and alarm systems and control systems is to be verified.

4.2.3.21 Examination so far as is possible of cargo, bilge, ballast and stripping pumps for excessive gland seal leakage, verification of proper operation of electrical and mechanical remote operating and shutdown devices and remote operation of pump room bilge system, and checking that pump foundations are intact.

4.2.3.22 Verification that installed pressure gauges on cargo discharge lines including those fitted outside the cargo pump room and level indicating systems are operational.

4.2.3.23 Verification that pumps, valves and pipelines are identified and distinctively marked.

4.2.3.24 Confirmation that machinery space ventilation systems are in good working condition.

4.2.3.25 Emergency lightning in all cargo pump rooms are to be examined.

4.2.3.26 For Ships constructed before 01 July 2017 and fitted with harmonic filters; following are to be verified at each survey:

a) Records of annual measurement of harmonic distortion levels of main bus bar under seagoing conditions and log entries showing which equipment was running and / or filters in service at the time of measurement. Harmonic distortion readings are to be carried out when the greatest amount of distortion is indicated by the measuring equipment.

b) Records of measurement of distortion levels, after any modification to the ship's electrical distribution system.

4.2.3.27 For Ships constructed on or after 01 July 2017 and fitted with harmonic filters; or for ships retrofitted with harmonic filters, on or after 01 July 2017; following are to be verified at each survey:

a) Engine log book containing distortion monitoring readings/ automatic records of same

b) Documentation of any approved relaxation on allowable distortion limits.

4.2.3.28 For ships contracted for construction on or after 01 Jan 2017 following are to be verified in emergency generator rooms at each survey:

a) Hand operated ventilation louvres, closing appliances, if fitted, are kept open and corresponding instruction plates are visible near the louvres.

b) Power operated ventilation louvres and closing appliances, if fitted, are fail-to-open type and capable of opening automatically whenever emergency generator is starting / in operation.

c) It is to be possible to close ventilation openings by a manual operation from a clearly marked safe position outside the space where the closing operation can be easily confirmed. Further, such closing is not possible from any other remote position. The louvre status (open/closed) is indicated at this position.

4.2.3.29 For vessels fitted with ICCP system, proper functioning of the system is to be checked and records of system operation are to be verified. It is to be verified that all maintenance as per manufacturer's instructions are carried out.

4.2.4 Fire protection, detection and extinction

4.2.4.1 The arrangements for fire protection, detection and extinction are to be examined and are to include confirmation that no changes have been made in the structural fire protection. Following are to be examined / verified:

a) verification that fire control plans are properly posted;

b) examination as far as possible and testing as feasible, any fire detection and alarm system and any sample extraction smoke detection system;

c) examination of the fire main system and verification that each fire pump including the emergency fire pump can be operated separately so that the two required powerful jets of water can be produced simultaneously from different hydrants at any part of the ship whilst the required pressure is maintained in the fire main;

d) verification that fire hoses, nozzles, applicators and spanners are in good working condition and situated at their respective locations;

e) examination of fire-fighting system (including fixed fire-fighting system for the machinery spaces) controls, piping, instructions and marking, checking for evidence of proper maintenance and servicing including date of last systems tests;

f) verification that all semi-portable and portable fire extinguishers are in their stowed positions, checking for evidence of proper maintenance and servicing, conducting random check for evidence of discharged containers;

g) verification, as far as practicable, that the remote controls for stopping fans and machinery in machinery spaces are in working order. Examination of the arrangements for oil fuel, lubricating oil and other flammable oils and testing the remote closing of valves for oil fuel, lubricating oil and other flammable oils and, the operation of the remote means of closing the valves on the tanks that contain oil fuel, lubricating oil and other flammable oils;

h) examination of the closing arrangements of ventilators, funnel annular spaces, skylights, doorways and tunnel, where applicable;

i) confirmation that the fire fighters' outfits including its self-contained compressed air breathing apparatus and emergency escape breathing devices (EEBDs) are complete and in good condition and that the cylinders, including the spare cylinders, of any required self-contained breathing apparatus are suitably charged and that on board means of recharging breathing apparatus cylinders used during drills or a suitable number of spare cylinders to replace those used are provided, and provision of two-way portable radiotelephone apparatus of an explosion-proof type or intrinsically safe;

j) examination of any manual and automatic fire doors and proving their operations;

k) Verification that the pump room ventilation system is operational, ducting intact, dampers operational and screens are clean;

l) External examination of piping and cut-out valves of cargo tank and cargo pump room fixed fire fighting system;

m) Verification that all electrical equipment in dangerous zones is suitable for such locations, is in good condition and has been properly maintained so far as is practicable;

n) Checking the deck foam system, including the supplies of foam concentrate and testing that minimum number of jets of water at the required pressure in the fire main is obtained when the system is in operation;

o) Examining the fixed fire-fighting system for the cargo pump room and the deck foam system for the cargo area and confirming that their means of operation are clearly marked;

p) Confirming that potential sources of ignition in or near the cargo pump room are eliminated, such as loose gear, combustible materials etc., that there are no signs of undue leakage and that access ladders are in satisfactory condition;

q) Confirming that the condition of portable fire-fighting equipment for the cargoes to be carried in the cargo area is satisfactory;

r) examination of the fire-extinguishing systems for spaces containing paint and/or flammable liquids and deep fat cooking equipment in accommodation and service spaces;

s) examination of the fire safety requirements of helicopter facilities, including foam firefighting appliances ;

t) Confirming, as far as practicable, that the intrinsically safe systems and circuits used for measurement, monitoring, control and communication purposes in all hazardous locations are being properly maintained.

u) Confirming that the system for continuous monitoring of the concentration of flammable vapours is satisfactory. (Refer Pt.5, Ch.3, Cl. 11.1.4).

v) Confirming that sampling points or detector heads are located in suitable positions in order that potentially dangerous leakages are readily detected. (Refer Pt.5, Ch.3, Cl. 11.1.4).

w) Examination of the fixed carbon dioxide fire-extinguishing systems for the protection of machinery spaces and cargo pump-rooms, where applicable, are provided with two separate controls, one for opening of the gas piping and one for discharging the gas from the storage container, each of them located in a release box clearly identified for the particular space.

x) Examination of the fire protection arrangements in cargo spaces and confirming, as far as practicable and as appropriate, the operation of the means of control provided for closing the various openings.

y) Testing the fire dampers of ventilation ducts and the means of closing the main inlets and outlets of all ventilation systems and testing the means of stopping power ventilation systems from outside the space served.

Surveys carried out by the National Authority of the country in which the ship is registered would normally be accepted as meeting these requirements, at the discretion of the Surveyor.

4.2.4.2 For tankers fitted with inert gas system, examination of the inert gas system as detailed in Section 12, Para 12.2.1 is to be carried out.

4.2.4.3 Confirmation that the means of escape from accommodation, machinery spaces and other spaces are satisfactory.

4.2.4.4 Examination of the arrangements for gaseous fuel for domestic purposes.

4.2.5 Other safety arrangements related to cargo

4.2.5.1 The following are to be dealt with where applicable:

a) Examination of gauging devices, high level alarms and valves associated with overflow control.

b) Verification that any devices provided for measuring the temperature of the cargo and any associated alarms are satisfactory.

c) Examination of the cargo heating/cooling system sampling arrangements where fitted.

d) Verification that removable pipe lengths or other approved equipment necessary for cargo separation are available, and satisfactory.

e) Verification that the ventilation system including portable equipment, if any, of all spaces in the cargo area is operational.

f) Verification that arrangements are made for sufficient inert/padding/drying gas to be carried or generated to compensate for normal losses and that means are provided for monitoring of ullage spaces.

g) Verification that arrangements are made for sufficient medium to be carried where drying agents are used on air inlets to cargo tanks.

h) Examining the cargo transfer arrangements and confirming that any hoses are suitable for their intended purpose and where appropriate, marked with date of testing.

i) Verification that any special arrangements made for bow or stern loading and unloading are in good condition and testing the means of communication and remote shutdown of the cargo pump.

j) Verification that, if applicable, the provisions made for chemicals which have special requirements listed in relevant Ch.3 of Pt.5 of the Rules are in order.

4.2.6 Personnel protection

a) Verification that cargo pump room rescue arrangements are in order.

b) Verification that suitable protective clothing is available for crew engaged in loading

and discharging operations and that suitable storage is maintained.

c) Verification that the requisite safety equipment and associated breathing apparatus with requisite air supplies and emergency escape respiratory and eye protection, if required, are in good condition and are properly stowed.

d) Verification that medical first aid equipment including stretchers and oxygen resuscitation is in good condition and that satisfactory arrangements are made for antidotes for cargoes actually carried to be on board.

e) Verification that decontamination arrangements are operational.

f) Verification that the requisite gas detection instruments are on board and that satisfactory arrangements are made for the supply of any required vapour detection tubes.

g) Verification that the cargo sample stowage arrangements are in good condition.

4.3 Intermediate Surveys

4.3.1 General

4.3.1.1 Intermediate surveys are to be carried out at or between the second or third Annual Survey. (Also refer to Note 9 of Sec.1, Table 1.1.1). However, only those items which are additional to the requirements of annual survey may be examined between the second or third annual survey.

Concurrent crediting to both Intermediate survey and Special survey for surveys and thickness measurements of spaces is not acceptable.

4.3.1.2 The following requirements are applicable for vessels over five years of age. For vessels below 5 years of age additional examination over and above the requirements of Annual survey may be required at the discretion of the Surveyors.

4.3.1.3 For vessels over 10 years of age a specific survey program is to be worked out by the owner in cooperation with the Surveyors considering the requirements of the previous special survey, executive hull summary of that survey, later relevant survey records and taking account of any amendments to the survey requirements after the last special survey. The survey program is to be submitted in written format for approval and kept on board until the intermediate survey has been completed. (See 4.4.2 for guidance on preparation of survey program).

4.3.1.4 Prior to the commencement of any part of the intermediate survey, a survey planning meeting is to be held between the attending Surveyor(s), the owner's representative in attendance and where involved, the thickness measurement company representative and the master of ship or an appropriately qualified representative appointed by the master or Company for the purpose to ascertain that all the arrangements envisaged in the survey programme are in place, so as to ensure the safe and efficient conduct of the survey work to be carried out.

4.3.2 Examination tanks and spaces

4.3.2.1 The survey of integral cargo tanks and ballast tanks depending on the age of the vessel is to be carried out as specified in 4.3.3 to 4.3.5.

4.3.3 Chemical tankers between 5 and 10 years of age

4.3.3.1 The following are to be carried out:

For ballast tanks, an Overall Survey of Representative Tanks selected by the Surveyor is to be carried out. If such inspections reveal no visible structural defects, the examination may be limited to a verification that the hard Protective Coating remains in GOOD condition.

4.3.3.2 In addition to the requirements above, suspect areas identified at previous surveys are to be examined.

4.3.3.3 A ballast tank is to be examined at subsequent annual intervals where:

a) a hard protective coating has not been applied from the time of construction, or
b) a soft or semi-hard coating has been applied, or
c) substantial corrosion is found within the tank, or
d) the hard protective coating is found to be in less than GOOD condition and the hard protective coating is not repaired to the satisfaction of the Surveyor.

4.3.4 Chemical tankers between 10 and 15 years of age

4.3.4.1 The requirements of the intermediate survey are to be to the same extent as the previous special survey as required in 4.4 for hull structure and piping systems in way of cargo holds, cofferdams, pipe tunnels, void spaces within the cargo area and all ballast tanks. However, testing of cargo and ballast tanks and survey of automatic air pipe heads specified in 4.4.6.2 are not required unless deemed necessary by the attending surveyor. Thickness measurement is to be carried out for items 1) to 4) of Table 4.4.9.1.

4.3.4.2 The intermediate survey may be commenced at the second annual survey and be progressed during the succeeding year with a view to completion at the third annual survey in lieu of the application of 4.4.1.4.

4.3.4.3 An in-water survey complying with the requirements of Sec.7.2 may be accepted in lieu of the requirements of 4.4.1.10.

4.3.5 Chemical tankers exceeding 15 years of age the following is to apply:

4.3.5.1 The requirements of the intermediate survey are to be to the same extent as the previous special survey as required in 4.4 for hull structure and piping systems in way of cargo holds, cofferdams, pipe tunnels, void spaces within the cargo area and all ballast tanks. However, testing of cargo and ballast tanks is not required unless deemed necessary by the attending surveyor. Thickness measurement is to be carried out for items 1) to 4) of Table 4.4.9.1.

4.3.5.2 For the application of 4.3.5.1 the intermediate survey may be commenced at the second annual survey and be progressed during the succeeding year with a view to completion at the third annual survey in lieu of the application of 4.4.1.4.

4.3.5.3 A survey in dry dock is to be part of the intermediate survey. Any remaining work in respect of the overall and close-up surveys and thickness measurements and repairs applicable to the lower portions of cargo tanks and water ballast tanks (i.e. parts below light ballast waterline) are to be completed in the dry-dock.

4.3.6 Safety arrangements related to cargo

4.3.6.1 The following are to be dealt with as applicable:

a) Examination of vent line drainage arrangements.

b) Verification that the cargo heating/cooling system is in good condition.

c) Verification that the ship's cargo hoses are approved and in good condition.

d) Verification that where applicable, pipelines and independent cargo tanks are electrically bonded to the hull.

e) An examination of cargo, cargo washing, bunker, ballast, steam and vent piping on the weather decks, as well as vent masts and headers. If upon examination there is any doubt as to the condition of the piping, the pipe may require to be pressure tested, gauged or both.

f) A General Examination of the electrical equipment and cables in dangerous zones such as cargo pump-rooms, and areas adjacent to cargo tanks for defective certified safe type equipment, improperly installed wiring, non-approved lighting and fixtures and dead end wiring. Testing insulation resistance of the circuits except in cases where a proper record of the testing is maintained, consideration is to be given to accepting recent readings by the crew. If any of the readings are marginal or if the condition of the cables, fixtures or equipments appears defective in any way, verification measurements may be required. These measurements are not to be attempted until the ship is in a gas free condition and are to be carried out within an acceptable time period.

g) Confirmation that spares are provided for cargo area mechanical ventilation fans.

h) Examining the equipment for personal protection.

i) Examining externally and confirming that the pumping and piping systems, including a stripping system if fitted and associated equipment remain as approved.

j) Examining externally the tank washing piping and confirming that the type,

capacity, number and arrangement of the tank washing machines are as approved.

k) Examining externally the wash water heating system.

l) Examining externally, as far as practicable the underwater discharge arrangement.

m) Confirming that the means of controlling the rate of discharge of the residue is as approved.

n) Confirming that flow rate indicating device is operable.

o) Confirming that the ventilation equipment for residue removal is as approved and satisfactory.

p) Examining externally, as far as is accessible, the heating system required for solidifying and high viscosity substances.

q) Confirming that any cargo tank high level alarms are operable.

r) Verifying from the Cargo Record Book that the pumping and stripping arrangements have been emptying the tanks efficiently and all are in working order.

s) Confirming, if possible, that the discharge outlets are in good condition.

t) Confirming the satisfactory operation of the recording device, as fitted and verifying by an actual flow test that it has an accuracy of $\pm$ 15% or better.

Surveys carried out by the National Authority of the country in which the ship is registered may be accepted at the discretion of the Surveyor as meeting these additional requirements.

4.4 Special Surveys - Hull

4.4.1 General

4.4.1.1 All ships classed with IRS are to undergo Special Surveys at 5 yearly intervals. The first Special Survey is to be completed within 5 years from the date of the initial classification survey and thereafter 5 years from the assigned date of the previous Special Survey. However, an extension of class of 3 months maximum beyond the 5th year may be granted in exceptional circumstances in accordance with 1.11. In such cases, the next period of class will start from the expiry date of the Special Survey before extension was granted.

4.4.1.2 The interval between the Special Surveys may be reduced at the request of the parties concerned or by IRS if considered appropriate.

4.4.1.3 For surveys completed within 3 months before the expiry date of the Special Survey, the next period of class will start from the expiry date of the Special Survey. For surveys completed more than 3 months before the expiry date of the Special Survey, the period of class will start from the survey completion date. In cases where the vessel has been laid up or has been out of service for a considerable period because of a major repair or modification and the owner elects to only carry out the overdue surveys, the next period of class will start from the expiry date of the special survey. If the owner elects to carry out the next due special survey, the period of class will start from the survey completion date. Any requirement of the Flag Administration in this regard is also to be complied with.

4.4.1.4 The Special Survey may be commenced at the 4th Annual Survey and be progressed with a view to completion by the 5th anniversary date. When the special survey is commenced prior to the fourth annual survey, the entire survey is to be completed within 15 months if such work is to be credited to the special survey and in this case the next period of class will start from the survey completion date.

Concurrent crediting to both Intermediate survey and Special survey for surveys and thickness measurements of spaces is not acceptable.

4.4.1.5 As part of the preparation for Special Survey, the proposed Survey Programme (See 4.4.2) including the schedule for thickness measurements (See 4.4.9) are to be submitted at least 3 months in advance of the intended commencement of the Special Survey.

4.4.1.6 Record of Special Survey will not be assigned until the Machinery Survey has been completed or postponed in agreement with IRS.

4.4.1.7 Ships which have satisfactorily passed a Special Survey will have a record entered in the Supplement to the Register Book indicating the assigned date of Special Survey. In addition, a notation "ESP" will be entered for chemical tankers.

4.4.1.8 The special survey is to include, in addition to the requirements of the Annual Survey, examination, tests and checks of sufficient extent to ensure that the hull, equipment and related piping are in satisfactory condition and that the ship is fit for its intended purpose for the next five (5) year class period, subject to proper maintenance and operation and the periodical surveys being carried out at the due dates.

4.4.1.9 The special survey requirements to be applied in respect of independent cargo tanks are given in 4.4.11.

4.4.1.10 A Docking Survey in accordance with the requirements of Sec.7 is to be carried out as part of the Special Survey. Any remaining work in respect of the overall and close-up surveys and thickness measurements and repairs applicable to the lower portions of cargo tanks and water ballast tanks (i.e. parts below light ballast water line) are to be completed in the dry-dock.

4.4.2 Planning and preparation for survey

4.4.2.1 A specific Survey Programme is to be worked out in advance of the Survey by the Owner in cooperation with the Surveyors and submitted to IRS for approval. The Survey Programme shall be in a written format prior to the development of survey programme, the survey planning questionnaire in prescribed format is to be completed by the owner and forwarded to IRS. The survey program is to be worked out taking into account any amendments to the survey requirements after the last special survey.

4.4.2.2 In developing the Survey Programme, the following documentation is to be collected and consulted with a view to selecting tanks, areas and structural areas for examination :

a) Survey status and basic ship information

b) Documentation on board as per 4.4.3

c) Main structural plans (scantling drawings), including information regarding use of high strength steels, clad steel and stainless steel

d) Executive hull summary

e) Relevant previous damage and repair history

f) Relevant previous survey and inspection reports of IRS and the Owners

g) Information regarding the use of the ship's holds and tanks, typical cargoes and other relevant data

h) Details of the inert gas plant and tank cleaning procedures

i) Information and other relevant data regarding conversion or modification of the ship’s cargo and ballast tanks since the time of construction

j) Description and history of the coating and corrosion protection system (previous class notations), if any

k) Inspections by the Owner’s personnel during the last 3 years with reference to structural deterioration in general, leakages in tank boundaries and piping and condition of the coating and corrosion protection system, if any

l) Information regarding the relevant maintenance level during operation including port state control reports of inspection containing hull related deficiencies. Safety Management System non-conformities relating to hull maintenance, including the associated corrective action(s); and

m) Any other information that will help identify suspect areas and critical structural areas.

4.4.2.3 The Survey Programme submitted for approval is to account for and comply, as a minimum, with the requirements of close-up survey, thickness measurement, tank testing and pipe testing respectively, and to include relevant information including at least :

a) Basic ship information and particulars
b) Main structural plans (scantling drawings), including information regarding use of high strength steels, clad steel and stainless steel
c) Plan of tanks

d) List of tanks with information on use, corrosion prevention and condition of coating
e) Conditions for survey (e.g. information like tank cleaning, gas freeing, ventilation, lighting, etc.)
f) Provisions and methods of access to structures
g) Equipment for survey
h) Nomination of tanks and areas for close-up survey (As per Table 4.4.8.1a) and Table 4.4.8.1b))
i) Nomination of sections for thickness measurement (As per Table 4.4.9.1
j) Nomination of tanks for testing and the pipes that are to undergo pipe testing as per 4.4.10
k) Identification of the thickness measurement company
l) Damage experience related to the ship in operation.
m) Critical structural areas and suspect areas, where relevant.

4.4.2.4 IRS will advise the Owner of the maximum acceptable structural corrosion diminution levels applicable to the vessel.

4.4.2.5 The ship is to be prepared for overall survey in accordance with the requirements of Table 4.4.2.5. The preparation is to be of sufficient extent to facilitate an examination to ascertain any excessive corrosion, deformation, fractures, damages and other structural deterioration.

4.4.2.6 Proper preparation and close co-operation between the attending surveyor(s) and the owner's representatives onboard prior to and during the survey are an essential part in the safe and efficient conduct of the survey. During the survey on board safety meetings are to be held regularly.

4.4.2.7 Prior to the commencement of any part of the Special and Intermediate Survey a survey planning meeting is to be held between the attending Surveyor(s), the Owner's representative in attendance and the thickness measurement firm representative, where involved, and the master of the ship or an appropriately qualified representative appointed by the master or Company for the purpose of ascertaining that all the arrangements envisaged in the survey programme are in place, so as to ensure the safe and efficient conduct of the survey work to be carried out.

Table 4.4.2.5 : Survey preparation			
Special Survey No. I **Age ≤ 5**	**Special Survey No. II** **5 < Age ≤ 10**	**Special Survey No. III** **10 < Age ≤ 15**	**Special Survey No. IV and subsequently** **Age > 15**
1) All tanks, peaks, bilges and drain wells, engine and boiler spaces and other spaces are to be cleared out and cleaned as necessary for examination. Floor plates in engine and boiler spaces are to be lifted as may be necessary for examination of the structure underneath. Where necessary ceiling, lining, casings and loose insulation are to be removed as required by the Surveyor for examination of the structure. Compositions on the plating are to be examined and sounded, but need not be disturbed if found satisfactorily adhering to the plating 2) The steelwork is to be exposed and cleaned as may be required for its proper examination by the Surveyor and close attention is to be paid to the parts of the structure which are particularly liable to excessive corrosion or to deterioration due to other causes. 3) All tanks are to be cleaned as necessary to permit examination. 4) Casings or covers of air, sounding, steam and other pipes, spar ceiling and lining in way of the side scuttles are to be removed, as required by the Surveyor.	1) Requirements of Special Survey I to be complied with 2) The chain locker is to be cleaned internally. The chain cables are to be ranged for inspection. The anchors are to be cleaned and placed in an accessible position for inspection.	1) Requirements of Special Survey II to be complied with 2) Portions of wood sheathing, or other covering, on steel decks are to be removed, as considered necessary by the Surveyor, in order to ascertain the condition of the plating.	1) Requirements of Special survey III to be complied with

4.4.2.8 The following is an indicative list of items that are to be addressed in the meeting:

a) Schedule of the vessel (i.e. the voyage, docking and undocking manoeuvres, periods alongside, cargo and ballast operations etc.);
b) Provisions and arrangements for thickness measurements (i.e. access, cleaning / de-scaling, illumination, ventilation, personal safety);
c) Extent of the thickness measurements;
d) Acceptance criteria (refer to the list of minimum thicknesses);
e) Extent of close-up survey and thickness measurement considering the coating condition and suspect areas / areas of substantial corrosion;
f) Execution of thickness measurements;
g) Taking representative readings in general and where uneven corrosion / pitting is found;
h) Mapping of areas of substantial corrosion; and
i) Communication between attending surveyor(s) the thickness measurement, firm operator(s) and owners representative(s) concerning findings.

4.4.3 Documentation on board

4.4.3.1 The Owners are to obtain supply and maintain on board documentation as specified in 4.4.3.3, which is to be readily available for the Surveyor.

4.4.3.2 The documentation is to be kept on board for the life time of the ship.

4.4.3.3 A Survey Report File is to be a part of the documentation on board consisting of

- Reports of structural surveys
- Executive Hull Summary
- Thickness measurement reports.

4.4.3.4 The Survey Report File is to be available also in the Owners management offices and with IRS.

4.4.3.5 The following additional supporting documentation is to be available on board:

- Main structural plans of cargo holds, cargo and ballast tanks
- Previous repair history
- Cargo and ballast history
- Extent of use of inert gas plant and tank cleaning procedures
- Inspection by ship's personnel with reference to
    - structural deterioration in general
    - leakages in bulkheads and piping
    - condition of coating or corrosion prevention systems, if any
- Any other information that will help identify critical structural areas or Suspect Areas requiring inspection
- Survey Programme as required by 4.4.2 until such time as the Special Survey has been completed.

4.4.3.6 Prior to survey, the Surveyor is to examine the completeness of the documentation on board, and its contents as a basis for the survey.

4.4.4 Surveys at sea or at anchorage

4.4.4.1 See Sec.1.8.

4.4.5 Space protection

4.4.5.1 Where provided, the condition of the corrosion prevention system of cargo tanks is to be examined.

A ballast tank is to be examined at subsequent annual intervals where:

a) a hard protective coating has not been applied from the time of construction, or
b) a soft or semi-hard coating has been applied, or
c) substantial corrosion is found within the tank, or
d) the hard protective coating is found to be in less than GOOD condition and the hard protective coating is not repaired to the satisfaction of the Surveyor.

4.4.5.2 Where the hard protective coating in cargo tanks is found to be in GOOD condition, the extent of close-up surveys and thickness measurements may be specially considered.

4.4.6 Survey and examination

4.4.6.1 All spaces within the hull and superstructure are to be examined. The special survey is to include examination of underwater parts as per Section 7.

4.4.6.2 All tanks other than cargo and ballast tanks are to be examined internally in accordance with the requirements of Table 4.4.6.2.

4.4.6.3 All spaces including double bottom, deep,ballast, peak and cargo tanks; pump rooms, pipe tunnels, duct keels, machinery spaces, dry spaces, cofferdams and voids are to be internally examined including the plating and framing, bilges and drain wells, sounding, venting, pumping and drainage arrangements. This examination is to be supplemented by testing and thickness measurement as required by 4.4.7 and 4.4.9 to ensure that the structural integrity remains effective. The aim of the examination is to discover Substantial Corrosion, significant deformation, fractures, damages or other structural deterioration and if deemed necessary by the Surveyor, a suitable non-destructive examination may be required. At special survey No.3 and subsequent special surveys, structural downflooding ducts and structural ventilation ducts are to be internally examined.

Table 4.4.6.2 : Requirements for internal examination of tanks

Tank	Special Survey No. I Age ≤ 5	Special Survey No. II 5 < Age ≤ 10	Special Survey No. III 10 < Age ≤ 15	Special Survey No. IV and subsequent Age > 15
Fuel oil bunker tanks				
- Engine room	None	None	One	One
- Cargo area	None	One	Two	Half the number of tanks, minimum 2
- If no tanks in Cargo Area, additional fuel tank(s) outside of Engine Room (if fitted)	None	One	One	Two
Lub.oil	None	None	None	One
Fresh water	None	One	All	All

Notes:

1) These requirements apply to tanks of integral (structural) type.

2) If a selection of tanks is accepted to be examined, then different tanks are to be examined at each special survey, on a rotational basis.

3) Peak tanks (all uses) are subject to internal examination at each special survey.

4) At special survey No.III and subsequent special surveys, one deep tank for fuel oil is to be included, if fitted.

4.4.6.4 Cargo piping on deck and cargo and ballast piping systems within the above tanks and spaces are to be examined and operationally tested to working pressure to attending Surveyor's satisfaction to ensure that tightness and condition remain satisfactory. Special attention is to be given to ballast piping in cargo tanks and cargo piping in Ballast Tanks and void spaces and Surveyors are to be advised on all occasions when this piping, including valves and fittings are open during repair periods and can be examined internally.

4.4.6.5 Where ballast tanks have been converted to void spaces, the survey extent is to be based upon ballast tank requirements.

4.4.6.6 All watertight bulkheads and watertight doors are to be examined. All decks, casings and superstructures are to be examined. Attention is to be given to the corners of openings and other discontinuities in way of the strength decks and top sides.

4.4.6.7 The masts, standing rigging and anchors are to be examined.

The Surveyor should satisfy himself that there are sufficient mooring ropes on board and also that a tow line is provided when this is a Rule requirement.

4.4.6.8 The steering gear, and its connections and control systems (main and alternative) are to be examined. The auxiliary steering gear with its various parts are to be examined in working condition.

4.4.6.9 The hand pumps and suctions, air and sounding pipes are to be examined. The Surveyors are to ensure that striking plates are fitted under the sounding pipes whilst examining the tanks internally.

Automatic air pipe heads are to be internally examined at special surveys as indicated in Table 4.4.6.9. For designs where the inner parts cannot be properly inspected from

outside, the head is to be removed from the air pipe. Particular attention is to be paid to the condition of the zinc coating in heads constructed from galvanised steel.

Table 4.4.6.9 : Requirements for internal examination of automatic air pipe heads

Location	Special survey No.I Age ≤ 5	Special survey No.II 5 < Age ≤ 10	Special survey No.III and subsequent Age > 10
forward 0.25L	Two air pipe heads[1,2] one port and one starboard on exposed decks	All air pipe heads on exposed decks	All air pipe heads[3] on exposed decks
aft of 0.25L from the forward perpendicular	Two air pipe heads[1,2] one port and one starboard on exposed decks	At least 20% of air pipe heads[1,2] on exposed decks	

Notes:

1. Preferably air pipes serving ballast tanks.
2. The selection of air pipe heads is to be made by the attending Surveyor. According to the results of the inspection, the Surveyor may require additional air pipe heads to be examined.
3. When there is substantiated evidence of replacement within the previous five years, individual air pipe heads may not be examined.

4.4.6.10 The Surveyor should satisfy himself regarding the efficient condition of the following :

- Means of escape from machinery spaces, crew and passenger spaces and spaces in which crew are normally employed;
- Means of communication between bridge and engine room and between bridge and alternative steering position;
- Helm indicator;
- Protection to the aft steering wheel and the gear.

4.4.6.11 The chain cables are to be ranged and the anchors and the chain cables are to be examined. At special survey no. II and subsequent special surveys, the chain cables are to be gauged. Any length of chain cable which is found to have reduced in mean diameter at its most worn part by more than 12 per cent of its original rule diameter is to be renewed.

4.4.6.12 The windlass is to be examined.

4.4.6.13 The chain locker, hold fasts, hawse pipes and chain stoppers are to be examined and pumping arrangements of the chain locker tested.

4.4.6.14 A thorough examination of aft and forward emergency towing arrangements is to be carried out to ensure its ready availability and satisfactory condition.

- examination of pick-up gear, towing pennant and chafing gear for possible deterioration;

- examination of strong points, fairleads, pedestal roller and their attachment to hull structure.

The survey is to confirm that one of the towing arrangements (aft or forward) are pre-rigged.

4.4.6.15 For vessels with single point mooring arrangements where 'SPM' notation is assigned, the following is to be carried out:

a) A thorough examination of the components of the single point mooring system (bow chain stoppers, bow fairleads, pedestal roller fairleads, winches and capstans) to verify their satisfactory condition.

b) A close-up examination of the hull structures supporting and adjacent to the components of the single point mooring system to verify that there is no

deformation or fracture. Thickness determination and non-destructive tests are to be carried out if required by the Surveyor.

4.4.6.16 Engine room structure is to be examined. Particular attention being given to tank tops, shell plating in way of tank tops, brackets connecting side shell frames and tank tops and engine room bulkheads in way of tank tops and bilge wells. Where excessive areas of wastage are found, thickness measurements are to be carried out and renewals of repairs made when wastage exceeds allowable limits.

4.4.6.17 The attachment to the structure and condition of anodes in tanks is to be examined.

4.4.6.18 Where fitted, the strums of the cargo suction pipes are to be removed or lifted to facilitate examination of the shell plating and bulkheads in the vicinity, unless other means for visual inspection of these parts are provided.

4.4.6.19 The loading instrument is to be checked for accuracy by applying test load conditions in presence of the Surveyor.

4.4.6.20 Examination of accommodation ladders, gangways and their winches are to be carried out as required for annual surveys. In addition, the accommodation ladders and gangways are to be operationally, tested with the specified maximum operation load.

The tests are to be carried out with the load applied as uniformly as possible along the length of the accommodation ladder or gangway, at an angle of inclination corresponding to the maximum bending moment on the accommodation ladder or gangway.

Accommodation ladder winch is to be operationally tested at special surveys. The brake system of the winch is to be tested for holding the maximum operational load on the ladder.

For existing installations on board ships constructed prior to 01 Jan 2010 where the maximum operational load is not known, load nominated by the shipowner or operator may be considered as the test load.

4.4.7 Extent of tank testing

4.4.7.1 The minimum requirements for tank testing for chemical tankers are given in Table 4.4.7.1.

4.4.7.2 All double bottom and peak tanks are to be tested in addition. The Surveyor may extend the tank testing as deemed necessary.

Table 4.4.7.1 : Table of minimum requirements for tank testing at special survey of chemical tankers

Special Survey No. I Age ≤ 5	Special Survey No. II and subsequent Age > 5
1. All ballast tank boundaries	1. All ballast tank boundaries
2. Cargo tank boundaries facing ballast tanks, void spaces, pipe tunnels, pump rooms or cofferdams	2. All cargo tank bulkheads

4.4.7.3 Boundaries of ballast tanks are to be tested with a head of liquid to the top of air pipes. Boundaries of cargo tanks are to be tested to the highest point that liquid will rise under service conditions.

4.4.7.4 Boundaries of fuel oil, lub.oil and fresh water tanks are to be tested with a head of liquid to the highest point that liquid will rise under service conditions. Tank testing of fuel oil, lub.oil and fresh water tanks may be specially considered based on a satisfactory external examination of the tank boundaries and a confirmation from the Master stating that the pressure testing has been carried out according to the requirement with satisfactory results.

4.4.7.5 The testing of double bottom tanks and other spaces not designed for the carriage of liquid may be omitted, provided a satisfactory internal examination together with an examination of the tank top is carried out.

4.4.7.6 Cargo tank testing carried out by the vessel's crew under the direction of the Master may be accepted by the surveyor subject to the approval of the Administration, provided the following conditions are complied with:

a) a tank testing procedure, specifying fill heights, tanks being filled and bulkheads being tested, taking into account the guidelines provided in the ESP Planning document, has been submitted by the owner and reviewed by IRS prior to the testing being carried out;

b) there is no record of leakage, distortion or substantial corrosion that would affect the structural integrity of the tank;

c) the tank testing has been satisfactorily carried out, in accordance with the reviewed procedure and the guidelines mentioned in a) above, within special survey window not more than 3 months prior to the date of the survey on which the overall or close up survey is completed;

d) the satisfactory results of the testing is recorded in the vessel's logbook;

e) the internal and external condition of the tanks and associated structure are found satisfactory by the surveyor at the time of the overall and close up survey.

4.4.8 Close-up survey requirements

4.4.8.1 The minimum requirements for Close-up Surveys at Special Survey are given in Table 4.4.8.1a) and Table 4.4.8.1b).

The survey of stainless steel tanks may be carried out as an overall survey supplemented by close-up survey as deemed necessary by the Surveyor.

4.4.8.2 The Surveyor may extend the Close-up Survey as deemed necessary taking into account the maintenance of the tanks under survey, the condition of the corrosion protection system and also in the following cases:

a) In particular, tanks having structural arrangements or details which have suffered defects on similar tanks or on similar ships according to available information.

b) In tanks which have structures approved with reduced scantlings due to an approved corrosion control system.

4.4.8.3 For areas in tanks where coatings are found to be in a GOOD condition, the extent of Close-up Surveys according to Table 4.4.8.1a) and Table 4.4.8.1b) may be specially considered by the Surveyor.

4.4.9 Thickness measurement

4.4.9.1 The minimum requirements for thickness measurements at Special Survey are given in Table 4.4.9.1.

4.4.9.2 Provisions for extended measurements for areas with Substantial Corrosion in case of Chemical Tankers are given in Table 4.4.9.2.

The Surveyor may further extend the thickness measurements as deemed necessary.

4.4.9.3 Transverse sections are to be chosen where the largest reductions are suspected to occur or are revealed from deck plating measurements.

In cases where two or three sections are to be measured at least one is to include a Ballast Tank within 0.5L amidships.

4.4.9.4 The thickness measurements are to be carried out by a qualified firm certified by IRS.

Table 4.4.8.1a) : Minimum requirements for close-up survey at special survey of single skin chemical tankers

Special Survey No. I Age ≤ 5	**Special Survey No. II 5 < Age ≤ 10**	**Special Survey No. III 10 < Age ≤ 15**	**Special Survey No. IV and subsequently Age > 15**
A) **One Web Frame Ring** - in a ballast wing tank	A) **All Web Frame Rings** - in a ballast wing tank or double bottom ballast tank	A) **All Web Frame Rings** - in all ballast tanks	As Special Survey No.3
B) **One Deck Transverse** - in a cargo tank or on deck	B) **One Deck Transverse** - in each of the remaining ballast tank or on deck	A) **All Web Frames Rings** - in a cargo wing tank	Additional transverse areas as deemed necessary by the Surveyor
D) **One Transverse Bulkhead** – lower part in a ballast tank	B) **One Deck Transverse** - in a cargo wing tank or on deck	A) **One Web Frames Rings** - in each remaining cargo tank	
D) **One Transverse Bulkhead** - lower part in a cargo wing tank	B) **One Deck Transverse** – in two cargo center tanks or on deck	C) **All Transverse Bulkheads** - in all cargo and tanks	
D) **One Transverse Bulkhead** – lower part in a cargo center tank (See Note 1)	C) **Both Transverse Bulkhead** - in a ballast wing tank	C) **All Transverse Bulkheads** – in all ballast tanks	
	D) **One Transverse Bulkhead** – lower part in each remaining ballast tank D) **One Transverse Bulkhead** - lower part in a cargo wing tank D) **One Transverse Bulkhead** - lower part in two cargo centre tanks (See Note 1)		

Note 1) Where no center cargo tanks are fitted (as in the case of center longitudinal bulkhead), transverse bulkheads in wing tanks are to be surveyed.

A-D are areas subjected to close-up surveys and thickness measurements (See Fig.4.4.8.1 to 4.4.8.3)

A) Complete transverse web frame ring including adjacent structural members
B) Deck transverse including adjacent deck structural members
C) Transverse bulkhead complete - including girder system and adjacent members
D) Transverse bulkhead lower part - including girder system and adjacent structural members

Table 4.4.8.1b) : Minimum requirements for close-up survey at special survey of double skin chemical tankers

Special Survey No. I Age ≤ 5	**Special Survey No. II 5 < Age ≤ 10**	**Special Survey No. III 10 < Age ≤ 15**	**Special Survey No. IV and subsequently Age > 15**
1) **One Web Frame Ring** – in a ballast double hull tank (See Note 1)	1) **All Web Frame Rings** – in a ballast wing tank or ballast double hull tank (See Note 1)	1) **All Web Frame Rings** – in all ballast tanks	As special survey No.3
2) **One Deck Transverse** – in a cargo tank or on deck	6) **The Knuckle Area and the Upper Part** (3 metres approx.) of one web frame in each remaining ballast tank	7) **All Web Frame Rings** – in a cargo wing tank	Additional transverse areas as deemed necessary by the Surveyor
4) **One Transverse Bulkhead** – in a ballast tank (See Note 1)		7) **One Web Frame Ring** – in each remaining cargo tank	
5) **One transverse bulkhead** – in a cargo wing tank	2) **One Deck Transverse** – in two cargo tanks	3) **All Transverse Bulkheads** – in all cargo tanks	
5) **One Transverse Bulkhead** – in a cargo center tank (See Note II)	4) **One Transverse Bulkhead** – in each ballast tank (See Note I)	4) **All Transverse Bulkheads** – in all ballast tanks	
	5) **One Transverse Bulkhead** – in two cargo centre tanks (See Note II)		
	5) **One Transverse Bulkhead** – in cargo wing tank		

(1), (2), (3), (4), (5), (6) and (7) are areas to be subjected to close-up surveys and thickness measurements (See Figs. 4.4.8.1 to 4.4.8.3).

(1) Web frame in a ballast tank means vertical web in side tank, hopper web in hopper tank, floor in double bottom tank and deck transverse in double deck tank (where fitted), including adjacent structural members. In fore and aft peak tanks web frame means a complete transverse web frame ring including adjacent structural members.

(2) Deck transverse, including adjacent deck structural members (or external structure on deck in way of the tank, where applicable).

(3) Transverse bulkhead complete in cargo tanks, including girder system, adjacent structural members (such as longitudinal bulkheads) and internal structure of lower and upper stools, where fitted.

(4) Transverse bulkhead complete in ballast tanks, including girder system and adjacent structural members, such as longitudinal bulkheads, girders in double bottom tanks, inner bottom plating, hopper side, connecting brackets.

(5) Transverse bulkhead lower part in cargo tank, including girder system, adjacent structural members (such as longitudinal bulkheads) and internal structure of lower stool, where fitted.

(6) The knuckle area and the upper part (3 metres approximately), including adjacent structural members. Knuckle area is the area of the web frame around the connections of the slope hopper plating to the inner hull bulkhead and the inner bottom plating, upto 2 metres from the corners both on the bulkhead and the double bottom.

(7) Web frame in a cargo tank means deck transverse, longitudinal bulkhead structural elements and cross ties, where fitted, including adjacent structural members.

Note I : Ballast double hull tank : means double bottom tank plus double side tank plus double deck tank, as applicable, even if these tanks are separate.

Note II : Where no center cargo tanks are fitted (as in the case of center longitudinal bulkhead), transverse bulkheads in wing tanks are to be surveyed.

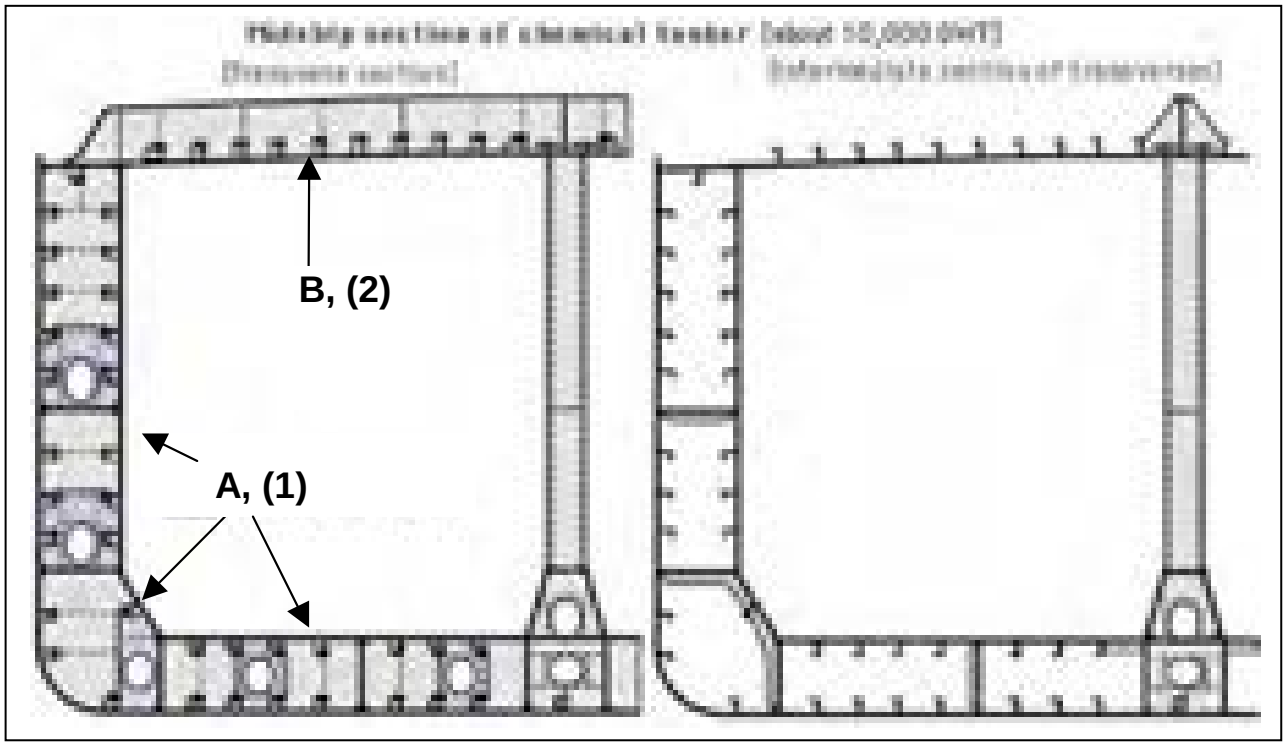

Fig. 4.4.8.1 : Representative transverse section of chemical tanker. Areas 1 and 2

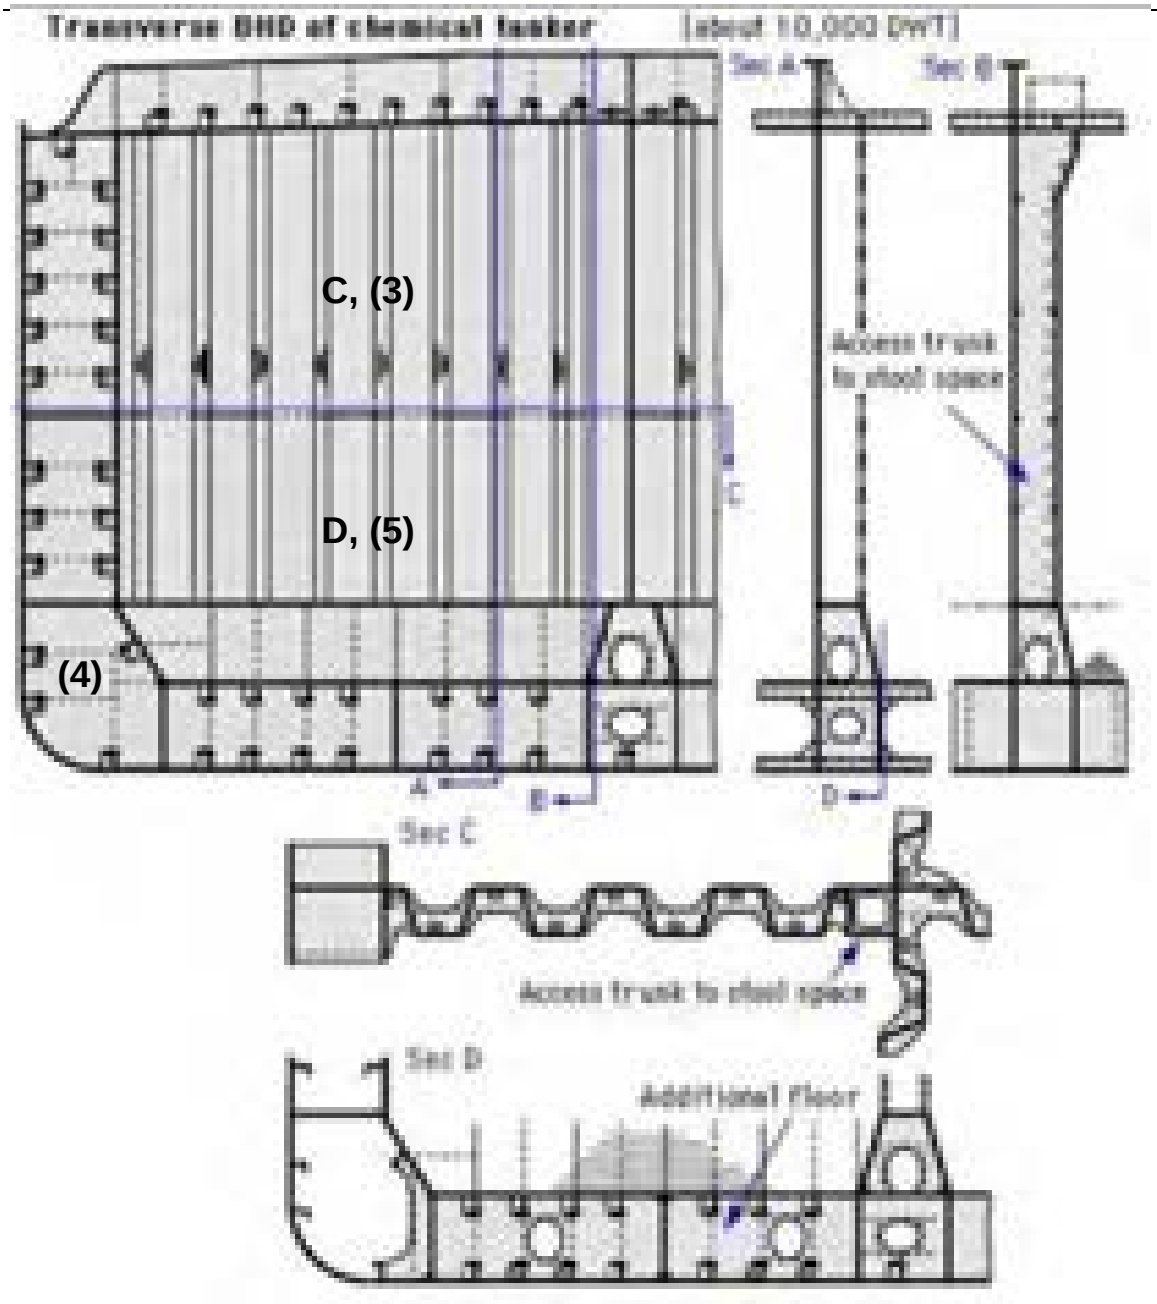

Fig. 4.4.8.2 : Representative transverse section of chemical tanker. Areas 3, 4 and 5

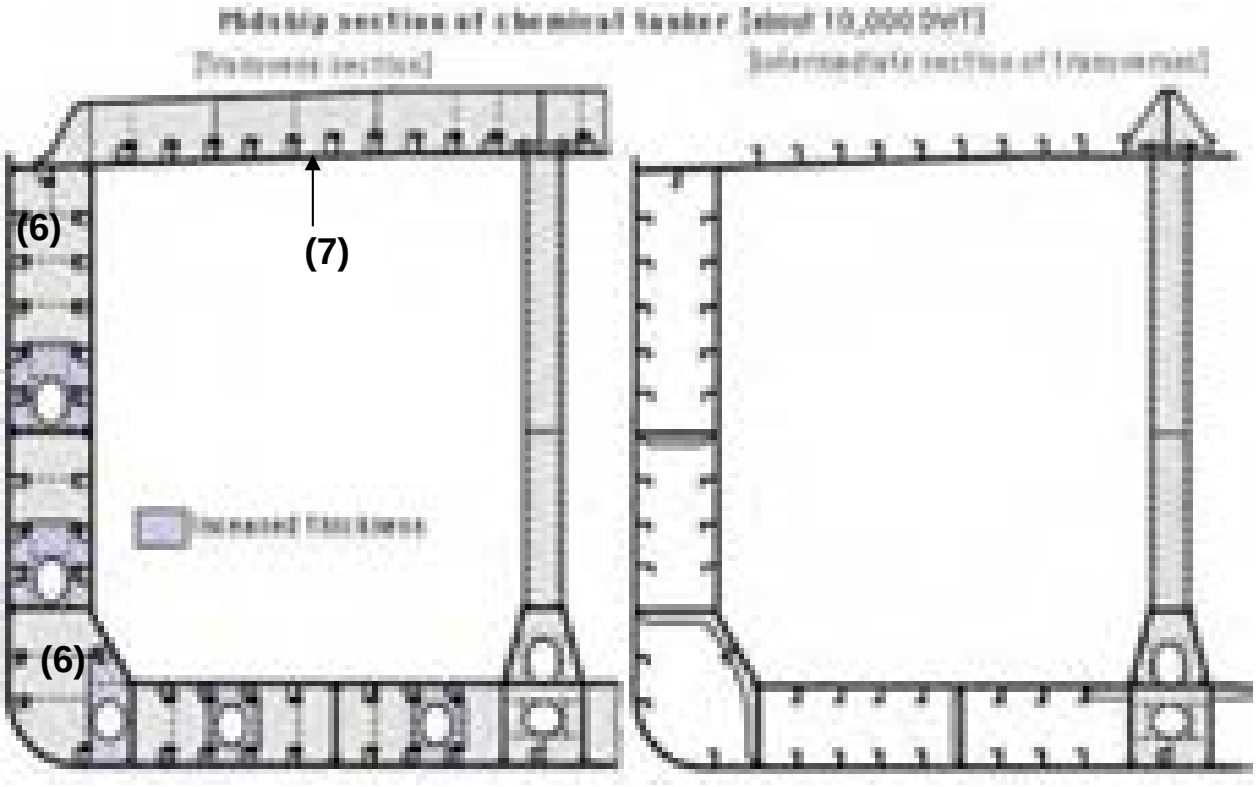

Fig. 4.4.8.3 : Representative transverse section of chemical tanker. Areas 6 and 7

Table 4.4.9.1 : Table of minimum requirements for thickness measurements at special survey of chemical tankers

Special Survey No. I **Age ≤ 5**	**Special Survey No. II** **5 < Age ≤ 10**	**Special Survey No. III** **10 < Age ≤ 15**	**Special Survey No. IV and subsequently** **Age > 15**
1) Suspect areas throughout the vessel	1) Suspect areas throughout the vessel	1) Suspect areas throughout the vessel	1) Suspect areas throughout the vessel
	2) Within the cargo area: a) Each deck plate b) One Transverse section	2) Within the cargo area: a) Each deck plate b)Two Transverse sections(1) c) All wind and water strakes	2) Within the cargo area: a) Each deck plate b) Three Transverse sections(1) c) All wind and water strakes d) Each bottom plate
	3) Measurements of structural members subject to close-up survey according to Table 4.4.8.1a) and Table 4.4.8.1b), for general assessment and recording of corrosion pattern	3) Measurements of structural members subject to close-up survey according to Table 4.4.8.1a) and Table 4.4.8.1b), for general assessment and recording of corrosion pattern	3) Measurements of structural members subject to close-up survey according to Table 4.4.8.1a) and Table 4.4.8.1b), for general assessment and recording of corrosion pattern

Table 4.4.9.1 : (Contd.)			
Special Survey No. I Age ≤ 5	**Special Survey No. II 5 < Age ≤ 10**	**Special Survey No. III 10 < Age ≤ 15**	**Special Survey No. IV and subsequently Age > 15**
	4) All wind and water strakes outside the cargo area	4) All wind and water strakes outside the cargo area	4) All wind and water strakes outside the cargo area
		5) Internals in forepeak and after peak ballast tanks	5) Internals in forepeak and after peak ballast tanks
			6) All exposed main deck plating outside cargo area
			7) Representative exposed superstructure deck plating (poop, bridge, forecastle deck)
			8) All keel plates, additional bottom plates in way of machinery space, aft end of tanks and cofferdams outside cargo area
			9) a) Plating of sea chests. b) Shell plating in way of overboard discharges as considered necessary by the Surveyor.
(1) At least one section is to include a ballast tank within 0.5L amidships			

Table 4.4.9.2 : Requirements for extent of thickness measurements at those areas of substantial corrosion, special survey of chemical tankers within the cargo area length		
Structural member	**Extent of measurement**	**Pattern of measurement**
Bottom, inner bottom and hopper structure		
Bottom, inner bottom and hopper structure plating	Minimum of three bays across tank, including aft bay Measurements around and under all suction bell mouths	5-point pattern for each panel between longitudinals and floors
Bottom, inner bottom and hopper structure longitudinals	Minimum of three longitudinals in each bay where bottom plating measured	Three measurements in line across the flange and three measurements on vertical web
Bottom girders, including the watertight ones	At fore and aft watertight floors and in center of tanks	Vertical line of single measurements on girder plating with one measurement between each panel stiffener, or a minimum of three measurements. Two measurements across face flat where fitted
Bottom floors, including the watertight ones	Three floors in bays where bottom plating measured, with measurements at both ends and middle	5-point pattern over two square metre area

Table 4.4.9.2 : Contd.)		
Structural member	**Extent of measurement**	**Pattern of measurement**
Hopper structure web frame ring	Three floors in bays where bottom plating measured	5-point pattern over one square metre of plating. Single measurements on flange
Hopper structure transverse watertight bulkhead or swash bulkhead	- Lower 1/3 of bulkhead	- 5-point pattern over one square metre of plating
	- Upper 2/3 of bulkhead	- 5-point pattern over two square metre of plating
	- Stiffeners (minimum of three)	- For web, 5-point pattern over span (two measurements across web at each end and one at center of span). For flange, single measurements at each end and center of span
Panel stiffening	Where applicable	Single measurements
Deck structure		
Deck plating	Two transverse bands across tank	Minimum of three measurements per plate per band
Deck longitudinals	Every third longitudinal in each of two bands with a minimum of one longitudinal	Three measurements in line vertically on webs and two measurements on flange (if fitted)
Deck girders and brackets	At fore and aft transverse bulkhead, bracket toes and in centre of tanks	Vertical line of single measurements on web plating with one measurement between each panel stiffener, or a minimum of three measurements. Two measurements across flange, 5-point pattern on girder/bulkhead brackets
Deck transverse webs	Minimum of two webs, with measurements at both ends and middle of span	5-point pattern over one square metre area. Single measurements on flange
Vertical web and transverse bulkhead in wing ballast tank for double hull design (two metres from deck)	Minimum of two webs and both transverse bulkheads	5-point pattern over one square metre area
Panel stiffening	Where applicable	Single measurements
Side shell and longitudinal bulkheads		
Side shell and longitudinal bulkhead plating: - Deckhead and bottom strakes and strakes in way of horizontal girders - All other strakes	- Plating between each pair of longitudinals in a minimum of three bays (along the tank) - Plating between every third pair of longitudinals in same three bays	Single measurement

Table 4.4.9.2 : Contd.)		
Structural member	**Extent of measurement**	**Pattern of measurement**
Side shell and longitudinal bulkhead longitudinals on: - Deckhead and bottom strakes - All other strakes	- Each longitudinal in same three bays - Every third longitudinal in same three bays	3 measurements across web and 1 measurement on flange
Longitudinals – brackets	- Minimum of three at top, middle and bottom of tank in same three bays	5-point pattern over area of brackets
Vertical web and transverse bulkheads of double side tanks (excluding deck area): - Strakes in way of horizontal girders - Other strakes	- Minimum of two webs and both transverse bulkheads - Minimum of two webs and both transverse bulkheads	- 5-point pattern over approx. two square metre area - Two measurements between each pair of vertical stiffeners
Web frames and cross ties for other tanks than double side tanks	Three webs with minimum of three locations on each web, including in way of cross tie connections and lower end brackets	5-point pattern over approximately two square metre area of webs, plus single measurements on flanges of web frame and cross ties
Horizontal girders	Plating on each girder in a minimum of three bays	Two measurements between each pair of longitudinal girder stiffeners
Panel stiffening	Where applicable	Single measurements
Transverse watertight and swash bulkheads		
Upper and lower stool, where fitted	- Transverse band within 25 [mm] of welded connection to inner bottom / deck plating - Transverse band within 25 [mm] of welded connection to shelf plate	5-point pattern between stiffeners over one metre length
Deckhead and bottom strakes and strakes in way of horizontal stringers	Plating between pair of stiffeners at three locations: approximately ¼, ½ and ¾ width of tank	5-point pattern between stiffeners over one metre length
All other strakes	Plating between pair of stiffeners at middle location	Single measurement
Strakes in corrugated bulkheads	Plating for each change of scantling at center of panel and at flange of fabricated connection	5-point pattern between stiffeners over one metre length
Stiffeners	Minimum of three typical stiffeners	For web, 5-point pattern over span between bracket connections (two measurements across web at each bracket connection and one at center of span). For flange, single measurements at each bracket toe and at center of span

Table 4.4.9.2 : Contd.)		
Structural member	**Extent of measurement**	**Pattern of measurement**
Brackets	Minimum of three at top, middle and bottom of tank	5-point pattern over areas of bracket
Horizontal stringers	All stringers with measurements at both ends and middle	5-point pattern over one square metre areas, plus single measurements near bracket toes and on flanges
Deep webs and girders	Measurements at toe of bracket and at center of span	For web, 5 point pattern over about 1 square metre, 3 measurements across face flat

4.4.9.5 In order to ensure necessary control during the process of thickness measurements, these are normally to be carried out under the supervision of the Surveyor. The Surveyor has the right to re-check the measurements as deemed necessary to ensure acceptable accuracy.

4.4.9.6 In all cases the extent of the thickness measurements are to be sufficient as to represent the actual average condition.

4.4.9.7 A thickness measurement report is to be prepared. The report is to give the location of measurements, the thickness measured as well as corresponding original thickness. Furthermore, the report is to give the date when the measurements were carried out, type of measuring equipment, names of personnel and their qualifications and has to be signed by the operator. The Surveyor is to review the report of the final thickness measurement after repairs have been carried out and countersign the cover page.

4.4.10 Additional requirements for cargo and ballast piping

4.4.10.1 For chemical tankers exceeding 10 years of age selected steel cargo pipes outside cargo tanks and ballast pipes passing through cargo tanks are to be:

- Thickness measured at random or selected pipe lengths to be opened for internal inspection.

- Pressure tested to the maximum working pressure. Special attention is to be given to cargo/slop discharge piping through ballast tanks and void spaces.

4.4.11 Survey of independent tanks

4.4.11.1 All independent cargo tanks are to be surveyed internally and externally together with tank supports and the adjacent hull structure.

4.4.11.2 Thickness gauging of the independent cargo tanks is to be carried out as found necessary by the Surveyor.

4.4.11.3 All independent cargo tanks are to be hydraulically pressure tested to their MARVS (Maximum Allowable Relief Valve Setting). However, testing of gravity type tanks may be omitted if the tanks are found without corrosion and other damages and otherwise acceptable.

4.4.12 Reporting and evaluation of survey

4.4.12.1 The data and information on the structural condition of the vessel collected during the survey is to be evaluated for acceptability and continued structural integrity of the vessel.

4.4.12.2 An Executive Hull Summary of the survey and results is to be issued to the Owner and placed on board the vessel for reference at future surveys. The Executive Hull Summary is to be endorsed by IRS Head Office.

4.4.13 Watertight Cable Transits

4.4.13.1 The requirements for Special Survey may be undertaken by the attending Surveyor or by a firm approved as a service supplier according to Pt.1 Ch.1, Sec 1.9.

4.4.13.2 All transits are to be examined to confirm their satisfactory condition and the Cable Transit Seal System Register is to be reviewed to confirm that it is being maintained. The Special Survey is to be recorded in the

Register, in which a single record entry will be sufficient to record the survey of all transits.

4.4.13.3 From review of the Register, where there are records entered since the last special survey of any disruption to the cable transits or installation of new cable transits (except which are reviewed and examined at previous annual surveys), the satisfactory condition of those transits is to be confirmed by the attending Surveyor by review of records and examination of the transits; the results are to be recorded in the Register against each of those cable transits.

4.4.13.4 In case the cable transits have been examined by an approved service supplier, the attending surveyor is to review the Register in order to ascertain that it has been properly maintained by the owner and correctly endorsed by the service supplier.

4.5 Special Surveys - Machinery

4.5.1 Requirements for examination of machinery and systems are given in Sec.8.

Section 5

Surveys - Liquefied Gas Carriers

5.1 Scope

5.1.1 This section gives the requirements for periodical surveys of vessels which have been assigned the class notation:

Liquefied gas carrier.

5.2 Annual surveys

5.2.1 General

5.2.1.1 Annual Surveys are to be carried out within 3 months before or after the anniversary date each year. (Also refer to Note 9 of Sec.1, Table 1.1.1). These should be held concurrently with statutory annual or other relevant statutory Surveys, where practicable.

5.2.1.2 At Annual Surveys, the Surveyor is to examine the hull and machinery, so far as necessary and practicable, in order to be satisfied as to their general condition.

5.2.1.3 The annual survey is preferably to be carried out during a loading or unloading operations.

5.2.1.4 It is to be confirmed that no new installation of material containing asbestos was carried out since last survey.

5.2.1.5 Where applicable, examination of alternative design and arrangement for segregation of the cargo area or machinery or electrical installations or fire safety, in accordance with the test, inspection and maintenance requirements, if any, specified in the approved documentation is to be carried out.

5.2.2 Hull and weather deck

5.2.2.1 The survey is to consist of an examination for the purpose of ensuring, as far as practicable, that the hull, equipment, closing appliances and related piping are maintained in satisfactory/efficient condition. Special attention is to be paid to the following:

a) Weather deck, shipside plating above waterline.

b) Openings on freeboard and superstructure decks; exposed casings; skylights and fiddley openings; deck houses; companionways and superstructure bulkheads; side scuttles and dead lights; flush deck scuttles; ash shoots and other openings.

c) Weld connection between air pipes and deck plating; air pipe heads on exposed decks (external examination); flame screens on vents to all bunker tanks; ventilators and closing devices.

d) Watertight bulkheads and their penetrations as far as practicable.

e) Scuppers and sanitary discharges as far as practicable together with valves and their controls.

f) Guard rails, bulwarks, freeing ports, gangways, walkways and life lines.

g) Examining the cargo, bunker, ballast and vent piping systems, including PRVs, vacuum relief valves, vent masts and devices to prevent the passage of flame on vents to all bunker, holds and void spaces, as far as practicable and confirming that the PRVs are type-approved or marked with date of testing.

h) Confirming that the wheel house doors and windows, non-opening type side scuttles and windows in superstructure and deck house ends facing the cargo area are in a satisfactory gastight condition.

i) Confirming that any special arrangements to survive conditions of damage are in order.

5.2.2.2 Examining the cargo machinery spaces and turret compartments, including their escape routes

Examination of the electric motor room and compressor room bulkheads for signs of leakage or fractures and in particular, the sealing arrangements of all penetrations on bulkheads.

5.2.2.3 Confirming that the sealing arrangements at the gas domes are satisfactory.

5.2.2.4 All watertight doors in watertight bulkheads, to be examined and tested (locally and remotely) as far as practicable.

5.2.2.5 Suspect areas identified at previous special or intermediate surveys are to be close-up surveyed. Thickness measurements are to be taken in the area of substantial corrosion identified at previous surveys.

5.2.2.6 Examination of ballast tanks is to be carried out when required as a consequence of the results of the Special Survey or Intermediate Survey. (See 5.4.3.5, 5.4.3.6, 5.3.2.1 and 5.3.2.2). When considered necessary by the Surveyor or where extensive corrosion is found, thickness measurement is to be carried out. When examination of ballast tanks reveals substantial corrosion, additional thickness measurements are to be carried out to determine the extent of the areas of substantial corrosion in accordance with Table 5.4.4.2.

5.2.2.7 Anchoring and mooring equipment is to be examined as far as is practicable. A general examination of the emergency towing arrangements is to be carried out to ensure their ready availability. It is to be confirmed that the towing and mooring equipment is properly marked with any restriction associated with its safe operation.

For vessels with single point mooring arrangements where 'SPM' notation is assigned, the following are to be generally examined:

a) Components of the single point mooring system (bow chain stoppers, bow fairleads, pedestal roller fairleads, winches and capstans), to verify their satisfactory condition.

b) Hull structures supporting and adjacent to the components of the single point mooring system, to verify that there is no deformation or fracture.

5.2.2.8 Where applicable Surveyor should satisfy himself regarding the freeboard marks on the ship's side.

5.2.2.9 The Surveyor is to confirm that, where required, an approved loading instrument together with its operation manual are available on board, See Pt.3, Ch.5. It is to be verified by the Surveyor that the loading instrument is checked for accuracy at regular intervals by the ship's staff by applying test loading conditions.

5.2.2.10 Accommodation ladders are to be examined at annual surveys. Satisfactory condition of the following items is to be checked, in particular :

a) steps;
b) platforms;
c) all support points such as pivots, rollers, etc.;
d) all suspension points such as lugs, brackets, etc.;
e) stanchions, rigid handrails, hand ropes and turntables;
f) davit structure, wire and sheaves, etc.

5.2.2.11 Access to bow arrangements are to be examined. Gangways are to be examined at annual surveys. Satisfactory condition of the following items is to be checked, in particular:

a) treads;
b) side stringers, cross-members, decking, deck plates, etc.;
c) all support points such as wheel, roller, etc.;
d) stanchions, rigid handrails, hand ropes.

5.2.2.12 Winches of accommodation ladders and gangways are to be examined to verify the satisfactory condition of the following items:

a) brake mechanism including condition of brake pads and band brake, if fitted;
b) remote control system, and
c) power supply system for electric motor.

5.2.2.13 Davits and fittings on the ship's deck associated with accommodation ladders and gangways are to be examined for satisfactory condition at annual surveys. Fittings or structures for means of access to deck such as handholds in a gateway or bulwark ladder and stanchions are also to be examined.

5.2.2.14 The maintenance and inspection records of accommodation ladders and gangways are to be verified. It is to be confirmed that supporting wires are being renewed at intervals not exceeding 5 years.

5.2.2.15 When examining internal spaces, as far as practicable, the permanent means of access where appropriate, are to be verified that they remain in good condition.

5.2.2.16 For vessels subject to IMO PSPC (See Pt.3, Ch.2, 3.6) it is to be confirmed that the maintenance, repair and partial re-coating of dedicated ballast tanks, as appropriate, are recorded in the coating technical file.

5.2.2.17 Watertight cable transit seal systems register is to be reviewed to confirm that it is being maintained and as far as practicable the transits are to be examined to confirm their satisfactory condition. Where there are records entered since last annual survey of any disruption to the cable transits or installation of new cable transits, the satisfactory condition of those transits is to be confirmed by review of records and, if deemed necessary, by examination. The results are to be recorded in the Register against the specific cable transit.

5.2.2.18 In case the cable transits have been examined by an approved service supplier, the attending surveyor is to review the Register in order to ascertain that it has been properly maintained by the owner and correctly endorsed by the service supplier.

5.2.3 Machinery and systems

5.2.3.1 A general examination of the machinery, boilers, all pressurised systems (steam, hydraulic, pneumatic) and their associated fittings, propulsion system and auxiliary machinery to see whether they are being properly maintained and with particular attention to the fire and explosion hazards.

5.2.3.2 Confirmation that machinery, boilers and other pressure vessels, associated piping systems and fittings are so installed and protected as to reduce to a minimum any danger to persons on board, due regard being given to moving parts, hot surfaces and other hazards.

5.2.3.3 Confirmation that Periodical Surveys of boilers and other pressure vessels have been carried out as required by the Rules and the safety devices have been tested.

5.2.3.4 Confirmation that the normal operation of the propulsion machinery can be sustained or restored even though one of the essential auxiliaries becomes inoperative.

5.2.3.5 Confirmation that means are provided so that machinery can be brought into operation from the dead ship condition without external aid.

5.2.3.6 All main and auxiliary steering arrangements and their associated equipment and control systems are to be examined and tested. Where applicable, Surveyors are to verify that log entries have been made in accordance with statutory requirements.

5.2.3.7 Confirming, when appropriate, that requisite arrangements to regain steering capability in the event of the prescribed single failure are being maintained.

5.2.3.8 All the means of communication between the navigating bridge and the machinery control positions, as well as the bridge and the main alternative steering position, if fitted, are to be tested. It is to be confirmed that means of indicating the angular position of the rudder are operating satisfactorily.

5.2.3.9 Confirmation that with ships having emergency steering positions there are means of relaying heading information and, when appropriate, supplying visual compass readings to the emergency steering positions.

5.2.3.10 Confirmation that various alarms required for hydraulic power operated, electric and electro-hydraulic steering gears are, operating satisfactorily and that the recharging arrangements for hydraulic power operated steering gears are being maintained.

5.2.3.11 Examining the means for the operation of the main and auxiliary machinery essential for propulsion and the safety of the ship, including when applicable, the means of remotely controlling the propulsion machinery from the navigating bridge and the arrangements to operate the main and other machinery from a machinery control room.

5.2.3.12 Confirmation that the engine room telegraph, the second means of communication between the navigation bridge and the machinery space and the means of communication with any other positions from which the engines are controlled are operating satisfactorily.

5.2.3.13 Examination and testing of the general emergency alarm system and confirmation that the engineer's alarm is clearly audible in the engineer's accommodation.

5.2.3.14 It is to be confirmed that ballasting and de-ballasting arrangements are satisfactory. The bilge pumping systems and bilge wells including operation of each bilge pump, extended spindles and level alarms, where fitted, are to be examined as far as is practicable. It is also to be confirmed that bilge pumping system for each watertight compartment is satisfactory.

It is also to be confirmed that drainage from enclosed spaces in cargo areas situated on freeboard deck is satisfactory.

5.2.3.15 Examining visually the condition of non-metallic expansion joints where fitted in piping systems which penetrate the ship's side, with both the penetration and the expansion joint located below the deepest load waterline, and checking the service record.

5.2.3.16 General examination visually and in operation, as feasible, of the main electrical machinery, the emergency sources of electrical power, the switch gear, other electrical equipment including the lighting system is to be carried out.

5.2.3.17 Confirmation as far as practicable, the operation of the emergency source(s) of electrical power, including their starting arrangement, the systems supplied, and when appropriate, their automatic operation.

5.2.3.18 Examining in general, that the precautions provided against shock, fire and other hazards of electrical origin are being maintained.

5.2.3.19 General Examination of automation equipment is to be carried out. Satisfactory operation of safety devices, bilge level detection and alarm systems and control systems is to be verified.

5.2.3.20 Confirmation that machinery space ventilation systems are in good working condition.

5.2.3.21 For Ships constructed before 01 July 2017 and fitted with harmonic filters; following are to be verified at each survey:

a) Records of annual measurement of harmonic distortion levels of main bus bar under seagoing conditions and log entries showing which equipment was running and / or filters in service at the time of measurement. Harmonic distortion readings are to be carried out when the greatest amount of distortion is indicated by the measuring equipment.

b) Records of measurement of distortion levels, after any modification to the ship’s electrical distribution system.

5.2.3.22 For Ships constructed on or after 01 July 2017 and fitted with harmonic filters; or for ships retrofitted with harmonic filters, on or after 01 July 2017; following are to be verified at each survey:

a) Engine log book containing distortion monitoring readings/ automatic records of same

b) Documentation of any approved relaxation on allowable distortion limits.

5.2.3.23 For ships contracted for construction on or after 01 Jan 2017 following are to be verified in emergency generator rooms at each survey:

a) Hand operated ventilation louvres, closing appliances, if fitted, are kept open and corresponding instruction plates are visible near the louvres.

b) Power operated ventilation louvres and closing appliances, if fitted, are fail-to-open type and capable of opening automatically whenever emergency generator is starting / in operation.

c) It is to be possible to close ventilation openings by a manual operation from a clearly marked safe position outside the space where the closing operation can be easily confirmed. Further, such closing is not possible from any other remote position. The louvre status (open/closed) is indicated at this position.

5.2.3.24 For vessels fitted with ICCP system, proper functioning of the system is to be checked and records of system operation are to be verified. It is to be verified that all maintenance as per manufacturer's instructions are carried out.

5.2.4 Fire protection, detection and extinction

5.2.4.1 The arrangements for fire protection, detection and extinction are to be examined and are to include confirmation that no changes have been made in the structural fire protection. Following are to be examined / verified:

a) verification that fire control plans are properly posted;

b) examination as far as possible and testing as feasible, any fire detection and alarm system and any sample extraction smoke detection system;

c) examination of the fire main system and verification that each fire pump including the emergency fire pump can be operated separately so that the two required powerful jets of water can be produced simultaneously from different hydrants at any part of the ship whilst the required pressure is maintained in the fire main; testing the remote means for starting one main fire pump;

d) verification that fire hoses, nozzles, applicators and spanners are in good working condition and situated at their respective locations;

e) examination of fire-fighting system (including fixed fire fighting for the machinery spaces) controls, piping, instructions and marking, checking for evidence of proper maintenance and servicing including date of last systems tests;

f) verification that all semi-portable and portable fire extinguishers are in their stowed positions, checking for evidence of proper maintenance and servicing, conducting random check for evidence of discharged containers;

g) verification, as far as practicable, that the remote controls for stopping fans and machinery in machinery spaces are in working order. Examination of the arrangements for oil fuel, lubricating oil and other flammable oils and testing the remote closing of valves for oil fuel, lubricating oil and other flammable oils and , the operation of the remote means of closing the valves on the tanks that contain oil fuel, lubricating oil and other flammable oils;

h) examination of the closing arrangements of ventilators, funnel annular spaces, skylights, doorways and tunnel, where applicable;

i) confirmation that the fire fighters' outfits including its self-contained compressed air breathing apparatus and emergency escape breathing devices (EEBDs) are complete and in good condition and that the cylinders, including the spare cylinders, of any required self-contained breathing apparatus are suitably charged, and that on board means of recharging breathing apparatus cylinders used during drills or a suitable number of spare cylinders to replace those used are provided, and provision of two-way portable radiotelephone apparatus of an explosion-proof type or intrinsically safe ;

j) examination of any manual and automatic fire doors and proving their operations;

k) Examining the fixed fire fighting system for the enclosed cargo machinery spaces, and the enclosed cargo motor room within the cargo area, and confirming that its means of operation is clearly marked;

l) Examining the water spray system for cooling, fire protection and crew protection and confirming that its means of operation is clearly marked;

m) Confirming that all electrical equipment in gas dangerous spaces and zones is suitable for such locations, is in satisfactory condition and properly maintained;

n) Examining the dry chemical powder fire extinguishing system for the cargo area and confirming that its means of operation is clearly marked;

o) Examining the fixed fire fighting system for the cargo pump room and the deck foam system for the cargo area and confirming that their means of operation are clearly marked.

p) Examining the appropriate fire-extinguishing system for the enclosed cargo machinery spaces for ships that are dedicated to the carriage of a restricted number of cargoes and the internal water spray system for the turret compartments and confirming that their means of operation is clearly marked.

q) examination of the fire-extinguishing systems for spaces containing paint and/or flammable liquids and deep fat cooking equipment in accommodation and service spaces;

r) examination of the fire safety requirements of helicopter facilities, including foam firefighting appliances .

s) Examination of the fixed carbon dioxide fire-extinguishing systems for the protection of machinery spaces and cargo pump-rooms, where applicable, are provided with two separate controls, one for opening of the gas piping and one for discharging the gas from the storage container, each of them located in a release box clearly identified for the particular space.

t) Examination of the fire protection arrangements in cargo spaces and confirming as far as practicable and as appropriate, the operation of the means of control provided for closing the various openings.

u) Testing the fire dampers of ventilation ducts and the means of closing the main inlets and outlets of all ventilation systems and testing the means of stopping power ventilation systems from outside the space served.

Surveys carried out by the National Authority of the country in which the ship is registered would normally be accepted as meeting these requirements, at the discretion of the Surveyor.

5.2.4.2 On ships where inert gas systems are installed, the requirements of Sec.12 are to be complied with.

5.2.4.3 Confirmation that the means of escape from accommodation, machinery spaces and other spaces are satisfactory.

5.2.4.4 Examination of the arrangements for gaseous fuel for domestic purposes.

5.2.5 Other safety arrangements related to cargo / cargo area

5.2.5.1 The ship's log and operational records for the cargo containment system covering the period from the previous survey are to be examined taking into consideration hours per day of the reliquefaction plant or the boil-off rate. Any malfunction of the system entered in the log is to be investigated, the cause ascertained, and that part of the system at fault is to be found or placed in good order.

5.2.5.2 Cargo liquid level indicating devices are to be generally examined. The low level, high level, and overfill alarms are to be examined and tested to ascertain that they are in working order. Consideration will be given to the acceptance of simulated tests, provided that they are carried out at the cargo temperature, or comprehensive maintenance records, including details of tests held, in accordance with the cargo plant instrumentation maintenance manual. The calibration status of the measuring instruments may also be verified.

5.2.5.3 Cargo gas leakage detection systems are to be examined and tested to ascertain that they are in working order and calibrated using sample gas.

The gas detection arrangements for cargo control rooms and the measures taken to

exclude ignition sources where such spaces are classified as hazardous, are to be examined.

5.2.5.4 The correct functioning of the cargo containment system temperature and pressure indicating equipment, including, when fitted, the thermal oxidation systems and any refrigeration system, together with any associated alarms, is to be verified.

5.2.5.5 Control devices for the cargo containment systems and cargo handling equipment, together with any associated shutdown and/or interlock, are to be checked under simulated working conditions and, if necessary, recalibrated.

5.2.5.6 The arrangements for manually operated emergency shutdown system together with the automatic shut down of the cargo pumps and compressors are to be checked to ascertain they are in working order.

Alternatively, the log books may be examined for verification that the emergency shutdown system has been tested.

5.2.5.7 Ventilation systems and air locks in working spaces are to be checked for satisfactory operation.

5.2.5.8 Cargo pipeline, valves and fittings are to be generally examined, with special reference to expansion bellows, supports and vapour seals on insulated pipes.

5.2.5.9 Examining the process piping including the expansion arrangements, insulation from hull structure, pressure relief and drainage arrangements and water curtain protection as appropriate.

5.2.5.10 Portable and/or fixed drip trays, or insulation for deck protection in the event of cargo leakage, are to be examined for condition.

5.2.5.11 Examining when applicable bow or stern loading and unloading arrangements with particular reference to the electrical equipment, fire- fighting arrangements and means of communications between the cargo control room and the shore location.

5.2.5.12 Confirming that the cargo tank and interface pressure and relief valves, including safety systems and alarms are satisfactory.

5.2.5.13 Confirming that all liquid and vapour hoses are suitable for their intended purpose.

5.2.5.14 Confirming that any air drying system and any inter barrier and hold space purging inert gas system are satisfactory.

For membrane containment systems, normal operation of the nitrogen control system for insulation and inter barrier spaces is to be confirmed by the Master.

5.2.5.15 Confirming that two sets of portable gas detection equipment suitable for the cargoes to be carried and a suitable instrument for measuring oxygen levels have been provided.

5.2.5.16 Electrical bonding of the cargo pipes and tanks to the hull is to be verified.

5.2.5.17 Confirming that when applicable arrangements are made for sufficient inert gas to be carried to compensate for normal losses and that means are provided for monitoring the spaces.

5.2.5.18 Confirming that the use of inert gas has not increased beyond that needed to compensate for normal losses by examining records of inert gas usage.

5.2.5.19 Examining the emergency lighting in all cargo compressor rooms and electric motor rooms for cargo compressors.

5.2.5.20 Examining the cargo control room.

5.2.6 Reliquefaction/refrigeration equipment

5.2.6.1 Where reliquefaction or refrigeration equipment for cargo temperature and pressure control is fitted and notation HY(LGC) assigned, the following are to be examined, so far as is practicable:

a) The machinery under working conditions.

b) The shells of all pressure vessels in the system, externally, insulation need not be removed for this examination, but any deterioration of insulation or evidence of dampness which could lead to external corrosion of the vessels of their connections, is to be investigated.

c) Primary refrigerant gas and liquid pipes, cargo vapour and liquid condensate pipes and condenser cooling water pipes. Insulation need not be removed, but any deterioration or evidence of dampness is to be investigated.

d) The reliquefaction/refrigeration plant spare gear.

5.2.7 Methane burning equipment and other equipment components

5.2.7.1 The following components are to be generally examined externally. If insulation is fitted, this need not be removed, but any deterioration of insulation, or evidence of dampness which could lead to external corrosion of the vessels or their connections, is to be investigated.

a) Heat exchangers and pressure vessels for use with methane burning in boilers or machinery.

b) Cargo heaters, vaporizers, masthead heaters and other miscellaneous pressure vessels.

5.2.7.2 Controls and interlocks are to be checked.

5.2.7.3 Alarm systems are to be checked to ascertain they are in working order.

5.2.7.4 Exhaust fans and/or pressurizing system for gas trunking are to be tested.

5.2.7.5 The relevant instruction and information material such as cargo handling plans, filling limit information, cooling down procedures etc. are to be verified as being onboard.

5.2.8 Cargo containment systems

5.2.8.1 At the first Annual Survey after initial commissioning of the ship, the operating records of the primary gas detection system are to be examined.

5.2.8.2 Where the insulation arrangement is such that the insulation cannot be examined during special surveys (See 5.4.6.9) the surrounding structures of wing tanks, double bottom tanks and cofferdams are to be examined for cold spots, prior to the survey. This examination is to be held at a convenient cargo discharge operation with the cargo tanks loaded at approximately the minimum notation temperature.

5.2.8.3 On application by the Owner, consideration will be given to the cold spot examination, where applicable, being carried out by the ship's staff.

5.2.8.4 When tests are required after repairs, independent cargo tanks, other than independent tanks, type C, are to be tested by hydraulic or hydropneumatic means as appropriate. Test heads and pressures should be as defined in Pt.5, Ch.4. Cargo tanks of the membrane or semi-membrane type are to be tested by means of a detectable gas in the inter-barrier spaces and discolouring paint on the weld seams of the cargo tanks wall, or other suitable means. Independent cargo tanks of type C are to be tested hydraulically at 1.25 times the approved maximum vapour pressure.

5.2.9 Personnel protection

a) Verification that the requisite safety equipment and associated breathing apparatus with requisite air supplies and emergency escape respiratory and eye protection, if required, are in good condition and are properly stowed.

b) Verification that medical first air equipment including stretchers and oxygen resuscitation is in god condition and that satisfactory arrangements are made for antidotes for cargoes actually carried to be on board.

c) Verification that decontamination arrange-ments are operational.

5.3 Intermediate Surveys

5.3.1 General

5.3.1.1 Intermediate surveys are to be carried out at or between the second or third Annual Survey. (Also refer to Note 9 of Sec.1, Table 1.1.1). However, only those items which are additional to the requirements for annual surveys may be examined between the second or third annual surveys.

Concurrent crediting to both Intermediate survey and Special survey for surveys and thickness measurements of spaces is not acceptable.

5.3.1.2 The following requirements are applicable for vessels over five years of age. For vessels below 5 years of age additional examination over and above the requirements of Annual survey may be required at the discretion of the Surveyors.

5.3.1.3 For ships carrying liquefied gases in bulk the intermediate survey is preferably to be carried out with the ship in a gas free condition. The purpose of the intermediate survey is to supplement the annual survey by testing the cargo handling installations with related automatic control, alarm and safety systems for their correct functioning. The extent of the testing required for the intermediate survey will normally be such that the survey cannot be carried out during loading or discharging operation.

5.3.1.4 Prior to the commencement of any part of the intermediate survey, a survey planning meeting is to be held between the attending Surveyor(s), the owner's representative in attendance and where involved, the thickness measurement company representative and the master of ship or an appropriately qualified representative appointed by the master or Company for the purpose to ascertain that all the arrangements envisaged in the survey programme are in place, so as to ensure the safe and efficient conduct of the survey work to be carried out.

5.3.2 Ballast tanks

5.3.2.1 Vessels of age more than 5 years but not exceeding 10 years

a) An overall survey of representative ballast tanks is to be carried out. When extensive corrosion is found, thickness measurements are to be carried out. If such examination reveals no visible structural defects, the examination may be limited to a verification that the corrosion prevention system remain efficient.

b) Where POOR coating condition, corrosion or other defects are found in ballast tanks or where hard protective coating was not applied from the time of construction, the examination is to be extended to other ballast tanks of the same type.

c) For ballast tanks, other than double bottom tanks, where a protective coating is found to be in POOR condition and is not renewed, where a soft or semi-hard coating has been applied or where a hard protective coating was not applied from the time of construction, the tank(s) in question are to be examined at subsequent annual surveys.

d) For double bottom ballast tanks, where a protective coating is found to be in POOR condition and is not renewed, where a soft or semi-hard coating has been applied or where a hard protective coating was not applied from the time of construction, the tank(s) in question may be examined at subsequent Annual surveys.

5.3.2.2 Vessels of age more than 10 years

a) An overall survey of all ballast tanks is to be carried out. When extensive corrosion is found, thickness measurements are to be carried out. If such examination reveals no visible structural defects, the examination may be limited to a verification that the corrosion prevention system remain efficient.

b) For ballast tanks, other than double bottom tanks, where a protective coating is found to be in POOR condition and is not renewed, where a soft or semi-hard coating has been applied or where a hard protective coating was not applied from the time of construction, the tank(s) in question are to be examined at subsequent annual surveys.

c) For double bottom ballast tanks, where a protective coating is found to be in POOR condition and is not renewed, where a soft or semi-hard coating has been applied or where a hard protective coating was not applied from the time of construction, the tank(s) in question may be examined at subsequent Annual surveys.

d) The Surveyor is to carry out a Close-up survey and thickness measurement of structure identified at the previous Special Survey as having substantial corrosion. The minimum requirements for close-up surveys at intermediate survey are given in Table 5.3.2.2.

Table 5.3.2.2 : Table of the minimum requirements for close-up survey of hull at intermediate surveys of liquefied gas carriers

10 < age ≤ 15	**age > 15**
Close-up survey of: - all web frames and both transverse bulkheads in a representative ballast tank (1) and (2) - the upper part of one web frame in another representative ballast tank - one transverse bulkhead in another representative ballast tank (2)	Close-up survey of : - all web frames and both transverse bulkheads in two representative ballast tanks (1) and (2)
(1) Complete transverse web frame including adjacent structural members	
(2) Transverse bulkhead complete, including girder system and adjacent members and adjacent longitudinal bulkhead structure	
Note 1 : Ballast tanks include topside, double hull side, double bottom, hopper side or any combined arrangement of the aforementioned and peak tanks where fitted.	
Note 2 : For areas in tanks where protective coating is found to be in good condition, the extent of close-up survey may be specially considered.	
Note 3 : For ships having independent tanks of type C, with a midship section similar to that of a general cargo ship, the extent of close-up surveys may be specially considered.	
Note 4 : The extent of close-up surveys may be extended by the Surveyor as deemed necessary, taking into account the maintenance of the tanks under survey, the condition of the corrosion prevention system and also in the following cases: - in particular, in tanks having structural arrangements or details which have suffered defects in similar tanks, or on similar ships according to available information; - in tanks having structures approved with reduced scantlings.	

5.3.3 Safety arrangements related to cargo

5.3.3.1 The following are to be dealt with as applicable:

a) Examination of means for draining the vent piping system.

b) Verification that the heating arrangements, if any, for steel structures are satisfactory.

c) With regard to the Cargo containment systems examination of the items in accordance with 5.2.8.1 and 5.2.8.2.

d) Confirmation, where applicable that pipelines and independent cargo tanks are electrically bonded to the hull.

e) Generally examining the electrical equipment and cables in hazardous areas and zones such as cargo machinery spaces and areas adjacent to cargo tanks to check for defective equipment, fixtures and wiring. The insulation resistance of the circuits is to be tested and in cases where a proper record of testing is maintained, consideration should be given to accepting recent readings. Examination with reference to the following is to be carried out:

- Protective earthing (spot check).

- Integrity of flame proof enclosures.

- Damage of outer sheath of cables.

- Function testing of pressurized equipment and associated alarms.

- Testing of systems for de-energizing non-certified safe electrical equipment located in spaces protected by air

locks, such as electrical motor-rooms, cargo control rooms, etc.

f) Confirming that spares are provided for cargo area mechanical ventilation fans.

g) Checking the provision of equipment for personnel protection.

h) Examining when applicable, the arrangements for the use of cargo as fuel and testing as far as practicable, that the gas supply to the machinery space is cut off should the exhaust ventilation not be functioning correctly and that the master gas fuel valve may be remotely closed from within the machinery space.

i) The emergency shutdown system is to be tested without flow in the pipelines, to verify that the trip system stops the cargo pumps and compressors.

5.4 Special Surveys - Hull

5.4.1 General

5.4.1.1 All ships classed with IRS are to undergo Special Surveys at 5 yearly intervals. The first Special Survey is to be completed within 5 years from the date of the initial classification survey and thereafter 5 years from the assigned date of the previous Special Survey. However, an extension of class of 3 months maximum beyond the 5th year may be granted in exceptional circumstances in accordance with 1.11. In such cases, the next period of class will start from the expiry date of the Special Survey before extension was granted.

Concurrent crediting to both Intermediate survey and Special survey for surveys and thickness measurements of spaces is not acceptable.

5.4.1.2 The interval between the Special Surveys may be reduced at the request of the parties concerned or by IRS if considered appropriate.

5.4.1.3 For surveys completed within 3 months before the expiry date of the Special Survey, the next period of class will start from the expiry date of the Special Survey. For surveys completed more than 3 months before the expiry date of the Special Survey, the period of class will start from the survey completion date. In cases where the vessel has been laid up or has been out of service for a considerable period because of a major repair or modification and the owner elects to only carry out the overdue surveys, the next period of class will start from the expiry date of the special survey. If the owner elects to carry out the next due special survey, the period of class will start from the survey completion date. Any requirement of the Flag Administration in this regard is also to be complied with.

5.4.1.4 The Special Survey may be commenced at the 4th Annual Survey and be progressed with a view to completion by the 5th anniversary date. When the special survey is commenced prior to the fourth annual survey, the entire survey is to be completed within 15 months if such work is to be credited to the special survey and in this case the next period of class will start from the survey completion date.

5.4.1.5 For the purpose of special survey, results of thickness measurement carried out during or after the fourth annual survey only would be considered.

5.4.1.6 Record of Special Survey will not be assigned until the Machinery Survey has been completed or postponed in agreement with IRS.

5.4.1.7 Ships which have satisfactorily passed a Special Survey will have a record entered in the Supplement to the Register Book indicating the assigned date of Special Survey.

5.4.1.8 The special survey is to include, in addition to the requirements of the Annual Survey, examination, tests and checks of sufficient extent to ensure that the hull, equipment and related piping are in satisfactory condition and that the ship is fit for its intended purpose for the new period of class of five years to be assigned subject to proper maintenance and operation and the periodical surveys being carried out at the due dates.

5.4.1.9 The examinations of the hull are to be supplemented by thickness measurements (See 5.4.4) and testing as deemed necessary, to ensure that the structural integrity remains effective. The aim of the examination is to discover substantial corrosion, significant deformation, fractures, damages or other structural deterioration, that may be present.

5.4.1.10 A Docking Survey in accordance with the requirements of Sec.7 is to be carried out

as part of the Special Survey. Any remaining work in respect of the overall and close-up surveys and thickness measurements and repairs applicable to the lower portions of ballast tanks (i.e. parts below light ballast waterline) are to be completed in the dry dock.

5.4.2 Planning and preparation for survey

5.4.2.1 The ship is to be prepared for overall survey in accordance with the requirements of Table 5.4.2.1. The preparation is to be of sufficient extent to facilitate an examination to ascertain any excessive corrosion, deformation, fractures, damages and other structural deterioration.

5.4.2.2 Prior to commencement of any part of the special survey, a survey planning meeting is to be held between the attending surveyor(s), the owner's representative in attendance, the thickness measurement company representative and the master of the ship or an appropriately qualified representative appointed by the master or Company for the purpose to ascertain that all the arrangements envisaged in the survey programme are in place, so as to ensure the safe and efficient conduct of the survey work to be carried out.

5.4.3 Examination and testing

5.4.3.1 All spaces within the hull and superstructure are to be examined. The special survey is to include examination of underwater parts as per Section 7.

5.4.3.2 All tanks other than cargo and ballast tanks are to be examined internally in accordance with the requirements of Table 5.4.3.2.

All bilge and ballast piping systems are to be examined and operationally tested to working pressure to attending Surveyor's satisfaction to ensure that tightness remains satisfactory.

Table 5.4.2.1 : Survey preparation

Special Survey No. I **Age ≤ 5**	**Special Survey No. II** **5 < Age ≤ 10**	**Special Survey No. III** **10 < Age ≤ 15**	**Special Survey No. IV and subsequently** **Age > 15**
1) All tanks, peaks, bilges and drain wells, engine and boiler spaces and other spaces are to be cleared out and cleaned as necessary for examination. Floor plates in engine and boiler spaces are to be lifted as may be necessary for examination of the structure underneath. Where necessary ceiling, lining, casings and loose insulation are to be removed as required by the Surveyor for examination of the structure. Compositions on the plating are to be examined and sounded, but need not be disturbed if found satisfactorily adhering to the plating 2) The steelwork is to be exposed and cleaned as may be required for its proper examination by the Surveyor and close attention is to be paid to the parts of the structure which are particularly liable to excessive corrosion or to deterioration due to other causes. 3) All tanks are to be cleaned as necessary to permit examination. 4) Casings or covers of air, sounding, steam and other pipes, spar ceiling and lining in way of the side scuttles are to be removed, as required by the Surveyor.	1) Requirements of Special Survey I to be complied with 2) The chain locker is to be cleaned internally. The chain cables are to be ranged for inspection. The anchors are to be cleaned and placed in an accessible position for inspection.	1) Requirements of Special Survey II to be complied with 2) Portions of wood sheathing, or other covering, on steel decks are to be removed, as considered necessary by the Surveyor, in order to ascertain the condition of the plating.	1) Requirements of Special survey III to be complied with

Table 5.4.3.2 : Requirements for internal examination of tanks

Tank	Special Survey No. I Age ≤ 5	Special Survey No. II 5 < Age ≤ 10	Special Survey No. III 10 < Age ≤ 15	Special Survey No. IV and subsequent Age > 15
Fuel oil bunker tanks				
- Engine room	None	None	One	One
- Cargo area	None	One	Two	Half the number of tanks, minimum 2
- If no tanks in Cargo Area, additional fuel tank(s) outside of Engine Room (if fitted)	None	One	One	Two
Lub.oil	None	None	None	One
Fresh water	None	One	All	All

Notes:

1) These requirements apply to tanks of integral (structural) type.

2) If a selection of tanks is accepted to be examined, then different tanks are to be examined at each special survey, on a rotational basis.

3) Peak tanks (all uses) are subject to internal examination at each special survey.

4) At special surveys No.III and subsequent special surveys one deep tank for fuel oil is to be included, if fitted.

5.4.3.3 All spaces including double bottom, deep, ballast, peak and cargo tanks; pump rooms, cargo compressor and electrical motor rooms, pipe tunnels, duct keels, machinery spaces, dry spaces, cofferdams and voids are to be internally examined including the plating and framing, bilges and drain wells, sounding, venting, pumping and drainage arrangements. This examination is to be supplemented by thickness measurement and testing as deemed necessary, to ensure that the structural integrity remains effective. The aim of the examination is to discover Substantial Corrosion, significant deformation, fractures, damages or other structural deterioration and if deemed necessary by the Surveyor, a suitable non-destructive examination may be required. At special survey No.3 and subsequent special surveys, structural downflooding ducts and structural ventilation ducts are to be internally examined.

5.4.3.4 Where ballast tanks have been converted to void spaces, the survey extent is to be based upon ballast tank requirements.

5.4.3.5 For ballast tanks, excluding double bottom tanks, where a hard protective coating is found in POOR condition and it is not renewed, where soft or semi-hard coating has been applied, or where a protective coating was not applied from the time of construction, the space in question is to be internally examined at Annual Surveys. Thickness measurement is to be carried out as deemed necessary by the Surveyor.

5.4.3.6 For double bottom ballast tanks where a protective coating is found in POOR condition and it has not been renewed or where soft or semi-hard coating has been applied, or where a protective coating was not applied from the time of construction, the spaces in question may be examined at Annual Surveys. When considered necessary by the Surveyor, thickness measurement is to be carried out.

5.4.3.7 All watertight bulkheads and watertight doors are to be examined. All decks, casings and superstructures are to be examined.

Attention is to be given to the corners of openings and other discontinuities in way of the strength decks and top sides.

5.4.3.8 The masts, standing rigging and anchors are to be examined.

The Surveyor should satisfy himself that there are sufficient mooring ropes on board and also that a tow line is provided when this is a Rule requirement.

5.4.3.9 The steering gear, and its connections and control systems (main and alternative) are to be examined. The auxiliary steering gear with its various parts are to be examined in working condition.

5.4.3.10 The hand pumps and suctions, air and sounding pipes are to be examined. The Surveyors are to ensure that striking plates are fitted under the sounding pipes whilst examining the tanks internally.

Automatic air pipe heads are to be internally examined at special surveys as indicated in Table 5.4.3.10. For designs where the inner parts cannot be properly inspected from outside, the head is to be removed from the air pipe. Particular attention is to be paid to the condition of the zinc coating in heads constructed from galvanised steel.

Table 5.4.3.10 : Requirements for internal examination of automatic air pipe heads

Location	Special survey No.I Age ≤ 5	Special survey No.II 5 < Age ≤ 10	Special survey No.III and subsequent Age > 10
forward 0.25L	Two air pipe heads[1,2] one port and one starboard on exposed decks	All air pipe heads on exposed decks	All air pipe heads[3] on exposed decks
aft of 0.25L from the forward perpendicular	Two air pipe heads[1,2] one port and one starboard on exposed decks	At least 20% of air pipe heads[1,2] on exposed decks	

Notes:

1. Preferably air pipes serving ballast tanks.
2. The selection of air pipe heads is to be made by the attending Surveyor. According to the results of the inspection, the Surveyor may require additional air pipe heads to be examined.
3. When there is substantiated evidence of replacement within the previous five years, individual air pipe heads may not be examined.

5.4.3.11 The Surveyor should satisfy himself regarding the efficient condition of the following :

- Means of escape from machinery spaces, crew and passenger spaces and spaces in which crew are normally employed;

- Means of communication between bridge and engine room and between bridge and alternative steering position;

- Helm indicator;

- Protection to the aft steering wheel and the gear.

5.4.3.12 The chain cables are to be ranged and the anchors and the chain cables are to be examined. At special survey no. II and subsequent special surveys, the chain cables are to be gauged. Any length of chain cable which is found to have reduced in mean diameter at its most worn part by more than 12 per cent of its original rule diameter is to be renewed.

5.4.3.13 The windlass is to be examined.

5.4.3.14 The chain locker, hold fasts, hawse pipes and chain stoppers are to be examined and pumping arrangements of the chain locker tested.

5.4.3.15 A thorough examination of aft and forward emergency towing arrangements is to be carried out to ensure its ready availability and satisfactory condition.

- examination of pick-up gear, towing pennant and chafing gear for possible deterioration;
- examination of strong points, fairleads, pedestal roller and their attachment to hull structure.

The survey is to confirm that one of the towing arrangements (aft or forward) are pre-rigged.

5.4.3.16 For vessels with single point mooring arrangements where 'SPM' notation is assigned, the following is to be carried out:

a) A thorough examination of the components of the single point mooring system (bow chain stoppers, bow fairleads, pedestal roller fairleads, winches and capstans) to verify their satisfactory condition.

b) A close-up examination of the hull structures supporting and adjacent to the components of the single point mooring system to verify that there is no deformation or fracture. Thickness determination and non-destructive tests are to be carried out if required by the Surveyor.

5.4.3.17 Engine room structure is to be examined. Particular attention being given to tank tops, shell plating in way of tank tops, brackets connecting side shell frames and tank tops and engine room bulkheads in way of tank tops and bilge wells. Where excessive areas of wastage are found, thickness measurements are to be carried out and renewals or repairs made when wastage exceeds allowable limits.

5.4.3.18 Boundaries of double bottom, deep, ballast, peak and other tanks are to be tested with a head of liquid to the top of air pipes. Boundaries of fuel oil, lub.oil and fresh water tanks are to be tested with a head of liquid to the highest point that liquid will rise under service conditions. Tank testing of fuel oil, lub.oil and fresh water tanks may be specially considered based on a satisfactory external examination of the tank boundaries and a confirmation from the Master stating that the pressure testing has been carried out according to the requirement with satisfactory results.

5.4.3.19 The loading instrument is to be checked for accuracy by applying test load conditions in presence of the Surveyor.

5.4.3.20 Examination of accommodation ladders, gangways and their winches are to be carried out as required for annual surveys. In addition, the accommodation ladders and gangways are to be operationally, tested with the specified maximum operation load.

The tests are to be carried out with the load applied as uniformly as possible along the length of the accommodation ladder or gangway, at an angle of inclination corresponding to the maximum bending moment on the accommodation ladder or gangway.

Accommodation ladder winch is to be operationally tested at special surveys. The brake system of the winch is to be tested for holding the maximum operational load on the ladder.

For existing installations on board ships constructed prior to 01 Jan 2010 where the maximum operational load is not known, load nominated by the shipowner or operator may be considered as the test load.

5.4.4 Thickness measurement

5.4.4.1 The minimum requirements for thickness measurement are given in Table 5.4.4.1. The surveyor may extend the thickness measurements as deemed necessary.

5.4.4.2 Where thickness measurements indicate substantial corrosion, the number of thickness measurements are to be increased to determine the extent of substantial corrosion. Table 5.4.4.2 may be used as guidance for additional measurements.

5.4.4.3 For areas in tanks where coating are found to be in a GOOD condition, the extent of thickness measurements may be specially considered, by the Surveyor.

5.4.4.4 Transverse sections are to be chosen where the largest reductions are suspected to occur or are revealed from deck plating measurements.

5.4.4.5 The thickness measurements are to be carried out by a qualified firm certified by IRS.

5.4.4.6 In order to ensure necessary control during the process, thickness measurements are normally to be carried out under the supervision of the Surveyor. The Surveyor has the right to re-check the measurements as deemed necessary to ensure acceptable accuracy.

5.4.4.7 A thickness measurement report is to be prepared. The report is to give the location of measurements, the thickness measured as well as corresponding original thickness. Furthermore, the report is to give the date when the measurements were carried out, type of measurement equipment, names of personnel and their qualifications and has to be signed by the operator. The Surveyor is to review the report of the final thickness measurement after repairs have been carried out and countersign the cover page.

Table 5.4.4.1 : Table of minimum requirements to thickness measurements of liquefied gas carriers

Special Survey No. I **Age ≤ 5**	**Special Survey No. II** **5 < Age ≤ 10**	**Special Survey No. III** **10 < Age ≤ 15**	**Special Survey No. IV and subsequently** **Age > 15**
1) Suspect areas throughout the vessel	1) Suspect areas throughout the vessel	1) Suspect areas throughout the vessel	1) Suspect areas throughout the vessel
2) Within the cargo area : One section of deck plating for the full beam of the ship within 0.5L amidships in way of a ballast tank, if any.	2) Within the cargo area: a) Each deck plate b) One Transverse section within 0.5L amidships in way of a ballast tank, if any	2) Within the cargo area: a) Each deck plate b) Two Transverse sections (1) c) All wind and water strakes	2) Within the cargo area: a) Each deck plate b) Three Transverse sections (1) c) All wind and water strakes d) Each bottom plate e) Duct keel or pipe tunnel plating and internals
3) Measurements of structural members subject to close-up survey according to Table 5.4.5.1, for general assessment and recording of corrosion pattern	3) Measurements of structural members subject to close-up survey according to Table 5.4.5.1, for general assessment and recording of corrosion pattern	3) Measurements of structural members subject to close-up survey according to Table 5.4.5.1, for general assessment and recording of corrosion pattern	3) Measurements of structural members subject to close-up survey according to Table 5.4.5.1, for general assessment and recording of corrosion pattern
	4) Selected wind and water strakes outside the cargo area	4) Selected wind and water strakes outside the cargo area	4) All wind and water strakes outside the cargo area
		5) Internals in forepeak and after peak ballast tanks	5) Internals in forepeak and afterpeak ballast tanks
			6) All exposed main deck plating outside cargo area
			7) Representative exposed superstructure deck plating (poop, bridge, forecastle deck)
			8) All keel plates, additional bottom plates in way of machinery space, aft end of tanks and cofferdams outside cargo area
			9) a) Plating of sea chests. b) Shell plating in way of overboard discharges as considered necessary by the Surveyor.
(1) at least one section is to include a ballast tank within 0.5L amidships, if any.			

Table 5.4.4.2 : Guidance for additional thickness measurements in way of substantial corrosion		
Structural Member	**Extent of Measurement**	**Pattern of Measurement**
Plating	Suspect area and adjacent plates	5 point pattern over 1 square meter
Stiffeners	Suspect area	3 measurements each in line across web and flange

5.4.5 Close-up survey requirements

5.4.5.1 The minimum requirements for Close-up Surveys at Special Survey are given in Table 5.4.5.1.

5.4.5.2 The Surveyor may extend the Close-up Survey as deemed necessary taking into account the maintenance of the tanks under survey, the condition of the corrosion prevention system and also in the following cases:

a) In particular, tanks having structural arrangements or details which have suffered defects on similar tanks or on similar ships according to available information.

b) In tanks which have structures approved with reduced scantlings due to an approved corrosion control system.

5.4.5.3 For areas in tanks where hard protective coatings are found to be in a GOOD condition, the extent of Close-up Surveys according to Table 5.4.5.1 may be specially considered by the Surveyor.

Table 5.4.5.1 : Table of minimum requirements for close-up surveys at special surveys of liquefied gas carriers

Special Survey No. I **Age ≤ 5**	**Special Survey No. II** **5 < Age ≤ 10**	**Special Survey No. III** **subsequent age > 10**
One web frame in a representative ballast tank of the topside, hopper side and double hull side type (1) One transverse bulkhead in a ballast tank (3)	All web frames in a ballast tank, which is to be a double hull side tank or a topside tank. If such tanks are not fitted, another ballast tank is to be selected (1) One web frame in each remaining ballast tank (1) One transverse bulkhead in each ballast tank (2)	All web frames in all ballast tanks (1) All transverse bulkheads in all ballast tanks (2)

(1) Complete transverse web frame including adjacent structural members.
(2) Transverse bulkhead complete, including girder system and adjacent members and adjacent longitudinal bulkhead structure.
(3) Transverse bulkhead lower part including girder system and adjacent structural members.

Notes :

a) Ballast tanks include topside, double hull side, double bottom, hopper side, or any combined arrangement of the aforementioned and peak tanks where fitted.

b) For ships having independent tanks of type C, with a midship section similar to that of a general cargo ship, the extent of close-up surveys may be specially considered by the Surveyor.

5.4.6 Cargo containment and systems

5.4.6.1 All cargo tanks are to be examined internally, also externally so far as is practicable, particular attention being paid to the plating in way of supports of securing arrangements, tower structures, seatings and pipe connections. Attention is also to be paid to the sealing arrangements in way of the deck penetrations and the antiflotation arrangements for independent tanks. The tightness of all cargo tanks is to be verified by an appropriate procedure. The ships gas detection equipment may be used for tightness test of independent tanks below deck. Provided that the structural examination is satisfactory, that the gas leakage monitoring systems have been found to be operating satisfactorily and that the voyage records have not shown any abnormal operation, cargo tanks do not require to be hydraulically tested.

5.4.6.2 Non-destructive testing is to supplement cargo tank inspection with special attention to be given to the integrity of the main structural members, tank shell and highly stressed parts, including welded connections as deemed necessary by the Surveyor. However, for Type C independent tanks non-destructive testing can not be dispensed with totally. The following items are, inter alia, considered as highly stressed parts:

- Cargo tank supports and anti-rolling/anti-pitching devices.
- Web frames or stiffening rings.
- Swash bulkhead boundaries.
- Dome and stump connections to tank shell.
- Foundations for pumps, towers, ladders etc.
- Pipe connections.
- Y-connections between tank shell and a longitudinal bulkhead of bilobe tanks.

5.4.6.3 For independent tanks of type B, the extent of non-destructive testing is to be given in a programme specially prepared for cargo tank design.

5.4.6.4 If findings of 5.4.6.1 to 5.4.6.2 or examination of voyage records do not reveal a satisfactory structural integrity of the cargo tanks, a hydraulic or hydro-pneumatic test is to be carried out. For integral tanks and for independent tanks of type A and B, the test pressure is to be atleast equal to MARVS. It is to be ensured that the maximum primary membrane stress or maximum bending stress in a primary membrane under the test conditions does not exceed 90% of the yield strength of the material (as fabricated) at the test temperature.

5.4.6.5 At every other special survey (i.e. 2nd, 4th, 6th etc.) independent cargo tanks of type C are to be either:

- hydraulically or hydro-pneumatically tested to 1.25 MARVS followed by non-destructive testing in accordance with para 5.4.6.2;

OR

- subjected to a thorough planned non-destructive testing. The testing programme is to be specially prepared for the tank design. Alternatively the items detailed in para 5.4.6.2 are to be subjected to non-destructive testing. The extent of radiographic examination with insulation removed as necessary is to be atleast 10% of the welded connections in each of the above mentioned areas, internally and externally as applicable.

5.4.6.6 Deck mounted cargo storage tanks are to be examined in the same manner as main cargo tanks.

5.4.6.7 Secondary barriers are to be examined for their effectiveness, visually whenever possible, or by means of pressure/vacuum tests on the inter-barrier spaces over a period of 36 hours. Alternative means of checking the secondary barriers will be considered. For membrane and semi-membrane tank systems, inspection and testing are to be carried out in accordance with programmes specially prepared in accordance with an approved method for the actual tank system.

For membrane containment systems, a tightness test of the primary and secondary barrier is to be carried out in accordance with the system designers procedures and acceptance criteria as approved by IRS. Low differential pressure may be used for monitoring the cargo containment system performance, however, is not considered an

acceptable test for the tightness of the secondary barrier.

For membrane containment systems with glued secondary barriers if the designer's threshold values are exceeded, an investigation is to be carried out and additional testing such as thermographic or acoustic emissions testing is to be carried out.

5.4.6.8 Where cargo containment systems have secondary barriers which cannot be examined or tested and have been approved on the basis of extensive prototype testing, the barriers will be considered to remain efficient provided a cold spot examination of the adjacent steel work is satisfactory and records of the steel work temperature readings are verified as acceptable.

5.4.6.9 Where a cargo tank or the hull structure is insulated and the insulation is accessible, the insulation should be examined externally, together with any vapour or protective barrier, and sections removed for examination, if considered necessary by the Surveyor. Special attention should be given to insulation in way of chocks, supports and keys. Portions of the insulation are also to be removed, if required by the Surveyor, to enable the condition of the plating to be ascertained. Where the insulation is not accessible, see 5.2.8.2.

5.4.6.10 Cargo tank internal pipes and fittings are to be examined, and all valves and cocks in direct communication with the interiors of the tanks are to be opened out for inspection and the connection pipes are to be examined internally, so far as is practicable.

5.4.6.11 Pressure relief valves and vacuum relief valves on cargo tanks and inter-barrier spaces are to be opened out for inspection. Pressure relief valves are subsequently to be adjusted to lift at a pressure not more than the percentage given below, above the maximum vapour pressure for which the tank have been approved:

For 0 to 1.5 bar – 10%
For 1.5 to 3.0 bar – 6%
For pressure exceeding 3.0 bar – 3%.

Relief valve harbour settings are to be checked, if applicable. Valves may be removed from the shell for the purpose of making this adjustment under pressure of air or other suitable gas. Relief valves on cargo gas and liquid pipelines are to have their pressure settings checked. The valves may be removed from the pipelines for the purpose.

If the cargo tanks are equipped with relief valves with non-metallic membranes in the main or pilot valves, then such non-metallic membranes are to be replaced. If a proper record of continuous overhaul and retesting of individually identifiable relief valves is maintained, then consideration will be given to acceptance on the basis of opening, internal examination and testing of a representative sampling of valves, including each size and type of liquefied gas or vapour relief valve in use, provided there is a logbook evidence that the remaining valves have been overhauled and tested since crediting of the previous special survey.

5.4.6.12 All cargo pumps, cargo booster pumps and cargo vapour pumps are to be opened out for examination. If requested by the Owner, these items may be examined on a Continuous Survey basis provided the interval between examination of each item does not exceed five years. Pumping systems for inter-barrier spaces are to be checked and verified to be in good working order.

5.4.6.13 Where considered necessary, insulated cargo gas and liquid pipelines are to have sections of insulation removed to ascertain the condition of the pipes. If visual examination raises doubt as to the integrity of the pipe lines, then the pipe lines are to be pressure tested to 1.25 times MARVS. Care is to be taken that in the replacement of insulation the outer vapour seal is made good.

5.4.6.14 Equipment for the production of inert gas is to be examined and shown to be operating satisfactorily within the gas specification limits. Pipelines, valves, etc., for the distribution of the inert gas are to be generally examined. Pressure vessels for the storage of inert gas are to be examined internally and externally and the securing arrangements are to be specially examined. Pressure relief valves are to be demonstrated to be in good working order. Liquid nitrogen storage vessels are to be examined, so far as is practicable, and all control equipment, alarms and safety devices are to be verified as operational.

5.4.6.15 Gas tight bulkhead shaft seals are to be opened out so that the sealing arrangements may be checked.

5.4.6.16 Sea connections associated with the cargo handling equipment are to be opened out when the ship is in dry-dock.

5.4.6.17 The arrangements for discharging the cargo overboard in an emergency are to be checked.

5.4.6.18 Special Survey I (Ships five years old)- reliquefaction / refrigeration equipment

a) Each reciprocating compressor is to be opened out. Cylinder bores, pistons, piston rods, connecting rods, valves and seats, glands, relief devices, suction filters and lubricating arrangements are to be examined. Crankshafts are to be examined but crankcase glands and the lower half of main bearings need not be exposed if the Surveyor is satisfied with the alignment and wear.

b) Where other than reciprocating type compressors are fitted, or where there is a program of replacement instead of surveys on board, alternative survey arrangements will be considered. Each case will be given individual consideration.

c) The water end covers of condensers are to be removed for examination of the tubes, tube plates and covers.

d) Refrigerant condenser cooling water pumps, including standby pump(s) which may be used on other services, are to be opened out for examination.

e) Where a pressure vessel is insulated, sufficient insulation is to be removed, especially in way of connections and supports, to enable the vessel's condition to be ascertained.

f) Insulated pipes are to have sufficient insulation removed to enable their condition to be ascertained. Vapour seals are to be specially examined for condition.

g) The Surveyor is to satisfy himself that all pressure relief valves and/or safety discs throughout the system are in good order. No attempt, however, is to be made to test primary refrigerant pressure relief valves on board ship.

h) The items covered by (a) to (d) may, at the request of the Owner, be examined on a Continuous Survey basis provided the interval between examination of each item does not exceed five years.

5.4.6.19 Special Survey I (ships five years old)- Methane burning equipment

a) Where methane is used as fuel for main propulsion purposes, the associated compressors and heat exchangers are to be opened out and examined as for reliquefaction/refrigeration equipment. The steam side of steam heaters is to be hydraulically tested to 1.5 times the design pressure.

b) Methane gas pipe trunks or casings are to be generally examined and the exhaust or inerting arrangements for these trunks are to be verified.

c) All alarms associated with the methane burning systems are to be verified.

5.4.6.20 Special Survey II and Special Surveys thereafter (ships 10 years old and over)

a) The requirements of 5.4.6.1 to 5.4.6.19 are to be complied with.

b) Water cooled condensers in which the primary refrigerant is in contact with the shell are to have the end covers removed and the shell pneumatically tested to a pressure equal to the designed working pressure.

c) All other pressure vessels in the reliquefaction/refrigeration system, methane burning system and other handling systems are to be pneumatically tested to a pressure equal to the designed working pressure.

d) Liquid cargo pipes are to be tested by approved means, to a pressure equal to 1.25 times the working pressure. Alternatively, selected representative lengths may be removed for internal examination and hydraulic testing.

e) At Special Survey III and at each alternate Special Survey thereafter, plating of independent cargo tanks, and also the hull structural plating surrounding cargo tanks, where it is insulated on one side, is to be measured for thickness by a non-destructive method.

5.4.7 Watertight Cable Transits

5.4.7.1 The requirements for Special Survey may be undertaken by the attending Surveyor or by a firm approved as a service supplier according to Pt.1 Ch.1, Sec 1.9.

5.4.7.2 All transits are to be examined to confirm their satisfactory condition and the Cable Transit Seal System Register is to be reviewed to confirm that it is being maintained. The Special Survey is to be recorded in the Register, in which a single record entry will be sufficient to record the survey of all transits.

5.4.7.3 From review of the Register, where there are records entered since the last special survey of any disruption to the cable transits or installation of new cable transits (except which are reviewed and examined at previous annual surveys), the satisfactory condition of those transits is to be confirmed by the attending Surveyor by review of records and examination of the transits; the results are to be recorded in the Register against each of those cable transits.

5.4.7.4 In case the cable transits have been examined by an approved service supplier, the attending surveyor is to review the Register inorder to ascertain that it has been properly maintained by the owner and correctly endorsed by the service supplier.

5.5 Special Surveys - Machinery

5.5.1 Requirements for examination of machinery and systems are given in Sec.8.

5.6 Additional survey requirements for Liquefied Gas Carriers with RV(LNG) Notation

5.6.1 Application

5.6.1.1 The requirements of this subsection are applicable to liquefied gas carriers assigned with additional class notation **RV(LNG)** *(Refer Part 5, Chapter 38)*

5.6.2 Annual Survey

5.6.2.1 Annual survey of the regasification system is to be carried out during unloading operation with the system in operation.

5.6.2.2 Logbooks and operating records pertaining to the regasification system (since the last survey) are to be examined in order to establish whether certain parts have shown any irregularities in operation.

5.6.2.3 The annual survey is to include the following:

5.6.2.3.1 Vessel Arrangement and Structure

a) General examination of the areas dedicated to regasification equipment

b) Examination of closing devices of air intakes and openings into dedicated spaces for regasification, as applicable

c) Examination of drip trays or insulation for deck protection and recesses against cargo leakage in regasification area

d) Confirmation that relevant shipboard instructions and procedures of the regasification installation are available

5.6.2.3.2 Systems and Equipment

a) External examination of vaporizers and their fittings

b) External examination of heat exchangers

c) General examination of high pressure pumps as far as practicable (including gland leakage and vibration indications)

d) Examination of the suction drum(s) and their sealing arrangements, as applicable

e) General examination of cargo and process piping, including the expansion arrangements, insulation from the hull structure, pressure control valves, inlet/ outlet valves, drainage arrangements and high pressure manifolds

f) Confirmation that all accessible cargo piping systems and components (suction drum(s), vaporizers, high-pressure pumps) are electrically bonded to the hull. Bonding straps, where fitted are to be examined.

5.6.2.3.3 Safety System

a) Examination of pressure gauges, control valves, metering unit, temperature and vibration indicating equipment. Particular attention is to be given to the instrumentation of high-pressure pumps and safety devices.

b) Confirmation that the certificate for the relief valves opening/closing pressures is on board. Examination of the relief valves, their sealing and associated safety systems and alarms.

c) Examination and testing of fixed gas detection equipment, as appropriate.

d) Examination of the logbooks for confirmation that the shutdown systems (emergency shutdown and process shutdown) have been tested and are satisfactory.

e) Examination of operational readiness and maintenance of firefighting system and confirmation that means of operation is clearly marked.

5.6.2.3.4 Control, Alarm and Monitoring

a) Confirmation that the instrumentation fitted on regasification equipment and in contact with gas and associated alarms are satisfactory.

b) Confirmation that the regasification control station is in satisfactory working condition.

5.6.3 Intermediate Surveys

5.6.3.1 In addition to the requirements of Annual surveys, the intermediate survey is to include the following:

5.6.3.1.1 Vessel Arrangement and Structure

a) Examination, as far as practicable, of stripping and vent piping system and high pressure manifolds of cargo and process. If upon examination there is any doubt as to the condition of the piping, pressure testing, thickness measurement or both may be required.

b) Examination of vent line drainage arrangement

5.6.3.1.2 Systems and Equipment

a) Review of the maintenance records of vaporizers.

b) If found necessary by the surveyor, thickness measurement, pressure test and/or opening up and internal examination of equipment may be required. Particular attention is to be given to rupture device, if fitted.

c) Examination of lifting arrangements of high pressure pumps.

d) Thickness measurement of suction drum(s) if deemed necessary by the surveyor.

e) Examination of electrical equipment

5.6.3.1.3 Safety Systems

a) Examination of pressure gauges, control valves, metering unit, liquid level gauges, temperature and vibration indicating equipment and associated alarms. Particular attention is to be given to high-pressure pumps instrumentation and safety devices. Instrumentation is to be tested by changing pressure, level and temperature as far as practicable and comparing with test instruments. Simulated tests may be accepted for sensors, which are not accessible. The test is to include alarm and safety functions.

b) Fixed firefighting system is to be tested.

5.6.3.1.4 Control, Alarm and Monitoring

a) Operational testing of the emergency shutdown system.

5.6.4 Special Survey

5.6.4.1 In addition to the requirements of Annual surveys and Intermediate Surveys, the special survey is to include the following:

5.6.4.1.1 Systems and Equipment

5.6.4.1.1.1 Suction Drum(s)

a) Suction drums are to be presented in clean and examined internally.

b) When accessible, the outer surface of uninsulated suction drum or the outer surface of regasification unit insulation together with any vapour or protective barrier is to be examined. Particular attention is to be given to the stocking unit and insulation in way of supports. Removal of insulation, in part or in entirety, may be required in order to verify the condition of the unit or the insulation itself if deemed necessary by the surveyor.

c) Thickness measurements or non-destructive testing may be required if deemed necessary by the surveyor

d) The tightness of suction drums is to be verified by an appropriate procedure.

e) Where the results of the above examination or the examination of the operational records raise doubts as to the structural integrity of the unit, a hydraulic or hydro pneumatic test is to be carried out. The test pressure is not to be less than 1.25 times the MARVS.

f) When the ship is 10 years old, at every alternate special survey, suction drum is to be either

- Hydraulically tested and thereafter nondestructively tested or,
- Subjected to thorough non-destructive testing as per 5.4.6.5

g) Suction drum supporting structures are to be visually examined, as far as practicable.

h) Fittings, valves and safety devices of suction drums are to be opened up, as deemed necessary by the surveyor, for visual examination and pressure tested as appropriate.

5.6.4.1.1.2 Gas handling equipment and Equipment in hazardous areas

a) Piping for cargo and process, stripping, venting systems high-pressure manifolds are to be examined. Insulation is to be removed as deemed necessary to ascertain the condition of the pipes. If the visual examination raises doubt as to the integrity of the pipelines, a pressure test at 1.25 times the MARVS for the pipeline is to be carried out. After reassembly, the complete piping systems are to be tested for leaks.

b) Maintenance records and logbooks of high-pressure pumps including starting pumps are to be made available to the Surveyor. High-pressure pumps are to be opened up for visual examination and their parts and components pressure tested, as deemed necessary by the Surveyor. The lifting device is to be tested.

c) The bottom of the high-pressure pump recess and vaporizer spaces are to be presented clean for the examination of gutters and stripping devices.

d) The pressure relief valves are to be opened for examination, adjusted, function tested and sealed. The valves including inlet/outlet valves, pressure control valves and discharge valves are to be tested for proper operation.

e) The maintenance records of vaporizers are to be reviewed. The Surveyor may require as considered necessary:

- external and internal examination of vaporizers which are to be presented clean
- opening up of their fittings, valves and safety devices

for visual examination and pressure tests

- thickness measurements and/or pressure test
- Confirmation that cargo pipes and regasification components are electrically bonded to the hull.

Particular attention is to be taken in way of the vaporizer rupture device if fitted.

f) Vaporizers, heat exchangers are to be opened up for visual examination as deemed necessary by the Surveyor and their parts and components are to be pressure tested, as appropriate. A working test is also to be carried out, including testing of alarms and safety devices.

5.6.4.1.2 Safety Systems

a) Examination of pressure gauges, control valves, metering unit, liquid level gauges, temperature and vibration indicating equipment, and associated alarms. Particular attention is to be given to high-pressure pumps instrumentation and safety devices. Instrumentation is to be tested by changing pressure, level and temperature as applicable and comparing with test instruments. Simulated tests may be accepted for sensors, which are not accessible. The test is to include alarms and safety functions.

b) For water spraying system:

- the associated pumps are to be opened up and examined at the Surveyor's discretion
- a working test of the system is to be carried out.

5.6.4.1.3 Control, Alarm and Monitoring

a) The shutdown systems are to be functionally tested.

Section 6

Surveys - Other Ship Types

6.1 Scope

6.1.1 This section gives the requirements for periodical surveys of all ship types other than bulk carriers, oil tankers, chemical tankers and liquefied gas carriers which are covered in Sections 2 to 5 of this chapter. The requirements for general dry cargo ships defined in 1.2.17, are also included.

6.1.2 For General Dry Cargo Ships with hybrid cargo hold arrangements, e.g. with some cargo holds of single-side skin and others of double-side skin, the requirements specified for general dry cargo ships are to be applied only to structure in way of the single-side skin cargo hold region. Special consideration may also be given to ships that are of double side-skin construction but with single skin in way of several frame spaces e.g. in way of a cargo hold entrance or in way of fore body hull form at the forward end of the foremost cargo hold.

6.2 Annual surveys

6.2.1 General

6.2.1.1 Annual Surveys are to be carried out within 3 months before or after the anniversary date each year. (Also refer to Note 9 of Sec.1, Table 1.1.1). These should be held concurrently with statutory annual or other relevant statutory Surveys, where practicable.

6.2.1.2 At Annual Surveys, the Surveyor is to examine the hull and machinery, so far as necessary and practicable, in order to be satisfied as to their general condition.

6.2.1.3 It is to be confirmed that no new installation of material containing asbestos was carried out since last survey.

6.2.1.4 Where applicable, examination of alternative design and arrangement for machinery or electrical installations or fire safety, in accordance with the test, inspection and maintenance requirements, if any,

specified in the approved documentation is to be carried out.

6.2.2 Hull - General

6.2.2.1 The survey is to consist of an examination for the purpose of ensuring, as far as practicable, that the hull, equipment, hatch coamings, hatch covers including their securing arrangement, other closing appliances and related piping are maintained in satisfactory/efficient condition.

a) Weather deck, shipside plating above water line.

b) Hatchways on freeboard and superstructure decks; exposed casings; skylights and fiddley openings; deck houses; companionways and superstructure bulkheads; side, bow and stern doors; side scuttles and dead lights; flush deck scuttles; ash shoots and other openings.

c) Weld connection between air pipes and deck plating, air pipe heads on exposed decks (external examination), flame screens on vents to all bunker tanks; ventilators and closing devices.

d) Scuppers and sanitary discharges as far as practicable together with valves and their controls.

e) Guard rails, bulwarks, freeing ports, gangways, walkways and life lines, fittings and appliances for timber deck cargo.

f) Watertight bulkheads and their penetrations as far as practicable.

6.2.2.2 Cargo hatch covers and coamings are to be examined to ensure that no alterations have been made to the approved arrangements :

a) Mechanically operated hatch covers are to be examined for satisfactory condition of:

- hatch covers;
- tightness devices of longitudinal, transverse and intermediate cross junctions, gaskets, gasket lips, compression bars, drainage channels;
- clamping devices, retaining bars, cleating;
- chain or rope pulleys;
- guides;
- guide rails and track wheels;
- stoppers, etc.;
- wires, chains, gypsies, tensioning devices;
- hydraulic system essential to closing and securing;
- safety locks and retaining devices.

b) Cargo hatch covers of the portable type (i.e. wood or steel pontoons) are to be examined to confirm the satisfactory condition of:

- wooden covers and portable beams, carriers or sockets for the portable beams and their securing devices;
- steel pontoons;
- tarpaulins;
- cleats, battens and wedges;
- hatch securing bars and their securing devices;
- loading pads/bars and the side plate edge;
- guide plates and chocks;
- compression bars, drainage channels and drain pipes, if any.

c) Checking the satisfactory condition of hatch coamings plating and their stiffeners.

d) Random checking of the satisfactory operation of mechanically operated hatch covers :

- stowage and securing in open position;
- proper fit, locking and efficiency of sealing in closed condition;
- operational testing of hydraulic and power components, wires, chains and link drives.

In the case of hatch covers / steel pontoons of general dry cargo ships, a close-up survey of hatch cover plating is to be carried out.

6.2.2.3 All watertight doors in watertight bulkheads, to be examined and tested (locally and remotely) as far as practicable.

6.2.2.4 Anchoring and mooring equipment is to be examined as far as is practicable. It is to be confirmed that the towing and mooring equipment is properly marked with any restriction associated with its safe operation.

6.2.2.5 Where applicable Surveyor should satisfy himself regarding the freeboard marks on the ship's side.

6.2.2.6 Suspect areas identified at previous special or intermediate surveys are to be close-up surveyed. Thickness measurements are to be taken in the area of substantial corrosion identified at previous surveys.

6.2.2.7 Examination of Ballast Tanks when required as a consequence of the results of the Special Survey or Intermediate Survey (See 6.4.3.1, 6.4.3.2 and 6.3.2, 6.3.3 respectively). When extensive corrosion is found, thickness measurement is to be carried out. If the results of these thickness measurements indicate substantial corrosion then the extent of thickness measurements are to be increased to determine the extent of areas of substantial corrosion in accordance with Table 6.4.8.2.

6.2.2.8 The Surveyor is to confirm that, where required, an approved loading instrument together with its operation manual are available on board, (See Pt.3, Ch.5). It is to be verified by the Surveyor that the loading instrument is checked for accuracy at regular intervals by the ship's staff by applying test loading conditions.

6.2.2.9 Accommodation ladders are to be examined at annual surveys. Satisfactory condition of the following items is to be checked, in particular :

a) steps;
b) platforms;
c) all support points such as pivots, rollers, etc.;
d) all suspension points such as lugs, brackets, etc.;
e) stanchions, rigid handrails, hand ropes and turntables;
f) davit structure, wire and sheaves, etc.

6.2.2.10 Gangways are to be examined at annual surveys. Satisfactory condition of the following items is to be checked, in particular :

a) treads;
b) side stringers, cross-members, decking, deck plates, etc.;
c) all support points such as wheel, roller, etc.;
d) stanchions, rigid handrails, hand ropes.

6.2.2.11 Winches of accommodation ladders and gangways are to be examined to verify the satisfactory condition of the following items:

a) brake mechanism including condition of brake pads and band brake, if fitted;
b) remote control system, and
c) power supply system for electric motor.

6.2.2.12 Davits and fittings on the ship’s deck associated with accommodation ladders and gangways are to be examined for satisfactory condition at annual surveys. Fittings or structures for means of access to deck such as handholds in a gateway or bulwark ladder and stanchions are also to be examined.

6.2.2.13 The maintenance and inspection records of accommodation ladders and gangways are to be verified. It is to be confirmed that supporting wires are being renewed at intervals not exceeding 5 years.

6.2.2.14 When examining internal spaces, as far as practicable, the permanent means of access where appropriate, are to be verified that they remain in good condition.

6.2.2.15 For vessels subject to IMO PSPC (See Pt.3, Ch.2, 3.6) it is to be confirmed that the maintenance, repair and partial re-coating of dedicated ballast tanks, as appropriate, are recorded in the coating technical file.

6.2.2.16 Watertight cable transit seal systems register is to be reviewed to confirm that it is being maintained and as far as practicable the transits are to be examined to confirm their satisfactory condition. Where there are records entered since last annual survey of any disruption to the cable transits or installation of new cable transits, the satisfactory condition of

those transits is to be confirmed by review of records and, if deemed necessary, by examination. The results are to be recorded in the Register against the specific cable transit.

6.2.2.17 In case the cable transits have been examined by an approved service supplier, the attending surveyor is to review the Register in order to ascertain that it has been properly maintained by the owner and correctly endorsed by the service supplier.

6.2.3 Examination of cargo holds of general dry cargo ships.

6.2.3.1 For cargo ships of 10 – 15 years of age:

a) Overall survey of one forward and one after cargo hold and their associated tween deck spaces.

b) When considered necessary by the Surveyor or where extensive corrosion exists, thickness measurement is to be carried out. If the results of these thickness measurements indicate substantial corro-sion, then the extent of thickness measurements is to be increased to determine the extent of areas of substantial corrosion in accordance with Table 6.4.8.2.

6.2.3.2 For cargo ships over 15 years of age:

a) Overall survey of all cargo holds and tween deck spaces.

b) In a forward lower cargo hold and one other selected lower cargo hold:

- Close-up examination of sufficient extent, minimum 25% of frames, to establish the condition of the lower region of the shell frames including approx. lower one third length of side frame at side shell, side frame end attachment and the adjacent shell plating.

- Where this level of survey reveals the need for remedial measures, the survey is to be extended to include a close-up survey of all of the shell frames and adjacent shell plating of those cargo holds and associated tween deck spaces (as applicable) as well as a close-up survey of sufficient extent of all remaining cargo holds and tween deck spaces (as applicable).

c) When considered necessary by the surveyor, or where extensive corrosion exists, thickness measurement is to be carried out. If the results of these thickness measurements indicate substantial corro-sion, then the number of thickness measurements are to be increased to determine the extent of substantial corrosion in accordance with Table 6.4.8.2.

d) Where the protective coating in cargo holds, as applicable, is found to be in a GOOD condition, the extent of close-up surveys may be specially considered.

e) All piping and penetrations in cargo holds, including overboard piping are to be examined.

6.2.4 Machinery and systems

6.2.4.1 A general examination of the machinery, boilers, all pressurised systems (steam, pneumatic, hydraulic) and their associated fittings, propulsion system and auxiliary machinery to see whether they are being properly maintained and with particular attention to the fire and explosion hazards.

6.2.4.2 Confirmation that machinery, boilers and other pressure vessels, associated piping systems and fittings are so installed and protected as to reduce to a minimum any danger to persons on board, due regard being given to moving parts, hot surfaces and other hazards.

6.2.4.3 Confirmation that Periodical Surveys of boilers and other pressure vessels have been carried out as required by the Rules and the safety devices have been tested.

6.2.4.4 Confirmation that the normal operation of the propulsion machinery can be sustained or restored even though one of the essential auxiliaries becomes inoperative.

6.2.4.5 Confirmation that means are provided so that machinery can be brought into operation from the dead ship condition without external aid.

6.2.4.6 All main and auxiliary steering arrangements and their associated equipment and control systems are to be examined and

tested. Where applicable, Surveyors are to verify that log entries have been made in accordance with statutory requirements.

6.2.4.7 Steering chains are to be cleaned for ascertaining wear and tear and lengths of chain worn in mean diameter by more than 12 per cent of the original rule diameter are to be renewed.

6.2.4.8 All the means of communication between the navigating bridge and the machinery control positions, as well as the bridge and the main alternative steering position, if fitted, are to be tested. It is to be confirmed that means of indicating the angular position of the rudder are operating satisfactorily.

6.2.4.9 Confirmation that with ships having emergency steering positions there are means of relaying heading information and, when appropriate, supplying visual compass readings to the emergency steering positions.

6.2.4.10 Confirmation that various alarms required for hydraulic power operated, electric and electro-hydraulic steering gears are, operating satisfactorily and that the recharging arrangements for hydraulic power operated steering gears are being maintained.

6.2.4.11 Examining the means for the operation of the main and auxiliary machinery essential for propulsion and the safety of the ship, including when applicable, the means of remotely controlling the propulsion machinery from the navigating bridge and the arrangements to operate the main and other machinery from a machinery control room.

6.2.4.12 Confirmation that the engine room telegraph, the second means of communication between the navigation bridge and the machinery space and the means of communication with any other positions from which the engines are controlled are operating satisfactorily.

6.2.4.13 Examination and testing of the general emergency alarm system and confirmation that the engineer's alarm is clearly audible in the engineer's accommodation.

6.2.4.14 It is to be confirmed that ballasting and de-ballasting arrangements are satisfactory. The bilge pumping systems and bilge wells including operation of each bilge pump, extended spindles and level alarms, where fitted, are to be examined as far as is practicable. It is also to be confirmed that bilge pumping system for each watertight compartment is satisfactory.

It is also to be confirmed that drainage from enclosed cargo spaces situated on freeboard deck is satisfactory.

The drainage facilities are to be examined visually for blockage or other damage and the provision of means to prevent blockage of drainage arrangements are to be confirmed, for closed vehicle and ro-ro spaces and special category spaces where fixed pressure water-spraying systems are used

6.2.4.15 Examining visually the condition of non-metallic expansion joints where fitted in piping systems which penetrate the ship's side, with both the penetration and the expansion joint located below the deepest load waterline and checking the service record.

6.2.4.16 General examination visually and in operation, as feasible, of the main electrical machinery, the emergency sources of electrical power, the switch gear, other electrical equipment including the lighting system is to be carried out.

6.2.4.17 Confirmation as far as practicable, the operation of the emergency source(s) of electrical power, including their starting arrangement, the systems supplied, and when appropriate, their automatic operation.

6.2.4.18 Examining in general, that the precautions provided against shock, fire and other hazards of electrical origin are being maintained.

6.2.4.19 General Examination of automation equipment is to be carried out. Satisfactory operation of safety devices, bilge level detection and alarm systems and control systems is to be verified.

6.2.4.20 For single hold cargo ships which require fitment of hold water level detectors as per Pt.4, Ch.3, Sec.3.6, the annual survey is to include an examination and a test of the water ingress detection system and their alarms.

6.2.4.21 Confirmation that machinery space ventilation systems are in good working condition.

6.2.4.22 For Ships constructed before 01 July 2017 and fitted with harmonic filters; following are to be verified at each survey:

a) Records of annual measurement of harmonic distortion levels of main bus bar under seagoing conditions and log entries showing which equipment was running and / or filters in service at the time of measurement. Harmonic distortion readings are to be carried out when the greatest amount of distortion is indicated by the measuring equipment.

b) Records of measurement of distortion levels, after any modification to the ship's electrical distribution system.

6.2.4.23 For Ships constructed on or after 01 July 2017 and fitted with harmonic filters; or for ships retrofitted with harmonic filters, on or after 01 July 2017; following are to be verified at each survey:

a) Engine log book containing distortion monitoring readings/ automatic records of same

b) Documentation of any approved relaxation on allowable distortion limits.

6.2.4.24 For ships contracted for construction on or after 01 Jan 2017 following are to be verified in emergency generator rooms at each survey:

a) Hand operated ventilation louvres, closing appliances, if fitted, are kept open and corresponding instruction plates are visible near the louvres.

b) Power operated ventilation louvres and closing appliances, if fitted, are fail-to-open type.

c) It is to be possible to close ventilation openings by a manual operation from a clearly marked safe position outside the space where the closing operation can be easily confirmed. The louvre status (open/closed) is to be indicated at this position.

6.2.4.25 For vessels fitted with ICCP system, proper functioning of the system is to be checked and records of system operation are to be verified. It is to be verified that all maintenance as per manufacturer's instructions are carried out.

6.2.5 Fire protection, detection and extinction

6.2.5.1 The arrangements for fire protection, detection and extinction are to be examined and are to include confirmation that no changes have been made in the structural fire protection. Following are to be examined / verified:

a) verification that fire control plans are properly posted;

b) examination as far as possible and testing as feasible, any fire detection and alarm system and any sample extraction smoke detection system;

c) examination of the fire main system and verification that each fire pump including the emergency fire pump can be operated separately so that the two required powerful jets of water can be produced simultaneously from different hydrants at any part of the ship whilst the required pressure is maintained in the fire main;

d) verification that fire hoses, nozzles, applicators and spanners are in good working condition and situated at their respective locations;

e) examination of fire-fighting system (including fixed fire-fighting system of the specific machinery, closed vehicle, special category and ro-ro spaces, as appropriate) controls, piping, instructions and marking, checking for evidence of proper maintenance and servicing including date of last systems tests;

f) verification that all semi-portable and portable fire extinguishers are in their stowed positions, checking for evidence of proper maintenance and servicing, conducting random check for evidence of discharged containers;

g) verification, as far as practicable, that the remote controls for stopping fans and machinery in machinery spaces are in working order. Examination of the arrangements for oil fuel, lubricating oil and other flammable oils and testing the remote closing of valves for oil fuel, lubricating oil and other flammable oils and , the operation of the remote means of closing the valves on the tanks that contain oil fuel, lubricating oil and other flammable oils;

h) examination of the closing arrangements of ventilators, funnel annular spaces, skylights, doorways and tunnel, where applicable;

i) confirmation that the fire fighters' outfits including its self-contained compressed air breathing apparatus and emergency escape breathing devices (EEBDs) are complete and in good condition and that the cylinders, including the spare cylinders, of any required self-contained breathing apparatus are suitably charged and that on board means of recharging breathing apparatus cylinders used during drills or a suitable number of spare cylinders to replace those used are provided, and provision of two-way portable radiotelephone apparatus of an explosion-proof type or intrinsically safe;

j) examination of any manual and automatic fire doors and proving their operations;

k) examination of the fire-extinguishing systems for spaces containing paint and/or flammable liquids and deep fat cooking equipment in accommodation and service spaces;

l) examination of the fire safety requirements of helicopter facilities, including foam firefighting appliances ;

m) examination of the fire protection arrangement in cargo, vehicle and ro-ro spaces, including the fire safety arrangements for vehicle carriers carrying motor vehicles with compressed hydrogen or natural gas in their tanks for their own propulsion as cargo, as applicable and confirmation, as far as practicable and as appropriate, the operation of the means of control provided for closing the various openings;

n) examination and testing the portable gas detectors suitable for the detection of the gas fuel, for vehicle carriers carrying motor vehicles with compressed hydrogen or natural gas in their tanks for their own propulsion as cargo;

o) Examination, when appropriate, of the special arrangements for carrying dangerous goods, including checking the electrical equipment and wiring, the ventilation, protective clothing and portable appliances and testing of water supply, bilge pumping and any water spray system.

p) Examination of the fixed carbon dioxide fire-extinguishing systems for the protection of machinery spaces and cargo pump-rooms, where applicable, are provided with two separate controls, one for opening of the gas piping and one for discharging the gas from the storage container, each of them located in a release box clearly identified for the particular space.

q) Testing the fire dampers of ventilation ducts and the means of closing the main inlets and outlets of all ventilation systems and testing the means of stopping power ventilation systems from outside the space served.

Surveys carried out by the National Authority of the country in which the ship is registered would normally be accepted as meeting these requirements, at the discretion of the Surveyor.

6.2.5.2 Confirmation that the means of escape from accommodation, machinery spaces and other spaces are satisfactory.

6.2.5.3 Examination of the arrangements for gaseous fuel for domestic purposes.

6.2.5.4 For ships designed to carry containers on or above weather deck, as applicable, examining the water mist lance, and as appropriate, the mobile water monitors and all necessary hoses, fittings and required fixing hardware.

6.2.6 Shell and inner doors of ro-ro ships

6.2.6.1 The survey is to consist of an examination to verify, as far as is practicable, that the bow, inner, side shell and stern doors are maintained in a satisfactory condition.

6.2.6.2 Confirmation is to be obtained that no unapproved changes have been made to the bow, inner, side shell and stern doors since the last survey.

6.2.6.3 Documents

If an Operating and Maintenance Manual (OMM) is required, it is to be verified that a copy approved by IRS is on board and any possible modifications are included. It is to be

verified that documented operating procedures for closing and securing doors are kept on board and posted at an appropriate place. The OMM is to be examined with special attention to the register of inspections and its contents as a basis for the survey.

6.2.6.4 Structural examination

Bow, inner, side shell and stern doors are to be examined with particular attention paid to:

- Structural arrangement of doors including plating, secondary stiffeners, primary structure, hinging arms and welding;
- Shell structure surrounding the opening of the doors and the securing, supporting and locking devices (refer Pt.3, Ch.12, Sections 5 and 6) including shell plating, secondary stiffeners, primary structure and welding;
- Hinges and bearings, thrust bearings;
- Hull and door side supports for securing, supporting and locking devices;
- Close-up survey of securing, supporting and locking devices including welding, refer to Table 6.2.6.4 for minimum requirements.

Whenever a crack is found, an examination with NDT is to be carried out in the surrounding areas and for similar items as considered necessary by the Surveyor.

Table 6.2.6.4 : Minimum requirements for close-up surveys of doors, locking, securing and supporting devices and fittings

List of the devices and fittings and associated welding to be subject to close-up survey by the attending Surveyor:	
i)	Cylinder securing pins, supporting brackets, back-up brackets (where fitted) and their welding connections;
ii)	Hinge pins, supporting brackets, back-up brackets (where fitted) and their welded connections;
iii)	Locking hooks, securing pins, supporting brackets, back-up brackets (where fitted) and their welded connections;
iv)	Locking pins, supporting brackets, back-up brackets (where fitted) and their welded connections;
v)	Locating and stopper devices and their welded connections.

6.2.6.5 Measurement of clearances

Clearances of hinges, bearings and thrust bearings are to be taken, where no dismantling is required. Where the function test is not satisfactory, dismantling may be required to measure the clearances. If dismantling is carried out, a visual examination of hinge pins and bearings together with NDT of the hinge pin is to be carried out. Clearances of securing, supporting and locking devices are to be measured, where indicated in the OMM

6.2.6.6 Sealing arrangement

An examination of packing material / rubber gaskets and retaining bars or channels, including welding is to be carried out.

6.2.6.7 Drainage arrangement

An examination of drainage arrangement, including bilge wells and drain pipes is to be carried out.

6.2.6.8 Function test of doors

Checking of the satisfactory operation of the bow, inner, side shell and stern doors during a complete opening and closing operation is to be carried out, as applicable, including:

- Proper working of the hinging arms and hinges;
- Proper engagement of the thrust bearings;
- Device for locking the door in the open position;
- Securing, supporting and locking devices;

- Proper sequence of the interlock system for the opening / closing system and the securing and locking devices;

- Mechanical lock of the securing devices;

- Proper locking of hydraulic securing devices in the event of a loss of the hydraulic fluid, according to the procedure provided by the OMM;

- Correct indication of open / closed position of doors and securing / locking devices at navigation bridge and other control stations;

- Isolating of the hydraulic securing / locking devices from other hydraulic systems;

- Confirmation that the operating panels are inaccessible to unauthorized persons;

- Verification that a notice plate giving instructions to the effect that all securing devices are to be closed and locked before leaving harbour is placed at each operating panel and supplemented by warning indicator lights;

- Examination of electrical equipment for opening, closing and securing the doors.

6.2.6.9 Function test of the indicator system

Checking of the satisfactory operation of the indicator system, where fitted, is to be carried out, as applicable, including:

- Proper visible indication and audible alarm on the navigation bridge panel, according to the selected function “harbour / sea voyage” and on the operating panel;

- Lamp test function on both panels;

- Verification that it is not possible to turn off the indicator light on both panels;

- Verification of failsafe performance, according to the procedure provided by the OMM;

- Confirmation that power supply for indicator system is supplied by the emergency source or other secure power_supply and independent of the power supply for operating the doors;

- Verification of proper condition of sensors and protection from water, ice formation and mechanical damage.

6.2.6.10 Test of water leakage detection system (where fitted)

The water leakage detection system is to be tested including proper audible alarm on the navigation bridge panel and on the engine control room panel, according to the procedure provided by the OMM.

6.2.6.11 Test of television surveillance system (where fitted)

The television surveillance system is to be tested including proper indication on the navigation bridge monitor and on the engine control room monitor.

6.2.6.12 Tightness test

A hose test or equivalent is to be carried out. If the visual examination and function test have shown satisfactory results, the tightness test of shell doors on ro-ro cargo ships need not be carried out unless considered necessary by the attending surveyor.

6.2.6.13 NDT and thickness measurements

When considered necessary by the Surveyor, NDT and thickness measurements may be required after visual examination and function test.

6.2.7 Container ships with container lashing software

6.2.7.1 For Container ships provided with approved lashing software and assigned CLS notation, confirmation that the approved version of the software is installed on-board and that user manual is available.

6.3 Intermediate surveys

6.3.1 General

6.3.1.1 Intermediate surveys are to be carried out at or between the second or third Annual Survey. (Also refer to Note 9 of Sec.1, Table 1.1.1).

Those items which are additional to the requirements of annual survey may be examined at or between the second and third annual survey.

6.3.1.2 The following requirements are applicable for vessels over five years of age.

For vessels below 5 years of age additional examination over and above the requirements of Annual survey may be required at the discretion of the Surveyors.

6.3.1.3 Prior to the commencement of any part of the intermediate survey, a survey planning meeting is to be held between the attending Surveyor(s), the owner's representative in attendance and where involved, the thickness measurement company representative and the master of ship or an appropriately qualified representative appointed by the master or Company for the purpose to ascertain that all the arrangements envisaged in the survey programme are in place, so as to ensure the safe and efficient conduct of the survey work to be carried out.

6.3.1.4 Concurrent crediting to both Intermediate survey and Special survey for surveys and thickness measurements of spaces is not acceptable.

6.3.2 Vessels of age between 5 and 10 years

6.3.2.1 Ballast tanks

a) An overall survey of representative ballast tanks is to be carried out. When extensive corrosion is found, thickness measurements are to be carried out. If such examination reveals no visible structural defects, the examination may be limited to a verification that the corrosion prevention system remain efficient.

b) Where POOR coating condition, corrosion or other defects are found in ballast tanks or where hard protective coating was not applied from the time of construction, the examination is to be extended to other ballast tanks of the same type.

c) For ballast tanks, other than double bottom tanks, where a protective coating is found to be in POOR condition and is not renewed, where a soft or semi-hard coating has been applied or where a hard protective coating was not applied from the time of construction, the tank(s) in question are to be examined at subsequent annual surveys.

d) For double bottom ballast tanks, where a protective coating is found to be in POOR condition and is not renewed, where a soft or semi-hard coating has been applied or where a hard protective coating was not applied from the time of construction, the tank(s) in question may be examined at subsequent Annual surveys.

6.3.2.2 Cargo hold of general dry cargo ships

a) An overall survey of one forward and one after cargo hold and their associated tween deck spaces.

b) Areas found suspect at previous surveys are to be surveyed in accordance with 6.2.2.6.

6.3.3 Vessels of age between 10 and 15 years

6.3.3.1 Ballast tanks:

a) An overall survey of all ballast tanks is to be carried out. When extensive corrosion is found, thickness measurements are to be carried out. If such examination reveals no visible structural defects, the examination may be limited to a verification that the corrosion prevention system remain efficient.

b) For ballast tanks, other than double bottom tanks, where a protective coating is found to be in POOR condition and is not renewed, where a soft or semi-hard coating has been applied or where a hard protective coating was not applied from the time of construction, the tank(s) in question are to be examined at subsequent annual surveys.

c) For double bottom ballast tanks, where a protective coating is found to be in POOR condition and is not renewed, where a soft or semi-hard coating has been applied or where a hard protective coating was not applied from the time of construction, the tank(s) in question may be examined at subsequent Annual surveys.

6.3.3.2 Cargo holds of general dry cargo ships:

a) An overall survey of all cargo holds and tween deck spaces.

b) Areas found suspect at previous surveys are to be surveyed in accordance with 6.2.2.6.

c) When considered necessary by the Surveyor or where extensive corrosion exists, thickness measurement is to be carried out. If the results of these thickness measurements indicate substantial corrosion, then the extent of thickness measurements are to be increased to determine the extent of areas of substantial corrosion in accordance with Table 6.4.8.2.

6.3.3.3 In the case of ships other than those engaged in the carriage of dry cargoes only, an internal examination of selected cargo spaces is to be carried out.

6.3.4 Vessels of age more than 15 years

a) For vessels other than general dry cargo ships, in addition to the requirements given in 6.3.3, an internal examination of selected cargo holds is to be carried out.

b) For general dry cargo ships, the requirements of the intermediate survey is to be to the same extent as the previous special survey as required in 6.4 for hull structure and piping systems in way of the cargo holds, cofferdams, pipe tunnels, void spaces and fuel oil tanks in the cargo area and all ballast tanks. However, tank testing specified in 6.4.6, survey of automatic air pipe heads specified in 6.4.4.7 and internal examination of fuel oil, lub.oil and freshwater tanks specified in Table 6.4.4.1 need not be carried out unless deemed necessary by the Surveyor. In water survey complying with the requirements of 7.2 may be accepted in lieu of docking survey required by 6.4.1.11. Thickness measurement is to be carried out for items 1 to 4 of Table 6.4.8.1b except for item 2d).

In lieu of the application of 6.4.1.4, the intermediate survey may be commenced at the second annual survey and be progressed with a view to completion at the third annual survey.

6.4 Special surveys - Hull

6.4.1 General

6.4.1.1 All ships classed with IRS are to undergo Special Surveys at 5 yearly intervals. The first Special Survey is to be completed within 5 years from the date of the initial classification survey and thereafter 5 years from the assigned date of the previous Special Survey. However, an extension of class of 3 months maximum beyond the 5th year may be granted in exceptional circumstances in accordance with 1.11. In such cases, the next period of class will start from the expiry date of the Special Survey before extension was granted.

6.4.1.2 The interval between the Special Surveys may be reduced at the request of the parties concerned or by IRS if considered appropriate.

6.4.1.3 For surveys completed within 3 months before the expiry date of the Special Survey, the next period of class will start from the expiry date of the Special Survey. For surveys completed more than 3 months before the expiry date of the Special Survey, the period of class will start from the survey completion date. In cases where the vessel has been laid up or has been out of service for a considerable period because of a major repair or modification and the owner elects to only carry out the overdue surveys, the next period of class will start from the expiry date of the special survey. If the owner elects to carry out the next due special survey, the period of class will start from the survey completion date. Any requirement of the Flag Administration in this regard is also to be complied with.

6.4.1.4 The Special Survey may be commenced at the 4th Annual Survey and be progressed with a view to completion by the 5th anniversary date. When the special survey is commenced prior to the fourth annual survey, the entire survey is to be completed within 15 months if such work is to be credited to the special survey and in this case the next period of class will start from the survey completion date.

Concurrent crediting to both Intermediate survey and Special survey for surveys and thickness measurements of spaces is not acceptable.

6.4.1.5 For the purpose of special survey, results of thickness measurement carried out during or after the fourth annual survey only would be considered.

6.4.1.6 Record of Special Survey will not be assigned until the Machinery Survey has been completed or postponed in agreement with IRS.

6.4.1.7 Ships which have satisfactorily passed a Special Survey will have a record entered in the Supplement to the Register Book indicating the assigned date of Special Survey.

6.4.1.8 For vessels other than general dry cargo ships, IRS may, at the request of the Owners, accept a Special Survey of the hull on a continuous basis spread over a period of 5 years. Proposals for such continuous Surveys are to be submitted for the consideration of IRS. In general, approximately one-fifth of the Special Survey is to be completed every year. All compartments of the hull should be opened for Survey and testing in rotation such that not more than 5 years elapse between consecutive examination of each part.

The Surveyor may extend the inspection at his discretion, to other items if the inspections carried out reveal any defects.

The agreement for surveys to be carried out on a continuous survey system basis may be withdrawn at the discretion of IRS or on the request of Owners.

Ships on continuous survey system are not exempt from other periodical survey requirements. For ships more than 10 years of age, the ballast tanks are to be internally examined twice in each five-year class period, i.e. once within the scope of the intermediate survey and once within the scope of the continuous system for the hull special survey.

Ships which have completed satisfactorily the Survey of all the items on such basis will have a record entered in the supplement to the Register Of Ships indicating the date of completion of the Survey.

6.4.1.9 The special survey is to include, in addition to the requirements of the Annual Survey, examination, tests and checks of sufficient extent to ensure that the hull, equipment and related piping as required in 6.4.4.2 and 6.4.4.3 are in satisfactory condition and that the ship is fit for its intended purpose for the new period of class of five years to be assigned subject to proper maintenance and operation and the periodical surveys being carried out at the due dates.

6.4.1.10 The examinations of the hull are to be supplemented by thickness measurements. (See 6.4.8) and testing as deemed necessary, to ensure that the structural integrity remains effective. The aim of the examination is to discover substantial corrosion, significant deformation, fractures, damages or other structural deterioration, that may be present.

6.4.1.11 A Docking Survey in accordance with the requirements of Sec.7 is to be carried out as part of the Special Survey. Any remaining work in respect of the overall and close-up surveys and thickness measurements, as applicable, of the lower portions of cargo holds and ballast tanks (i.e. parts below light ballast water line) are to be completed in dry dock.

6.4.2 Preparation for survey

6.4.2.1 The ship is to be prepared for overall survey in accordance with the requirements of Table 6.4.2.1. The preparation is to be of sufficient extent to facilitate an examination to ascertain any excessive corrosion, deformation, fractures, damages and other structural deterioration.

6.4.2.2 Prior to commencement of any part of the special survey, a survey planning meeting is to be held between the attending surveyor(s), the owner's representative in attendance, the thickness measurement company representative and the master of the ship or an appropriately qualified representative appointed by the master or Company for the purpose to ascertain that all the arrangements envisaged in the survey programme are in place, so as to ensure the safe and efficient conduct of the survey work to be carried out.

6.4.3 Tank protection

6.4.3.1 For ballast tanks, excluding double bottom tanks, where a hard protective coating is found in POOR condition and it is not renewed or where soft or semi-hard coating has been applied, or where a hard protective coating was not applied from the time of construction, tank in question is to be internally

examined at annual surveys. Thickness measurements are to be carried out as deemed necessary by the Surveyor.

6.4.3.2 For double bottom ballast tanks where a hard protective coating is found in POOR condition and it has not been renewed or where soft or semi-hard coating has been applied, or where a hard protective coating was not applied from the time of construction, the tanks in question may be examined at Annual Surveys. When considered necessary by the surveyor, thickness measurements are to be carried out.

Table 6.4.2.1 : Survey preparation

Special Survey No. I **Age ≤ 5**	**Special Survey No. II** **5 < Age ≤ 10**	**Special Survey No. III** **10 < Age ≤ 15**	**Special Survey No. IV and subsequently** **Age > 15**
1) The holds, tween decks, deep tanks, peaks, bilges and drain wells, engine and boiler spaces, coal bunkers and other spaces are to be cleared out and cleaned as necessary for examination. Floor plates in engine and boiler spaces are to be lifted as may be necessary for examination of the structure underneath. Where necessary ceiling, lining, casings and loose insulation are to be removed as required by the Surveyor for examination of the structure. Compositions on the plating are to be examined and sounded, but need not be disturbed if found satisfactorily adhering to the plating.	1) Requirements of Special Survey I to be complied with	1) Requirements of Special Survey II to be complied with	1) Requirements of Special survey III to be complied with
2) In ships with single bottom, a sufficient amount of close ceiling is to be lifted to enable examination of the structure below. The ceilings to be lifted is to comprise of at least two strakes on each side of centreline fore and aft and one of these strakes is to be in way of the bilges	2) In ships having a single bottom, a sufficient amount of ceiling is to be lifted to allow the examination of the structure underneath. The lifting of the ceiling is to comprise of at least three strakes all fore and aft on each side and one such strake one each side to be in way of the bilges. Where the ceiling is fitted in hatches, the whole of the hatches and at least one strake of planks in way of the bilges on each side are to be lifted. If the Surveyor considers it necessary the whole of the ceiling and the limber boards are to be lifted	2) Ceiling in the holds is to be removed in order to ascertain that the steel work is in good condition, free from rust and coated. If the Surveyor is satisfied, after removal of portions of the ceiling, than it need not all be removed	2) Where holds are insulated for the purpose of carrying refrigerated cargoes, limbers and hatches are to be lifted and a sufficient additional amount of insulation is to be removed in each compartment to enable the Surveyor to ascertain the condition of the structure in way and to enable the thickness of the shell plating to be ascertained

Table 6.4.2.1 : (Contd.)

Special Survey No. I Age ≤ 5	**Special Survey No. II 5 < Age ≤ 10**	**Special Survey No. III 10 < Age ≤ 15**	**Special Survey No. IV and subsequently Age > 15**
3) In ships having double bottom, a sufficient amount of ceiling is to be lifted from the tank top and the bilges to enable the condition of plating underneath to be ascertain. If the condition of the plating is found to be satisfactory, lifting of the remainder of the ceiling may be dispensed with. All bilges are to be cleaned for examination. Where the inner bottom plating is covered with cement or asphalt the removal of such covering may be dispensed with provided it is found to be adhering properly to the plating when carefully examined by hammering and chipping	3) In ships with double bottom, a sufficient amount of ceiling in the holds and other spaces is to be removed from the bilges and the inner bottom to enable the condition of the structure in the bilges, the inner bottom plating, pillar feet and the bottom plating of bulkheads and tunnel sides to be examined. If the Surveyor considers it necessary, the whole of the ceiling is to be removed	3) Portions of wood sheathing, or other covering, on steel decks are to be removed, as considered necessary by the Surveyor, in order to ascertain the condition of the plating	
4) Where holds are insulated for the carriage of refrigerated cargoes and the hull in way was examined by IRS Surveyors prior to the fitting of the insulation, it will be sufficient to remove the limbers and hatches for examination of the structure in way. In all other cases additional insulation will require to be removed as considered necessary to enable the Surveyor to satisfy himself regarding condition of the structure	4) The chain locker is to be cleaned internally. The chain cables are to be ranged for inspection. The anchors are to be cleaned and placed in an accessible position for inspection	4) Where the holds are insulated for the purpose of carrying refrigerated cargoes, the limbers and hatches are to be lifted and sufficient insulation is to be removed in each of the chambers to enable the Surveyor to satisfy himself of the condition of the framing and plating	
5) The steel work is to be exposed and cleaned as may be required for its proper examination by the Surveyor and close attention is to be paid to the parts of the structure which are particularly liable to excessive corrosion or to deterioration due to other causes			
6) All tanks are to be cleaned as necessary to permit examination required by Table 6.4.3.1			
7) Casings or covers of air, sounding, steam and other pipes, spar ceiling and lining in way of the side scuttles are to be removed, as required by the Surveyor			

Table 6.4.2.1 : (Contd.)			
Special Survey No. I Age ≤ 5	**Special Survey No. II 5 < Age ≤ 10**	**Special Survey No. III 10 < Age ≤ 15**	**Special Survey No. IV and subsequently Age > 15**
8) In refrigerated cargo spaces the condition of the coating behind the insulation is to be examined at representative locations. The examination may be limited to verification that the protective coating remains effective and that there are no visible structural defects. Where POOR coating condition is found, the examination is to be extended as deemed necessary by the Surveyor. The condition of the coating is to be reported. If indents, scratches, etc., are detected during surveys of shell plating from the outside, insulations in way are to be removed as required by the Surveyor, for further examination of the plating and adjacent frames.			

6.4.4 Survey and examination

6.4.4.1 All spaces within the hull and superstructure are to be examined. The special survey is to include examination of underwater parts as per Section 7.

6.4.4.2 All tanks are to be examined internally in accordance with the requirements of Table 6.4.4.1.

All bilge and ballast piping systems are to be examined and operationally tested to working pressure to attending Surveyor's satisfaction to ensure that tightness and condition remain satisfactory.

6.4.4.3 All spaces including holds and their 'tween decks where fitted; double bottom, deep, ballast, peak and cargo tanks; pumprooms, pipe tunnels, duct keels, machinery spaces, dry spaces, cofferdams and voids are to be internally examined including the plating and framing, bilges and drain wells, sounding, venting, pumping and drainage arrangements. At special survey No.3 and subsequent special surveys, structural downflooding ducts and structural ventilation ducts are to be internally examined.

For general dry cargo ships, the following requirements are also to be applied:

- An overall survey of all cargo holds, pipe tunnels, cofferdams and void spaces bounding cargo holds, decks and outer hull is to be carried out.

- All piping systems within the above spaces and in ballast tanks are to be examined and operationally tested to working pressure to attending Surveyor's satisfaction to ensure that tightness and condition remains satisfactory.

- The survey extent of ballast tanks converted to void spaces is to be based on the requirement for ballast tanks.

Table 6.4.4.1 : Requirements for internal examination of tanks				
Tank	**Special Survey No. I Age ≤ 5**	**Special Survey No. II 5 < Age ≤ 10**	**Special Survey No. III 10 < Age ≤ 15**	**Special Survey No. IV and subsequent Age > 15**
Fuel oil bunker tanks				
- Engine room	None	None	One	One
- Cargo area	None	One	Two	Half the number of tanks, minimum 2
- If no tanks in Cargo Area, additional fuel tank(s) outside of Engine Room (if fitted)	None	One	One	Two
Lub.oil	None	None	None	One
Fresh water	None	One	All	All
Water ballast	All	All	All	All

Notes:

1) These requirements apply to tanks of integral (structural) type.

2) If a selection of tanks is accepted to be examined, then different tanks are to be examined at each special survey, on a rotational basis.

3) Peak tanks (all uses) are subject to internal examination at each special survey.

4) At special survey No.III and subsequent special surveys one deep tank for fuel oil in the cargo area is to be included, if fitted.

6.4.4.4 All watertight bulkheads and watertight doors are to be examined.

6.4.4.5 All decks, casings and superstructures are to be examined. Attention is to be given to the corners of openings and other discontinuities in way of the strength decks and top sides.

Wooden decks or sheathings are to be examined and if decay or rot is found or the wood is excessively worn, the wood should be renewed.

Attention is to be given to the condition of the plating under wood decks, sheathing or other deck coverings. Removal of such coverings may be dispensed with if they are found to be sound and adhering satisfactorily to the plating.

6.4.4.6 Engine room structure is to be examined. Particular attention being given to tank tops, shell plating in way of tank tops, brackets connecting side shell frames and tank tops and engine room bulkheads in way of tank tops and bilge wells. Where excessive areas of wastage are found, thickness measurements are to be carried out and renewals or repairs made when wastage exceeds allowable limits.

6.4.4.7 The hand pumps and suctions, air and sounding pipes are to be examined. The Surveyors are to ensure that striking plates are fitted under the sounding pipes whilst examining the tanks internally.

For vessel other than passenger ships, automatic air pipe heads are to be internally examined at special surveys as indicated in Table 6.4.4.7. For designs where the inner parts cannot be properly inspected from outside, the head is to be removed from the air pipe. Particular attention is to be paid to the condition of the zinc coating in heads constructed from galvanised steel.

Table 6.4.4.7 : Requirements for internal examination of automatic air pipe heads

Location	Special survey No.I Age ≤ 5	Special survey No.II 5 < Age ≤ 10	Special survey No.III and subsequent Age > 10
forward 0.25L	Two air pipe heads[1,2] one port and one starboard on exposed decks	All air pipe heads on exposed decks	All air pipe heads[3] on exposed decks
aft of 0.25L from the forward perpendicular	Two air pipe heads[1,2] one port and one starboard on exposed decks	At least 20% of air pipe heads[1,2] on exposed decks	

1. Preferably air pipes serving ballast tanks.
2. The selection of air pipe heads is to be made by the attending Surveyor. According to the results of the inspection, the Surveyor may require additional air pipe heads to be examined.
3. When there is substantiated evidence of replacement within the previous five years, individual air pipe heads may not be examined.

6.4.4.8 The steering gear, and its connections and control systems (main and alternative) are to be examined. The auxiliary steering gear with its various parts are to be examined in working condition.

6.4.4.9 The Surveyor should satisfy himself regarding the efficient condition of the following :

- Means of escape from machinery spaces, crew and passenger spaces and spaces in which crew are normally employed;

- Means of communication between bridge and engine room and between bridge and alternative steering position;

- Helm indicator;

- Protection to the aft steering wheel and the gear.

6.4.4.10 The masts, standing rigging and anchors are to be examined.

The Surveyor should satisfy himself that there are sufficient mooring ropes on board and also that a tow line is provided when this is a Rule requirement.

6.4.4.11 The chain cables are to be ranged and the anchors and the chain cables are to be examined. At special survey no. II and subsequent special surveys, the chain cables are to be gauged. Any length of chain cable which is found to have reduced in mean diameter at its most worn part by more than 12 per cent of its original rule diameter is to be renewed.

6.4.4.12 The windlass is to be examined.

6.4.4.13 The chain locker, hold fasts, hawse pipes and chain stoppers are to be examined and pumping arrangements of the chain locker tested.

6.4.4.14 The loading instrument is to be checked for accuracy by applying test load conditions in presence of the Surveyor.

6.4.4.15 For single hold cargo ships which require fitment of hold water level detectors as per Pt.4, Ch.3, Sec.3.6, the special survey is to include an examination and a test of the water ingress detection system and their alarms.

6.4.4.16 Examination of accommodation ladders, gangways and their winches are to be carried out as required for annual surveys. In addition, the accommodation ladders and gangways are to be operationally, tested with the specified maximum operation load.

The tests are to be carried out with the load applied as uniformly as possible along the length of the accommodation ladder or gangway, at an angle of inclination corresponding to the maximum bending moment on the accommodation ladder or gangway.

Accommodation ladder winch is to be operationally tested at special surveys. The brake system of the winch is to be tested for holding the maximum operational load on the ladder.

For existing installations on board ships constructed prior to 01 Jan 2010 where the maximum operational load is not known, load nominated by the shipowner or operator may be considered as the test load.

6.4.5 Hatch covers and coamings

6.4.5.1 In addition to the requirements of annual survey, the following examination/testing is to be carried out:

a) checking of the satisfactory operation of the mechanically operated hatch covers:

   - stowage and securing in open condition;

   - proper fit, locking and efficiency in closed condition;

   - operational testing of hydraulic and power components, wires, chains and link drives.

b) checking the effectiveness of sealing arrangements of all hatch covers by hose testing or equivalent.

c) checking the residual thickness of coamings, steel pontoon or hatch cover plating and stiffening members as deemed necessary by the Surveyor.

For general dry cargo ships, close-up survey and thickness measurement of plating and stiffeners of hatch cover and coaming is to be carried out as required by Table 6.4.7.1 and Table 6.4.8.1b. Close up survey/thickness measurement is to be carried out for accessible parts of hatch cover structures. For cargo hold hatch covers of approved design which have no access to internal structures, close up survey/thickness measurements of such inaccessible structural members need not be carried out.

6.4.6 Tank testing

6.4.6.1 Boundaries of double-bottom, deep, ballast, peak and other tanks, including holds adapted for the carriage of water ballast are to be tested with a head of liquid to the top of air pipes or to near the top of hatches for ballast/cargo holds. Boundaries of fuel oil, lub.oil and fresh water tanks are to be tested with a head of liquid to the highest point that liquid will rise under service conditions. Tank testing of fuel oil lub.oil and fresh water tanks may be specially considered based on a satisfactory external examination of the tank boundaries and a confirmation from the master stating that the pressure testing has been carried out according to the requirements with satisfactory results.

6.4.6.2 The Surveyor may extend the tank testing as may be necessary.

6.4.7 Close-up surveys of general dry cargo ships

6.4.7.1 The minimum requirements for close-up survey for general dry cargo ships are given in Table 6.4.7.1.

The surveyor may extend the close-up survey as deemed necessary taking into account the maintenance of the spaces under survey, the condition of the corrosion prevention system and where spaces have structural arrangements or details which have suffered defects in similar spaces or on similar ships according to available information.

6.4.7.2 For areas in tanks and cargo holds where coatings are found in GOOD condition, the extent of close-up examination may be specially considered.

Table 6.4.7.1 : Requirements of close-up survey – General dry cargo ships

Special Survey No. I Age ≤ 5	Special Survey No. II 5 < Age ≤ 10	Special Survey No. III 10 < Age ≤ 15	Special Survey No. IV and subsequent Age > 15
(A) Selected shell frames in one forward and one aft cargo hold and associated tween deck spaces. (B) One selected cargo hold transverse bulkhead. (D) All cargo hold hatch covers and coamings (plating and stiffeners).	(A) Selected shell frames in all cargo holds and tween deck spaces. (B) One transverse bulkhead in each cargo hold. (B) Forward and aft transverse bulkhead in one side ballast tank, including stiffening system. (C)One transverse web with associated plating and framing in two representative ballast tanks of each type (i.e. topside, hopper side, side tank or double bottom tank). (D) All cargo hold hatch covers and coamings (plating and stiffeners). (E) Selected areas of all deck plating and underdeck structure inside line of hatch openings between cargo hold hatches. (F) Selected areas of inner bottom plating.	(A) All shell frames in the forward lower cargo hold and 25% frames in each of the remaining cargo holds and tween deck spaces including upper and lower end attachments and adjacent shell plating. (B) All cargo hold transverse bulkheads. (B) All transverse bulkheads in ballast tanks, including stiffening system. (C) All transverse webs with associated plating and framing in each ballast tank (D) All cargo hold hatch covers and coamings (plating and stiffeners). (E) All deck plating and underdeck structure inside line of hatch openings between cargo hold hatches. (F) All areas of inner bottom plating.	(A) All shell frames in all cargo holds and tween deck spaces including upper and lower end attachments and adjacent shell plating. Areas (B—F) as for Special Survey No.III

(A) Cargo hold transverse frames.

(B) Cargo hold transverse bulkhead plating, stiffeners and girders.

(C) Transverse web frame or watertight transverse bulkhead in ballast tanks.

(D) Cargo hold hatch covers and coamings. Close up survey/thickness measurement is to be carried out for accessible parts of hatch cover structures. For cargo hold hatch covers of approved design which have no access to internal structures, close up survey/thickness measurements of such inaccessible structural members need not be carried out.

(E) Deck plating and underdeck structure inside line of hatch openings between cargo hold hatches.

(F) Inner bottom plating.

Note : Close-up survey of cargo hold transverse bulkheads to carried out at the following levels:

- Immediately above the inner bottom and immediately above the tween decks, as applicable.
- Mid-height of the bulkheads for holds without tween decks.
- Immediately below the main deck plating and tween deck plating.

6.4.8 Thickness measurement

6.4.8.1 The minimum requirements for thickness measurement are given in Table 6.4.8.1a and Table 6.4.8.1b.

The Surveyor may extend the thickness measurements as deemed necessary.

Where thickness measurements indicate substantial corrosion, the number of thickness measurements are to be increased to determine the extent of substantial corrosion. Table 6.4.8.2 may be used as guidance for additional measurements.

Table 6.4.8.1a : Thickness measurement : General Ship Types (other than general dry cargo ships)

Special Survey No. I Age ≤ 5	**Special Survey No. II 5 < Age ≤ 10**	**Special Survey No. III 10 < Age ≤ 15**	**Special Survey No. IV and subsequently Age > 15**
1) Suspect areas throughout the vessel	1) Suspect areas throughout the vessel	1) Suspect areas throughout the vessel	1) Suspect areas throughout the vessel
	2) One transverse section of deck plating within the amidships 0.5L(in way of a cargo space, where provided)	2) Two transverse sections within the amidships 0.5L(in way of two cargo spaces, where provided)	2) A minimum of three transverse sections within the amidships 0.5L (in way of cargo spaces, where provided)
		3) Internals in forepeak and after peak ballast tanks	3) Internals in forepeak and after peak ballast tanks
		4) All cargo hold hatch covers and coamings (plating and stiffeners)	4) All cargo hold hatch covers and coamings (plating and stiffeners)
			5) All exposed main deck plating full length
			6) Representative exposed superstructure deck plating (poop, bridge and forecastle deck)

Table 6.4.8.1a : (Contd.)

Special Survey No. I Age ≤ 5	**Special Survey No. II 5 < Age ≤ 10**	**Special Survey No. III 10 < Age ≤ 15**	**Special Survey No. IV and subsequently Age > 15**
			7) Lowest strake and strakes in way of tween decks of all transverse bulkheads in cargo spaces together with internals in way
			8) All wind and water strakes, port and starboard, full length
			9) All keel plates full length. Also additional bottom plates in way of cofferdams, machinery space and aft end of tanks
			10) a) Plating of sea chests. b) Shell plating in way of overboard discharges as considered necessary by the Surveyor

Notes:

1) Thickness measurement locations are to be selected to provide the best representative sampling of areas likely to be most exposed to corrosion considering cargo and ballast history and arrangement and condition of protective coatings.
2) Thickness measurements of internals may be specially considered by the Surveyor if the hard protective coating is in GOOD condition.
3) For ships less than 100 [m] in length, the number of transverse sections required at Special Survey No.III may be reduced to one (1) and the number of transverse sections required at Subsequent Special Surveys may be reduced to two (2).
4) For ships equal to or more than 100 [m] in length, at special survey No.III, additional thickness measurements of exposed main deck plating within amidship 0.5L may be required.
5) Close up survey/thickness measurement is to be carried out for accessible parts of hatch cover structures. For cargo hold hatch covers of approved design which have no access to internal structures, close up survey/thickness measurements of such inaccessible structural members need not be carried out.

Table 6.4.8.1b : Thickness measurement : General dry cargo ships

Special Survey No. I **Age ≤ 5**	**Special Survey No. II** **5 < Age ≤ 10**	**Special Survey No. III** **10 < Age ≤ 15**	**Special Survey No. IV and subsequently** **Age > 15**
1) Suspect areas throughout the vessel	1) Suspect areas throughout the vessel	1) Suspect areas throughout the vessel	1) Suspect areas throughout the vessel
	2) Within the cargo area: One transverse section of deck plating in way of cargo space within the amidships 0.5L	2) Within the cargo area: a) Two transverse sections within the amidships 0.5L in way of two different cargo spaces b) Each deck plate outside line of cargo hatch openings c) All wind and water strakes	2) Within the cargo area: a) A minimum of three transverse sections within the amidships 0.5L b) Each deck plate c) All wind and water strakes d) Each bottom plate, including lower turn of bilge. e) Duct keel or pipe tunnel plating and internals
	3) Measurement for general assessment and recording of corrosion pattern of those structural members subject to close-up survey according to Table 6.4.7.1	3) Measurement for general assessment and recording of corrosion pattern of those structural members subject to close-up survey according to Table 6.4.7.1	3) Measurement for general assessment and recording of corrosion pattern of those structural members subject to close-up survey according to Table 6.4.7.1
		4) Selected wind and water strakes outside the cargo length area	4) All wind and water strakes outside cargo area
		5) Internals in forepeak and afterpeak ballast tank	5) Internals in forepeak and afterpeak ballast tank
			6) All exposed main deck plating outside cargo area
			7) Representative exposed super structure deck plating (poop, bridge and fore castle deck)
			8) All keel plates, additional bottom plates in way of machinery space, aft end of tanks and cofferdams outside cargo area
			9) a) Plating of sea chests. b) Shell plating in way of overboard discharges as considered necessary by the Surveyor

Notes:

1. Thickness measurement locations should be selected to provide the best representative sampling of areas likely to be most exposed to corrosion, considering cargo and ballast history and arrangement and condition of protective coatings.
2. For ships less than 100 metres in length, the number of transverse sections required at Special Survey No. III may be reduced to one and the number of transverse sections at Special Survey No. IV and subsequent surveys may be reduced to two.

6.4.8.2 For areas in spaces where hard protective coatings are found to be in a GOOD condition, the extent of thickness measurements may be specially considered by the Surveyor.

6.4.8.3 Transverse sections are to be chosen where the largest reductions are suspected to occur or are revealed from deck plating measurements.

6.4.8.4 The thickness measurements are to be carried out by a qualified firm certified by IRS.

6.4.8.5 In order to ensure necessary control during the process of thickness measurements, these are normally to be carried out under the supervision of the Surveyor. The Surveyor has the right to re-check the measurements as deemed necessary to ensure acceptable accuracy.

Table 6.4.8.2 : Guidance for additional thickness measurements in way of substantial corrosion

Structural Member	Extent of Measurement	Pattern of Measurement
Plating	Suspect area and adjacent plates	5 point pattern over 1 square meter
Stiffeners	Suspect area	3 measurements each in line across web and flange

6.4.8.6 A thickness measurement report is to be prepared. The report is to give the location of measurements, the thickness measured as well as corresponding original thickness. Furthermore, the report is to give the date when the measurements were carried out, type of measurement equipment, names of personnel and their qualifications and has to be signed by the operator. The Surveyor is to review the report of the final thickness measurement after repairs have been carried out and countersign the cover page.

6.4.9 Reporting and evaluation of survey of general dry cargo ships

6.4.9.1 The data and information on the structural condition of the vessel collected during the survey is to be evaluated for acceptability and continued structural integrity of the vessel.

6.4.9.2 The survey report would be issued to the owner and the same along with a copy of the thickness measurement report, verified and countersigned by the surveyor, is to be placed on board the vessel for reference at future surveys.

6.4.10 Shell and inner doors of ro-ro ships

6.4.10.1 The special survey is to include, in addition to the requirements of the Annual Survey as required in 6.2.6, examination, tests and checks of sufficient extent to verify that the bow, inner, side shell and stern doors, are in satisfactory condition and considered able to remain in compliance with applicable requirements, subject to proper maintenance and operation in accordance with the Operation and Maintenance Manual (OMM) or manufacturer's recommendations and the periodical surveys being carried out at the due dates for the five year period until the next Special Survey.

6.4.10.2 The examinations of the doors are to be supplemented by thickness measurements and testing to verify compliance with applicable requirements so that the structural and weathertight integrity remain effective. The aim of the examination is to identify corrosion, significant deformation, fractures, damages or other structural deterioration, that may be present.

6.4.10.3 The bow, inner, side shell and stern doors are to be surveyed as follows:

i) A survey of the items listed in 6.2.6.4, including close-up survey of securing, supporting and locking devices, together with welding, according to Table 6.2.6.4.

ii) Non-destructive testing and thickness measurements are to be carried out on securing, supporting and locking devices, including welding, to the extent considered necessary by the Surveyor. Whenever a crack is found, an examination with NDT is to be carried out in the surrounding area and for similar items as considered necessary by the Surveyor.

iii) The maximum thickness diminution of hinging arms, securing, supporting and locking devices is not to be more than 15% of the as-built thickness, in general.

iv) Effectiveness of sealing arrangements is to be verified by hose testing or equivalent.

v) Clearances of hinges, bearings and thrust bearings are to be taken. Unless otherwise specified in the OMM or by manufacturer's recommendation, the measurement of clearances on ro-ro cargo ships may be limited to representative bearings where dismantling is needed in order to measure the clearances. If dismantling is carried out, a visual examination of hinge pins and bearings together with NDT of the hinge pin is to be carried out.

vi) The non-return valves of the drainage system are to be dismantled and examined.

6.4.11 For general dry cargo ships compliance with new IACS requirements for strength of air pipes, ventilators and their closing devices and of small hatches and their securing devices is to be achieved as indicated in 2.4.13.

6.4.12 Watertight Cable Transits

6.4.12.1 The requirements for Special Survey may be undertaken by the attending Surveyor or by a firm approved as a service supplier according to Pt.1 Ch.1, Sec 1.9.

6.4.12.2 All transits are to be examined to confirm their satisfactory condition and the Cable Transit Seal System Register is to be reviewed to confirm that it is being maintained. The Special Survey is to be recorded in the Register, in which a single record entry will be sufficient to record the survey of all transits.

6.4.12.3 From review of the Register, where there are records entered since the last special survey of any disruption to the cable transits or installation of new cable transits (except which are reviewed and examined at previous annual surveys), the satisfactory condition of those transits is to be confirmed by the attending Surveyor by review of records and examination of the transits; the results are to be recorded in the Register against each of those cable transits.

6.4.12.4 In case the cable transits have been examined by an approved service supplier, the attending surveyor is to review the Register in order to ascertain that it has been properly maintained by the owner and correctly endorsed by the service supplier.

6.4.13 Container ships with container lashing software

6.4.13.1 In addition to the annual survey requirements, the functionality of the software is to be tested and verified with approved test cases/ samples.

6.5 Special surveys - Machinery

6.5.1 Requirements for examination of machinery and piping at special survey are given in Sec.8.

6.6 Surveys of Livestock Carriers

6.6.1 General

6.6.1.1 In addition to the relevant requirements of this Section, the following are to be complied with for the surveys of livestock carriers.

6.6.2 Annual Surveys

6.6.2.1 Confirmation that no unapproved changes have been made to livestock pens, passageways as well as the arrangement and protection of livestock since the last survey; confirmation that passageways and exits of the escape route of pen area are unblocked; confirming that two means of egress in each livestock space are not separated by the pen or other obstructions.

6.6.2.2 Confirmation that ventilation arrangements in livestock space are satisfactory and the operation of fans, including fan starters, failure indicators and alarms at different positions is normal. If only one fan is provided, confirmation that spare parts are adequate.

6.6.2.3 Confirming that fodder and drinking water supply, fresh water supply system, water washing system and sewage drainage and discharge system of livestock space are in good condition. The fodder tanks and the fresh water tanks in the livestock spaces are to be examined.

6.6.2.4 Confirming that all fire hydrants and fire hose connections arranged in the pen area are in satisfactory condition.

6.6.2.5 Verification that instructions for the changeover between main and secondary

sources of power and vice-versa are available and confirming the function of the changeover between main and secondary sources of power and vice-versa.

6.6.2.6 General visual examination of lamp casings on light fittings for the livestock spaces.

6.6.3 Special Surveys

6.6.3.1 In addition to the requirements in 6.6.2, the special survey is to include the examination, tests and checks specified in 6.6.3.2 to 6.6.3.5.

6.6.3.2 All fresh water pumps, sewage pumps and system components are to be opened up and examined.

6.6.3.3 Performance test of fodder system, fresh water supply system, water washing system and sewage drainage and discharge system.

6.6.3.4 Ventilation fan motor in the livestock space together with its control and operational mechanism are to be inspected and if necessary, operationally tested in working condition.

6.6.3.5 Interlocking devices of fan starters in the livestock space are to be tested.

6.7 Surveys of Towing Winch Emergency Release Systems

6.7.1 General

6.7.1.1 The requirements in this Section are applicable to surveys of winch emergency release systems that are used on towing ships within close quarters, ports or terminals, including those ships normally not intended for towing operations in transverse direction.

6.7.2 Annual Surveys

6.7.2.1 Operation of the towing winch emergency release system is to be confirmed with reference to the documented instructions for surveys provided by the manufacturer. Operation of the winch emergency release system under no load condition is to be verified. Where practical, activation of the emergency release system may be confirmed by observation of the winch brake.

6.7.2.2 The function of the alarms associated with the emergency release system is to be verified, as far as practicable and reasonable.

6.7.2.3 The condition of the emergency release system is to be visually examined to confirm it remains in satisfactory condition.

6.7.2.4 The means of emergency release of the towline in the event of a blackout is to be examined, and where additional sources of energy are arranged for this purpose, the sources of energy are to be visually inspected and operationally tested.

6.7.2.5 It is to be verified that the performance capabilities and operating instructions of the emergency release system are documented and made available on board the ship on which the winch has been installed.

6.7.3 Special Surveys

6.7.3.1 In addition to the annual survey requirements, instructions for special survey provided by the manufacturer, as appropriate, are to be followed.

6.7.3.2 The full functionality of the emergency release system is to be tested to the satisfaction of the surveyor. Testing may be conducted either during a bollard pull test or by applying the load against a strong point on the deck of the tug or the shore that is certified to the appropriate load.

6.7.3.3 The emergency release system is to be tested at a towline load that is equal to the lesser of 30% of the maximum design load or 80% of vessel bollard pull in both a normal power condition and power blackout condition to the satisfaction of the surveyor.

Section 7

Docking Surveys

7.1 General

7.1.1 The requirements for docking survey intervals are given in Table 1.1.1. Attention should also be given to any relevant statutory requirements of the National Authority of the country in which the ship is registered.

An extension of examination of the ship's bottom of 3 months beyond the due date can be granted in exceptional circumstances due to any of the following reasons:

a) Non-availability of drydocking facilities, repair facilities, essential materials, equipment or spare parts.

b) Delays incurred by action taken to avoid severe weather conditions or delays caused by severe weather conditions.

7.1.2 The ship is to be placed on blocks of sufficient height in a drydock or on a slipway and proper staging is to be erected as may be necessary. Shell plating, stern frame or stern post, rudder and sea inlet and discharge openings are to be examined. Particular attention is to be given to the bilge keels and their connection to the bilge strake, shell plating in way of side, bow and stern doors, ash shoots, and other openings and to parts of the structure particularly liable to excessive corrosion or to deterioration from causes such as chafing and lying on the ground and to any undue unfairness of the bottom plating. Important plate unfairness or other deterioration which do not necessitate immediate repairs are to be recorded.

Visible parts of rudder, rudder pintles, rudder shafts and couplings are to be examined. The clearances in the rudder bearings are to be ascertained. The rudder is to be lifted for examination of the pintles, if considered necessary by the Surveyor. Where applicable, pressure test of the rudder may be required as considered necessary by the Surveyor.

For vessels fitted with ICCP system, the condition of anodes, reference electrodes, and dielectric shields is to be examined.

7.1.3 When the chain cables are ranged the anchors and cables should be examined by the Surveyor.

7.1.4 Sea chests and their gratings, sea connections and overboard discharge valves and cocks and their fastenings to the hull or sea chests are to be examined. Valves and cocks need not be opened up more than once in a special survey period unless considered necessary by the Surveyor.

7.1.5 The Surveyor should examine the ship so far as is practicable in order to satisfy himself as to her general condition.

7.1.6 The propeller should be examined for erosion, pitting, cracking of blades or possible contact damage. The clearance in the stern bush should be measured. In the case of approved oil glands, measurements by poker gauges or other devices for ascertaining the stern bush weardown may be accepted, provided the sealing arrangements appear satisfactory.

7.1.7 For controllable pitch propellers, the Surveyor is to be satisfied with the fastenings and tightness of hub and blade sealing. Dismantling need not be carried out unless considered necessary by the Surveyor.

7.1.8 Exposed parts of side thrusters are to be examined. Propulsion systems which also have maneuvering characteristics (such as directional propellers, vertical axis propellers, water jets) are to be examined externally with focus on the condition of gear housing, propeller blades, bolt locking and other fastening arrangements. Sealing arrangement of propeller blades, propeller shaft and steering column is to be verified.

7.1.9 For vessels with class notation, EDD (X), an inspection of the outside of the vessel's bottom carried out as detailed in the IRS Classification Note "*Extended Dry-Docking Scheme*" may be credited as equivalent to the relevant requirements of a special survey in dry-dock.

7.2 In-water surveys

7.2.1 Eligibility

7.2.1.1 For ships less than 15 years in age the examination of the outside of ship's bottom and related items of ships may be carried out while the ship is afloat (inwater survey) in lieu of the required intermediate docking between special surveys provided following conditions are satisfied.

a) The ship has been assigned the class notation INWATER SURVEY as defined in Ch.1. However, on application by the owner and in special circumstances, such inwater survey may be considered for ships not assigned with the class notation INWATER SURVEY.

b) The ship does not have any outstanding Conditions of Class which require repair work in dry dock to the underwater part of the shell plating, the rudder, the propeller or the propeller shaft.

7.2.1.2 Acceptance of inwater surveys as above may be specially considered for ships other than bulk carriers, oil tankers and chemical tankers which are 15 years of age and over.

7.2.2 Requirements for assignment of INWATER SURVEY notation

7.2.2.1 Detailed plans of the hull and hull attachments below the water line are to be submitted to IRS in triplicate for approval. These plans are to indicate the location and/or the general arrangement of:

- all shell openings
- stem
- rudder and fittings
- sternpost
- propeller, including the means used for identifying each blade
- anodes, including securing arrange-ments
- bilge keels
- welded seams and butts.

The plans are also to include the necessary instructions to facilitate the divers' work, especially for taking clearance measurements.

7.2.2.2 The plans for approval are also to include the procedure for measurement or verification, as the case may be, of the following:

- rudder pintle/bush clearance
- stern bush clearance
- pintle securing arrangement in the socket.

7.2.2.3 As far as practicable, a photographic documentation, used as a reference during the in-water surveys, of the following hull parts is to be submitted to IRS:

- propeller boss
- rudder pintles, where slack is measured
- typical connections to the sea
- directional propellers, if any
- other details, as deemed necessary by IRS on a case by case basis.

7.2.2.4 The Owner is to put on board the ship the plans and documents given in 7.2.2.1 and 7.2.2.2 and they are to be made available to the Surveyor and the divers when an in-water survey is carried out.

7.2.3 Survey requirements

7.2.3.1 The in-water survey is to provide all the information normally obtained from a docking survey. However, special consideration may be given to ascertaining rudder bearing clearances and stern bush clearances of oil stern bearings based on a review of the operating history, on board testing and stern tube oil sample reports. These details are to be included in the proposals for in-water surveys which are to be submitted in advance of the survey so that satisfactory arrangements can be agreed with IRS.

7.2.3.2 The in-water survey is to be carried out with the ship in as light condition as possible in sheltered water preferably with weak tidal streams and currents. The in-water visibility

and the cleanliness of the hull below the waterline is to be good enough to permit a meaningful examination which allows the Surveyor and the in-water survey firm to determine the condition of the plating, appendages and the welding. IRS is to be satisfied with the methods of orientation of the divers or Remotely Operated Vehicle (ROV) on the plating, which should make use where necessary of permanent markings on the plating at selected points.

7.2.3.3 The in-water survey is to be carried out under surveillance of a Surveyor by an in-water survey firm approved as a service supplier.

The equipment, procedure for observing and reporting the survey are to be discussed with the parties involved prior to the in-water survey and suitable time is to be allowed to enable the in-water survey firm to test all equipment beforehand.

7.2.3.4 When professional divers are employed, the Surveyor is to be satisfied with the method of pictorial representation, and a good two-way communication between the Surveyor and divers is to be provided.

7.2.3.5 If the in-water survey reveals damage or a deterioration that requires early attention, the Surveyor may require that the ship to be drydocked in order that a detailed survey can be undertaken and the necessary repairs carried out.

7.2.3.6 The condition of the coating is to be confirmed at every drydocking for continuance of the INWATER SURVEY notation.

Section 8

Machinery - Special Surveys

8.1 General

8.1.1 Special surveys are to be carried out at 5 years intervals to renew the Class Certificate.

The first Special survey is to be completed within 5 years from the initial classification survey and thereafter 5 years from the assigned date of the previous special survey. However, an extension of class of 3 months maximum beyond the 5th year can be granted in exceptional circumstances.

In this case, the next period of class will start from the expiry date of the special survey before the extension was granted.

8.1.2 For surveys completed within 3 months before the expiry date of the special survey, the next period of class will start from the expiry date of the special survey. For surveys completed more than 3 months before the expiry date of the special survey, the period of class will start from the survey completion date. In cases where the vessel has been laid up or has been out of service for a considerable period because of a major repair or modification and the owner elects to only carry out the overdue surveys, the next period of class will start from the expiry date of the special survey. If the owner elects to carry out the next due special survey, the period of class will start from the survey completion date.

Any requirement of the Flag Administration in this regard is also to be complied with.

8.1.3 The special survey may be commenced at the 4th annual survey and be progressed with a view to completion by the 5th anniversary date. When the special survey is commenced prior to the 4th annual survey, the entire survey is to be completed within 15 months if such work is to be credited to the special survey.

8.1.4 Upon satisfactory completion of the Machinery Special Survey an appropriate record will be entered in the supplement of register of ships.

8.1.5 Further parts of machinery may require to be opened should any defects be found during the course of Survey of any item and the defects made good to the satisfaction of the Surveyor.

8.1.6 As part of the Special Survey of Machinery, a dock trial is to be carried out to attending Surveyor's satisfaction to confirm satisfactory operation of main and auxiliary machinery. If significant repairs are carried out to main or auxiliary machinery or steering

gear, consideration should be given to a sea trial to attending Surveyor's satisfaction.

8.1.7 If the significant repairs as stated in 8.1.6, is considered by IRS to have any impact on response characteristics of the propulsion systems, then the scope of sea trial is also to include a test plan for ahead and astern response characteristics based on those required for such an equipment or systems when fitted to the new ship. (*Refer to Pt.4, Ch.1, 1.10 and 3.2.8*). The tests are to demonstrate the satisfactory operation of the equipment or system under realistic service conditions at least over the manoeuvring range of the propulsion plant, for both ahead and astern directions. Depending on the actual extent of the repair, IRS may accept a reduction of the test plan.

8.2 Continuous survey of machinery (CSM)

8.2.1 At the request of the Owners and upon approval of the proposed arrangement a system of continuous Survey of Machinery (CSM) may be undertaken whereby the requirements of Special Survey of machinery are completed within a 5 year period. The Survey cycle should be such as would ensure that the interval between consecutive examination of each item does not exceed five years and it is expected that approximately an equal proportion of the machinery would be subjected for Survey each year.

8.2.2 Upon satisfactory completion of the continuous Machinery Survey cycle, a record indicating the date of completion of the cycle will be shown in the supplement to the Register Of Ships.

8.3 Survey requirements: Auxiliary engines

8.3.1 All auxiliary engines driving the generators and other essential machinery together with their coolers and attached pumps are to be opened up and examined as considered necessary by the Surveyor. Alarms and safety devices fitted on these units are to be included in this Survey.

8.4 Survey requirements: Air compressors, receivers and starting air pipes

8.4.1 All air receivers and other pressure vessels for essential services together with their mountings and safety devices are to be cleaned internally and examined internally and externally. If an internal examination of an air receiver is not practicable it is to be tested hydraulically to 1.3 times the working pressure.

8.4.2 Air compressors are to be opened up and coolers tested as considered necessary by the Surveyor. Selected pipes in the starting air systems are to be removed for internal examination and hammer tested. If an appreciable amount of lubricating oil is found in the pipes the starting air system is to be thoroughly cleaned by steaming or other suitable means. Some of the pipes selected are to be those adjacent to the starting air valves at the cylinders and to the discharges from the air compressors.

8.5 Survey requirements: Fresh water generators and evaporators

8.5.1 To the extent applicable, these are to be opened up and examined. After such Survey their relief valves are to be checked under working conditions, where practicable.

8.6 Survey requirements: Fuel tanks

8.6.1 Fuel tanks which do not form part of the ship's structure are to be examined externally and, if considered necessary by the Surveyor also internally. All mountings, fittings and remote control devices are to be examined as far as practicable. All such tanks are to be tested by filling to maximum working level.

8.7 Survey requirements: Pumps, heat exchangers, forced draught fans, etc.

8.7.1 All pumps, heat exchangers, forced draught fans, etc. used for essential purposes are to be opened up and examined as considered necessary by the Surveyor.

8.8 Survey requirements: Pumping and piping system

8.8.1 The valves, cocks and strainers of the bilge system including bilge injection are to be opened up as considered necessary by the Surveyor and, together with pipes, are to be examined and tested under working conditions. If non-return valves are fitted in hold bilges, these be opened up for examination.

8.8.2 The oil fuel, feed and lubricating systems and ballast connections and blanking arrangements to deep tanks which may carry liquid or dry cargoes, together with all pressure

filters, heaters and coolers used for essential service, are to be opened up and examined or tested as considered necessary by the Surveyor. All safety devices for the foregoing are to be examined.

8.8.3 Non-metallic expansion joints in piping systems, if located in system which penetrates the ship's side and both the penetration and the non-metallic expansion joint are located below the deepest load waterline, are to be examined and replaced as necessary or at an interval recommended by the manufacturer.

8.9 Survey requirements: Reduction gears, flexible couplings and clutch arrangements

8.9.1 Reduction gears, flexible couplings and clutch arrangements are to be opened as considered by the Surveyor in order to permit the examination of the gears, gear teeth, spiders, pinions, shafts and bearings, reversing gears, etc. Essential parts of other power transmission arrangements are to be opened up and examined as considered necessary by the Surveyor.

8.10 Survey requirements: Securing arrangements

8.10.1 Holding down bolts and chocks of main and auxiliary engines, gear cases, thrust blocks and tunnel bearings are to be checked.

8.11 Survey requirements: Shafting

8.11.1 Intermediate shafts and bearings, thrust bearings and their seating are to be examined. The lower halves of bearings need not be exposed if alignment and wear are found acceptable.

8.12 Survey requirements: Sea connections

8.12.1 All openings to the sea including sanitary and other overboard discharges in the machinery spaces and pump rooms together with valves and cocks are to be examined internally and externally. The fastenings of valves and cocks to the hull are to be examined and are to be renewed when considered necessary by the Surveyor. Particular attention is to be given to the sea suctions and sea water cooling pipes.

8.13 Survey requirements: Windlass and steering machinery

8.13.1 These are to be examined to ascertain that they are in good working order. Any relief valves fitted are to be included in the above examination.

8.14 Survey requirements: Internal combustion engines for propulsion

8.14.1 All working parts of the engines and their attached pumps are to be opened and examined. These should include all cylinders, cylinder heads, valves and valve gear, pistons, piston rods, cross heads, guides, connecting rods, crankshafts, vibration dampers and all bearings, camshafts and driving gear, fuel pumps and fittings, scavenge pumps, scavenge blowers and their prime movers, superchargers, air compressors, inter coolers, clutches, reverse gears, crankcase door fastenings and explosion relief devices and such other parts of the machinery as may be considered necessary. Integral piping systems are to be examined. The maneuvering of engines is to be tested under working condition.

8.15 Survey requirements: Steam turbines for propulsion

8.15.1 Upper halves of turbine casings are to be opened up rotors to be lifted up and inside of casings, rotors and bearings (including thrust) and governors to be examined.

8.15.2 At the first Special Periodical Survey only, for vessels having more than one main propulsion ahead turbine with emergency steam crossover arrangement, the turbine casings need not be opened provided approved vibration indicators and rotor position indicators are fitted and that the Surveyor considers the operating records to be satisfactory. An operational test of the turbines may be required if considered necessary by the Surveyor.

8.15.3 Essential valves attached to the turbines and flexible couplings are to be examined. The maneuvering of the turbines is to be tested under working conditions.

8.15.4 Exhaust steam turbines supplying power for main propulsion purposes in conjunction with reciprocating engines together with their gearing and appliances, steam compressors or electrical machinery are to be examined as far as practicable. Where cone connections to internal gear shafts are fitted, the coned ends are to be examined as far as practicable. The maneuvering of engines is to be tested under working conditions.

8.16 Survey requirements: Steam reciprocating engines for propulsion

8.16.1 Working parts of main engines and attached pumps including bulkhead stop valves, maneuvering valves, cylinders, pistons, valves and valve gear, piston rods, connecting rods, crankshaft and bearings and governor are to be opened up and examined. The maneuvering of engines is to be tested under working conditions.

8.17 Survey requirements: Gas turbines and free piston gas generators for propulsion

8.17.1 The Survey should include opening and examination of the following parts :-

- The blading, rotors, and casings of the turbines, the impellers or blading, rotors and casing of air compressors, the combustion chambers, burners, inter coolers, heat exchangers, gas and air pressure piping and fittings and reversing arrangements. When gas turbines operate in conjunction with free piston gas generators, the following parts of the free piston gas generators are to be opened and examined: the gas and air compressor cylinders and pistons and the compressor end covers, the valves and valve gear, fuel pumps and fittings, synchronising and control gear, cooling system explosion relief devices, gas and air piping, receivers and valves including by-pass. The maneuvering of engines is to be tested under working conditions.

8.18 Survey requirements: Unattended machinery spaces/Remote control systems

8.18.1 Where remote and/or automatic controls such as bridge controls, bilge controls and bilge level alarms, local hand controls, fire detection and prevention, alarms warning systems and shut-offs, electric supply, main controls station, are fitted for essential machinery, they are to be examined and tested to demonstrate that they are in good working order.

8.18.2 During such trials the proper operation of the safety devices will be checked, in particular, such as emergency stops, emergency astern movement, standby control of the propelling gear, fire alarm.

8.18.3 The log recording the operating conditions should be checked. If such scrutiny reveals that certain portion of the automated equipment has behaved abnormally the cause of such failure is to be investigated and appropriate remedies determined.

8.19 Survey requirements : Electrical equipment survey

8.19.1 Electrical installations including auxiliary and emergency equipment are to be examined in accordance with the following during each Survey cycle.

8.19.2 Switch boards (including for emergency use) and their accessories including section-boards and sub-division fuse boards are to be examined as far as possible and over current protective devices and fuses inspected to verify that they provide suitable protection for their respective circuits. In the case of diving support vessels using the emergency generator as the independent source of power for the diving system, the test should be carried out for the total load including diving system load.

8.19.3 All generator circuit breakers are to be tested, as far as practicable, to verify that the protective devices including preference tripping relays, if fitted, operate satisfactorily. The generators are to be run under load either separately or in parallel, and the governing of the engines to be tested.

8.19.4 The insulation resistance of cables, switch gear, generators, motors, heaters, lighting and other fittings is to be tested and should not be less than 100,000 ohms between all insulated circuits and earth. The installation may be subdivided to any desired extent by opening switches, removing fuses or disconnecting appliances for the purpose of this test.

The electric cables are to be examined as far as possible without undue disturbance of fixtures or casings unless deemed necessary by the Surveyor.

8.19.5 Transformers are to be examined. Samples of oil are to be taken and tested for breakdown voltage, acidity and moisture in case of oil immersed transformers or electrical apparatus associated with supplies to essential services. The testing is to be carried

out by a competent testing authority and a certificate giving the test results is to be furnished to the Surveyor.

8.19.6 Motors used for essential services including their starters are to be examined, and under working conditions if considered necessary by the Surveyors.

8.19.7 Generators and steering gear motors are to be examined under working conditions. Air gaps are to be checked for excessive wear down.

8.19.8 In the case of electromagnetic couplings, the air gaps are to be measured and reported and any excessive eccentricity corrected. Switch gear and couplings for same are to be examined and tested.

8.19.9 The emergency source of power and its associated circuits are to be tested. In the case of passenger ships, the temporary source of power and its automatic arrangements (if fitted) are also to be tested.

8.19.10 Navigation light indicators are to be tried under working conditions, and correct operation on the failure of supply or failure of navigation lights verified.

8.19.11 In tankers, a General examination of electrical equipment located in dangerous zones and spaces is to be made to ensure that the integrity of the safe type electrical equipment has not been impaired owing to corrosion, missing bolts, etc. Cable runs are to be examined for sheath and armouring defects, where practicable, and to ensure that the means of supporting the cable are in good order. Tests are to be carried out to demonstrate the effectiveness of earth bonding straps. Alarms and interlocks associated with pressurized equipment or spaces are to tested for correct operation.

Insulation resistance is to be measured for circuits terminating in, or passing through dangerous zones or spaces.

8.20 Survey requirements : Electrical propelling machinery

8.20.1 On ships which are electrically propelled, the main propulsion motors, generators, cables, together with all ancillary electrical gear, exciters and ventilating plant (including coolers) are to be examined and their insulation resistance to earth to be measured. Protective gear and alarm devices are to be checked as far as practicable and special attention should be given to windings, commutators and slip rings. Safety interlocks intended to prevent unsafe operation or unauthorised access are to be checked to verify that they are functioning correctly. Emergency over speed governors are to be tested. Where insulating oil is used, samples of oil are to be taken and tested for breakdown voltage, acidity and moisture by a competent testing authority and a certificate giving the test results is to be furnished to the Surveyor.

8.21 In service testing of large permanently installed breathing gas containers onboard diving vessels - Special Requirements

8.21.1 At the first special survey, following is to be carried out:

- External and internal survey, by intrascope if necessary.

- If internal survey is not possible or if corrosion or other items of concern are found, hydraulic test to 1.25 x design pressure to be carried out.

At subsequent special surveys, following to be carried out:

- External and internal survey, by intrascope if necessary.

- Hydraulic test to 1.25 x design pressure.

8.22 Surveys Requirements: Fuel installations on ships utilizing Gaseous Fuels or Other Low Flash Point Fuels

8.22.1 Surveys of Fuel installations on ships using Gaseous fuels or other low flash point fuels are to be carried out in accordance with the requirements of Section 20, as applicable.

Section 9

Boiler Surveys

9.1 General

9.1.1 All main and auxiliary boilers, exhaust gas steam generators and economisers are to be surveyed at intervals specified in Sec.1 of this Chapter. An extension of examination of the boiler of up to 3 months beyond the due date can be granted in exceptional circumstances. “Exceptional Circumstances” means un-availability of repair facilities, unavailability of essential materials, equipment or spare parts, or delays incurred by action taken to avoid severe weather conditions.

9.1.2 At each Survey, the boilers, superheaters, economisers, air heaters, desuperheaters, and other equipment are to be examined internally (water/steam side) and externally (fire side) as considered necessary.

In exhaust gas heated economizers of the shell type, all accessible welded joints are to be subjected to a visual examination for detection of cracks. Nondestructive testing may be required for this purpose.

When direct visual internal inspection is not feasible due to the limited size of the internal spaces, such as for small boilers and/or narrow internal spaces, this may be replaced by a hydrostatic pressure test or by alternative verifications as determined by IRS.

9.1.3 Boiler safety valve and its relieving gear are to be examined and tested to verify satisfactory operation. The adjustment of the safety valves is to be verified during each boiler internal survey. Safety valves are to be adjusted to a pressure not greater than 3 percent of the approved working pressure.

9.1.4 Review of the following records since the last boiler survey is to be carried out as part of the survey:

a) Operation
b) Maintenance
c) Repair history
d) Feed water chemistry

9.1.5 External survey of boilers including test of safety and protective devices and test of safety valve using its relieving gear, is to be carried out annually, within the window of the Annual Survey of a ship. For exhaust gas heated economizers, the safety valves are to be tested by the Chief Engineer at sea within the annual survey window. This test is to be recorded in the log book for review by the attending Surveyor prior to crediting the Annual Survey of Machinery.

9.1.6 Principal boiler mountings and safety valves are to be examined at each Survey. The remaining mountings are to be opened if considered necessary by the Surveyor. Manhole and hand hole doors, are to be examined to ensure that the joining faces are in good condition and that the clearances at the spigot are satisfactory.

9.1.7 In case where it is considered necessary, the parts subjected to pressure are to be hydraulically tested and the thickness of plates and size of stays ascertained to determine the safe working pressure. Collision chocks, rolling stays and boiler stools are to be examined and maintained in efficient condition. The shell plating in way of welded lugs or fabricated feet are to be carefully examined at each Survey. Insulation and sheathing in way are to be removed as considered necessary for this purpose.

In fired boilers employing forced circulation the pumps used for this purpose are to be opened and examined at each boiler Survey.

9.1.8 The proper operation of the water level indicators are to be confirmed at each Survey. The oil fuel burning system is to be examined under working conditions and a general examination made of the fuel tank valves, pipe, deck control gear and oil discharge pipes between pumps and burners.

GUIDANCE :

Every effort should be made to complete the boiler Survey once it has been commenced at the same port if possible or immediately afterwards on the first occasion when steam is raised.

9.1.9 An extension of survey may be granted by IRS, on the basis of 9.1.1, after the following is satisfactorily carried out:

a) External examination of the boiler

b) Boiler safety valve relieving gear (easing gear) is examined and operationally tested.

c) Boiler protective devices operationally tested.

d) Review of the records since the last boiler survey as mentioned in 9.1.4.

9.2 Steam heated steam generator

9.2.1 Steam heated steam generators are to be surveyed at two and half yearly intervals.

9.2.2 At each steam heated steam generator survey the mountings and the safety valves are to be examined. Manhole and hand hole doors are to be examined to ensure that joining faces are in good condition and that the clearances at the spigot are satisfactory.

9.2.3 Where it is considered necessary, parts subjected to pressure are to be hydraulically tested and the thickness of plates and the sizes of stays ascertained to determine the safe working pressure.

9.2.4 The proper operation of the water level indicators is to be confirmed at each Survey. The safety valves of the steam heated steam generator are to be adjusted to a pressure not greater than 3 per cent above the approved working pressure.

Section 10

Steam Pipes Surveys

10.1 General

10.1.1 Steam pipes are to be surveyed as part of special surveys of machinery or continuous surveys of machinery (CSM).

10.1.2 At each Survey a selected number of main and auxiliary steam pipes over 75 [mm] bore supplying steam for essential services are to be examined internally and tested hydraulically to 1.5 times the working pressure. If these are found satisfactory, the remaining need not be tested. In cases of pipes having welded joints, the lagging in way of the welds is to be removed and the welds examined and if considered necessary crack detected.

10.2 Cylindrical boilers having smoke tube superheaters

10.2.1 Where the saturated steam pipes adjoining the saturated steam headers are situated partly in the boiler smoke boxes, all such pipes adjoining and cross connecting these headers in the smoke boxes are required to be included in the pipes required for examination and testing for the steam pipe Survey.

10.3 Copper pipes

10.3.1 At 10 years from the date of build, or of installation and thereafter at 5 yearly intervals, all copper pipes over 75 [mm] bore and supplying steam for essential services at sea are to be hydraulically tested to twice the working pressure. Pipes which are subjected to bending and/or vibration are to be annealed before testing.

Section 11

Surveys of Propeller Shafts, Tube Shafts and Propellers

11.1 General

11.1.1 At shaft surveys, propeller shafts and tube shafts, if any, are to be sufficiently drawn to permit entire examination at intervals as detailed in Sec.1 of this Chapter.

Unless alternative means are provided to ensure the condition of the propeller shaft assembly, these requirements apply to all vessels with conventional shafting fitted with a propeller as follows:

.1 from 1 Jan 2016 for ships delivered on or after 1 Jan 2016;

.2 after the first shaft survey scheduled on or after 1 Jan 2016, for ships delivered before 1 Jan 2016. Upon completion of the first shaft survey scheduled on or after 1 Jan 2016, the designation of dates for the next shaft survey is to be made based on the requirements in this section.

11.1.2 For the purpose of these requirements, the following definitions are applicable:

.1 Shaft is a general definition that includes:

- Propeller shaft
- Tube shaft

The definition does not include the intermediate shaft(s) which is (are) considered part of the propulsion shafting inside the vessel.

.2 *Propeller Shaft.* Propeller shaft is the part of the propulsion shaft to which the propeller is fitted. It may also be called screwshaft or tailshaft. Where a separate tube shaft is not fitted, the propeller shaft runs through the stern tube and is connected to the intermediate shaft within the ship. In this case, only the propeller shaft and intermediate shaft are fitted and there is no tube shaft.

.3 *Tube Shaft.* Tube shaft is a shaft placed between the intermediate shaft and propeller shaft, normally arranged within a stern tube or running in open water. It may also be called Stern Tube Shaft.

.4 *Stern Tube*. Tube or pipe fitted in the shell of a ship at the stern (or rear part of the ship), below the water-line, through which passes the tube shaft or the propeller-shaft. Stern tube is the housing of the shaft bearings, generally two (one aft and one fore), that sustain the shaft and allows its rotation with less frictional resistance. The stern tube also accommodates the shaft sealing arrangement.

.5 *Close Loop (system) Oil Lubricated Bearing*. Closed loop oil lubricating systems use oil to lubricate the bearings and are sealed against the environment (seawater) by adequate sealing / gland devices.

.6 *Water Lubricated Bearing*. Water lubricated bearings are bearings cooled / lubricated by water (fresh or salt).

.7 *Closed Loop System Fresh Water Lubricated Bearing*. Closed loop water lubricating systems use fresh water to lubricate the bearings and are sealed against the environment (such as seawater) by adequate sealing / gland devices.

.8 *Open Systems (water)*. Open water lubricating systems use water to lubricate the bearings and are exposed to the environment.

.9 *Adequate means for protection against corrosion*. An adequate means for protection against corrosion is an approved means for full protection of the core shaft against sea water intrusion and subsequent corrosion attack. Such means are used for the protection of common steel material against corrosion particularly in combination with water lubricated bearings. Typical means are for example:

- continuous metallic, corrosion resistant liners,
- continuous cladding,
- multiple layer synthetic coating,
- multiple layer of fiberglass,
- combinations of above mentioned,
- rubber / elastomer covering coating.

The means for protection against corrosion are installed / applied according to IRS approved procedures.

.10 *Corrosion Resistant Shaft*. Corrosion resistant shaft is made in approved corrosion resistant steel as core material for the shaft.

.11 *Sterntube Sealing System*. Sterntube sealing system is the equipment installed on the inboard extremity and, for closed systems, at outboard extremity of the sterntube.

Inboard Seal is the device fitted on the fore part of the sterntube that achieve the sealing against the possible leakage of the lubricant media in to the ship internal.
Outboard seal is the device fitted on the aft part of the sterntube that achieve the sealing against the possible sea water ingress and the leakage of the lubricant media.

.12 *Service Records*. Service records are regularly recorded data showing in-service conditions of the shaft(s) and may include, as applicable: lubricating oil temperature, bearing temperature and oil consumption records (for oil lubricated bearings) or water flow, water temperature, salinity, pH, make-up water and water pressure (for closed loop fresh water lubricated bearings depending on design).

.13 *Oil sample examination*. An oil sample examination is a visual examination of the stern tube lubricating oil taken in presence of the surveyor with a focus on water contamination.

.14 *Lubricating oil analysis*. Lubricating oil analysis is to be carried out at regular intervals not exceeding six (6) months. The documentation on lubricating oil analysis is to be available on board.

Oil samples, to be submitted for the analysis, are to be taken under service conditions.

.15 *Fresh water sample test*. Fresh water sample test is to be carried out at regular intervals not exceeding six (6) months
Samples are to be taken under service conditions and are to be representative of the water circulating within the sterntube. Analysis results are to be retained on board and made available to the surveyor. At time of survey the sample for the test is to be taken in the presence of the surveyor.

Fresh water sample test is to include the following parameters:

- chlorides content,
- pH value,
- presence of bearing particles or other particles (only for laboratory analysis, not required for tests carried out in presence of the surveyor).

.16 *Keyless Connection*. Keyless connection is the forced coupling methodology between the shaft and the propeller without a key achieved through interference fit of the propeller boss on the shaft tapered end.

.17 *Keyed Connection*. Keyed connection is the forced coupling methodology between the shaft and the propeller with a key and keyway achieved through the interference fit of the propeller boss on the shaft tapered end.

.18 *Flanged Connection.* Flanged connection is the coupling methodology, between the shaft and the propeller, achieved by a flange, built in at the shaft aft end, bolted to propeller boss.

.19 *Alternative Means*. Shafting arrangements such as, but not limited to, an approved Condition Monitoring Scheme and/ or other reliable approved means for assessing and monitoring the condition of the tail shaft, bearings, sealing devices and the stern tube lubricant system capable to assure the condition of the propeller shaft assembly with an equivalent level of safety as obtained by survey methods as indicated in this Section. “TCM” notation requirements in Pt.4, Ch.4 of the Rules are considered as alternative means. Condition monitoring records, as applicable, are to be verified at annual surveys. For shaft surveys, methods and extensions based on the type of lubrication and connection, as indicated in Table 11.2.3 will be applicable.

11.2 Oil Lubricated Shafts or Closed Loop System Fresh Water Lubricated Shafts (Closed System)

11.2.1 Shaft Survey Methods

11.2.1.1 **METHOD 1**

.1 The survey is to consist of:

- Drawing the shaft and examining the entire shaft, seals system and bearings;

- For keyed and keyless connections:

- Removing the propeller to expose the forward end of the taper,

- Performing a non-destructive examination (NDE) by an approved surface crack-detection method all around the shaft in way of the forward portion of the taper section, including the keyway (if fitted).

  For shaft provided with liners the NDE is to extend to the after edge of the liner.

- For flanged connection:

- Whenever the coupling bolts of any type of flange-connected shaft are removed or the flange radius is made accessible in connection with overhaul, repairs or when deemed necessary by the surveyor, the coupling bolts and flange radius are to be examined by means of an approved surface crack detection method.

- Checking and recording the bearing clearances;

- Verification that the propeller is free of damages which may cause the propeller to be out of balance;

- Verification of the satisfactory conditions of inboard and outboard seals during the re-installation of the shaft and propeller;

- Recording the bearing wear down measurements (after re-installation)

11.2.1.2 **METHOD 2**

.1 The following are to be verified and found satisfactory as a pre-requisite for application of Method 2:

- Review of service records;

- Review of test records of:

- Lubricating Oil analysis (for oil lubricated shafts), or

- Fresh water sample test (for closed system fresh water lubricated shafts);

- Oil sample examination (for oil lubricated shafts), or fresh water sample test (for closed system fresh water lubricated);

- Verification that there are no repairs by grinding or welding of shaft and/or propeller.

.2 The survey is to consist of:

- For keyed and keyless connections:

- Removing the propeller to expose the forward end of the taper;

- Performing a non-destructive examination (NDE) by an approved surface crack-detection Method all around the shaft in way of the forward portion of the taper section, including the keyway (if fitted).

- For flanged connection:

- Whenever the coupling bolts of any type of flange-connected shaft are removed or the flange radius is made accessible in connection with overhaul, repairs or when deemed necessary by the surveyor, the coupling bolts and flange radius are to be examined by means of an approved surface crack detection Method.

- Checking and recording the bearing wear down measurements;

- Visual Inspection of all accessible parts of the shafting system;

- Verification that the propeller is free of damages which may cause the propeller to be out of balance;

- Seal liner found to be or placed in a satisfactory condition;

- Verification of the satisfactory re-installation of the propeller including verification of satisfactory conditions of inboard and outboard seals.

11.2.1.3 **METHOD 3**

.1 The pre-requisites for application of Method 3, are the same as those given in 11.2.1.2.1

.2 The survey is to consist of

- Checking and recording the bearing wear down measurements;

- Visual Inspection of all accessible parts of the shafting system;

- Verification that the propeller is free of damage which may cause the propeller to be out of balance;

- Seal liner found to be or placed in a satisfactory condition;

- Verification of the satisfactory conditions of inboard and outboard seals.

11.2.2 Shaft Extension Surveys – Extension Types

11.2.2.1 *Extension up to 2.5 years*

.1 In addition to the pre-requisites listed in 11.2.1.2.1, the Chief Engineer is to confirm that the shafting arrangement is in good working condition, for extension up to 2.5 years to be applied.

.2 The survey is to consist of:

- Checking and recording the bearing wear down measurements, as far as practicable;

- Visual inspection of all accessible parts of the shafting system;

- Verification that the propeller is free of damages which may cause the propeller to be out of balance;

- Verification of the effectiveness of inboard seal and outboard seals.

11.2.2.2 *Extension up to 1 year*

.1 In addition to the pre-requisites listed in 11.2.2.1.1, the previous wear down and/ or clearance recordings are also to be reviewed, for extension up to 1 year to be applied.

.2 The survey is to consist of:

- Visual inspection of all accessible parts of the shafting system;

- Verification that the propeller is free of damage which may cause the propeller to be out of balance;

- Verification of the effectiveness of inboard seal and outboard seals.

11.2.2.3 *Extension up to 3 months*

.1 The pre-requisites listed in 11.2.2.2.1 above are to be verified and found satisfactory for extension up to 3 months to be applied.

.2 The survey is to consist of:

- Visual inspection of all accessible parts of the shafting system;

- Verification of the effectiveness of the inboard seal.

11.2.3 Methods for oil lubricated shafts and fresh water lubricated shafts (closed loop systems) and shaft survey intervals.

Details of the applicable methods for flanged propeller connection, keyless propeller connection and keyed propeller connection and survey intervals are listed in Table 11.2.3. The types of survey extensions applicable, are also listed in Table 11.2.3.

Table 11.2.3 : Survey Intervals (Closed Systems)

Oil Lubricated [Survey Notation SH (OL)]			
	Flanged Propeller Coupling	Keyless Propeller Coupling	Keyed Propeller Coupling[b]
Every five years[a]	Method 1 or Method 2 or Method 3	Method 1 or Method 2 or Method 3[c]	Method 1 or Method 2
Extension 2.5 Y	Yes[d]	Yes[d]	Yes[d]
Extension 1 Y	Yes[e]	Yes[e]	Yes[e]
Extension 3 M	Yes[f]	Yes[f]	Yes[f]
Fresh Water Lubricated [Survey Notation SH (FW-C)]			
	Flanged Propeller Coupling	Keyless Propeller Coupling	Keyed Propeller Coupling[b]
Every five years[a]	Method 1[g] or Method 2 or Method 3	Method 1[g] or Method 2 or Method 3	Method 1[g] or Method 2
Extension 2.5 Y	Yes[d]	Yes[d]	Yes[d]
Extension 1 Y	Yes[e]	Yes[e]	Yes[e]
Extension 3 M	Yes[f]	Yes[f]	Yes[f]

General Notes :

For surveys (Method 1, or Method 2, or Method 3) completed within 3 months before the shaft survey due date, the next period is to start from the shaft survey due date.

The extension survey is normally to be carried out within 1 month of the shaft survey due date and the extension counts from the shaft survey due date. If the extension survey is carried out more than 1 month prior to the shaft survey due date, then the period of extension counts from the date on which the extension survey was completed.

Methods 1, 2 & 3 are described in 11.2.1.1, 11.2.1.2 and 11.2.1.3 respectively. The pre-requisites for each Method are to be satisfactorily verified, prior surveys.

Survey methods 1, 2 and 3 would normally require drydocking of the vessel. Extension surveys may be carried out without dry-docking by in water surveys.

a) Unless an Extension type (Extension 2.5 Y, Extension 1 Y, Extension 3 M) is applied in between.

b) Method 3 is not allowed.

c) The maximum interval between two surveys carried out according to Method 1 or Method 2 is not to exceed 15 years, except in the case when one extension for no more than three months is granted.

d) No more than one extension can be granted. No further extension of other type can be granted.

e) No more than two consecutive “one year extensions” can be granted.In the event an additional extension is requested the requirements of the “2.5 years extension” are to be carried out and the shaft survey due date, prior to the previous extension(s), is extended for a maximum of 2.5 years.

f) No more than one “three months extension” can be granted. In the event an additional extension is requested, the requirements of “one year extension” or “2.5 years extension” are to be carried out and the shaft survey due date prior to the previous extension is to be extended for a maximum of one year or 2.5 years.

g) The maximum interval between two surveys carried out according to Method 1 is not to be more than 15 years. An extension for no more than three months can be granted.

11.3 Water Lubricated Shafts (Open Systems)

11.3.1 Shaft Survey Methods

11.3.1.1 **METHOD 4**

The survey is to consist of

- Drawing the shaft and examining the entire shaft (including liners, corrosion protection system and stress reducing features, where provided), inboard seal system and bearings.

- For keyed and keyless connections:

- removing the propeller to expose the forward end of the taper,
- performing a non-destructive examination (NDE) by an approved surface crack detection method all around the shaft in way of the forward portion of the taper section, including the keyway (if fitted). For shaft provided with liners the NDE is to be extended to the after edge of the liner

- For flanged connection:

- Whenever the coupling bolts of any type of flange-connected shaft are removed or the flange radius is made accessible in connection with overhaul, repairs or when deemed necessary by the surveyor, the coupling bolts and flange radius are to be examined by means of an approved surface crack detection method.

- Checking and recording the bearing clearances.

- Verification that the propeller is free of damage which may cause the propeller to be out of balance.

- Verification of the satisfactory conditions of inboard seal during re-installation of the shaft and propeller.

11.3.2 Shaft Extension Surveys – Extension Types

11.3.2.1 *Extension up to 1 year*

.1 Pre-requisites to be verified and found satisfactory in order to apply extension up to 1 year are as follows:

- Review of the previous clearance recordings;

- Service records;

- Verification that there are no repairs by grinding or welding of shaft and/or propeller;

- Confirmation from the Chief Engineer that the shafting arrangement is in good working condition.

.2 The survey is to consist of:

- Visual Inspection of all accessible parts of the shafting system;

- Verification that the propeller is free of damages which may cause the propeller to be out of balance;

- Checking and recording the clearances of bearing;

- Verification of the effectiveness of the inboard seal.

11.3.2.2 *Extension up to 3 months*

.1 The pre-requisites listed in 11.3.2.1.1 are to be satisfactorily verified, for extension up to 3 months to be applied.

.2 The survey is to consist of:

- Visual Inspection of all accessible parts of the shafting system;

- Verification that the propeller is free of damage which may cause the propeller to be out of balance;

- Verification of the effectiveness of the inboard seal.

11.3.3 Methods for water lubricated shafts (open loop systems) and shaft survey intervals, along with applicable details are given in Table 11.3.3.

11.3.3.1 For single shaft operating exclusively in fresh water, single shaft provided with adequate means of corrosion protection, corrosion resistant shafts and multiple shaft arrangements; survey intervals up to 5 years may be allowed. Applicable details along with maximum permissible survey intervals are given in Table 11.3.3.

11.3.3.2 Shaft arrangements, other than the configurations listed in 11.3.3.1, are to be surveyed according to Method 4, every 3 years. Applicable details along with maximum permissible survey intervals are also given in Table11.3.3.

Table 11.3.3 : Survey Intervals (Open Systems)

Single shaft operating exclusively in fresh water [Survey Notation SH (S-FW-O)] **Single shaft provided with adequate means of corrosion protection, single corrosion resistant shaft** [Survey Notation SH (S-CP-O)] **All kinds of multiple shaft configurations** [Survey Notation SH (M-O)]		**Other Shaft Configurations** [Survey Notation SH (S-O)]	
All kinds of propeller couplings[d]			
Every five years[a]	Method 4	Every three years[a]	Method 4
Extension 1 Y	Yes[b]	Extension 1 Y	Yes[b]
Extension 3 M	Yes[c]	Extension 3 M	Yes[c]

General Notes :

For surveys (Method 4) completed within 3 months before the shaft survey due date, the next period will start from the shaft survey due date.

The extension survey is to be normally carried out within 1 month of the shaft survey due date and the extension counts from the shaft survey due date. If the extension survey is carried out more than 1 month prior to the shaft survey due date, then the period of extension is to count from the date on which the extension survey was completed.

Method 4 is described in 11.3.1.1. The pre-requisites for the Method are to be satisfactorily verified, prior survey.

Survey method 4 would normally require dry docking of the vessel. Extension surveys may be carried out without dry-docking by in water surveys.

In case of multiple shaft configurations, if there is a failure to one shaft system, vessel is to be dry-docked for carrying out surveys of all shaft systems, and repairs as necessary.

Notes :

a) Unless an Extension type (Extension 1 Y, Extension 3 M) is applied in between.

b) No more than one extension can be granted. No further extension, of other type, can be granted.

c) No more than one extension can be granted. In the event an additional extension is requested the requirements of the one year extension are to be carried out and the shaft survey due date prior to the previous extension is to be extended for a maximum of one year.

d) For keyless propeller connections the maximum interval between two consecutive dismantling and verifications of the shaft cone by means of non-destructive examination (NDE) is not to exceed 15 years.

11.4 Steerable and azimuth thrusters

The survey is to normally comprise of examination of the following:

a) Exposed parts including attachment to the hull.

b) The following items upon removal of propeller:

- propeller shaft threaded end and nut;
- cone, key and keyway including examination by an efficient crack detection method of fore part of the shaft cone;
- sealing glands.

c) Lubricating oil analysis (to include wear particle analysis) records to detect possible wear of internal gears and bearings.

d) Internal gears and control gears as far as practicable through hand holes or limited opening of controlling device.

If the above checks are not satisfactory, complete dismantling of the internal parts may be required.

11.5 Vertical axis propellers

The survey is to normally comprise of examination of the following:

a) Exposed parts.

b) Tightness of the oil glands and the backlash of the gears from outside by action on the blades.

c) Gears, as far as practicable through hand holes and observation ports.

d) Control gear for proper functioning.

e) Lubricating oil analysis (to include wear particle analysis) records to detect possible wear of internal gears and bearings.

If the above checks are not satisfactory, complete dismantling of the internal parts may be required.

11.6 Water jet systems

The survey is to normally comprise of examination of the following:

a) Impeller, shaft and bearing clearances.

b) Sealing glands.

c) Nozzle assembly.

d) Control and reversing gear.

e) Suction grids.

If the above checks are not satisfactory further dismantling may be required.

11.7 Controllable pitch propellers

Where controllable pitch propellers are fitted, in addition to the survey requirements of the shafts, the working parts and control gear are to be opened up sufficiently to enable Surveyors to examine them at each shaft survey. The survey is to include the following:

a) Analysis of hydraulic oil including wear particle analysis.

b) Propeller blades and hub including crack detection of blade root, flange and blade securing arrangements.

c) Examination of seals, carrier bearings, crank pin ring, fillets, blade openings in the boss and blade bolts, upon removal of at least one blade.

d) Examination of distribution box seal and bearings.

e) Verification upon re-assembly of, servomechanism and hydraulic test of hub and hydraulic piping including pitch controls together with limit stops.

Section 12

Surveys of Inert Gas Systems

12.1 General

12.1.1 Inert gas systems installed on board ships intended for the carriage of oil or liquid chemicals in bulk or liquefied gases are to be surveyed periodically as detailed in Sec.1 of this Chapter.

12.2 Annual surveys

12.2.1 Following are to be examined at each Annual Survey:

a) external examination of the condition of all piping and components for signs of corrosion or gas/effluent leakage.

b) verification of the proper operation of both inert gas blowers.

c) checking the operation of scrubber room ventilation system.

d) checking of deck water seal for automatic filling and draining and checking for the presence of water carry over and checking the condition of non-return valve.

e) examination of the operation of all remotely or automatically operated valves and, in particular, the flue gas isolating valve(s).

f) checking the interlocking feature of soot blowers.

g) checking that the gas pressure regulation valve automatically closes when the inert gas blowers are secured.

h) checking as far as practicable, the following alarms and safety devices of the inert gas systems using simulated conditions where necessary:

- high oxygen content of gas in the inert gas main;
- low gas pressure in the inert gas main;
- low pressure in the supply to the deck water seal;
- high temperature of gas in the inert gas main;
- low water pressure to the scrubber;
- accuracy of portable and fixed oxygen measuring equipment by means of calibration gas;
- high water level in scrubber;
- failure of the inert gas blowers;
- failure of the power supply to the automatic control system for the gas regulating valve and to the instrumentation for continuous indication and permanent recording of pressure and oxygen content in the inert gas main;
- high pressure of gas in the inert gas main.
- Surveys carried out by the National Authority of the country in which the ship is registered would normally be accepted as meeting these requirements, at the discretion of the Surveyor.

12.2.2 Checking when practicable, the proper operation of the inert gas system on completion of the checks listed in 12.2.1 h).

12.3 Special surveys

12.3.1 At each Special Survey of the inert gas system, the inert gas generator, scrubber and blower are to be opened out as considered necessary and examined. Gas distribution lines and shut off valves, including soot blower interlocking devices are to be examined as considered necessary. The deck seal and non-return valve is to be examined. Cooling water systems including the effluent piping and overboard discharge from scrubbers are to be examined. All automatic shut down devices and alarms are to be tested. The complete installation is to be tested under working conditions on completion of Survey.

12.3.2 When, at the request of an Owner, it has been agreed by IRS that Complete Survey of the inert gas system may be carried out on the continuous basis, the various items of the system are to be opened up for survey in rotation, so far as practicable, to ensure that the interval between consecutive examinations of each item will not exceed five years. In general one-fifth of the machinery is to be examined each year.

12.3.3 If any examination during Continuous Survey reveals defects, further parts are to be opened up and examined as considered necessary by the Surveyor, and the defects are to be made good to his satisfaction.

Section 13

Surveys of Vessels with Refrigerated Cargo Installations

13.1 General

13.1.1 Refrigerated Cargo Installation, on ships which have been assigned the character HY, are to be surveyed periodically as indicated in Sec.1 of this Chapter.

13.1.2 Where a Refrigerated Cargo Installation holds dual classification with IRS, additional Periodical Survey requirements, if any, of the corresponding Society would also be applicable.

13.2 Periodical surveys

13.2.1 A Special Survey is to be held at 5 yearly intervals. When due to special circumstances a Special Survey is commenced prior to its due date, the Survey is to be completed within a period not exceeding 9 months and not later than the expiry date of the classification certificate including any postponement that may be granted by IRS.

13.2.2 If a vessel at the time classification certificate expires is not in a port in which it is to be surveyed, IRS may upon Owners request extend the validity of the classification certificate for a period not exceeding 3 months. Such requests will only be considered to enable the vessel to complete its voyage to the port of survey and only in cases where it is considered proper and reasonable to do so.

13.3 Continuous special survey of refrigerating installation

13.3.1 At the request of the Owners and upon receipt of a satisfactory proposed arrangement, IRS may give consideration to a

system of Continuous Survey of refrigerating installation (CS HY) being carried out whereby the requirements of Special Surveys as detailed in 13.5 and 13.6 are completed within a 5 year period. In such case the various items of machinery should be opened out for Survey in rotation, so far as practicable, to ensure that the interval between consecutive examination of each item does not exceed five years and it is expected that approximately an equal proportion of the surveyable items would be subjected to Survey each year.

13.3.2 In case any defects are revealed during these examinations, further parts may have to be opened up as considered necessary by the Surveyor.

13.4 Annual survey requirements

13.4.1 Log Books or other records are to be examined to ascertain that the installation has been working satisfactorily. Any indications of breakdowns or defects, during the previous 12 months, are to be noted and reported. Whenever possible, an examination of the refrigerating plant is to be made upon arrival of the ship at the port of discharge before refrigerated cargo is unloaded.

13.4.2 Refrigerated chambers/holds are to be examined after careful cleaning. A detailed examination is to be made of these spaces. For this purpose, removable panels and covers are to be removed and if appropriate, spot checks of the insulation are to be carried out for condition and shrinkage. If there is trace of damp or leakage of the insulation from whatever source (fuel tank, pipe work, pipe coils, scuppers, etc.) or any trace of deterioration in the insulation or its lining, of the air ducts or air coolers, a more thorough examination is to be made and necessary measures taken to correct the defects thus ascertained.

13.4.3 Where the cargo is refrigerated by circulating air, the proper air tightness of the air ducts, air cooler casings, hatch covers, doors, butterfly dampers in ventilation ducts is to be checked. The insulation of the lining joints should also be carefully checked.

13.4.4 The bilges are to be cleaned and suction pipes, sounding pipes and scupper non-return valves examined. The Surveyor should satisfy himself that all scuppers draining the chambers and cooler trays are in good working order.

13.4.5 Air cooler coils, cooling grids and valves are to be examined and the Surveyor should satisfy himself that no pipe is partially or completely choked and that the valves are in good working order.

13.4.6 Brine coils are to be examined whilst under a pressure of 1.5 times working pressure or 3 bar whichever is greater.

13.4.7 Primary refrigerant cooler coils and grids are to be examined whilst under the refrigerant pressure prevailing in the system at the time of the Survey with the plant at rest and the regulating valves opened just sufficient to obtain an approximate balance of pressure throughout the system and to avoid accumulation of liquid in the coils or grids.

13.4.8 The shells of condensers, evaporators, separators, receivers, and other pressure vessels are to be examined as far as practicable. Any evidence of excessive corrosion of water end covers of "shell and tube" and "double-pipe" type condensers is to be investigated.

13.4.9 Primary refrigerant gas and liquid pipes, condenser cooling water piping and valves are to be examined as far as possible.

13.4.10 Any evidence of dampness or deterioration of the insulation which could lead to external corrosion of the vessels or other parts mentioned, is to be investigated and necessary measures are to be taken to correct the defects thus ascertained.

13.4.11 A general examination is to be made of the fans, their motors, control gear and the insulation resistance is to be measured. The insulation resistance is not to be less than 100,000 ohms. The generating plant supplying electric power is to be examined generally with a view to ascertaining that the plant is being efficiently maintained.

13.4.12 The thermometers for measuring the chamber air suction and air delivery temperatures are to be examined. If repairs and renewals are carried out, the thermometers are afterwards to be checked for accuracy.

13.4.13 A Survey book or other permanent record is to be kept on board the ship to show the date of examination of various parts. This is to be available to the Surveyor at all times and is to be signed by the Surveyor on each occasion after the Survey.

13.5 Requirements of first special survey

13.5.1 Each reciprocating compressor, including those provided for sub- cooling the primary refrigerant, is to be opened up. Cylinder bores, pistons, piston rods, connecting rods, valves and seats, glands, relief devices, suction filters and lubricating arrangements are to be examined. Crankshafts are to be examined, but crankcase glands and the lower halves of main bearings need not be exposed if the Surveyor is satisfied as to alignment and wear.

13.5.2 For screw-type compressors, the period before opening up may be extended to 6 years or 25000 running hours, whichever is the earlier.

13.5.3 Where there is a programme of replacement instead of Surveys on board, alternative Survey arrangements will be considered. Each case will be given individual consideration.

13.5.4 Refrigerant condenser cooling water pumps, including standby pump(s) which may be used on other services, are to be opened up and their working parts exposed.

13.5.5 Brine and primary refrigerant pumps are to be opened up and their working parts exposed. Special consideration will be given to Survey requirements for primary refrigerant pumps of the hermetically sealed type.

13.5.6 The water end covers of "shell and tube" and "double-pipe" type condensers are to be removed for examination of the tubes, tube plates and covers.

13.5.7 The shells and connections of "shell-and-tube" and "double-pipe" type condensers and evaporators, separators, receivers, driers, filters and other pressure vessels, and the coil terminals of "coil-in-casing" type condensers and evaporators, are to be examined as far as practicable.

13.5.8 In the case of pressure vessels covered by insulation, any evidence of dampness or deterioration of the insulation which could lead to external corrosion of the vessels or their connections is to be investigated.

13.5.9 Sufficient insulation is to be stripped from insulated pressure vessels to allow the condition of the vessels and their connections to be ascertained. Care is to be taken that in replacement of the insulation, the vapour sealing of the outer covering is made good.

13.5.10 Sufficient insulation is to be stripped from pipes carrying the refrigerant at various points of the system both outside and inside the insulated chambers to permit the condition of the pipes to be ascertained. Sections of piping exposed are to include locations where lengths of piping have been connected by screwed couplings or butt welding. Care is to be taken that when ungalvanized portions of the piping in way of joints have been exposed they be suitably coated and taped, after pressure testing, to prevent corrosion. On replacement of the insulation, the vapour sealing of the outer covering is to be made good.

13.5.11 The Surveyor is to satisfy himself that all pressure relief valves and/or safety discs throughout the refrigerating plant are in good order. However, no attempt is to be made to test primary refrigerant pressure relief valves on board ship.

13.5.12 Sea connections to refrigerant condensers cooling water pumps are to be opened up on the occasion of the hull and/or main machinery Special Survey.

13.5.13 The electric motors driving refrigerant compressors, pumps and fans, together with their control gear and cables, are to have their insulation resistance tested and this is to be not less than100000 ohms between all insulated circuits and earth. The installation may be subdivided to any desired extent by opening switches, removing fuses or disconnecting appliances for the purpose of this test.

13.5.14 The fittings on switchboards and Section boards are to be examined, and over-current protective devices and fuses are to be inspected to verify that they provide suitable protection for their respective circuits.

13.5.15 Any arrangements fitted to disconnect automatically the excess non- essential load when the electrical generators are overloaded are to be examined to ascertain that the circuits for cargo refrigerating machinery are included in the last group to be disconnected.

13.5.16 All automatic controls and alarms are to be tested.

13.5.17 Sufficient air trunking and insulation lining is to be stripped from the chamber's overhead and vertical surfaces to allow the condition of the insulation, insulation linings, grounds, supports, hangers and fixtures which support the insulation, grids, meat rails, etc., to be ascertained. Care is to be taken that on replacement the ducts and linings are sealed against air blowing into the insulation, or against moisture ingress from refrigerated cell or space atmosphere.

13.5.18 Sufficient tank top insulation is to be stripped to allow the condition of the grounds and inner insulation lining to be ascertained.

13.5.19 Due consideration is to be given to the type of insulation used in the holds and chambers when determining the amount of insulation lining to be removed as detailed in 13.5.17 and 13.5.18. Where organic foam insulants have been used, including foamed "in situ", or other insulants in slab form, the Surveyor should use his discretion regarding the removal of linings if he is able to satisfy himself that the condition of the insulation is good by means of test bore holes.

13.5.20 Under normal circumstances, the condition of hold and chamber insulation, grounds, etc., can be ascertained when the Special Survey of the ship's steel structure is being held.

13.5.21 Arrangements made for defrosting air coolers, and for draining condensate from trays below coolers, are to be examined to ascertain that they are in working order.

13.5.22 Any air refreshing arrangements are to be examined.

13.6 Subsequent special surveys

13.6.1 In addition to the requirements for first Special Survey the following items, as mentioned in Table 13.6.1, are to be tested and examined.

13.7 Loading port surveys

13.7.1 Where the Owner or his authorised representative requests for a Loading Port Survey, a Survey as detailed below is to be carried out at the Loading Port.

13.7.2 In the case of ships engaged on voyages of less than two months duration, a loading port certificate will be considered as valid for two months, provided the cargoes carried are of such a nature as not to damage the insulation or appliances in the insulated chambers, nor to affect by taint or mould the refrigerated cargoes loaded during that period.

13.7.3 If a vessel loads at more than one port, Loading Port Survey at the first Loading Port would only be required provided all the chambers which are intended to be loaded with refrigerated cargo during the voyage are offered for examination and no general cargo is subsequently loaded in these chambers prior to loading of refrigerated cargo.

13.7.4 The refrigerated cargo spaces are to be examined in an empty state prior to loading the cargo. The Surveyor is to satisfy himself that the spaces are clean and free from odour which may adversely affect the cargo to be loaded. The brine or other refrigerant pipe grids, cooler coils and connections should show no trace of leakage. The Surveyor should also satisfy himself that the fixed cargo battens on the vertical surfaces are in good order, that cargo gratings or dunnage battens are provided for the floors or decks and that no damage has been sustained to the insulation or its lining prior to the loading of the refrigerated cargo.

13.7.5 Any indication of defective insulation not considered to warrant immediate attention should be noted and specially reported.

13.7.6 The scuppers and bilges in the refrigerated cargo spaces are to be clean and dry and the liquid seals should be primed.

13.7.7 The Surveyor will check whether the entire refrigerated cargo installation operates satisfactorily and he will record the temperatures in the cargo spaces.

13.7.8 The proper operation of air duct couplings for connecting refrigerated containers on the ship's own refrigerating installation has to be checked. If refrigerated containers are coupled to the air ducts during the on board Survey, the tight sealing effect of the couplings is also to be checked.

13.7.9 It is to be clearly understood that the certificate issued for the carrying out of a Loading Port Survey is not in respect of the cargo to be loaded or the manner in which it is to be stowed.

Table 13.6.1 : The requirements of special surveys			
Item	**Dichlorodifluoro-methane (R12)**	**Ammonia (NH_3) or Monochlorodifluoro-methane R22)**	**Carbondioxide (CO_2)**
"Shell and tube" type gas condensers or gas evaporators (brine coolers) (primary refrigerant in the shell)	7 bar	14 bar	-
	Water or brine end covers to be removed and shell pneumatically tested with the refrigerant or air or a mixture of inert gas and refrigerant to the above pressures		
"Coil in casing" type gas condensers	17 bar	70 bar	140 bar
	Where it is impracticable to remove the coils they may be examined and tested in place		
"Coil in casing" type gas evaporators (brine coolers)	14 bar	35 bar	105 bar
	Where it is impracticable to remove the coils they may be examined and tested in place		
Primary refrigerant chamber grids or air cooler coils	7 bar	10 bar	70 bar
"Shell and tube" type gas evaporators (brine coolers) (brine is in the shell)	Primary refrigerant end covers are to be removed and tested		
	Shell to be hydraulically tested to twice the design pressure but not less than 3 bar		

Section 14

Planned Maintenance System

14.1 General

14.1.1 An approved Planned Maintenance System on board a ship may be accepted in lieu of the regular surveys by IRS Surveyors on CSM basis provided the requirements of this section are complied with.

Any item not covered by PMS is to be surveyed and credited in the usual way. In general the intervals for PMS is not to exceed those specified for CSM survey. However, for components where the maintenance is based on running hours longer intervals may be accepted as long as the intervals are based on the manufacturer's recommendations. PMS is to be programmed and maintained by a computerised system.

14.1.2 A vessel complying with the requirements of section will be assigned the PMS survey notation.

14.1.3 The survey system (PMS) is to be approved by IRS before being implemented. When the system is implemented machinery inspection may be based on calendar or running hours calling for items to be opened for inspection and overhaul at specified periods.

14.1.4 Other items of machinery and components, which are not subjected to an approved condition monitoring system and part of PMS are required to be surveyed at intervals not greater than those specified for CSM.

14.1.5 Chief Engineer of the vessel will be responsible and in-charge of PMS and is to be approved by IRS as per Pt.1, Ch.2, 1.4.3.

14.1.6 The survey of machinery and components (defined at 14.2) & covered by the PMS may be carried out by the Chief Engineer. Survey of machinery and components defined in 14.3 is not eligible to be surveyed by the Chief Engineer.

14.1.7 At the time of the Annual Classification Survey an audit of the planned maintenance system will be carried out to ensure that the

system is being correctly operated in accordance with the conditions of approval.

14.1.8 When the annual audit is held, a confirmatory survey will be carried out for those items to be credited which have been examined by the Chief Engineer under the planned maintenance system during the preceding year.

14.2 Machinery acceptable for survey by Chief Engineers under Planned Maintenance System

14.2.1 The following machinery may be surveyed by the Chief Engineer under PMS:

- Main engine cylinder covers.
- Main engine valves and valve gears.
- Main engine cylinder liners.
- Main engine pistons and piston rods.
- Main engine connecting rods, crossheads, top end bearings, guides, gudgeon pins and bushes.
- Main engine crankshafts and bearings (multiple engine installations only).
- Main engine fuel injection pumps and fuel booster pumps.
- M.E. Scavenge pumps, blowers and air coolers.
- Main engine detuners, dampers and balancer units.
- Main engine camshaft and camshaft drive.
- Main propulsion steam turbines (casing, rotor and blading) at alternate surveys provided the monitoring is provided and vibration measurements and full power trials are carried out at the time of the survey in the presence of a Surveyor.
- M.E. driven pumps, e.g. bilge, lubricating oil, cooling water.
- Independently driven pumps and associated motors and cables where insulation resistance readings are supplied e.g. bilge, ballast, fresh water cooling, sea water cooling, lubricating oil, oil fuel transfer.
- M.E. fresh water and lubricating oil coolers.
- Low pressure heaters used in fuel oil systems of internal combustion engines
- Main and auxiliary condensers/drain coolers.
- Air compressors including their safety devices.
- Windlass and windlass machinery.
- Forced or induced draught fans.
- Auxiliary oil and steam engines including their coolers and pumps (provided the number of generating sets is such that all services essential to the propulsion and safety of the ship, also the preservation of refrigerated cargo, can be supplied when any two sets are not working. One of these sets can be overhauled while the other remains as "stand-by").
- Intermediate shafts.
- Main engine thrust bearing.

  Note : In cases where torsional vibration characteristics indicate that there is no susceptibility to damage as a result of uneven firing and condition monitoring equipment is installed, a special arrangement may be granted whereby the Chief Engineer is permitted to survey the main engine crankshafts and bearings on single engine installations provided a modified confirmatory survey is carried out by IRS Surveyors at the time of the annual audit as follows:

  - Check condition-monitoring records.
  - Check bearing clearances where possible.
  - Check for signs of wiped or broken white metal in crankcase.
  - Check witness marks of shrink fits.

- Check bed plate structure inside and outside.
- Obtain Chief Engineer's statements regarding crankpins, journals and bearings.

Ships fitted with Approved Inert Gas Systems

- Scrubber units
- Blowers
- Independent gas generators.

14.3 Machinery not acceptable for Survey by Chief Engineers

- Main engine crankshaft and bearings in single engine installations where special requirements in 14.2.1 are not complied with
- Reduction/increase gearing, flexible coup-lings and clutches.
- Holding down bolts and chocks
- Crankcase doors, crankcase and scavenge relief devices
- Boilers and all other pressure vessels
- Boiler fuel oil heaters
- Steam pipes and starting air pipes
- Maneuvering valves and bulkhead stop valves
- Steering machinery

- Pumping arrangements for Bilge/Ballast/ Fuel Oil/Fresh Water/Sea water/Lub.Oil/ Fire
- Electrical equipment other than that defined in 14.2.1
- Propellers
- Screwshafts
- Sea connections
- M.E. controls, bridge, centralised or automatic and controls in unmanned machinery spaces
- Engine trial
- First start arrangements trial.

Ships fitted with Approved Inert Gas Systems

- All other I.G. system components not listed in 14.2.1.

14.4 System Administration

14.4.1 The Owner is to make a formal request to IRS providing the documentation and information detailed in 14.4.2 below for approval of the system.

14.4.2 The documentation and information to be submitted is to include the following:

a) A description of the system and its application onboard and organizational interface identifying the areas of responsibility ashore and the people responsible for the PMS onboard.

b) The list of items of machinery, equipment and components to be considered for inclusion in the PMS. The list is to be same in terms of description and identification with the identification system adopted by IRS.

c) Time schedules and scope of the maintenance procedures for each item listed in b), including acceptable limit conditions of the parameters to be monitored on items of opened up machinery, based on the manufacturer's recommendations or recognized standards. These are to be laid down in appropriate PMS sheets.

d) The documentation flow and filing procedure.

   This is to include a system for reporting to Owners, records to be maintained onboard and at Owner’s head quarters.

e) A list of all personnel likely to be in-charge of the PMS system.

14.4.3 Computerized system requirement

14.4.3.1 The access to and updating the maintenance documentation and the maintenance program is to be permitted by the Chief Engineer or other authorized person only.

14.4.3.2 The system is to be suitably protected by suitable password access w.r.t. alterations to maintenance schedules, list of items under PMS and noting of damages.

14.4.3.3 The computerized system is to include a backup procedure, which is activated at regular intervals.

14.4.3.4 The functional applications of these computerized systems are to be approved by IRS.

14.4.4 Information to be available onboard.

a) All the documentation listed in 14.4.2, duly updated.

b) Maintenance instructions for each machinery, as applicable (supplied by the manufacturer or the shipyard).

c) Reference documentation (trend investi-gation procedures etc.).

d) The records of the maintenance performed, including conditions found, repairs and renewals carried out.

14.5 System Implementation

14.5.1 After the PMS documentation has been approved, an Implementation survey is to be carried out by IRS Surveyors.

14.5.2 Upon successful completion of the Implementation Survey, the PMS is considered approved and the survey notation PMS is assigned to the vessel and entered in the Register of Ships.

14.5.3 The PMS is retained throughout the class period of the vessel provided that :

a) An annual report covering the year’s service is submitted to IRS detailing the list of items of machinery and components which were subjected to preventive

maintenance in the period under review, together with preventive maintenance sheets and any changes to PMS documentation.

b) An annual audit of the PMS is carried out.

c) Any change to the PMS is submitted to IRS for approval.

14.5.4 The survey agreement for machinery according to PMS will be withdrawn by IRS if the PMS is not satisfactorily operated in terms of improperly maintained records or unsatisfactory condition of machinery or failure to observe the agreed intervals between overhauls.

14.5.5 The Owner may discontinue the PMS at any time by informing IRS in writing. In such a case the items that have been inspected under the PMS since last annual audit may be credited for IRS records at the discretion of the attending surveyor carrying out confirmatory surveys.

14.5.6 In case of change of management of the ship or transfer of class approval is to be reconsidered.

14.6 System Surveys

14.6.1 **Implementation Survey** is to be carried out by an IRS Surveyor within one year from the date of the documentation approval. The scope of this survey is to verify that :

a) The PMS is implemented as per the approved documentation and is suitable to the type and complexity of machinery and systems onboard.

b) The documentation required for the annual audit is available and the adopted system is able to produce such a report.

c) The requirements of surveys and testing for continuing the class status are complied with.

d) The shipboard personnel are familiar with the PMS procedures including documentation.

14.6.2 **Annual Audit** is to be carried out once the PMS is implemented and approved, to verify the continued compliance with the documented PMS. The annual audit is carried out in conjunction with the annual class surveys. The scope of the audit is to be as given in the following :

a) The Surveyor is to verify that the PMS is correctly operated and that all items (due for survey in the relevant period) have actually been surveyed in due time.

b) The Surveyor is to verify that the machinery has been functioning satisfactorily upon review of the maintenance and performance records since the previous survey or audit and where needed necessary measures have been taken in response to machinery operating parameters exceeding acceptable limits and that the overhaul intervals have been observed.

c) A report detailing overhaul/repairs carried out and spare parts used on items in the list of surveyable items is to be presented by the Chief Engineer. Any machinery part or component, which has been replaced by a spare due to damage, is to be retained onboard and submitted to the attending surveyor's examination.

d) The attending surveyor after verification of records on board for the identification details of the Chief Engineers who have undertaken the maintenance activity and prepared the reports given in c), for compliance with the approved PMS, and upon satisfactory general examination and confirmatory surveys will credit the items for survey.

e) Written reports of break down or malfunction are to be made available.

f) If the surveyor is not satisfied with results of the PMS i.e. with degree of accuracy as regards the maintenance records and/or the general condition of the machinery, a report will be forwarded to IRS recommending that the special arrangements dealing with machinery surveys be suspended.

g) Upon satisfactory completion of the annual audit the surveyor confirms the validity of the PMS by crediting the PMS Annual audit.

14.7 Damage and repairs

14.7.1 Damage to components or items of machinery covered by the PMS which may

affect the class is to be reported to IRS immediately. A surveyor will attend on board, survey the damage and on the basis of the survey results decide whether condition of class is to be recommended.

14.7.2 All parts of machinery or components, which need to undergo substantial repairs, are to be surveyed by IRS before, during and after the repairs, as deemed appropriate by the attending surveyor.

14.7.3 In the case of outstanding conditions of class or records of unrepaired damage, which may affect the PMS, the relevant items are to be taken out of the PMS until the conditions of class are dealt with or the repairs are carried out.

Section 15

Surveys - Vapour Control Systems

15.1 For tankers and combination carriers with notations VCS1 and VCS2

15.1.1 Annual Surveys

At each annual survey, the vapour emission control system is to be generally examined for ensuring its satisfactory condition. The survey is also to include:

a) Components and piping

External examination of all components and piping, including isolating / relief valves, means of collecting and draining condensate, means for separation of vapours from non-compatible cargoes and electrical continuity / bonding arrangements.

b) Manifold isolating valve

Confirmation of the proper operation of the vapour manifold isolating valve, including manual operation.

c) Vapour connection flanges

Confirmation of the continuing effectiveness of the “lug and hole” construction of the vapour connection flange(s), or other approved means of preventing misconnection of the loading hose to the vapour collection system.

d) Hoses

Confirmation that any hose used for the conveyance of vapour are in accordance with section 2.1.2 of Pt.5, Ch.29.

e) Inert gas piping

Where inert gas distribution piping is used for vapour collection, confirmation of the continuing effectiveness of the inert gas main isolating valve(s).

f) Cargo gauging system

Correct operation of the closed cargo gauging system for each tank, which is connected to the vapour collection system. Where portable gauging devices are used, the number of devices available are to be equal to the number of tanks that can be simultaneously loaded plus two (2) additional units.

g) Cargo tank venting system

Examination of the cargo tank venting system, including flame screens, where fitted.

h) Alarms and safety devices

Verification of the satisfactory operation of the following alarms and safety devices using simulated conditions, where necessary.

- High vapour pressure in main vapour collection line(s) (not required for tank barges).
- Low vapour pressure in main vapour collection line(s) (not required for tank barges).
- Cargo tank high liquid level.
- Cargo tank overfill (high-high liquid level), where fitted.
- Loss of power to alarm system or, alternatively, failure of tank level sensor circuitry.

- Automatic shutdown system, where fitted.

i) Operation and maintenance records

Examination of the permanent records to verify the satisfactory operation and maintenance of the system. Consideration may be given by the Surveyor for crediting certain items whose satisfactory operation has been properly documented and recorded.

15.1.2 Special surveys

At each Special Survey – Machinery, the following items of the vapour emission control system are to be examined for ensuring its satisfactory condition; in addition to the requirements of annual survey in 15.1.1:

a) Valves

All valves, including cargo tank isolating valves, main vapour line cross-over valves (where fitted for vapour segregation), condensate drain valves, manifold isolating valves, pressure / vacuum relief valves and spill valves / rupture disks (where fitted as additional overfill control devices) are to be examined.

b) Gauging system

The closed gauging system, including portable gauging devices where applicable, is to be examined.

c) Alarms

The independent cargo tank overfill alarms, where fitted, are to be examined.

d) Hoses

Vapour collection system hoses are to be tested for electrical continuity or non-conductivity, as applicable.

e) Inert gas piping

Where inert gas distribution piping is used for vapour collection, deck seals or double block and bleed assemblies are to be examined.

15.2 For tankers and combination carriers with notations VCS1-B and VCS2-B

15.2.1 Annual surveys

At each annual survey, in addition to the requirements of 15.1.1, the following items of the vapour emission control system are to be examined for ensuring its satisfactory condition.

a) Detonation flame arrester

Confirmation that the detonation flame arrester (where fitted) is in satisfactory condition.

b) Vapour manifold

Confirmation that a means of electrical insulation (insulating flange or non-conductive hose, etc.) is provided for the vapour manifold connection.

c) Fixed oxygen analyzer

Confirmation of the accuracy of the fixed oxygen analyzer (required to be fitted within 3 [m] (10 feet) of the vessel's vapour manifold connection) by means of a calibration gas.

d) Vapour blowers / compressors

General examination of any devices (such as compressors or blowers) used to increase the vapour flow rate.

15.2.2 Special surveys

At each Special Survey – Machinery, in addition to the requirements of 15.1.2 and 15.2.1, the following items of the vapour emission control system are to be examined for ensuring its satisfactory condition:

a) Vapour Blowers / Compressors and detonation flame arresters

Vapour blowers / compressors and detonation flame arresters, where fitted, are to be examined, including isolating and relief valves, as applicable.

Section 16

Surveys of Thermal Oil Heating Systems

16.1 General

16.1.1 Thermal Oil Heating systems are to be surveyed at intervals specified in Sec.1, Table 1.1.1 of this Chapter.

16.1.2 At each Survey, the following components are to be examined as applicable.

- Oil fired thermal oil heater/s and Economiser/s are to be examined externally including the heat exchanger coils, insulation and fuel oil burning arrangement
- Circulating pumps
- Dump cooler
- Piping arrangement including control valves and insulation
- Expansion tank and temperature blocking pipe
- Alarms and safety devices
- Thermal oil (analysis results).

16.2 Oil fired thermal oil heater and Economiser

16.2.1 These are to be examined externally for condition of the insulation, cleanliness and their attachment to the ship's structure.

16.2.2 Heat exchanger coils are to be examined for any signs of overheating or corrosion and that they are in a state to ensure proper heat exchange.

16.2.3 Heat exchanger coils are to be subjected to a leakage test, at working pressure and with working fluid.

16.2.4 All mountings are to examined externally and internally, if considered necessary by the surveyor.

16.2.5 Fuel oil burning arrangements are to be examined for proper operation including operation of safety cut-outs.

16.3 Circulating pumps

16.3.1 Circulating pumps are to be examined externally and internally, if considered necessary by the surveyor. The pumps are to be examined for proper operation including automatic change over.

16.4 Dump cooler

16.4.1 Dump coolers are to be examined internally and externally including pressure relief devices.

16.5 Piping arrangement

16.5.1 Complete piping arrangement is to be externally examined including condition of insulation and tested for any leaks.

16.5.2 Pipe fittings and valves are to be examined externally and internally, if considered necessary by the surveyor.

16.6 Expansion tank

16.6.1 Expansion tank including associated save-alls is to be visually examined.

16.6.2 Arrangement to limit the temperature of thermal oil in the expansion tanks (in open vent systems) such as 'Temperature Blocking Pipe" are to be examined for proper operation.

16.6.3 De-aeration arrangement and vent is to be examined for proper operation.

16.7 Alarms and safety devices

16.7.1 Following alarms and safety devices are to be tested:

- Thermal oil high temperature alarm and safety cut out (both in Oil fired heater and Economiser)
- Minimum flow control device
- Minimum flow control alarm and safety cut out (both in Oil fired heater and Economiser)
- Flue gas high temperature alarm and safety cut out (both in Oil fired heater and Economiser)
- Thermal oil leakage alarm and safety cut out (both in Oil fired heater and Economiser)

- Expansion tank low level and low-low level alarm and safety cut out
- Fire Extinguishing arrangements.

16.8 Thermal oil analysis

16.8.1 Thermal oil is to be analysed at regular intervals – atleast annually.

16.8.2 The thermal oil shall be free from harmful contaminants and signs of oxidation or deterioration.

16.9 System operation test

16.9.1 On completion of survey the entire system is to be examined under working conditions with particular attention to signs of leakage and functioning of control and safety devices.

16.10 Repairs

16.10.1 Any defects to alarms and safety devices the proper operation of which may pose a fire risk are to be promptly repaired to the satisfaction of the surveyor.

16.10.2 When repairs or renewals are carried out to system parts or components, these are to be subjected to a pressure test to 1.5 times the working pressure, prior to putting them into service.

Section 17

Surveys of External Fire Fighting Systems

17.1 General

17.1.1 External Fire Fighting Systems on ships assigned with class notations **Agni 1, Agni 2** or **Agni 3** are to be surveyed at intervals specified in Sec. 1 Table 1.1.2 of this chapter.

17.2 Annual survey

17.2.1 The annual survey is to consist of general examination / verification of the items indicated in 17.2.2 to 17.2.7.

17.2.2 Hull

General examination of:

- Maneuvering arrangements including side thrusters and power management system, where fitted
- Floodlights.

17.2.3 Self Protection of the Vessel

Agni 1 :

- General examination and functional verification of fixed water-spraying system.

Agni 2 & Agni 3 :

- General examination of dead lights and external steel shutters
- General examination / functional verification of insulation / water spray system, where fitted.

17.2.4 Water monitors and controls

- General examination of water monitors and their securing arrangements
- Functional verification of water monitors
- General examination and functional verification of remote and local/manual controls.

Additional for Agni 3:

- General examination of foam monitors, foam concentrate tank and associated pumping and piping arrangements including their securing arrangements
- Condition of foam concentrate
- Functional test of the foam monitors
- General examination and functional verification of remote and local/manual controls.

17.2.5 Pumping and piping

- General examination of fire pumps and water spray pumps, associated piping from sea inlets to monitors and required instru-mentation.
- Examination and test of water spray piping over pressure preventing arrangement, where fire pumps also supply to water spray piping.
- Verification of arrangement for prevention of overheating of fire pumps at low delivery rates.

17.2.6 Portable fire fighting equipment

- General examination of hose stations and fire hydrants.
- Ensuring ready availability of hoses and nozzles for the hose stations and their condition.
- Examination of pressure reducing arrangement at hose stations.

Additional for Agni 2 & Agni 3:

- Examination of portable high expansion foam generator including condition of the foam forming liquid.

17.2.7 Fireman's Outfits

- Ensuring ready availability and condition of fireman's outfit including self contained breathing apparatus with spare air bottle.
- General examination of compressor for recharging air bottles.

17.3 Special survey

17.3.1 In addition to the requirements for annual survey the following need to be examined at each special survey.

17.3.2 Internal examination and testing of the following:

- Fire and water spray pumps
- Fire and water spray pump prime movers
- One section of fire and water spray piping to assess the condition of corrosion prevention measures
- Electrical equipment associated with the external fire fighting systems
- Foam tank to the extent possible.

Section 18

Surveys of Diving Support Vessels and Diving Systems

18.1 General Requirements for Diving Support Vessels

18.1.1 Requirements for initial surveys and classification pertaining to diving related interfaces and facilities in diving support vessels are indicated in Pt. 5, Ch. 26, Sec. 2.

18.1.2 All diving related interfaces and facilities are required to be maintained in conditions for which they are approved and installed.

18.1.3 Periodical surveys of the diving support vessel and diving systems may be carried out independent of each other.

18.1.4 Periodical survey requirements for diving facilities in diving support vessels are covered in 18.2 and 18.3.

18.2 Annual Surveys

18.2.1 Documentation that the Vessel meets the stability requirements of Class Notation 'STS' is to be verified.

18.2.2 Operational availability of position keeping capability i.e. Dynamic Positioning / Anchoring System is to be verified.

18.2.3 Communication system provided between position control station and dive control station is to be checked. Operational availability of manually operated alarm is to be confirmed.

18.2.4 Securing arrangements and supporting structure of the diving systems are to be examined for any deterioration/ damage.

18.2.5 Moon pool structure (if fitted), is to be examined as far as practicable for visible signs of damage/ deterioration.

18.2.6 It is to be confirmed that diving systems, if situated on open deck are

- located away from vicinity of ventilation outlet from machinery spaces and galley;
- not located in hazardous area zone 0, and
- no additions/ alterations to the system have been carried out.

18.2.7 It is to be verified that

- exhaust, venting and pressure relief gases from diving system are released away from source of ignition;

- no high pressure piping carrying mixed gas or oxygen is passing through the accommodation and machinery space of Category A, and is protected from mechanical damage.

18.2.8 It is to be confirmed that oxygen bottles are placed in separate storage room and ventilation system of room is effective.

18.2.9 Operational verification of oxygen sensor fitted in storage room for initiating audio- visual alarm in manned control station. Operational verification of sensor located in upper level and lower level of the room to confirm satisfactory alarm initiation.

18.2.10 Verification that the emergency source of power is located outside the machinery spaces and that this independent source of power is available for safe termination of diving operation in case of failure of main supply.

18.2.11 General examination of the visible parts of items forming structural fire protection, such as bulkheads, decks, doors and trunks with due attention being given to integrity of insulating materials.

18.2.12 General condition of fire protection system of outer area, self- closing doors on outer areas and the ventilation system for the outer areas is to be examined.

18.2.13 Satisfactory operation of fire detection and alarm system is to be confirmed by Surveyor. Verification of satisfactory functioning of repeater panel fitted in dive control and machinery control is to be carried out.

18.2.14 Verification that sufficient number of portable fire extinguishers are provided and fire-fighters outfit is provided for each person required for operation of diving system during fire.

18.2.15 Verification that control stations are provided with breathing apparatus for use during bell recovery or launching of hyperbaric evacuation unit and they are in satisfactory condition.

18.3 Special Surveys

18.3.1 In addition to the scope of annual surveys indicated above, the special survey of spaces containing the diving system is to include the following:

18.3.1.1 Verification that diving equipment/ divers are not directly exposed to any sea intake and such opening if any are protected by mesh or other structure.

18.3.1.2 Verification of accuracy of oxygen sensors by means of calibration gas, as far as practicable.

18.4 General requirements for diving systems

18.4.1 Survey requirements for diving systems permanently installed on diving support vessels, stand-alone diving systems and diving systems temporarily installed on diving support vessels are covered in the succeeding paragraphs.

18.4.2 Requirements for initial survey and classification of diving systems are laid down in Pt. 5, Ch. 26, Sec. 3.

18.4.3 The surveyor may require assistance of technically qualified personnel during surveys and repairs. Assistance may be required for the following:

- Life supports systems and monitoring equipment

- Hyperbaric Systems

- Electronic equipment and communication facilities

- Emergency operations after system malfunction due to following:

- Failure of components;
- Loss of breathing gas pressure;
- Loss of power; etc.

18.4.4 All diving equipment/ systems and hyperbaric facilities are required to be maintained in conditions for which they were approved and installed.

18.4.5 A log book is to be maintained by responsible personnel detailing the dive depths, dates and times, dive durations and other details. The log book is to contain maintenance records based on inspections and checks by the crew/ other specialized personnel. Inspection procedures and check lists are also to be part of the log book. The log book is to be available for verification by the Surveyor.

18.5 Annual Surveys

18.5.1 Annual Surveys of the hull, machinery and equipment are to be made within three months either way of anniversary date each year.

18.5.2 The Surveyor is to review the Operating and Maintenance Manuals, operational and maintenance records, log books including all recorded malfunctions or repairs carried out since the last survey. Summarized procedures for normal and emergency operations are to be verified on board. The Surveyor is to record the date of last use and the extent of use of the facilities since last survey.

The Annual Survey is to include surveys/ examination/ verification of the following, as applicable:

18.5.2.1 Pressure Equipment

.1 Pressure Vessels for Human Occupancy

- Structural integrity and corrosion status of chambers and bell are to be examined by internal and external survey. Special attention is to be paid to bilges (especially floor plating contact with shell), equipment locks, location of battery packs etc. for damage and possible corrosion. Examination with NDE may be carried out, as necessary. Condition of external anodes (if fitted) is to be reviewed;
- Shell penetrations are to be examined with special attention to hot water penetrations for sign of corrosion;
- External fairings are to be removed as far as practicable to provide better access to the entire surface of the pressure boundaries. Removal of protective coatings and insulation is not required unless deterioration or trace of rust or corrosion is evident or as otherwise required by the Surveyor for inspection or NDE;
- Careful examination of doors, safe locking mechanisms, appendages, attachments, framework, sealing surfaces, supporting structures for chambers and systems, bunk supports, insulation, paintwork; etc. Presence of safe locking mechanisms is to be checked on all hatches and function tested with the relevant chamber under pressure;
- The windows/ viewports are to be examined for de-colouration, possible deterioration, signs of damage, cracks or scratches; integrity of sealing arrangement and protective shield. Windows exceeding 10 years of age are normally to be replaced;
- Adequacy of over pressure-relief valve and alarm;
- Function testing of Built in Breathing Systems (BIBS) in chambers, bells and HES.

.2 Gas Storage & Pressure Vessels in Supply and Return Lines

- Provision of hazard warning signs, Colour coding, marking and stamping of testing date on cylinders and pressure vessels is to be verified;
- Structural integrity and corrosion status of gas containers and pressure vessels is to be inspected, with NDE, if necessary. Attachments and framework, supporting steelwork are to be examined for signs of corrosion;
- In the case of gas storage compartments, high/ low Oxygen alarms fitted external to the door and

in repeated position(s) are to be verified.

.3 Pumps and Compressors

- Verification that maintenance of equipment is being carried out in accordance with manufacturer's instructions;
- Quality of breathing air and gas to be verified by specialist/ competent agency;
- Verification of solenoid switches for auto-stopping facility of compressors on overheating.

.4 System components including piping, umbilicals, hoses, valves, filters etc.

- System cleanliness is to be examined by visual survey and checked for possible contamination;
- Verification of any possible chafing/ twisting of umbilicals and leaks in gas piping or in distribution boxes. Proof of pressure test of the system components by crew is to be verified.

18.5.2.2 Controls

.1 Gas Supply and Distribution

- System cleanliness to be examined by visual survey and checked for possible contamination by grease, oil, etc.;
- Function test of gas-regeneration units and Oxygen make-up system to be carried out;
- Arrangements for each diver's gas supply line are to be confirmed such that if one fails, the failure does not interfere with another diver's supply.

.2 Depth / Pressure Controls

- Calibration of internal gauges, external gauges, depth and life support system gauges is to be verified;
- Life support system gauges (which indicate pressure critical to life support functions) are to be examined for functionality.

.3 Temperature and Humidity Control

- Calibration evidence of all available instrumentation is to be examined;
- Functional tests of the following is to be carried out:
  - Heaters in chambers, bells and HES;
  - Cooling systems for divers (if fitted);
  - Environment conditioning units (by temperature monitoring);
  - Standby power supply to the heating/ cooling system to maintain operations for the period of diver recovery (in case of main power failure);

.4 Gas Contamination Analysis

- Verification of calibration of gas analyzers and arrangements for monitoring of Carbon dioxide, Oxygen, temperature, relative humidity in chamber;
- Primary and secondary means of Carbon dioxide scrubbing arrangements are to be examined with special attention to check that the secondary Carbon dioxide scrubbing arrangement provided is independent of any surface power supply and has minimum endurance of 24 [hrs];

.5 Domestic/ Sanitary Systems

- Internal inspection of sewage tanks;
- Functional test of toilet flush (special attention to safe working under pressure) and bilge drains in chambers (special attention to chamber shell under deck plating. Ultrasonic measurements may be carried out at the discretion of the Surveyor).

.6 Auxiliary Services to Life Support Equipment

- Main and emergency power supplies for following are to be examined/ tested;
  - Lighting of chambers and bell;
  - Monitoring devices;
  - Control consoles;

- Normal and emergency life support systems;
- Alarm systems including fire loops;
- DP alarms

- General condition of switchboards, breakers and cables including electrical hygiene, earth leakage detection systems and alarms is to be examined;

- Changeover from main to emergency supplies is to be tested.

18.5.2.3 Communication

.1 The listed alarms and record of their checks as part of their planned maintenance by crew is to be verified.

.2 Functional checks of the following are to be carried out:

- CCTV systems;
- sound powered telephone;
- recording instruments.

.3 Operational checks of primary and secondary means of communication are to be undertaken:

- between bridge and dive control station;
- dive control and
  - bells
  - chambers
  - divers in water
  - diving machinery areas
  - winch/ crane operator

.4 Ultrasound underwater telephones may be checked by simulation or during test dive.

18.5.2.4 Launch and Recovery Systems

.1 General

- Bell lifting arrangements, especially load bearing components are to be carefully examined, with NDE as required;

- Attachments and framework, supporting steelwork are to be examined for signs of corrosion, with NDE as necessary;

- General condition of wire rope and its ends is to be visually inspected. Lubrication records and records of exchange of ends are to be checked;

- Dynamic load test of system is to be carried out on main and emergency power supply. The alarm and safety functions are to be verified;

- Simulated power failure test of launch and recovery system in accordance with laid down procedures for emergency retrieval is to be performed in presence of Surveyor;

- Hydraulic power system during launch and recovery is to be examined for

  - unusually high vibration levels
  - oil leakage
  - pressure peaks and jerking

- Oil hygiene analysis is to be carried out, as necessary;

- Bell emergency release mechanism is to be tested.

.2 Controls

- The main electrical power supplies to the following are to be checked:

  - Monitoring devices
  - Alarm systems
  - Control consoles
  - Switchboards, breakers

- The correct operation of change-over from main to emergency supply is to be verified.

.3 Auxiliary Services to Launch and Recovery Systems

- Close examination of umbilical winch systems, including brake and carry out function tests;

- Examine condition of umbilical and safety provisions to stop umbilicals from jumping out of sheaves;

- Examine breathing apparatus provided for winch operator in case of fire related emergency, requiring bell recovery.

18.5.2.5 Safety Equipment

- The condition of A-60 insulation towards any enclosed spaces from the outer area of the diving system is to be examined;

- The alarms, safety limits and failure conditions of the fixed fire-fighting systems is to be verified;

- The quantity and efficacy of portable fire-extinguishers (as per approved plan), is to be verified.

18.6 Additional requirements for Third Annual Survey

18.6.1 In addition to the annual survey requirements stipulated in 18.5, the requirements indicated in the succeeding paragraphs are to be additionally undertaken at every third annual survey, as applicable:

18.6.1.1 Pressure Equipment

.1 Pressure Vessels for Human Occupancy

- Leak test of bell and chamber to Maximum Allowable Working Pressure (MAWP) with minimum 20% Helium. Leak test of pressure equipment is to be carried out at low and high pressures by increasing the pressure to the working pressure, stepwise. Leak test is to be carried out as per approved procedure, adopting appropriate safety precautions listed in the procedure. The procedure is to include an inspection for leaks at low pressure before increasing to MAWP. The test duration is to be minimum 6 [hrs].

.2 Gas Storage & Pressure Vessels in Supply and Return Lines

- Leak test of gas containers and pressure vessels to minimum 10% Helium. Precautions and test duration to be as per 18.6.1.1.1;

- Function test of valves on permanently installed gas bottles is to be undertaken.

Note: Leak tests are normally to be carried out with a minimum of 10% Helium, if the pressure vessel or piping is designed to hold Heliox mixtures or pure Helium. Due to the inherent fire risk with the use of air at high pressure, it is recommended that leak tests may be carried out incorporating Nitrogen, where applicable.

.3 Pumps and Compressors

- Running condition test of pumps and compressors is to be carried out;

- Safety valves are to be examined/ tested as per manufacturer's instructions.

.4 System components including piping, umbilicals, hoses, valves, filters etc.

- Leak test of pipe work to MAWP with minimum 10% Helium;

- Manual/ automatic control valves are to be randomly tested and recorded ;

- Examine and function test the main bell umbilical to MAWP of hoses.

18.6.1.2 Controls

.1 Gas Supply and Distribution

- Life support systems including pipe work and reclaim units are to be examined and tested.

.2 Depth/ Pressure Control

- As per scope of Annual Survey

.3 Temperature and Humidity Control

- As per scope of Annual Survey

.4 Gas Contamination Analysis

- As per scope of Annual Survey

.5 Domestic/ Sanitary Systems

- As per scope of Annual Survey

.6 Auxiliary Services to Life Support Equipment

- As per scope of Annual Survey

18.6.1.3 Communication

- Scope of annual survey is to be applied for primary, secondary and emergency means of communication;

- Listed alarms and record of their checks/ routine tests as part of planned maintenance system by crew are to be verified, as applicable;

- At least the following alarms, if fitted, are to be function tested:

    - High/ low pressure alarm – chamber
    - Temperature alarm – chamber
    - Humidity alarm – chamber
    - Divers hot water temperature alarm
    - Divers hot water pressure alarm
    - High pressure alarm – gas delivery compressor
    - Low pressure alarm – compressor cooling system
    - Low pressure lub.oil alarm – compressor
    - High level alarm for gas reclaim bag
    - High/low alarm – Oxygen analyzers
    - Oxygen sensors/ detectors in control stations

18.6.1.4 Launch and Recovery Systems

.1 General

(a) For submergence launch and recovery system:

- The working weight of the bell is to be determined, compared with previous weight and recorded;

- The following alarms for hydraulic systems for bell launch and recovery are to be tested:

    - Low pressure alarm
    - High temperature alarm
    - Low oil level in tank alarm

.2 Controls

- The power failure alarms for controls of launch and recovery systems, including (for hydraulic system) are to be tested:

    - Low pressure alarm
    - High temperature alarm
    - Low oil in tank alarm

- All alarms are to be function tested.

18.6.1.5 Safety Equipment

- The fire detection and alarm system is to be tested;

- One portable extinguisher at random, is to be function tested;

- Blow through with air of water based fixed extinguishing system is to be carried out to clear the lines;

- Records of last inspection of the fixed extinguishing system are to be reviewed by the Surveyor.

18.7 Special Surveys

18.7.1 Scope

18.7.1.1 Special surveys are to be carried out at 5 yearly intervals before the anniversary date. In addition to the requirements of the third annual survey, the scope of special survey is to be as described in 18.7.2 to 18.7.7.

18.7.2 Pressure Tests

.1 Pressure tests are to be carried out in accordance with an approved procedure, based on a recognized national/ international standard for the relevant pressure vessels. Procedures for testing are to be submitted to IRS, well in advance for review.

.2 The pressure test is to be repeated when the modifications to the pressure boundaries have been carried out and the test requirements apply as given for new pressure vessels.

.3 All pressure tests are to be carried out in presence of IRS Surveyor.

.4 A thorough internal and external visual inspection is to be carried out, prior to hydro tests.

.5 If diving bells are used for observation diving, they are to be hydro-tested to the external pressure test pressure, as per the design code.

18.7.3 Pressure Equipment

.1 Pressure Vessels for Human Occupancy

- Bell insulation is to be examined and it is to be determined if affected areas require renewal because of damage/ corrosion. Ultrasonic examination may be carried out, as necessary;
- Areas around windows are to be subject to critical examination;
- Chamber and bell are to be hydro-tested as per the manual and recorded.

.2 Gas Storage & Pressure Vessels in Supply and Return Lines

- Gas storage tubes, air and gas tanks, sewage tanks, hot water tanks are to be hydro tested and recorded.

.3 Pumps and Compressors

- As per scope of third annual survey

.4 System components including piping, umbilicals, hoses, valves, filters etc.

- Pressure test of piping systems is to be carried out.

18.7.4 Controls

Survey of the following items is to be carried out with the scope of survey same as that of third annual survey:

.1 Gas Supply and Distribution

.2 Depth/ Pressure Control

.3 Temperature and Humidity Control

.4 Gas Contamination Analysis

.5 Domestic/ Sanitary Systems

.6 Auxiliary Services to Life Support Equipment

18.7.5 Communication

- Primary, secondary and emergency means of communication are to be examined as per scope of third annual survey.

18.7.6 Launch and Recovery Systems

.1 General

(a) For submergence launch and recovery system:

- Bell ballast weight release is to be load tested and NDE to be carried out on load bearing members;
- Emergency retrieval of bell to be tested.

(b) For surface launch and recovery:

- Various systems are to be load tested as per manual and NDE to be carried out on load bearing members;

.2 Controls

- As per scope of third annual survey.

.3 Auxiliary Services to Launch and Recovery Systems

- As per scope of third annual survey.

18.7.7 Safety Equipment

- As per scope of third annual survey.

18.8 Surveys of Hyperbaric Evacuation Systems (HES)

18.8.1 Initial Surveys

.1 The requirements for initial surveys and classification of Hyperbaric Evacuation Systems (HES) are laid down in Pt.5, Ch. 26, Sec. 4.

.2 Statutory requirements of national authorities/ flag administrations are to be taken into account whilst approving and surveying HES.

.3 The interface between the HES and the installed diving system is to be examined carefully so that the HES does not become a hazard to the diving system operations.

.4 HES are connected to the diving system and are to be surveyed in the same manner as the main diving system. Corrosion on the chamber exterior is to be examined carefully due to high humidity levels.

18.8.2 Annual and Special Surveys of HES

18.8.2.1 The initial survey requirements for HES, stipulated in Cl. 4.4.1 of Pt.5, Ch.26, Sec. 4 are to be applied for all annual surveys in addition to the scope laid down below.

18.8.2.2 Annual and Special Survey requirements for components of the HES are indicated in 18.8.2.3 to 18.8.2.7

18.8.2.3 Pressure Equipment

.1 Pressure Vessels for Human Occupancy

- Annual and special survey requirements as applicable to diving systems may be followed.

.2 Gas Storage & Pressure Vessels in Supply and Return Lines

- Examine if gas cylinders exposed to sea water are certified and tested every two years;
- For other components, periodical survey requirements as applicable to diving systems are to be applied.

.3 Pumps and Compressors

- Annual and special survey requirements as applicable to diving systems are to be applied

.4 System components including piping, umbilicals, hoses, valves, filters etc.

- Examine, if all valves are firmly secured to prevent any movement due to ship motions in rough weather;
- Examine, if all external valves on the chambers are secured “open” to prevent accidental operation during deployment of HEU.

18.8.2.4 Controls

Annual and special survey requirements are to be as applicable for diving systems, for items .1 to .6, with additional requirements where indicated for each item:

.1 Gas Supply and Distribution

- The following are to be additionally verified at each annual survey:
  - Oxygen supply is fitted with a device to ensure Oxygen injection at controlled rate;
  - Availability of sufficient Oxygen for metabolic make-up for the maximum complement of divers at a rate of 0.5 [lit/min/diver], for a minimum duration of 24 [hrs];
  - There is a minimum amount of Helium/ Oxygen carried, sufficient to compensate for the use of medical locks, as specified by the equipment manufacturer.

.2 Depth/ Pressure Control

.3 Temperature and Humidity Control

- Annual and special survey requirements are to be as applicable to diving systems may be followed. In addition, the following are to be verified at each annual survey:
  - Confirm that there are adequate means of maintaining the diver’s thermal balance in the compression chamber to the required level, for a minimum of 24 [hrs];
  - Function test of the external fired diesel heater (if fitted).

.4 Gas Contamination Analysis

.5 Domestic/ Sanitary Systems

.6 Auxiliary Services to Life Support Equipment

- The following are to be additionally verified at each annual survey:
  - The safety provisions applied to reduce potential hazards from battery charging;
  - Ducted hydrogen gas ventilation for safe dumping;
  - Housing of rechargeable batteries in separate well ventilated area, located outside the crew area;

- Precautions as laid down by the manufacturer being followed for in-situ charging of batteries.

18.8.2.5 Communication

Annual and special survey requirements are to be as applicable to diving systems for items .1 to .4, with additional requirements where indicated for each item:

.1 Primary Means:

- Additionally, the following are to be verified at each annual survey:
    - Examine, if the hard wired communication system linking HES launch control/ HES internal/ saturation life support control is available and effective.

.2 Secondary Means:

.3 Emergency Means:

- Additionally, at each annual survey, examine if the HEU is fitted with relocation devices including:
    - Radar reflector
    - Strobe Light
    - Radio distress beacon

.4 Alarms:

18.8.2.6 Launch and Recovery Systems

.1 General

- Manufacturer's instructions for periodical surveys are to be followed;
- Examine HES release arrangements;
- Launch test the HES with a full load during surveys. In case of a float away chamber, a floatation test is to be carried out with full load;
- Examine if a suitable method of assisting an injured/ unconscious diver in to the chamber is available;
- Examine if, safety locking mechanism is fitted between the saturation diving complex and HES, and the same is effective;
- Examine fall length and confirm that the same allows the HEU to be fully supported in water when the ship/ installation is in the lightest sea-going state. The same is to be determined at the worst angle of list and trim on the side where the HEU is located;
- Examine falls for turning and deterioration. Falls are to be turned end to end at 30 month intervals and renewed when deteriorated, or at intervals not exceeding 5 years;
- Load test of HEU launch system to be carried out, as applicable on annual basis;
- Where secondary means of launch is provided, the launch of the HEU by secondary means is to be tested under same conditions as primary means of launch.

2 Controls

- Annual and special survey requirements as applicable to diving systems may be followed.

.3 Auxiliary Services to Launch and Recovery Systems

- Annual and special survey requirements as applicable to diving systems may be followed.

18.8.2.7 Safety Equipment

- As per the relevant Statutory requirements.

18.9 Surveys for Transit Damage

18.9.1 During transportation of the diving system or hyperbaric facility, precautions are to be taken to protect the pressure hull, external structures, acrylic windows, batteries, etc. from undue deterioration or damage.

18.9.2 A survey for transit damage is to be conducted after the transportation of diving system or hyperbaric facility from the manufacturer's or the assembler's plant to the operational location or from one location of operations to another.

18.9.3 This survey is to include but may not be limited to the following:

- Pressure boundary and its components are to be visually checked for damage.
- Systems and components are to be inspected, and recalibration of instruments may be required if deemed necessary by the Surveyor.
- External structures, fairings and skins are to be checked for damage.
- Further in-depth examination may be required by and at the discretion of the Surveyor.

18.9.4 If the survey is carried out by the Owner and damage is found which affects or may affect classification, IRS is to be advised of the details and provisions are to be made for examination by the Surveyor at first available opportunity.

Section 19

Surveys – Ballast Water Management

19.1 General

19.1.1 Periodical survey requirements for ballast water management techniques (Ballast Water Exchange and Ballast Water Treatment) used onboard vessels are covered in the succeeding paragraphs. Requirements for design and installation of Ballast Water Management Systems are given in Part 5, Chapter 37 of the Rules.

19.2 Vessels Using Ballast Water Exchange Methods

19.2.1 Annual Survey

19.2.1.1 The following documentation is to be checked onboard during the survey:

a) Approved ballast water management plan

b) Ballast water record book stating type of exchange (sequential, flow-through, dilution).

19.2.1.2 The sediment management arrangement and control of all valves and each pump required for ballast water exchange are to be examined and verified.

19.2.1.3 The function of control system used for dilution method is to be verified, if applicable.

19.2.2 Intermediate Survey

19.2.2.1 Verification of the accessibility of sampling points.

19.2.2.2 Verification of satisfactory operation of tank level indicating system, valve position indicating system, draught indicating system and communication to local control station at central ballast control station.

19.2.3 Special Survey

19.2.3.1 Verification of satisfactory operation of local and remote control at each pump used during ballast water exchange.

19.2.3.2 Verification that manually operated independent means of control of all valves required for ballast water exchange are in satisfactory condition.

19.2.3.3 Examine and verify function of control, monitoring and communication systems on the ballast control station, including:

a) tank level indicating system

b) valve position indicating system

c) draught indicating system

d) communication to local control station.

19.3 Vessels Using Ballast Water Treatment Systems

19.3.1 Annual Survey

19.3.1.1 The following documentation is to be verified onboard and in practical use:

a) approved ballast water management plan

b) ballast water record book

c) type approval certificate for treatment system

d) calibration procedures and certificates for sensors on the treatment system

e) equipment manuals for major components on the treatment system

f) maintenance log for treatment system

g) operational manual for treatment system including maintenance procedure

h) material safety data sheet of active substances, if relevant.

19.3.1.2 Confirming that no unauthorized alteration or modification has been done to the original arrangement including no changes to electrical, controls & monitoring system or hardware and software (version) for computer based systems;

19.3.1.3 Checking whether any new equipment has been fitted and, if so, confirm that it has been approved before installation and that any changes are reflected in the certificate;

19.3.1.4 General external examination of the structure, equipment, systems, fittings, arrangements and material/ process associated with the ballast water management plan, in order to confirm that the BWMS has been maintained and remain in compliance with the requirements of the Convention.

19.3.1.5 Examination of satisfactory condition of non-metallic expansion joints (if any) in the piping system which penetrates the ship's side.

19.3.1.6 Verification to confirm the satisfactory operation of the control and monitoring equipment including examination of records of the proper functioning or failure of the BWMS.

19.3.1.7 Confirmation that the records of the recording device fitted are satisfactory and adequate supply of consumables for the recording device(s) are available on board.

19.3.1.8 For systems using active substances:

.1 Confirmation that active substance(s) in accordance with the manufacturer's recommendations are provided on board

.2 Confirmation that dosage instruction for active substance(s) or preparations are available on board

.3 Confirmation that storage of the active substance(s) is satisfactory taking into account the risks/hazards involved with the substance as provided in the safety data sheet

.4 Confirmation of the satisfactory condition of the chemical storage tanks if provided, piping and fittings by external examination.

19.3.1.9 The sediment management arrangement and control of all valves and each ballast pumps are to be examined.

19.3.2 Intermediate Survey

19.3.2.1 In addition to the scope of annual surveys, examination of the ballast water management system for obvious defects, deterioration or damage including examination of associated pumps, piping and fittings for wear and corrosion is to be undertaken and confirmed that these are in satisfactory condition.

19.3.3 Special Survey

19.3.3.1 In addition, to the scope of intermediate surveys, indicated above, it is to be confirmed that the operation (by simulation test or equivalent) of the ballast water management system is satisfactory.

Section 20

Surveys – Fuel Installations on Ships Utilizing Gaseous Fuel or Other Low Flash Point Fuels

20.1 Application

20.1.1 Requirements of this section apply to ships, other than those covered by Section 5, which utilize gaseous fuel or other low flash point fuels as a fuel for propulsion prime mover/auxiliary power generation arrangements and associated systems. These requirements are in addition to the requirements of Section 8.

20.2 Annual Survey

20.2.1 Schedule

20.2.1.1 Annual Surveys are to be held within 3 months before or after each anniversary date of the date of the initial classification survey or of the date credited for the last Special Survey. They will normally be performed at the same time as an Annual Hull survey.

20.2.2 Scope

20.2.2.1 The following is to be carried out during the survey of the Fuel Storage, Fuel Bunkering
System, and Fuel Supply System:

20.2.2.1.1 Logbooks/Records

i) The logbooks and operating records are to be examined with regard to correct functioning of the systems, such as, gas detection systems and fuel supply/gas systems. The hours per day of the reliquefaction plant, gas combustion unit, as applicable, the boil-off rate, and nitrogen consumption (for membrane containment systems) are to be considered together with gas detection records.

20.2.2.1.2 Operating and Maintenance Instruction Manuals

i) The manufacturer/builder instructions and manuals covering the operations, safety and maintenance requirements and occupational health hazards relevant to fuel storage, fuel bunkering, and fuel supply and associated systems for the use of the fuel, are to be confirmed as being aboard the vessel.

20.2.2.1.3 Control, Monitoring and Safety Systems

i) Gas detection and other leakage detection equipment in compartments containing fuel storage, fuel bunkering, and fuel supply equipment or components or associated systems, including indicators and alarms, are to be confirmed in satisfactory operating condition. Recalibration of the gas detection systems is to be verified in accordance with the manufacturers' recommendations.

ii) Verification of the satisfactory operation of the control, monitoring and automatic shutdown systems as far as practicable of the fuel supply and bunkering systems.

iii) Operational test, as far as practicable, of the shutdown of ESD protected machinery spaces.

20.2.2.1.4 Fuel Handling Piping, Machinery and Equipment

i) Piping, hoses, emergency shut-down valves, remote operating valves, relief valves, machinery and equipment for fuel storage, fuel bunkering, and fuel supply such as venting, compressing, refrigerating, liquefying, heating, cooling or otherwise handling the fuel are to be examined, as far as practicable. Means for inerting is to be examined. Stopping of pumps and compressors upon emergency shut-down of the system is to be confirmed as far as practicable.

20.2.2.1.5 Ventilating System

i) Examination of the ventilation system, including portable ventilating equipment where fitted, is to be made for spaces containing fuel storage, fuel bunkering, and fuel supply units or components or associated systems, including air locks, pump rooms, compressor rooms, fuel

preparation rooms, fuel valve rooms, control rooms and spaces containing gas burning equipment. Where alarms, such as differential pressure and loss of pressure alarms, are fitted, these should be operationally tested as far as practicable.

20.2.2.1.6 Drip Trays

i) Portable and fixed drip trays and insulation for the protection of the ship's structure in the event of leakage are to be examined.

20.2.2.1.7 Hazardous Areas

i) Electrical equipment and bulkhead/deck penetrations including access openings in hazardous areas are to be examined for continued suitability for their intended service and installation area.

20.2.2.1.8 Electrical Bonding.

i) Electrical bonding arrangements in hazardous areas, including bonding straps where fitted, are to be examined.

20.2.2.1.9 Fuel Storage, Bunkering and Supply Systems

i) The following are to be examined, so far as applicable. Insulation need not be removed, but any deterioration or evidence of dampness is to be investigated:

a. Fuel Storage

i. External examination of the storage tanks including secondary barrier if fitted and accessible.

ii. General examination of the fuel storage hold place.

iii. Internal examination of tank connection space.

iv. External examination of tank and relief valves.

v. Verification of satisfactory operation of tank monitoring system.

vi. Examination and testing of installed bilge alarms and means of drainage of the compartment.

vii. Testing of the remote and local closing of the installed main tank valve.

b. Fuel Bunkering System

i. Examination of bunkering stations and the fuel bunkering system.

ii. Verification of satisfactory operation of the fuel bunkering control, monitoring and shutdown systems.

c. Fuel Supply System

i. Examination of the fuel supply system during working condition as far as practicable.

ii. Verification of satisfactory operation of the fuel supply system control, monitoring and shut-down systems.

iii. Testing of the remote and local closing of the master fuel valve for each engine compartment.

20.3 Intermediate Survey

20.3.1 Schedule

20.3.1.1 The Intermediate Survey is to be held at or between either the 2nd or 3rd Annual Survey.

20.3.1.2 Those items which are additional to the requirements of the Annual Surveys may be surveyed either at or between the 2nd and 3rd Annual Survey.

20.3.2 Scope

20.3.2.1 In addition to the applicable requirements of the Annual Survey, the Intermediate Survey is to include the following:

20.3.2.2 Safety Systems

20.3.2.2.1 Gas detectors, temperature sensors, pressure sensors, level indicators, and other equipment providing input to the fuel safety system are to be randomly tested to confirm satisfactory operating condition. Proper response of the fuel safety system upon fault conditions is to be verified.

20.4 Special Survey

20.4.1 Schedule

20.4.1.1 Special Surveys are to be carried out at 5 years intervals to renew the Classification Certificate.

20.4.1.2 The first Special Survey is to be completed within 5 years from the date of the initial classification survey and thereafter within 5 years from the credited date of the previous Special Survey. However, an extension of class of 3 months maximum beyond the 5th year can be granted in exceptional circumstances. In this case, the next period of class will start from the expiry date of the Special Survey before the extension was granted.

20.4.1.3 For surveys completed within 3 months before the expiry date of the Special Survey, the next period of class will start from the expiry date of the Special Survey. For surveys completed more than 3 months before the expiry date of the Special Survey, the period of class will start from the survey completion date. In cases where the vessel has been laid up or has been out of service for a considerable period because of a major repair or modification and the owner elects to only carry out the overdue surveys, the next period of class will start from the expiry date of the Special Survey. If the owner elects to carry out the next due Special Survey, the period of class will start from the survey completion date.

20.4.1.4 The Special Survey may be commenced at the 4th Annual Survey and be progressed with a view to completion by the 5th anniversary date. When the Special Survey is commenced prior to the 4th Annual Survey, the entire survey is to be completed within 15 months if such work is to be credited to the Special Survey.

20.4.1.5 Special Surveys may be carried out on a continuous survey basis. In this case, the interval between consecutive examinations of each item is not to exceed five (5) years.

20.4.2 Scope

20.4.2.1 The Special Survey is to include, in addition to the requirements of the Annual and Intermediate Surveys, examination, tests and checks of sufficient extent to ensure that the fuel installations are in a satisfactory condition and are fit for their intended purpose for the new period of class of 5 years to be assigned, subject to proper maintenance and operation and to periodical surveys being carried out at the due dates.

20.4.2.2 Fuel Handling and Piping

i) All piping for fuel storage, fuel bunkering, and fuel supply such as venting, compressing, refrigerating, liquefying, heating storing, burning or otherwise handling the fuel and liquid nitrogen installations are to be examined. Removal of insulation from the piping and opening for examination may be required. Where deemed suspect, a hydrostatic test to 1.25 times the Maximum Allowable Relief Valve Setting (MARVS) for the pipeline is to be carried out. After reassembly, the complete piping is to be tested for leaks. Where water cannot be tolerated and the piping cannot be dried prior to putting the system into service, the Surveyor may accept alternative testing fluids or alternative means of testing.

20.4.2.3 Fuel Valves

i) All emergency shut-down valves, check valves, block and bleed valves, master gas valves, remote operating valves, isolating valves for pressure relief valves in the fuel storage, fuel bunkering, and fuel supply piping systems are to be examined and proven operable. A random selection of valves is to be opened for examination.

20.4.2.4 Pressure Relief Valves

i) Fuel Storage Tank Pressure Relief Valves: The pressure relief valves for the fuel storage tanks are to be opened for examination, adjusted, and function tested. If the tanks are equipped with relief valves with non-

metallic membranes in the main or pilot valves, such non-metallic membranes are to be replaced.

ii) Fuel Supply and Bunkering Piping Pressure Relief Valves: Pressure relief valves for the fuel supply and bunkering piping are to be opened for examination, adjusted, and function tested. Where a proper record of continuous overhaul and retesting of individually identifiable relief valves is maintained, consideration will be given to acceptance on the basis of opening, internal examination, and testing of a representative sampling of valves, including each size and type of liquefied gas or vapor relief valve in use, provided there is logbook evidence that the remaining valves have been overhauled and tested since crediting of the previous Special Survey.

iii) Pressure/Vacuum Relief Valves: The pressure/vacuum relief valves, rupture disc and other pressure relief devices for interbarrier spaces and hold spaces are to be opened, examined, tested and readjusted as necessary, depending on their design.

20.4.2.5 Fuel Handling Equipment

i) Fuel pumps, compressors, process pressure vessels, inert gas generators, heat exchangers and other components used in connection with fuel handling are to be examined as per the requirements in Sec 5, 8 & 12, as applicable.

20.4.2.6 Electrical Equipment

i) Examination of electrical equipment to include the physical condition of electrical cables and supports, intrinsically safe, explosion proof, or increased safety features of electrical equipment.

ii) Functional testing of pressurized equipment and associated alarms.

iii) Testing of systems for de-energizing electrical equipment which is not certified for use in hazardous areas.

iv) An electrical insulation resistance test of the circuits terminating in, or passing through, the hazardous zones and spaces is to be carried out.

20.4.2.7 Safety Systems

i) Gas detectors, temperature sensors, pressure sensors, level indicators, and other equipment providing input to the fuel safety system are to be tested to confirm satisfactory operating condition.

ii) Proper response of the fuel safety system upon fault conditions is to be verified.

iii) Pressure, temperature and level indicating equipment are to be calibrated in accordance with the manufacturer's requirements.

20.4.2.8 Fuel Storage Tanks

i) Fuel storage tanks are to be examined in accordance with an approved survey plan. In developing the inspection/survey plan, the requirements for the survey of liquefied gas fuel containment systems are to be in accordance with the relevant requirements of Section 5, 5.4.6, except as noted below:

a. The tank insulation and tank support arrangements should be visually examined. Non-destructive testing may be required if conditions raise doubt to the structural integrity.

b. Vacuum insulated independent fuel storage tanks of type C without access openings need not be examined internally. Where fitted, the vacuum monitoring system should be examined and records should be reviewed.

Section 21

Condition Monitoring and Condition Based Maintenance

21.1 General

21.1.1 Application

.1 The requirements in this Section are applicable to the approved Condition Monitoring and Condition Based Maintenance schemes where the condition monitoring results are used to influence the scope and/ or frequency of Class surveys.

.2 A condition monitoring system may be used to provide a greater understanding of equipment condition, and a condition based maintenance scheme may be used to obtain maintenance efficiency. IRS approval is required where owners wish to change the survey cycle based on CM/ CBM.

.3 This scheme may be applied to components and systems covered by the Continuous Survey of Machinery (CSM), and other components and systems as requested by the Owner.

.4 The extent of condition based maintenance and associated monitoring of equipment to be included in the PMS is to be decided by the owner, based on the recommendations of the OEM and availability of suitable condition monitoring equipment. The CM/ CBM scheme is to be submitted to IRS for approval.

.5 In general, these requirements can be applied only to vessels operating on approved PMS survey scheme.

.6 The scheme may be applied to any individual items and systems. Any items not covered by the scheme are to be surveyed and credited in accordance with the requirements of Section 14 or traditional survey methods for machinery.

.7 Software systems can use complex algorithms, machine learning and knowledge of global equipment populations/ defect data in order to identify acceptability for continued service or the requirement for maintenance. These systems may be independent of the OEM recommended maintenance and condition monitoring suggested limits. Approval of this type of software would be based on OEM recommendations, industry standards and IRS experience.

21.1.2 Definitions

21.1.2.1 The following definitions (from ISO 13372:2012) are applicable for the requirements of this Section.

21.1.2.2 *Condition Monitoring*: acquisition and processing of information and data that indicate the state of a machine over time. The machine state deteriorates if faults or failures occur.

21.1.2.3 *Diagnostic*: examination of symptoms and syndromes to determine the nature of faults or failures.

21.1.2.4 *Condition Based Maintenance:* **m**aintenance performed as governed by condition monitoring programmes.

21.1.3 Condition Monitoring

21.1.3.1 Where an approved condition monitoring system is fitted, credit for survey may be based on acceptable condition monitoring results. The condition monitoring results are to be reviewed during the annual audit.

21.1.3.2 Limiting parameters are to be based on the Original Equipment Manufacturers guidelines, or a recognized international standard.

21.1.3.3 The condition monitoring system is to provide an equivalent or greater degree of confidence in the condition of the machinery to traditional survey techniques.

21.1.3.4 The condition monitoring system is to be approved in accordance with the methodology in 21.2 and 21.3.

21.1.3.5 IRS retains the right to test or open-up the machinery, irrespective of the CM results, if deemed necessary.

21.1.4 Condition Based Maintenance (CBM)

21.1.4.1 Where an owner wishes to base their equipment maintenance on a CBM approach, this is to meet the requirements of the ISM Code.

21.1.4.2 Where an agreed planned maintenance and CBM scheme is in operation, the CSM and other survey intervals may be extended based on OEM maintenance recommendations and acceptable condition monitoring results.

21.1.4.3 Limiting parameters (alarms and warnings) are to be based on the OEM guidelines, or a recognized international standard.

21.1.4.4 The CBM scheme is to provide an equivalent or greater degree of confidence in the condition of the machinery to traditional maintenance techniques.

21.2 Procedures and Conditions for approval of CM and CBM

21.2.1 Onboard Responsibility

21.2.1.1 The Chief Engineer is to be the responsible person on board in charge of the CM and CBM.

21.2.1.2 Documentation on the overhaul of items covered by CM and CBM schemes is to be reported by the Chief Engineer.

21.2.1.3 Access to computerized systems for updating of the maintenance documentation and maintenance program is only to be permitted by the chief engineer or other authorized person.

21.2.1.4 All personnel involved in CM and CBM are to be appropriately qualified.

Note: CM does not replace routine surveillance or the chief engineer's responsibility for taking decisions in accordance with his judgement.

21.2.2 Equipment and System Requirements

21.2.2.1 The CM/ CBM scheme and its extent would be approved by IRS.

21.2.2.2 The CBM scheme is to be capable of producing a condition report, and maintenance recommendations.

21.2.2.3 A system is to be provided to identify where limiting parameters (alarms and warnings) are modified during the operation of the scheme.

21.2.2.4 Where CM and CBM schemes use remote monitoring and diagnosis (i.e. data is transferred from the vessel and analyzed remotely), the system is to meet the applicable standards for Cyber Safety and Security. The system is to be capable of continued onboard operation in the event of loss of the communication function.

21.2.2.5 CBM schemes are to identify defects and unexpected failures that were not prevented by the CM system.

21.2.2.6 Systems are to include a method of backing up data at regular intervals.

21.2.3 Documentation and Information

21.2.3.1 The following documentation is to be made available to IRS for approval of the scheme:

(i) Procedure for changes to software system and CM parameters

(ii) Listing of equipment to be included in the scheme

(iii) Listing of acceptable condition monitoring parameters

(iv) Description of CBM scheme

(v) Listing, specifications and maintenance procedures for condition monitoring equipment

(vi) Baseline data for equipment with condition monitoring

(vii) Qualification of personnel and company responsible for analyzing CM results

21.2.3.2 In addition to the above documentation the following information is to be available on board:

(i) All requirements in 21.2.3.1 in an up-to-date manner

(ii) Maintenance instructions (manufacturer's and shipyard's)

(iii) Condition monitoring data including all data since last opening of the machine and the original base line data

(iv) Reference documentation (trend investigation procedures etc.)

(v) Records of maintenance including repairs and renewals carried out

(vi) Records of changes to software systems and parameters

(vii) Sensors calibration records / certification / status

21.2.4 Approval validity

21.2.4.1 An Annual Audit is to be carried out to maintain the validity of the CM/CBM scheme.

21.2.4.2 The survey arrangement for machinery under CM/ CBM may be cancelled by IRS if it is evident that the scheme is not being satisfactorily carried out either from the maintenance records or the general condition of the machinery.

21.2.4.3 In case of sale or change of management of the ship or transfer of class the approval is to be reconsidered.

21.2.4.4 The owner may, at any time, cancel the survey arrangement for machinery under the scheme by informing IRS in writing and for this case the items which have been inspected under the scheme since the last annual Audit can be credited for class at the discretion of the attending surveyor.

21.3 Surveys

21.3.1 Installation Survey

21.3.1.1 Condition monitoring equipment is to be installed and surveyed, and a set of base line readings is to be taken, as part of Installation Survey.

21.3.2 Implementation Surveys

21.3.2.1 The Implementation Survey is to be carried out by IRS surveyor no earlier than 6 months after installation survey and no later than the first Class annual survey.

21.3.2.2 During the Implementation survey the following is to be verified by the surveyor:

(i) the CM/ CBM scheme is implemented according to the approval documentation, including a comparison with baseline data;

(ii) the scheme is producing the documentation required for the Annual Audit and the requirements of surveys and testing for the maintenance of class are complied with;

(iii) the onboard personnel are familiar with operating the scheme;

(iv) records of any limiting parameters (alarms and warnings) that have been modified during the operation of the scheme;

(v) records of any failures of monitored equipment are to be reviewed to ensure that the condition monitoring scheme is effective/ sufficient.

21.3.2.3 When this survey is carried out and the implementation is found in order, a report describing the scheme is to be submitted to IRS and the scheme may be put into service.

21.3.3 Annual Audit

21.3.3.1 An annual audit of the CM/ CBM scheme is to be carried out concurrently with the annual class surveys.

21.3.3.2 The purpose of this audit is to verify that the scheme is being correctly operated and that the machinery has been functioning satisfactorily since the previous audit. This is to include any limiting parameters (alarms and warnings) that have been modified since the last audit. A general examination of the items concerned is to be carried out.

21.3.3.3 The performance, condition monitoring and maintenance records are to be examined to verify that the machinery has functioned satisfactorily since the previous survey, or action has been taken in response to machinery operating parameters exceeding acceptable tolerances.

21.3.3.4 Written details of break-down or malfunction are to be made available by the Chief Engineer.

21.3.3.5 At the discretion of the surveyor, function tests, confirmatory surveys and random check readings, where Condition Monitoring / Condition Based Maintenance equipment is in use, are to be carried out as far as practicable and reasonable.

21.3.3.6 The familiarity of the Chief Engineer and other personnel involved with the CM system is to be verified.

21.3.3.7 Calibration status of sensors and equipment is to be verified.

21.3.3.8 Verification that the suitability of the CM/ CBM scheme has been reviewed following defects and failures is to be carried out.

21.3.4 Damage and repairs

21.3.4.1 Damage to components or items of machinery is to be reported to IRS by the Chief Engineer. The repairs of such damaged components or items of machinery are to be carried out to the satisfaction of the Surveyor.

21.3.4.2 Details of repairs and maintenance carried out are to be examined. Any machinery part, which has been replaced by a spare one, due to damage, is to be retained on board where possible until examined by IRS Surveyor.

21.3.4.3 Defects and failure data are to be reviewed in order to ensure the system output is appropriate. Where necessary, following review of the failure data, there is to be a method of amending the CM and CBM scheme.

Section 22

Surveys – Comfort On-board Ships

22.1 General

22.1.1 The requirements in this Section are applicable to surveys of noise and vibration aspects in Ships which are assigned additional Class notations for Comfort in accordance with the requirements in Part 5, Chapter 39 of the Rules.

22.1.2 It is the responsibility of the Owner to advise IRS regarding any modifications, alterations or repairs, including replacement of major machinery and equipment, which may lead to significant changes in the noise and vibration levels on board, compared to the initial surveys.

22.2 Annual Surveys

22.2.1 The following information is to be provided by the Owner and reviewed by the attending Surveyor for issues that could affect the Comfort notation, since previous survey:

- Modifications/ repairs carried out in crew or passenger spaces;
- HVAC/ duct routing modifications;
- Major repairs, modifications, replacement of machinery;
- Collision and grounding reports and repairs thereof;
- Fire, repair and damage reports

22.2.2 Based on above information, the attending Surveyor would review whether changes or alterations have taken place that could affect the Comfort notation. As a result of the review, if the observations indicate that the noise and/ or vibration levels may exceed the stipulated criteria and those measured at the initial survey, a measurement program would be agreed between the Owner and IRS; and measurements taken again in accordance with the Rules.

22.3 Special Surveys

22.3.1 Information is to be provided by the Owner, as indicated in 22.2.1 for review by the attending Surveyor.

22.3.2 Noise and vibration can increase due to general wear and tear. The noise and vibration measurements are to be carried out during special surveys.

22.3.3 The measurements can be limited in comparison to initial survey measuring points depending on ship type as follows;

- For passenger ships, 30% of initial survey measuring points (excluding passenger cabins) and 10% of initial survey measuring points in passenger cabins.
- For Cargo ships, 30% of initial survey measuring points.

Section 23

Surveys of Floating Dry Docks

23.1.General

23.1.1 This Section is applicable to Periodical Surveys of floating dry docks in normal service for maintenance of Classification, in accordance with the intervals and window period specified in Section 1 of this Chapter.

23.1.2 General requirements for Surveys of Ships would be applied as relevant and applicable to floating dry docks, unless otherwise specified in this Section.

23.1.3 Floating dry docks are subjected to Intermediate Surveys and Special Surveys. Annual Surveys are not applicable to floating dry docks. Further, floating docks may be subjected to Unscheduled Surveys or Surveys for damage or alterations.

23.1.4 Attention should also be given to any relevant requirements of the statutory authority or flag Administration with which the floating dry dock is registered.

23.2 Intermediate Surveys

23.2.1 At each Intermediate Survey, the following are to be examined and placed in good condition:

- Pontoon, safety and top decks, steel structures externally above the light waterline, keel and side blocks and their foundations, swing bridges (where provided), access gangways
- Crane foundations
- Vents and overflow pipes and overboard scuppers
- Hatchways, manholes and their closing appliances
- Casings, skylights, companionways, ladders, and handrails and other means of protection that might be provided for access to all spaces
- Ventilators and other deck openings
- Overboard scuppers and discharges
- Means of escape from machinery spaces, crew accommodation and work spaces
- Deflection and stress monitoring system
- Draught marks
- Fire protection and extinguishing arrangements
- Machinery including boilers (where fitted), bilge and ballast system, electrical equipment, pumps and other equipment

23.3 Special Surveys

23.3.1 In addition to the requirements for Intermediate Surveys, the following are to be carried out:

.1 Pontoon and wing wall tanks are to be cleaned, examined internally, and hydraulically tested to the satisfaction of the Surveyor. For floating docks over 15 years of age, oil fuel tanks forming part of the main structure are to be examined internally.

.2 Examination of condition of means of protection to openings.

.3 Spaces above safety deck are to be examined internally, removing linings, etc. where necessary for survey.

.4 Where fitted, sounding pipes are to be examined. The Surveyors are to ensure that striking plates are fitted under the sounding pipes whilst examining the tanks internally.

.5 Where the surface of plating is covered with cement, composition, or wood sheathing, the covering is to be removed as may be required for examination of the plating.

.6 Thickness measurement of any part of the structure where signs of deterioration are evident may be required by the Surveyor. The structure is to be renewed, where necessary.

.7 Anchoring and mooring arrangements are to be examined for satisfactory condition. For areas which may be inaccessible /not readily accessible, Owner is to submit to IRS a plan highlighting procedures for surveys and verification of conditions for such areas.

.8 The efficient condition of the means of communication between control position and machinery spaces is to be verified.

23.3.2 At the Special Survey after the dock is 20 years old, and at 10 years intervals thereafter, in addition to the requirements in 23.3.1, thickness measurements of the structure are to be carried out to assess the overall general condition of the floating dry dock. Two sections of gauging are to be made within the 0.4 L mid-length of the dock. In addition, the Surveyor may require additional thickness measurements to be taken in those areas where it is suspected that corrosion and wastage exceed the acceptable limits.

23.3.3 Surveys of boilers are to be in accordance with the requirements of Section 9 of this Chapter.

23.3.4 Surveys of machinery, piping systems, electrical equipment and control engineering systems are to be in accordance with the requirements of Section 8 of this Chapter, as relevant and applicable.

23.3.5 Bottom Surveys

23.3.5.1 General

.1 Bottom survey means the examination of the outside of the floating dry dock's bottom, related items and part of the dry dock below the light waterline. This examination may be carried out with the floating dock either in dry dock (or on a slipway) or afloat.

.2 Bottom surveys are to be carried out along with Special Surveys.

23.3.5.2 In-water Survey

.1 Floating dry docks may be assigned INWATER SURVEY notation in compliance with the requirements of Section 7.2.2 of this Chapter, as relevant to such dry-docks.

.2 Survey of the outer bottom below the light waterline may be carried out by some combination of:

- Ultrasonic measurement of plate thickness
- Heeling/ tilting of the dock for partial examination of the bottom
- Examination by remote operated vehicle (ROV)
- Examination by diver(s)

.3 The methods and extent of the examination is to be agreed with IRS.

.4 Unless dry docked, the owner's proposal for survey of that part of the dry dock below the light waterline is to be submitted for consideration. This proposal is to include such information on the dry dock as the area of operations, type of coatings and method of corrosion control, if any.

.5 Where it is intended to tilt the dry dock, consideration is to be given to the stability and longitudinal strength of the dry dock. Such information is to be included in the operating manual, where applicable.

.6 For the extension of intervals of the examination below the waterline, special consideration may be given by IRS based on a risk analysis taking into account the age, overall condition of the dock, coating condition and method of corrosion protection.

.7 Grids for sea chests are to be removed. Valves and cocks with their fastenings are to be examined externally. If considered

necessary by the Surveyor, valves and cocks are to be dismantled for internal inspection.

23.3.5.3 Bottom survey in dry-dock

.1 When a floating dock is dry-docked, it is to be placed on blocks of sufficient height and with necessary staging to permit the examination of elements such as shell plating including bottom and bow plating, stern frame, sea chests and valves, appendages.

.2 The outer shell plating is to be visually examined for excessive corrosion, or deterioration due to chafing or contact with the ground or for any undue deformation or buckling.

.3 Significant plate unevenness or other deterioration which does not necessitate immediate repairs is to be recorded.

.4 Sea chests and their gratings, sea connections and overboard discharge valves and cocks and their fastenings to the hull or sea chests are to be examined.

Section 24

Remote Surveys

24.1 Application

24.1.1 This Section indicates requirements to be complied with for satisfactory conduct of remote surveys.

Remote Survey Notation

24.1.2 The additional class notation **REMOTE SURVEY** will be assigned to ships considered capable by IRS, for carrying out classification surveys remotely, subject to the following:

a) provided with suitable equipment/ hardware/ software that are acceptable to IRS

b) vessel not under condition improvement/ condition monitoring programme of IRS

c) procedures available for training and familiarity of on-board personnel/ crew in use of equipment/ hardware/ software

d) satisfactory completion of sample remote survey(s)

24.1.3 IRS reserves the right, at its sole discretion, to either suspend or withdraw this additional class notation in case the above-mentioned evaluation is no longer valid, e.g. due to a deterioration in the ship's condition of maintenance, or change of Management, non-availability of suitable equipment/ hardware/ software on board.

24.1.4 As far as statutory surveys are concerned, requirements of the relevant Flag Administration on remote surveys are to be complied with.

24.1.5 Unmanned non-self-propelled barges/ pontoons are not eligible to be assigned **REMOTE SURVEY** notation.

24.1.6 For ships assigned **REMOTE SURVEY** notation, the satisfactory functioning of equipment/ hardware/ software and, procedures for training of on-board personnel/ crew in the use of equipment/ hardware/ software, is to be verified by the Surveyor during Annual Surveys.

24.1.7 Ships assigned **REMOTE SURVEY** notation indicate that capability to undertake remote surveys has been verified by IRS in accordance with the relevant requirements, thereby facilitating use of this capability during various surveys, as indicated in Table 24.4.1.

24.1.8 Conduct of remote surveys on ships not assigned **REMOTE SURVEY** notation will be considered on case-to-case basis, based on specific request from the Owners, and compliance with relevant requirements of this Section.

Conduct of Remote Surveys

24.2 Definitions

24.2.1 *Remote survey* is a process of verifying that a ship and its equipment are in compliance with the Rule requirements, where the verification is partially or fully undertaken by applying digital and technological means, in an efficient and secure manner, without attendance on-board by a Surveyor.

Note: ‘Attendance on-board by a Surveyor’ means physical attendance on-board the ship

by a Surveyor. Remote classification activities not requiring a survey, such as some administrative tasks, are not considered as remote surveys.

24.2.2 *Administrative task* is a task where a survey decision is not being made, for example re-issue of a certificate or record following a correction, or an update to the ship's records held by IRS or a document review.

24.2.3 *Documentary verification* means any verification that can be undertaken based on examination of documents.

24.2.4 *Owner's Representative* means Master/ Chief Engineer or crew member designated by the Master as responsible for remote surveys.

24.2.5 *Information and Communication Technology (ICT)* are the technologies used in the scope of remote surveys for gathering, storing, retrieving, processing, analyzing and transmitting information which includes both hardware and software.

24.3 Requirements for equivalency

The requirements for equivalency of a remote survey, to a survey attended on board by a Surveyor include:

- eligibility of the remote survey
- qualification of Surveyors
- planning of the remote survey
- performance of the remote survey
- assessment of the remote survey
- reporting

Equivalency is obtained when, with the use of available ICT, a Surveyor can perform a survey remotely being able to (with same level of assurance as obtained with physical attendance on-board):

- obtain the supporting and technical evidence required according to the applicable requirements and;
- verify applicable survey items and relevant tests,

24.3.1 Eligibility of the remote survey

.1 Eligibility of the remote survey is to be decided based on type and scope of the requested survey, in accordance with Cl. 24.4.1 and, if applicable, flag Administration acceptance and possible instructions, when the Classification Survey is also related to a statutory item, and IRS is carrying out the statutory survey on behalf of the flag Administration.

.2 A remote survey is deemed eligible when it provides the same level of assurance, according to the requirements for equivalency, as if it was conducted with attendance on board by a Surveyor.

24.3.2 Qualification of Surveyors

.1 Remote surveys will be carried out by appropriately trained and qualified IRS Surveyors.

24.3.3 Planning of the remote survey

.1 Request for remote surveys is to be made by the Owner, well in advance of the survey falling due, with details of the technologies proposed to facilitate remote surveys. Planning of the remote survey is required to ensure that the remote survey is carried out in accordance with the applicable requirements. The planning is to be based on the scope of the remote survey (Also refer 24.4.1).

.2 To ensure that the Surveyor can properly plan the remote survey and communicate with personnel/ crew, so that the survey is carried out according to the applicable rules, adequate means are to be available enabling the Surveyor and allowing IRS to:

- properly interact with personnel/ crew involved in the remote survey, before and during the survey process;
- agree on the ICT means to be used;
- verify that personnel/ crew involved in the remote survey are suitably skilled to use the electronic devices and/or software used by IRS to perform the remote survey;
- acquire as deemed necessary information on identity and ranking of personnel/ crew involved in the remote survey;

- provide the survey item/scope to the personnel/ crew involved in facilitating the remote surveys, including the tests that will be performed;

- communicate, during the remote survey, additional actions depending on the evidence to be collected.

.3 One or more of the following means is to be provided for planning the remote survey:

- live-streaming video and audio connection

- exchange of data/ electronic documents through use of ICT

.4 The owner is to provide the necessary facilities for the safe execution of the survey

24.3.4 Performance of the remote survey

.1 To ensure that the Surveyor can properly perform the remote survey according to the applicable Rules, the available evidence is to allow the attending Surveyor to:

- examine and assess a survey item and/ or a group of items and/ or supporting documents,

- verify and assess applicable tests and/ or services.

.2 The evidence provided to the Surveyor is subject to technical evaluation and final acceptance by the Surveyor with respect to the completeness and accuracy, necessary to perform the requested survey according to the applicable requirements.

.3 One or more of the following types of evidence is to be provided for performing the remote survey:

- live-streaming video and audio
- recorded videos provided by the Owner's representative
- photos provided by the Owner's representative
- other data and/or supporting documents acceptable to IRS (such as ship's logbook, master's/ chief engineer's statement, owner's confirmation, ship's maintenance records, service reports issued by manufacturer's, service suppliers or service providers).

24.3.5 Assessment of the remote survey

.1 The Surveyor is to evaluate all evidence received and accept them before crediting the remote survey.

.2 The means used for the remote survey are to allow the Surveyor to collect the necessary evidence that will be examined according to the Surveyor's professional judgement in order to satisfactorily complete and credit the relevant survey items.

.3 If the remote survey does not provide the same level of assurance as a survey with attendance on board, then, a physical visit onboard by the Surveyor will be required.

24.4 Scope and Procedures of remote surveys

24.4.1 Scope of Remote Surveys

.1 A remote survey may be proposed, as an alternative to a survey attended on-board by the Surveyor for surveys listed in Table 24.4.1:

.2 Remote surveys are generally to be carried out with internet connection allowing a live streaming visual examination, although, at the discretion of the Surveyor, a combination of remote survey methods (see 24.3.4) may be used. For simple/ limited verifications, other types of ICT may be accepted by the Surveyor.

.3 When the classification survey is also related to a statutory item, and IRS is carrying out the statutory survey on behalf of the flag Administration, then the flag Administration acceptance is required, and additional requirements (if any) are to be complied with.

Table 24.4.1: Eligible Remote Survey Items

SNo.	Surveys and related items eligible for remote surveys	Live streaming required (See Notes)
1	Postponement, issuance, deletion of Condition of Class	X (1)
2	Postponement of Class surveys (Boiler Surveys, Tailshaft surveys for a maximum period of one year, Docking Surveys and CSM)	X (1)
3	Items of Continuous Survey for Machinery or Planned Maintenance Scheme	X (1)
4	Occasional survey for change of ship's name	X (1)
5	Occasional survey for loss of anchor	X (1)
6	Occasional survey for minor machinery or equipment damage	X (1)
7	Occasional survey for minor hull damage	X (1)
8	Occasional survey for minor deficiencies/ defects not subject to a Condition of Class	X (1)
9	In-water bottom survey	X
10	Specified items of a class periodical survey (excluding additional specific items of initial or special surveys), including completion of remaining items of a part held class periodical survey	X (1),(2)
11	Non-propelled / un-manned barges/pontoon – annual surveys when no survey of hull compartments is due	X
12	Minor retrofit / installation/upgrade of equipment	X (1)
13	Documentary or data based initial / periodical / renewal / occasional verifications and surveys	(2)

Notes:

(a) X - Yes

(b) (1): means that live streaming may not be required for minor survey scope or that a combination remote survey method, as listed in 24.3.4, may be used at the sole discretion of IRS.

(c) (2): means that pure documentary verifications are eligible in accordance with item 13.

(d) (3) Live streaming may be required for surveys not marked X in the Table, depending on the survey scope at the sole discretion of IRS.

(e) "Minor" in the items 6, 7, 8 and 12 means that the item can be surveyed remotely according to requirements for equivalency given in 24.3.

24.4.2 Procedures for Remote Surveys

24.4.2.1 Verification that eligibility requirements have been met (Refer 24.3.1)

24.4.2.2 Digital information quality, completeness and accuracy

.1 Verification of the quality of digital information by the Surveyor, and that the content and quality of digital information collected, and the survey carried out is satisfactory, allowing the Surveyor to confirm its completion.

.2 The Owner is to provide complete and accurate digital information. The digital information submitted by the Owner to the Surveyor is to reflect the real situation of the surveyed item. The date and time, when a photo or video was taken are to be made available to the Surveyor or identifiable from its metadata.

.3 Digital information is required to be collected and stored as evidence of the survey. It is not necessary to store all of digital information received; the exact digital

information stored is to support the survey decision and is to be decided by the Surveyor crediting the survey in accordance with the procedures of IRS.

.4 The remote survey is to be carried out under the supervision and upon instructions of the Surveyor, who is in charge of crediting the remote surveys. A Surveyor attendance on board may be required to complete the survey, upon the Surveyor's request and at his/ her discretion.

24.4.2.3 Requirements for a remote survey when live streaming is not used.

.1 When live streaming is not used, communication and digital information collection are to be performed through an ICT channel (such as emails, data streams and clouds), which is to be accepted by IRS prior to the survey.

.2 The Owner’s representative is to confirm the identity of the ship at the commencement of the survey.

24.4.2.4 Requirements for a remote survey when live streaming is used

.1 The Owner is to ensure that:

- the Owner’s representative is attending onboard and has access to the areas intended to be surveyed.

- the Owner’s representative has at his disposal a 2-ways visual and audible communication means complying with the requirements in 24.5.

- ICT solution is available on the communication means and meets the requirements indicated in 24.5.

In case these requirements cannot be fulfilled, the remote survey may be rejected. The Surveyor is to verify the identity of the ship at the commencement of the survey by live streaming.

24.5 Hardware and ICT Solution

24.5.1 Hardware

.1 The Owner is responsible for ensuring that all hardware installations on board used for the remote survey will comply with the applicable requirements relevant for use and location on board, including hazardous areas. The ICT will typically consist of:

- A host computer device onshore, to receive the streaming of images/data/video. This is usually a laptop or desktop computer compatible with the software application used for the remote survey

- On board standalone device which may include digital cameras capable of capturing videos/ photos/ data

- On board smart device compatible with the applicable software/technology

- Communication accessories like headphones and microphone for the noisy environment as applicable and as deemed necessary.

Note: The smart device may be a smartphone, tablet, computer, wearable device, smart glass, digital camera, or any other device which can be connected to the network and capable of transmitting the necessary data/ images to shore.

.2 The communication equipment used for live streaming is to have the following minimum functionalities:

- both ends are to simultaneously see the same image/videos in near real-time (i.e., live streaming)

- two-way direct voice communication

- possibility to take screenshots

.3 When using a portable device on board for live streaming, the movement of the handheld device may affect the stability of the video and the image, leading to lower quality outputs. When necessary, a suitable anti-shake device is to be used to provide proper stability.

Note:
1. The host computer screen is to be able to present an image quality that is sufficient to enable a survey decision to be made.

2. Portable equipment on board is to be equipped with a power capacity suitable for the intended scope and time of the survey.

24.5.2 Requirements for Internet Connectivity

.1 The Owner's representative is to ensure that internet connectivity tests are carried out before the survey and that proper connectivity is available and maintained during the survey.

.2 When live streaming communication is applied, the internet connection is to have sufficient and stable bandwidth capacity to ensure quality (such as resolution and frame rate) of the direct colour image/video and voice communication to the remote survey location to the satisfaction of the Surveyor.

.3 When remote survey by live streaming is being undertaken, a connection that enables live streaming between the Surveyor and the Owner's representative attending on board is required. The quality of the live streaming connection (audio and video) is to ensure proper communication and to allow the Surveyor to carry out the survey remotely, to the Surveyor's satisfaction. In case where a live streaming connection with the Surveyor is not possible or is not continuous at the place of the survey (e.g. Engine Room), partly online sequences (where the Owner is able to capture pictures and videos offline of those items not covered by live streaming) may be accepted by the Surveyor.

.4 The on-board smart devices are to have the capability of transmitting the images/ video/ data over a cellular, wi-fi or satellite connection to the remote Surveyor.

24.5.3 Software and Data Security

The audio/ video software or application selected for use for the remote survey is to be acceptable to IRS. The overall function and ability of the software used to ensure the security of data is to be evaluated prior to use as per the requirements given below.

.1 The Surveyor is to normally control the live video call, providing instructions to the on-site personnel/crew and supervising survey activities for capturing relevant information. The on-board device is to have the capability of transmitting the data over a cellular, wi-fi, or satellite connection to the Surveyor.

.2 The software used to perform the remote survey may also be provided with technologies that support the Surveyor in the process of making a decision, such as:

- Artificial Intelligence (AI) for the recognition and the classification of defects,
- Internet of things (IoT) for collecting parameters and evaluating acceptability/ working condition of machinery and equipment,
- Data driven verification or other means considered acceptable by IRS.

.3 When considering the use of software/ applications and other technologies, data protection is to be considered in accordance with applicable requirements of IRS (IRS *Guidelines on Maritime Cyber Safety* may be referred) before the remote survey is commenced. The software/ application used to perform the remote survey is to be compatible with the technical requirements detailed in this paragraph; in addition, the software used is to comply with IRS' applicable requirements for:

- Cybersecurity
- Data protection and confidentiality for the transmitted data

.4 During the survey preparation, it is the Owner's responsibility to ensure that their data security policies are implemented as per the Company's Safety Management System.

24.6 Recording of evidence (also see 24.3.4) and reporting of surveys

24.6.1 In principle, live streaming video and audio are applied to remote surveys as primary means (refer to Table 24.4.1).

24.6.2 Additionally, and/or alternatively, one or more of the following types of evidence may be submitted or verified as requested by the Surveyor during remote survey so that the Surveyor is able to verify conditions of survey items:

- Recorded video and audio
- Photos
- Ship's logbook
- Owner's confirmation

Note: Recorded videos/ photos provided by the Owner's representative is to be supplemented with a statement signed by the Master and/ or the Chief Engineer confirming the condition of the items shown in the evidence.

24.6.3 For the recorded videos/ photos, the following information is to be available:

- confirmation that they were actually taken on the ship by the Owner's representative
- date and time when they were taken
- identity of the personnel/ crew responsible for taking evidence

24.6.4 The Surveyor may request the Owner's representative to submit other supporting documents such as ship's maintenance reports and record for the operation of machinery, and equipment and service reports issued by manufacturers, service suppliers or service providers.

24.6.5 The Owner's representative is to confirm the correctness and completeness of the provided information and evidence (if any) relevant to the condition of the items requested to be surveyed.

24.6.6 The Master is to make entries into ship's logbook on the following occasions and submit copies of the relevant pages when requested by the Surveyor:

- when a remote survey is carried out by the Surveyor
- when videos/photos are taken and submitted to the Surveyor with the Master's/ Chief Engineer's statement and additional documents as applicable.

24.6.7 The final evaluation of the remote survey by the Surveyor is to be based on all of the provided evidence, and it does not delegate the responsibility to the Master/ Chief Engineer's statement only.

Section 25

Cyber Resilience Surveys

25.1 General

25.1.1 The requirements in this Section are applicable to periodical surveys for verifying compliance with cyber resilience requirements for ships assigned CyS-E Class Notation.

25.1.2 Construction and initial survey requirements for ships assigned CyS-E notation are specified in Part 4, Chapter 7, Section 7 of the Rules.

25.1.3 Ships will be subjected to annual and special surveys for verification of compliance with cyber resilience requirements.

Note: In the context of this Section, the term 'first annual survey' refers to the first annual survey post the delivery of the ship.

25.1.4 The general requirements to be complied with during the operation life, for ships assigned CyS-E notation are as follows:

.1 Once the cyber resilient ship is delivered, the Owner/Company is to manage technical and organizational security countermeasures by establishing and implementing processes as specified in Part 4, Chapter 7, Section 7 of the Rules.

.2 Modifications to the Computer Based Systems (CBSs) are to be carried out in accordance with the management of change (MoC) requirements in Part 4, Chapter 7, Section 6 of the Rules. This includes maintaining documentation of the CBSs up to date.

.3 The Owner/Company, with the support of suppliers, is to keep the Ship cyber resilience test procedure up to date and aligned with the CBSs onboard the ship and the networks connecting such systems to each other and to other CBSs not onboard (e.g. ashore).

.4 The Owner/Company is to update the Ship cyber resilience test procedure considering the changes occurred on CBSs and networks onboard, possible emerging risks related to such changes, new threats, new vulnerabilities and other possible changes in the ship's operational environment.

.5 The Owner/Company is to prepare and implement operational procedures, provide

periodic training and carry out drills for the onboard personnel and other concerned personnel ashore to familiarize them with the CBSs onboard the ship and the networks connecting such systems to each other and to other CBSs not onboard (e.g. ashore), and to properly manage the measures adopted for the fulfilment of requirements.

.6 The Owner/Company, with the support of supplier, is to keep the measures adopted for the fulfilment of requirements up to date, e.g. by periodic maintenance of hardware and software of CBSs onboard the ship and the networks connecting such systems.

.7 The Owner/Company is to retain onboard a copy of results of execution of tests and an updated Ship cyber resilience test procedure and make them available to IRS.

25.1.5 First Annual Survey

.1 the Owner/Company is to submit a Ship cyber security and resilience program to IRS for approval, documenting management of cyber security and cyber resilience of the CBSs, as relevant and applicable, well in advance of the first annual survey.

.2 The Ship cyber security and resilience program is to include policies, procedures, plans and/or other information documenting the processes/ activities specified in subsections “demonstration of compliance” in Part 4, Chapter 7, Section 7 of the Rules.

.3 The Owner/Company is to demonstrate compliance by presenting records or other documented evidence of implementation of the processes described in the approved Ship cyber security and resilience program.

.4 Change of vessel management company will require a new verification of the Ship cyber security and resilience program.

25.1.6 Subsequent Annual Surveys

In the subsequent annual surveys of the ship, the Owner/Company is to demonstrate implementation of the Ship cyber security and resilience program, when requested by IRS.

25.1.7 Special Surveys

The Owner/Company is to carry out testing witnessed by the Surveyor in accordance with the Ship cyber resilience test procedure. Certain security safeguards are to be demonstrated at Special survey whereas others need only be carried out upon request by the Surveyor based on modifications to the CBSs as specified in subsections “Operation phase” in Part 4, Chapter 7, Section 7 of the Rules.

25.2 Vessel asset inventory

25.2.1 First Annual Survey

.1 The Owner/Company is to present to the Surveyor records or other documented evidence demonstrating implementation of the Ship cyber security and resilience program, i.e., that:

- The approved management of change process has been adhered to.

- Known vulnerabilities and functional dependencies have been considered for the software in the CBSs.

- The vessel asset inventory has been kept updated.

25.2.2 Subsequent annual surveys

The Owner/Company is to upon request by the Surveyor demonstrate implementation of the Ship cyber security and resilience program by presenting records or other documented evidence as specified for the first annual survey.

25.2.3 Special Surveys

The Owner/Company is to demonstrate to IRS the relevant activities (pertaining to the commissioning phase, refer Part 4, Chapter 7, Section 7.6.1.1.3 c) of the Rules) as per the Ship cyber resilience test procedure.

25.3 Security Zones and Network Segmentation

25.3.1 First annual survey

The Owner/Company is to demonstrate to the Surveyor that the Zones and conduit diagram has been kept updated and present records or other documented evidence demonstrating implementation of the Ship cyber security and resilience program, i.e., that security zone boundaries are managed in accordance with the above requirements.

25.3.2 Subsequent annual surveys

The Owner/Company is to upon request by the Surveyor demonstrate implementation of the Ship cyber security and resilience program by presenting records or other documented evidence as specified for the first annual survey.

25.3.3 Special surveys

The Owner/Company is to demonstrate to the Surveyor the relevant activities (pertaining to the commissioning phase, refer Part 4, Chapter 7, Section 7.6.2.1.3 c) of the Rules) as per the Ship cyber resilience test procedure.

25.4 Network protection safeguards

25.4.1 Special surveys

Subject to modifications of the CBSs, the Owner/Company is to demonstrate to the Surveyor the relevant activities (pertaining to the commissioning phase, refer Part 4, Chapter 7, Section 7.6.2.2.3 a) of the Rules) as per the Ship cyber resilience test procedure.

25.5 Antivirus, antimalware, antispam and other protections from malicious code

25.5.1 First annual survey

The Owner/Company is to present to the Surveyor records or other documented evidence demonstrating implementation of the Ship cyber security and resilience program, i.e., that:

- Any anti-malware software has been maintained and updated.

- Procedures for use of portable, mobile or removable devices have been followed.

- Policies and procedures for access control have been followed.

- Physical safeguards are maintained.

25.5.2 Subsequent annual surveys

The Owner/Company is to upon request by the Surveyor demonstrate implementation of the Ship cyber security and resilience program by presenting records or other documented evidence as specified for the first annual survey.

25.5.3 Special surveys

The Owner/Company is to demonstrate to the Surveyor the relevant activities (pertaining to the commissioning phase, refer Part 4, Chapter 7, Section 7.6.2.3.3 c) of the Rules) as per the Ship cyber resilience test procedure.

25.6 Access control

25.6.1 First annual survey

The Owner/Company is to present to the Surveyor records or other documented evidence demonstrating implementation of the Ship cyber security and resilience program, i.e., that:

- Personnel are authorized to access the CBSs in accordance with their responsibilities.

- Only authorized devices are connected to the CBSs.

- Visitors are given access to the CBSs according to relevant policies and procedures.

- Physical access controls are maintained and applied.

- Credentials, keys, secrets, certificates, relevant CBS documentation, and other sensitive information is managed and kept confidential according to relevant policies and procedures.

25.6.2 Subsequent annual surveys

The Owner/Company is to upon request by the Surveyor demonstrate implementation of the Ship cyber security and resilience program by presenting records or other documented evidence as specified for the first annual survey.

25.7 Wireless communication

25.7.1 Special surveys

Subject to modifications of the wireless networks, the Owner/Company is to demonstrate to the Surveyor the relevant activities (pertaining to the commissioning

phase, refer Part 4, Chapter 7, Section 7.6.2.5.3 c) of the Rules) as per the Ship cyber resilience test procedure.

25.8 Remote access control and communication with untrusted networks

25.8.1 First annual survey

The Owner/Company is to present to the Surveyor records or other documented evidence demonstrating implementation of the Ship cyber security and resilience program, i.e., that:

- Remote access sessions have been recorded or logged and carried out as per relevant policies and user manuals.

- Installation of security patches and other software updates have been carried out in accordance with Management of change procedures and in cooperation with the supplier.

25.8.2 Subsequent Annual surveys

The Owner/Company is to upon request by the Surveyor demonstrate implementation of the Ship cyber security and resilience program by presenting records or other documented evidence as specified for the first annual survey.

25.8.3 Special surveys

The Owner/Company is to demonstrate to the Surveyor the relevant activities (pertaining to the commissioning phase, refer Part 4, Chapter 7, Section 7.6.2.6.3 c) of the Rules) as per the Ship cyber resilience test procedure.

25.9 Use of Mobile and Portable Devices

25.9.1 First annual survey

The Owner/Company is to present to the Surveyor records or other documented evidence demonstrating implementation of the Ship cyber security and resilience program, i.e., that:

- The use of mobile, portable or removable media is restricted to authorized personnel and follows relevant policies and procedures.

- Only authorized devices are connected to the CBSs.

- Means to restrict use of physical interface ports are implemented as per approved design documentation.

25.9.2 Subsequent annual surveys

The Owner/Company is to upon request by the Surveyor demonstrate implementation of the Ship cyber security and resilience program by presenting records or other documented evidence as specified for the first annual survey.

25.9.3 Special surveys

The Owner/Company is to demonstrate to the Surveyor the relevant activities (pertaining to the commissioning phase, refer Part 4, Chapter 7, Section 7.6.2.7.3 c) of the Rules) as per the Ship cyber resilience test procedure.

25.10 Network operation monitoring

25.10.1 First annual survey

The Owner/Company is to present to the Surveyor records or other documented evidence demonstrating implementation of the Ship cyber security and resilience program, i.e., that:

- The CBSs are routinely monitored for anomalies by inspection of security audit records and investigation of alerts in the CBSs.

25.10.2 Subsequent annual surveys

The Owner/Company is to upon request by the Surveyor demonstrate implementation of the Ship cyber security and resilience program by presenting records or other documented evidence as specified for the first annual survey.

25.10.3 Special surveys

Subject to modifications of the CBS, the Owner/Company is to demonstrate to the Surveyor the relevant activities (pertaining to the commissioning phase, refer Part 4, Chapter 7, Section 7.6.3.1.3 a) of the Rules) as per the Ship cyber resilience test procedure.

25.11 Verification and diagnostic functions of CBS and networks

25.11.1 First annual survey

The Owner/Company is to present to the Surveyor records or other documented evidence demonstrating implementation of the Ship cyber security and resilience program, i.e., that the security functions in the CBSs are periodically tested or verified.

25.11.2 Subsequent annual surveys

The Owner/Company is to upon request by the Surveyor demonstrate implementation of the Ship cyber security and resilience program by presenting records or other documented evidence as specified for the first annual survey.

25.12 Incident Response Plan

25.12.1 First annual survey
The Owner/Company is to present to the Surveyor records or other documented evidence demonstrating implementation of the Ship cyber security and resilience program, i.e., that:

- The incident response plans are available for the responsible personnel onboard.

- Procedures or instructions for local/manual controls are available for responsible personnel onboard.

- Procedures or instructions for disconnection/isolation of security zones are available for responsible personnel onboard.

- Any cyber incidents have been responded to in accordance with the incident response plans.

25.12.2 Subsequent annual surveys

The Owner/Company is to upon request by the Surveyor demonstrate implementation of the Ship cyber security and resilience program by presenting records or other documented evidence as specified for the first annual survey.

25.13 Local, independent and/ or manual operation

25.13.1 Special surveys

Subject to modifications of the CBSs, the Owner/Company is to demonstrate to the Surveyor the relevant activities (pertaining to the commissioning phase, refer Part 4, Chapter 7, Section 7.6.4.2.3 b) of the Rules) as per the Ship cyber resilience test procedure.

25.14 Network isolation

25.14.1 Special surveys

Subject to modifications of the CBSs, the Owner/Company is to demonstrate to the Surveyor the relevant activities (pertaining to the commissioning phase, refer Part 4, Chapter 7, Section 7.6.4.3.3 b) of the Rules) as per the Ship cyber resilience test procedure.

25.15 Fallback to a minimal risk condition

25.15.1 Special surveys

Subject to modifications of the CBSs, the Owner/Company is to demonstrate to the Surveyor the relevant activities (pertaining to the commissioning phase, refer Part 4, Chapter 7, Section 7.6.4.4.3 b) of the Rules) as per the Ship cyber resilience test procedure.

25.16 Recovery plan

25.16.1 First annual survey

The Owner/Company is to present to the Surveyor, records or other documented evidence demonstrating implementation of the Ship cyber security and resilience program, i.e., that:

- Instructions and/or procedures for incident recovery are available for the responsible personnel onboard.

- Equipment, tools, documentation, and/or necessary software and data needed for recovery is available for the responsible personnel onboard.

- Backup of the CBSs have been taken in accordance with the policies and procedures.

- Manuals and procedures for shutdown, reset, restore and restart

are available for the responsible personnel onboard.

25.16.2 Subsequent annual surveys

The Owner/Company is to upon request by the Surveyor demonstrate implementation of the Ship cyber security and resilience program by presenting records or other documented evidence as specified for the first annual survey.

25.17 Backup and restore capability

25.17.1 Special surveys

Subject to modifications of the CBSs, the Owner/Company is to demonstrate to the Surveyor the relevant activities (pertaining to the commissioning phase, refer Part 4, Chapter 7, Section 7.6.5.2.3 a) of the Rules) as per the Ship cyber resilience test procedure.

25.18 Controlled shutdown, reset, roll-back and restart

25.18.1 Special surveys

Subject to modifications of the CBSs, the Owner/Company is to demonstrate to the Surveyor the relevant activities (pertaining to the commissioning phase, refer Part 4, Chapter 7, Section 7.6.5.3.3 b) of the Rules) as per the Ship cyber resilience test procedure.

25.19 Appendix 1 may be referred for summary of actions to be taken and documents to be maintained by various stakeholders.

Appendix I – Summary of actions and documents

Legend:

Submit	The stakeholder is to submit the document to IRS for verification and approval of compliance with requirements in Part 4, Chapter 7, Section 7 of the Rules.
Maintain	The stakeholder is to keep the document updated in accordance with procedure for management of change (MoC). Updated document and change management records are to be submitted to IRS as per Part 4, Chapter 7, Section 6 of the Rules.
Demonstrate	The stakeholder is to demonstrate compliance to IRS in accordance with the approved document.
1st AS	First annual survey
AS	Annual survey
SS	Special survey

Contents

Chapter 1 : General Requirements

Section 1 : Conditions for Manufacture, Survey and Certification

1.1 Scope

1.2 Information to be supplied to the manufacturer

1.3 Manufacture

1.4 Survey procedure

1.5 Chemical composition

1.6 Heat treatment

1.7 Test material

1.8 Mechanical tests

1.9 Definitions

1.10 Retest procedures

1.11 Visual and non-destructive examination

1.12 Rectification of defective material

1.13 Identification of materials

Section 2 : Certification of Materials Based on Alternative Certification Scheme

2.1 General

2.2 Requirements for approval

2.3 Information required for approval

Chapter 2 : Mechanical Testing Procedures

Section 1 : General Requirements

1.1 General

1.2 Selection of test samples

1.3 Preparation of test specimens

1.4 Discarding of test specimens

Section 2 : Tensile Testing

2.1 Dimensions of tensile test specimens

2.2 Fracture elongation

2.3 Definition of yield stress

2.4 Procedure for tensile testing at ambient temperature

2.5 Procedure for tensile testing at elevated temperatures

2.6 Bend Test Specimen

Section 3 : Impact Tests

3.1 Dimensions of test pieces

3.2 Testing procedure

3.3 Charpy Re-test procedure

3.4 Drop Weight Specimens

Section 4 : Ductility Testing of Pipes and Tubes

4.1 Bend tests

4.2 Flattening tests

4.3 Drift expanding test

4.4 Flanging tests

4.5 Ring expanding test

4.6 Ring tensile test

Section 5 : The Brittle Crack Arrest Toughness Test

5.1 Scope

5.2 Test Procedures

5.3 Determination of Kca at a specific temperature and its evaluation

Section 6 : Isothermal Crack Arrest Temperature (CAT) Test

6.1 Scope

6.2 Symbols

6.3 Testing equipment

6.4 Test specimens

6.5 Test Method

6.6 Measurements after test and test validation judgement

6.7 Judgement of 'arrest' or 'propagate'

6.8 T_{test}, T_{arrest} and CAT determination

6.9 Reporting

6.10 Use of test for material qualification testing

Chapter 3 : Rolled Steel Plates, Strips, Sections and Bars

Section 1 : General Requirements

1.1 Scope

1.2 Manufacture

1.3 Quality of materials

1.4 Thickness tolerance of plates and wide flats with width $\geq$ 600 [mm]

1.5 Heat treatment, condition of supply

1.6 Test material

1.7 Mechanical test specimens

1.8 Surface inspection and dimensions

1.9 Freedom from defects

1.10 Special quality plate material ('z' quality)

1.11 Branding of materials

1.12 Test certificates or other documentation

Section 2 : Normal Strength Steels for Ship Structures

2.1 General

2.2 Approval

2.3 Method of manufacture

2.4 Chemical composition

2.5 Condition of supply

2.6 Mechanical properties

2.7 Surface quality

2.8 Internal soundness

2.9 Tolerances

2.10 Identification of materials

2.11 Testing and inspection

2.12 Test material

2.13 Mechanical test specimens

2.14 Number of test specimens

2.15 Retest procedures

Section 3 : Higher Strength Steels for Ship Structures

3.1 General

3.2 Approval

3.3 Method of manufacture

3.4 Chemical composition

3.5 Condition of supply

3.6 Mechanical properties

3.7 Surface quality

3.8 Internal Soundness

3.9 Tolerances

3.10 Identification of Materials

3.11 Testing and Inspection

3.12 Test Material

3.13 Mechanical tests specimens

3.14 Number of Test Specimens

3.15 Manufacturing approval scheme for EH47 steels

3.16 Retest Procedures

Section 4 : High Strength Steels for Welded Structures

4.1 General

4.2 Approval

4.3 Method of manufacture

4.4 Chemical composition

4.5 Delivery condition – Rolling process and heat treatment

4.6 Mechanical properties

4.7 Tolerances

4.8 Surface quality

4.9 Internal soundness

4.10 Stress relieving heat treatment and other heat treatments

4.11 Facilities for inspection

4.12 Identification of materials

4.13 Branding

4.14 Documentation of inspection tests

Section 5 : Steel for Low Temperature Service

5.1 General

5.2 Deoxidation and chemical composition

5.3 Heat treatment

5.4 Mechanical tests

Section 6 : Steels for Boilers and Pressure Vessels

6.1 General

6.2 Deoxidation and chemical composition

6.3 Heat treatment, condition of supply

6.4 Mechanical tests

6.5 Mechanical properties for design purposes at elevated temperatures

Section 7 : Steels for Machinery Structures

7.1 General

Section 8 : Plates with Specified minimum through Thickness Properties (‘Z’ Quality)

8.1 General

8.2 Manufacture

8.3 Test material

8.4 Dimensions of through thickness tensile test specimens

8.5 Mechanical tests

8.6 Non-destructive examination

Section 9 : Austenitic and Duplex Stainless Steels

9.1 Scope

9.2 Chemical composition

9.3 Heat treatment

9.4 Mechanical tests

9.5 Through thickness tests

9.6 Intergranular corrosion tests

9.7 Dimensional tolerances

9.8 Clad plates

9.9 Identification of materials

9.10 Certification of materials

Section 10 : Brittle Crack Arrest Steels

10.1 General

10.2 Manufacturing Approval Scheme

Annex 1 Approval Scheme of Small-scale Test Methods for Brittle Crack Arrest Steels

Chapter 4 : Steel Castings

Section 1 : General Requirements

1.1 Scope

1.2 Manufacture

1.3 Quality of castings

1.4 Chemical composition

1.5 Inspection

1.6 Hydraulic pressure testing

1.7 Rectification of defective castings

1.8 Identification of castings

1.9 Certification

Section 2 : Hull and Machinery Steel Castings for General Applications

2.1 Scope

2.2 Manufacture

2.3 Quality of Castings

2.4 Chemical composition

2.5 Heat treatment (including straightening)

2.6 Mechanical tests

2.7 Mechanical properties

Section 3 : Ferritic Steel Castings for Low Temperature Services

3.1 General

3.2 Chemical composition

3.3 Heat treatment

3.4 Mechanical tests

3.5 Non-destructive testing

Section 4 : Steel Castings for Propellers

4.1 Scope

4.2 Foundry Approval

4.3 Quality of castings

4.4 Dimensions, dimensional and geometrical tolerances

4.5 Chemical Composition

4.6 Heat treatment

4.7 Mechanical properties

4.8 Definition of skew, severity zones

4.9 Non-destructive examination

4.10 Acceptance criteria for liquid penetrant testing and magnetic particle testing

4.11 Repair of defects

4.12 Welding repair procedure

4.13 Identification and marking

4.14 Document and Certification

4.15 Welding procedure qualification test for repair of cast steel propeller

Section 5 : Austenitic Stainless Steel Castings

5.1 Scope

5.2 Chemical composition

5.3 Heat treatment

5.4 Mechanical tests

5.5 Intergranular corrosion tests

5.6 Non-destructive examination

Section 6 : Castings for other Applications

6.1 General

Chapter 5 : Steel Forgings

Section 1 : General Requirements

1.1 Scope

1.2 Manufacture

1.3 Quality of forgings

1.4 Chemical composition

1.5 Heat treatment (including surface hardening and straightening)

1.6 Mechanical tests

1.7 Inspection

1.8 Rectification of defective forgings

1.9 Identification of forgings

1.10 Certification

Section 2 : Hull and Machinery Steel Forgings for General Applications

2.1 Scope

2.2 Chemical composition

2.3 Mechanical tests

2.4 Mechanical properties

Section 3 : Ferritic Steel Forgings for Low Temperature Service

3.1 Scope

3.2 Chemical composition

3.3 Heat treatment

3.4 Mechanical tests

3.5 Pressure tests

Section 4 : Austenitic Stainless Steel Forgings

4.1 General

4.2 Mechanical properties for design purposes

4.3 Non-destructive testing

4.4 Intergranular corrosion tests

Chapter 6 : Steel Pipes and Tubes

Section 1 : General Requirements

1.1 Scope

1.2 Manufacture

1.3 Quality

1.4 Chemical composition

1.5 Heat treatment

1.6 Test material

1.7 Test specimens and testing procedures

1.8 Visual and non-destructive testing

1.9 Hydraulic tests

1.10 Rectification of defects

1.11 Identification

1.12 Certification

Section 2 : Seamless Pressure Pipes

2.1 General

2.2 Manufacture and chemical composition

2.3 Heat treatment

2.4 Mechanical tests

2.5 Mechanical properties for design

Section 3 : Welded Pressure Pipes

3.1 General

3.2 Manufacture and chemical composition

3.3 Heat treatment

3.4 Mechanical tests

3.5 Mechanical properties for design

Section 4 : Boiler and Superheater Tubes

4.1 General

4.2 Manufacture and chemical composition

4.3 Heat treatment

4.4 Mechanical tests

4.5 Mechanical properties for design

Section 5 : Tubes and Pipes for Low Temperature Services

5.1 Scope

5.2 Manufacture

5.3 Chemical composition

5.4 Heat treatment

5.5 Mechanical tests

Section 6 : Austenitic Stainless Steel Pressure Pipes

6.1 Scope

6.2 Manufacture and chemical composition

6.3 Heat treatment

6.4 Mechanical tests

6.5 Intergranular corrosion tests

6.6 Fabricated pipework

Chapter 7 : Iron Castings

Section 1 : General Requirements

1.1 Scope

1.2 Manufacture

1.3 Quality of castings

1.4 Chemical composition

1.5 Heat treatment

1.6 Mechanical tests

1.7 Mechanical properties

1.8 Visual and non-destructive examination

1.9 Metallographic examination

1.10 Rectification of defective castings

1.11 Identification of castings

1.12 Certification

Chapter 8 : Copper Alloys

Section 1 : General Requirements

1.1 Scope

Section 2 : Castings for Valves and Fittings

2.1 Scope

2.2 Manufacture

2.3 Quality of castings

2.4 Chemical composition

2.5 Heat treatment

2.6 Mechanical tests

2.7 Visual examination

2.8 Pressure testing

2.9 Rectification of defective castings

2.10 Identification

2.11 Certification

Section 3 : Castings for Propellers

3.1 Scope

3.2 Foundry approval

3.3 Moulding and casting

3.4 Quality of castings

3.5 Dimensions, dimensional and geometrical tolerances

3.6 Chemical composition and metallurgical characteristics

3.7 Mechanical properties and tests

3.8 Definition of skew, severity zones

3.9 Non-destructive testing

3.10 Acceptance criteria for liquid penetrant testing

3.11 Repair of defects

3.12 Welding repair procedure

3.13 Straightening

3.14 Identification and marking

3.15 Manufacturer’s Certificates

3.16 Welding procedure qualification tests for repair of cast copper alloy propeller

Section 4 : Tubes

4.1 Scope

4.2 Manufacture

4.3 Quality

4.4 Chemical composition

4.5 Heat treatment

4.6 Mechanical tests

4.7 Visual examination

4.8 Stress cracking test

4.9 Hydraulic test

4.10 Identification

4.11 Certification

Chapter 9 : Aluminium Alloys

Section 1 : General

1.1 Scope

Section 2 : Wrought Aluminium Alloys

2.1 Scope

2.2 Manufacture

2.3 Quality of materials

2.4 Dimensional tolerances

2.5 Chemical composition

2.6 Heat treatment

2.7 Test material

2.8 Testing and inspection

2.9 Freedom from defects

2.10 Corrosion testing

2.11 Test materials

2.12 Mechanical test specimens

2.13 Number of test specimens

2.14 Retest procedures

2.15 Visual and non-destructive examination

2.16 Rectification of defects

2.17 Identification

2.18 Certification

Section 3 : Aluminium Alloy Castings

3.1 Scope

3.2 Manufacture

3.3 Quality of castings

3.4 Chemical composition

3.5 Heat treatment

3.6 Mechanical tests

3.7 Visual examination

3.8 Rectification of defective castings

3.9 Pressure testing

3.10 Identification

3.11 Certification

Section 4 : Aluminium/Steel Transition Joints

4.1 Scope

4.2 Manufacture

4.3 Visual and non-destructive examination

4.4 Mechanical tests

4.5 Identification

4.6 Certification

Chapter 10 : Equipment

Section 1 : Anchors

1.1 Scope

1.2 Manufacture

1.3 Dimensions and tolerances

1.4 Proof test of anchors

1.5 Inspections and other tests

1.6 Identification

1.7 Painting

Section 2 : Stud Link Chain Cables

2.1 Scope

2.2 Manufacture

2.3 Design and tolerances

2.4 Material for welded chain cables and accessories

2.5 Material for cast chain cables and accessories

2.6 Material for forged chain cables and accessories

2.7 Heat treatment of completed chain cables

2.8 Materials and welding of studs

2.9 Testing of completed chain cables

2.10 Accessories for chain cables

2.11 Identification

Section 3 : Short Link Chain Cables

3.1 General

3.2 Testing and inspection of chain cables

Section 4 : Steel Wire Ropes

4.1 General

4.2 Materials

4.3 Zinc coating tests

4.4 Test on completed ropes

4.5 Identification

Section 5 : Offshore Mooring Chains

5.1 Scope

5.2 Chain grades

5.3 Approval of chain manufacturers

5.4 Approval of quality system at chain and accessory manufacturers

5.5 Approval of steel mills - rolled bar

5.6 Approval of forge shops and foundries - accessories

5.7 Rolled steel bars

5.8 Forged steel

5.9 Cast steel

5.10 Materials for studs

5.11 Design and manufacture

5.12 Chain cable manufacturing process

5.13 Testing and inspection of finished chain

5.14 Testing and inspection of accessories

5.15 Chafing chain for single point mooring arrangements

Chapter 11 : Approval of Welding Consumables for Use in Ship Construction

Section 1 : General

1.1 Scope

1.2 Manufacture

1.3 Grading

1.4 Approval procedure

1.5 Test assemblies

1.6 Annual inspection and tests

1.7 Upgrading and uprating

1.8 Dimensions of test specimens

1.9 Testing procedures

1.10 Re-test procedures

1.11 Chemical composition

Section 2 : Electrodes for Normal Penetration Manual Welding

2.1 General

2.2 Deposited metal tests

2.3 Butt weld tests

2.4 Fillet weld tests

2.5 Hydrogen test

2.6 Covered electrodes for gravity or contact welding

2.7 Annual tests

2.8 Upgrading and uprating

2.9 Certification

Section 3 : Deep Penetration Electrodes for Manual Welding

3.1 General

3.2 Deep penetration butt weld tests

3.3 Deep penetration fillet weld test

3.4 Electrodes designed for gravity or contact welding

3.5 Annual tests

3.6 Certification

Section 4 : Wire-flux Combinations for Submerged Arc Automatic Welding

4.1 General

4.2 Multi-run technique

4.3 Deposited metal tests

4.4 Butt weld test (two-run technique)

4.5 Butt weld test (multi-run technique)

4.6 Annual tests

4.7 Upgrading and uprating

Section 5 : Wires and Wire-gas Combinations for Semi-automatic and Automatic Welding

5.1 General

5.2 Approval tests for two-run automatic welding

5.3 Approval tests for semi-automatic multi-run welding

5.4 Approval tests for multi-run automatic welding

5.5 Annual tests

5.6 Upgrading and uprating

2 *Certification of Materials Based on Alternative Certification Scheme*

Section 1

Conditions for Manufacture, Survey and Certification

1.1 Scope

1.1.1 Materials, used for the construction or repair of the hull and machinery of ships which are classed or intended to be classed with IRS, are to be manufactured, tested and inspected in accordance with the requirements of this Part.

1.1.2 Materials complying with recognized national or international standards with specifications equivalent to the requirements of this Part may be accepted.

1.2 Information to be supplied to the manufacturer

1.2.1 The ship or machinery builder is to provide the manufacturer with such information as is necessary to ensure that inspection and testing can be carried out in accordance with these Rules.

1.3 Manufacture

1.3.1 Materials used for the construction or repair of the hull and machinery of ships which are classed or intended to be classed with IRS are to be made at works which have been approved by IRS for the type of the product being supplied.

1.3.2 Where this part of the Rules requires materials or products to be manufactured at works approved by IRS, consideration may be given by IRS for the acceptance of works approved by other IACS Member Societies.

1.3.3 The manufacturer should demonstrate to the satisfaction of IRS that necessary manufacturing and testing facilities are available and are supervised by qualified personnel.

1.3.4 Approval of manufacturers with respect to the materials and grades covered by this Part will be considered by IRS on the basis of a detailed description of the manufacturing process and inspection routines, results from testing of materials and a report made by IRS Surveyors confirming the information given by the works and results.

1.3.5 Where the manufacturer has more than one works, approval for individual works would be required.

1.4 Survey procedure

1.4.1 The Surveyors are to be allowed access to all the relevant parts of the works and are to be provided with necessary facilities and information to enable them to verify that manufacture is being carried out in accordance with the approved procedure. Adequate facilities are also to be provided for the selection of test materials, the witnessing of mechanical tests and the examination of materials, as required by these Rules.

1.4.2 Prior to the submission of material for acceptance, manufacturers are to provide the Surveyors with details of the order specification and any special conditions additional to the Rule requirements.

1.4.3 Before final acceptance, all materials are to be submitted to specified tests and examinations under conditions acceptable to the Surveyors. The results are to comply with Rules and all materials are to be to the satisfaction of the Surveyors.

1.4.4 The specified tests and examinations are to be carried out prior to the dispatch of all finished materials from the manufacturer's works. Where materials are supplied in the rough or unfinished condition, as many as possible of the specified tests are to be carried out by the manufacturer and any tests or examinations not completed are to be carried out in consultation with the Surveyors, at a subsequent stage of manufacture.

1.4.5 In the event of any material proving unsatisfactory, during subsequent working, machining or fabrication, it is to be rejected, not withstanding any previous certification.

1.5 Chemical composition

1.5.1 The chemical composition of the ladle samples is to be determined by the manufacturer in an adequately equipped and competently staffed laboratory. The manufacturer's analysis will be accepted, but may be subject to occasional independent checks if required by the Surveyors.

1.5.2 At the discretion of the Surveyors, a check chemical analysis of suitable samples from products may also be required. These samples are to be taken from the material used for mechanical tests, but where this is not practicable an alternative procedure for obtaining a representative sample is to be agreed with the manufacturer.

1.6 Heat treatment

1.6.1 Materials are to be supplied in the condition specified in, or permitted by the Rules. Heat treatment is to be carried out in properly constructed furnaces which are efficiently maintained and have adequate means for control and recording of temperature. The furnace dimensions are to be such as to allow the whole item to be uniformly heated to the necessary temperature. In the case of very large components which require heat treatment, alternative methods will be specially considered.

1.7 Test material

1.7.1 Sufficient test material is to be provided for the preparation of the tests detailed in the specific requirements. It is, however, in the interests of manufacturers to provide additional material for any retests which may be necessary, as insufficient or unacceptable test material may be a cause for rejection.

1.7.2 The test material is to be representative of the item or batch and is not to be separated until all the specified heat treatment has been completed, except where provision for an alternative procedure is made in the subsequent chapters of this Part.

In case of castings where separately cast test samples are accepted, the test samples are to be cooled down under the same conditions as the castings.

1.7.3 All test material is to be selected by the surveyor and identified by suitable markings which are to be maintained during the preparation of the test specimen.

1.8 Mechanical tests

1.8.1 The number and direction of test specimens and their dimensions are to be in accordance with the requirements of subsequent chapters of this Part and the specific requirements for the product.

1.8.2 Where Charpy impact tests are required, a set of three test specimens are to be prepared and the average energy value is to comply with the requirements of subsequent Chapters of this part. One individual value may be less than the required average value provided that it is not less than 70 per cent of that value.

1.8.3 Where metric or imperial units are to be used for acceptance testing, the specified values are to be converted in accordance with the appropriate conversions given in Table 1.8.1.

Table 1.8.1 : **Conversion of SI units to metric and imperial units**

1 N/mm^2 or Mpa	= 0.102 kgf/mm^2
1 N/mm^2 or Mpa	= 0.0647 tonf/in^2
1 N/mm^2 or Mpa	= 0.145 x 10^3 lbf/in^2
1 J	= 0.102 Kgf m
1 J	= 0.738 ft lbs
1 Kgf/mm^2	= 9.81 N/mm^2 or MPa
1 tonf/in^2	= 15.45 N/mm^2 or MPa
1 lbf/in^2	= 6.89 x 10^{-3} MPa
1 kgf m	= 9.81 J
1 ft lbf	= 1.36 J

Notes :

The conversions may be rounded to the nearest multiples as follows :

1	For tensile strength values at ambient temperature	1 Kgf/mm^2 0.5 tonf/in^2 1 x 10^3 lbf.in^2 10N/mm^2
2	For yield and proof stress values at ambient temperature	0.5 kgf/mm^2 0.2 tonf/in^2 0.5 x 10^3 lbf/in^2 5 N/mm^2
3	For lower yield or proof stress values at elevated temperatures and stress to rupture.	0.1 kgf/mm^2 0.05 tonf/in^2 0.1 x 10^3 lbf/in^2 1 N/mm^2
4	For impact energy values	0.1 kgf m 1 ft lbf 1 J

1.9 Definitions

1.9.1 The following definitions are applicable to this Part:

Item A single forging, casting, plate, tube or other rolled product as delivered.

Piece The rolled product from a single slab or billet or from a single ingot if this is rolled directly into plates, strips, sections or bars.

Batch A number of similar items or pieces presented as a group for acceptance testing.

1.10 Retest procedures

1.10.1 Where the result of any test, other than an impact test, does not comply with the requirements, two additional tests of the same type may be taken. For acceptance of the material satisfactory results are to be obtained from both of these tests.

1.10.2 Where the results from a set of three impact test specimens do not comply with the requirements, an additional set of three impact test specimens may be tested provided that not more than two individual values are less than the required average value and, of these, not more than one is less than 70 per cent of this average value. The results obtained are to be combined with the original results to form a new average which, for acceptance, is not to be less than the required average value. Additionally, for these combined results, not more than two individual values are to be less than the required average value and, of these, not more than one is to be less than 70 per cent of this average value.

1.10.3 The additional tests detailed in 1.10.1 and 1.10.2 are, where possible, to be taken from material adjacent to the original tests. For castings, however, where insufficient material remains in the original test samples, the

additional tests may be prepared from other test samples representative of the castings.

1.10.4 When unsatisfactory results are obtained from tests representative of a batch of material, the item or piece from which the tests were taken is to be rejected. The remainder of the batch may be accepted provided that two further items or pieces are selected and tested with satisfactory results. If the tests from one or both of these additional items or pieces give unsatisfactory results, the batch is to be rejected.

1.10.5 When a batch is rejected, the remaining items or pieces in the batch may be re-submitted individually for test, and those which give satisfactory results may be considered for acceptance by the Surveyors.

1.10.6 At the option of the manufacturer, rejected material may be re-submitted as another grade and may then be considered for acceptance by the Surveyors, provided that the test results comply with the appropriate requirements.

1.10.7 When material which is intended to be supplied in the "as rolled" or "hot finished" condition fails test, it may be suitably heat treated and re-submitted for test, with the prior concurrence of the ship or machinery builder. Similarly materials supplied in the heat-treated condition may be re-heat treated and re-submitted for test.

1.11 Visual and non-destructive examination

1.11.1 Prior to the final acceptance of materials, surface inspection, verification of dimensions and non-destructive examination are to be carried out in accordance with the requirements detailed in subsequent chapters of this Part.

1.11.2 When there is visible evidence to doubt the soundness of any material or component, such as flaws in test specimens or suspicious surface marks, the manufacturer is expected to prove the quality of the material by any acceptable method.

1.12 Rectification of defective material

1.12.1 Small surface imperfections may be removed by mechanical means provided that, after such treatment, the dimensions are acceptable, the area is proved free from defects and the rectification has been completed in accordance with applicable requirements of subsequent chapters of this Part and to the satisfaction of Surveyors.

1.12.2 The repair of defects by welding can be accepted only when permitted by the appropriate specific requirements and provided that the agreement of the Surveyor is obtained before the work is commenced. When a repair has been agreed, it is necessary in all cases to prove by suitable methods of non-destructive examination that the defects have been completely removed before welding is commenced. Welding procedures and inspection on completion of the repair are to be in accordance with the appropriate specific requirement and are to be to the satisfaction of the Surveyor.

1.13 Identification of materials

1.13.1 The manufacturer is to adopt a system of identification which will enable all finished material to be traced to the original cast, and the Surveyors are to be given all facilities for so tracing the material when required. When any item has been identified by the personal mark of a Surveyor, or his deputy, this is not to be removed until an acceptable new identification mark has been made. Failure to comply with this condition will render the item liable to rejection.

1.13.2 Before any item is finally accepted it is to be clearly marked by the manufacturer in at least one place with the particulars detailed in the appropriate specific requirements.

1.13.3 Hard stamping is to be used except where this may be detrimental to the material, in which case stenciling, painting or electric etching is to be used. Paints used to identify alloy steels are to be free from lead, copper, zinc or tin, i.e., the dried film is not to contain any of these elements in quantities more than 250 ppm.

1.13.4 Where a number of identical items are securely fastened together in bundles, the manufacturer need only brand the top of each bundle. Alternatively a durable label giving the required particulars may be attached to each bundle.

Section 2

Certification of Materials Based on Alternative Certification Scheme

2.1 General

2.1.1 Alternative procedures for survey and testing may be accepted by IRS at works where materials are manufactured under closely control rolled conditions by semi-continuous or continuous processes under the Alternative Certification Scheme (ACS), as detailed in Part1, Chapter 1, Section 4 of the Rules.

2.1.2 Where it is considered that compliance with Rule requirements can be satisfactorily achieved, IRS will issue a Quality Assurance Approval Certificate, based on the ACS to the manufacturer.

2.1.3 The quality system procedures and practices of a manufacturer who has been granted approval will be kept under continuous review and audited as per the ACS.

2.2 Requirements for approval

2.2.1 The conditions for approval are broadly outlined in Pt.1, Ch.1, Sec. 4, Cl. 4.3 of the Rules.

2.3 Information required for approval

2.3.1 Manufacturers applying for approval under this scheme are to submit the information required by 2.3.2 to 2.3.6, in addition to the requirements of the ACS (Pt.1, Ch.1, Sec. 4, Cl. 4.4).

2.3.2 A detailed specification for each product.

2.3.3 An outline description of all important manufacturing plant and equipments. This is to include a production flow chart indicating all stages where testing and inspection are carried out along with details of equipments used for measuring and testing.

2.3.4 The system used for the identification and traceability of raw materials, semi-finished and finished Products.

2.3.5 Information on the system of procurement and acceptance of materials e.g. ingots, billets or blooms for further processing where the manufacturer does not produce such raw materials.

2.3.6 Consolidated test results, physical, chemical, non-destructive tests etc. for a period of preceding three months of products, if possible, covering the full range of thickness, weight range and grades for which approval is sought. The data is to include the number of samples, minimum, maximum, average value and standard deviation. For high strength ship steels, the carbon equivalent values are also required. The data is to also include numbers of rejections during manufacture as well as after delivery and reasons thereof.

2.4 Assessment and approval, maintenance of approval and certification of products would be generally based on the ACS detailed in Pt.1, Ch.1, Sec.4 of the Rules.

Mechanical Testing Procedures

Contents

Section

1 General Requirements

2 Tensile Testing

3 Impact Tests

4 Ductility Testing of Pipes and Tubes

5 The Brittle Crack Arrest Toughness Test

6 Isothermal Crack Arrest Temperature (CAT) Test

Section 1

General Requirements

1.1 General

1.1.1 All tests are to be carried out by competent personnel. The machines are to be maintained in satisfactory and accurate condition and are to be recalibrated at approximately annual intervals. This calibration is to be carried out by a nationally recognized Authority or other organization of standing and is to be carried out to the satisfaction of Surveyors. The accuracy of test machines is to be within ± one per cent. A record of all calibrations is to be kept available in the test house.

Testing machines are to be calibrated in accordance with the following or other equivalent recognized standards:

a) Tensile / compression testing : ISO 7500-1:2018
b) Impact testing : ISO 148-2:2016

1.2 Selection of test samples

1.2.1 Test samples are to be selected by the Surveyor unless otherwise agreed.

1.2.2 All materials in a batch presented for testing are to be of the same product form (e.g. plates, sections, bars). Normally, the materials are to be from the same cast and in the same condition of heat treatment.

1.3 Preparation of test specimens

1.3.1 If test samples are cut from material by flame cutting or shearing, a reasonable margin is required to enable sufficient material to be removed from the cut edges during final machining.

1.3.2 Test specimens are to be cut and prepared in a manner which does not affect their properties, i.e. not subjected to any significant cold straining or heating.

1.3.3 Where possible, test specimens from rolled materials are to retain their rolled surface on both sides.

1.4 Discarding of test specimens

1.4.1 If a test specimen fails because of faulty manufacture, visible defects, or incorrect operation of the testing machine, it may be discarded at the Surveyor's discretion and replaced by a new test specimen prepared from material adjacent to the original test.

Section 2

Tensile Testing

2.1 Dimensions of tensile test specimens

2.1.1 Generally, proportional test specimens with a gauge length of $5.65\sqrt{S_o}$ (where S_o is the cross-sectional area of the test length) are to be used. Where it is not possible to use such specimens, non-proportional specimens may be considered.

2.1.2 For the purpose of determining the different parameters related to tensile testing, three different types of test specimens may be used :

- Round test specimens;
- Flat test specimens; and
- Full cross-section test specimens.

See also Fig.2.1.1.

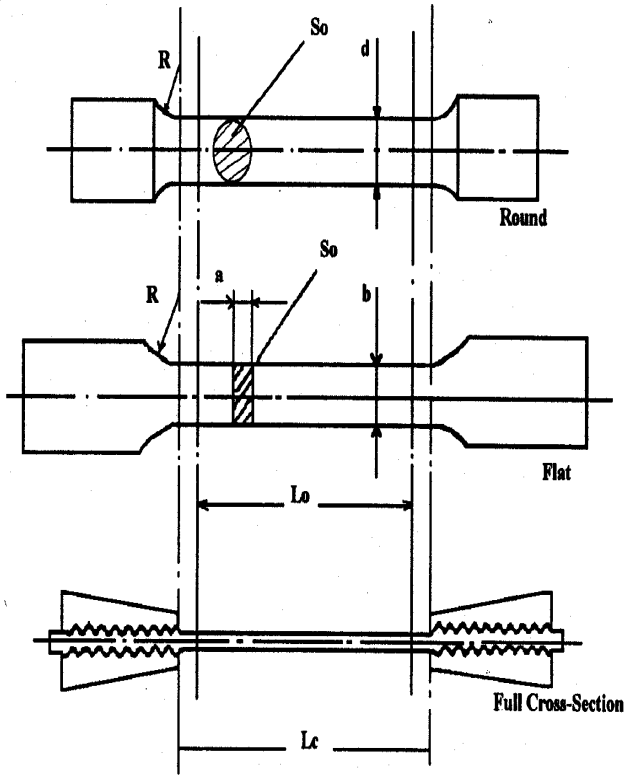

Fig. 2.1.1 : Tensile test specimens

2.1.2.1 The following symbols have been used in the figure and in subsequent paragraphs:-

d =diameter
a =thickness of specimen
b =width
Lo = Original gauge length
Lc = Parallel length
So = Original cross-sectional area
R = Transition radius
D =External tube diameter
t = plate thickness

2.1.2.2 The gauge length may be rounded off to the nearest 5 [mm] provided that the difference between this length and Lo is less than 10% of Lo.

2.1.2.3 For plates with thickness equal to and greater than 3 [mm], test specimen according to alternatives A or B given below are to be used. Where the capacity of the available testing machine is insufficient to allow the use of a test specimen of full thickness, this may be

reduced by machining one of the rolled surfaces.

Alternatively for materials over 40 [mm] thick, proportional round test specimens with dimensions as specified in C below may be used.

Alternative A, Non-proportional flat test specimen

a = t
b =25 [mm]
Lo =200 [mm]
Lc ≥ 212.5 [mm]
R =25 [mm]

Alternative B, Proportional flat test specimen

a = t

b =25 [mm]

$Lo = 5.65 \sqrt{S_o}$

$Lc \approx Lo + 2 \sqrt{S_o}$

R =25 [mm]

Alternative C, round test specimen

d =14 [mm] in general, but in no case less than 10 mm nor more than 20 [mm].

Lo = 5d [mm

Lc ≥ Lo + d/2 [mm]

R =10 [mm], in general
≥ 1.5 d [mm], for nodular cast iron and materials with a specified elongation of less than 10%.

2.1.2.4 The round test specimen is to be located with its center t/4 from the plate surface or as close to this position as possible.

2.1.2.5 For sheets and strips with thickness less than 3 [mm]

a = t
b =12.5 [mm]
Lo =50 [mm]
Lc ≈75 [mm]
R =25 [mm]

2.1.2.6 Wires: Full cross sectional test specimen with the following dimensions is to be used:

Lo =200 [mm]

Lc =Lo + 50 [mm].

2.1.2.7 For forgings, castings (excluding grey cast iron) and bars round test specimens with dimensions as specified in alternative C of 2.1.2.3 are usually to be used.

2.1.2.8 If for special reasons, other dimensions are to be used, they will have to conform with the following geometric relationship:

Lo =5d;

Lc =Lo + d:

R=10 [mm], except for materials with a specified minimum elongation A ≤ 10 per cent, where R is to be 1.5 x d.

2.1.2.9 For tubes, test specimen according to alternative A or B below are to be used:

Alternative A :- Full cross-section test specimens with plugged ends -

$Lo = 5.65 \sqrt{S_o}$

$Lc \approx Lo + D/2$

Lc is the distance between the grips or the plugs, whichever is smaller.

Alternative B :- Strip
a =wall thickness of tube
b ≥ 12 [mm]
$Lo = 5.65 \sqrt{S_o}$
Lc = Lo + 2b

The parallel test length is not to be flattened. but the enlarged ends may be flattened for gripping in the testing machine.

Round test specimens may also be used provided that the wall thickness is sufficient to allow the machining of such specimens to the dimensions in alternative C in 2.1.2.3 above with their axes located at the midwall thickness.

2.1.2.10 The above is subject to any specific dimensions or minimum cross-sectional area

requirements, with respect to test specimens, given in any subsequent Chapters of this Part.

2.1.2.11 Tensile test specimens for grey cast iron are to be machined to the dimensions shown in Fig.2.1.2. Usually test specimens are machined from separately cast standard test coupons with 30 [mm] diameter.

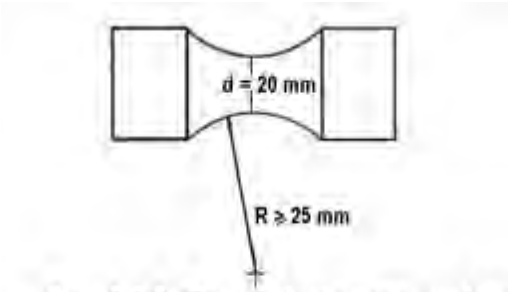

Fig : 2.1.2 : Tensile test specimen for grey cast iron

2.1.2.12 The tolerances on specimen dimensions are to be in accordance with ISO 6892-1:2019, ISO 6892-2:2018 or other recognised standards as appropriate.

2.1.2.13 Aluminium Alloys: Flat tensile test specimens are to be used for specified thicknesses up to and including 12.5 [mm]. The tensile test specimens are to be prepared so that both rolled surfaces are maintained. For thicknesses exceeding 12.5 [mm], round tensile specimens are to be used. For thicknesses up to and including 40 [mm], the longitudinal axis of the round tensile test specimen is to be located at a distance from the surface equal to half of the thickness. For thicknesses over 40 [mm], the longitudinal axis is to be located at a distance from one of the surfaces equal to one quarter of the thickness.

2.2 Fracture elongation

2.2.1 Unless otherwise specified, the elongation values in this part correspond to those required for proportional test specimens over a gauge length 5.65 $\sqrt{S_o}$.

If any part of the fracture takes place outside of the middle one-third of the original gauge length, the elongation value obtained may not be representative of the material. In such cases if the elongation measured is less than the minimum requirements, the test result may be discarded and a retest carried out.

2.2.2 If the material is ferritic steel of low or medium strength and not cold worked the elongation may also be measured on a non-proportional gauge length after agreement with IRS.

In that case the elongation required is to be calculated from the following formula:

$$A_o = 2 \text{ x } A_s \left[\frac{\sqrt{S_o}}{L_o} \right]^{0.4}$$

where,

A_o = Required elongation for the non-proportional test specimen

A_s = Specified elongation on a gauge length of $5.65\sqrt{S_o}$

S_o = Cross-sectional area of test specimen

L_o = Gauge length of test specimen.

For tables and graphs, refer ISO 2566-1:1984, ISO 2566-2:1984.

2.3 Definition of yield stress

2.3.1 The yield phenomenon is not exhibited by all the steels detailed in this Part but, for simplification the term "Yield Stress" is used throughout when requirements are specified for acceptance testing at ambient temperature.

2.3.2 Where reference is made to "Yield Stress" in the requirements for carbon, carbon-manganese and alloy steel products and in the requirements for the approval of welding consumables, either the upper yield stress or the 0.2 per cent proof stress under load is to be determined.

2.3.3 For austenitic and duplex stainless steel products and welding consumables, both the 0.2 per cent and 1.0 per cent proof stresses are to be determined.

2.4 Procedure for tensile testing at ambient temperature

2.4.1 Unless otherwise specified, the test is to be carried out at ambient temperature between 10^0C and 35^0C.

2.4.2 Yield stress (Yield point) is to be taken as the value of stress measured at the commencement of plastic deformation at yield or the value of the stress measured at the first peak obtained during yielding even when the peak is equal to or less than any subsequent peaks observed during plastic deformation at

yield. The tensile test is to be carried out with an elastic stress rate within the limits indicated in Table 2.4.2.

Table 2.4.2

Modulus of elasticity of the material (E) [N/mm^2]	Rate of stressing [N/mm^2] per second	
	Min.	Max.
< 150 000	2	20
≥ 150 000	6	60

2.4.3 After reaching the yield or proof load, the straining rate may be increased to a maximum of 0.008 per second for the determination of tensile strength.

2.4.4 For steel, the upper yield stress is to be calculated from :

a) the load immediately prior to a distinct drop in the testing machine lever; or

b) the load immediately prior to a fall back in the movement of the pointer or the load at a marked hesitation of this pointer; or

c) a load/extension diagram using the value of load measured either at the commencement of plastic deformation or yield or at the first peak obtained during yielding even when that peak is equal to or less than any subsequent peaks observed.

2.4.5 The 0.2 or 1.0 per cent proof stress (non-proportional elongation) is to be determined from an accurate load/extension diagram by drawing a line parallel to the straight elastic portion and distant from it by an amount representing 0.2 or 1.0 per cent of extensometer gauge length. The point of intersection of this line with the plastic portion of the diagram represents the proof load, from which 0.2 or 1.0 per cent proof stress can be calculated.

2.5 Procedure for tensile testing at elevated temperatures

2.5.1 The test specimens used for the determination of lower yield or 0.2 per cent proof stress at elevated temperatures are to have an extensometer gauge length of not less than 50 [mm] and a cross sectional area of not less than 65 [mm^2]. Where, however, this is precluded by the dimensions of the product or by the test equipment available, the test specimen is to be of the largest practical dimensions.

2.5.2 The heating apparatus is to be such that the temperature of the specimen during testing does not deviate from that specified by more than ± 5°C.

2.5.3 The straining rate when approaching the lower yield or proof load is to be controlled within the range 0.1 to 0.3 per cent of the extensometer gauge length per minute.

2.5.4 The time intervals used for estimation of strain rate from measurements of strain are not to exceed 6 seconds.

2.6 Bend Test Specimen

2.6.1 Flat bend test specimen, as given in the following, is to be used (Ref. Fig. 2.6.1). Edges on tension side to be rounded to a radius of 1 to 2 mm.

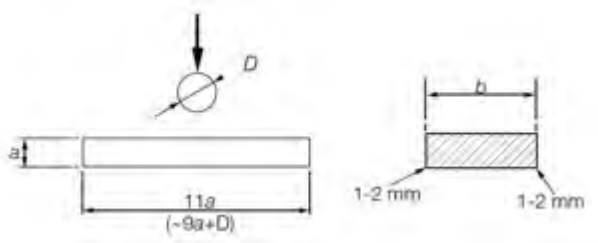

Fig. 2.6.1: Bend Test Specimen

2.6.2 Forgings, castings and semi-finished products

a = 20 mm
b = 25 mm

2.6.3 Plates, structural sections, sheets:

a = t
b = 30 mm

2.6.4 Butt welds, transverse specimen

a) face and root bend

a = t
b = 30 mm

If the as rolled thickness t is greater than 25 mm, it may be reduced to 25 mm by machining on the compression side of the bend specimen.

The surfaces of the weld are to be machined (ground) flush with the surface of the plate.

b) side bend

a = 10 mm
b = t

If t ≥ 40 mm, the side-bend specimen may be subdivided, each part being at least 20 mm wide.

2.6.5 Butt weld, longitudinal specimens

The test specimens, for longitudinal face and root test, are to be in accordance with an appropriate recognized standard.

Section 3

Impact Tests

3.1 Dimensions of test pieces

3.1.1 Impact tests are to be of either the charpy V-notch or the charpy U-notch type as required by the subsequent Chapters. The test specimens are to be machined to the dimensions and tolerances given in Table 3.1.1 and Table 3.1.2 and are to be carefully checked for dimensional accuracy.

3.1.2 For material under 10 [mm] in thickness the largest possible size of standard subsidiary charpy V-notch is to be prepared with the notch cut in the narrow face. Generally, impact tests are not required when the thickness of material is less than 5 [mm] (less than 6 [mm] for pipes and tubes).

Table 3.1.1 : Dimensions and tolerances for charpy V-notch impact test specimens

Dimensions	Nominal	Tolerance
Length [mm]	55	± 0.60
Width [mm]		
- standard specimen	10	± 0.11
- subsize specimen	7.5	± 0.11
- subsize specimen	5	± 0.06
Thickness [mm]	10	± 0.06
Angle of notch	45°	± 2°
Depth below notch [mm]	8	± 0.06
Root radius [mm]	0.25	± 0.025
Distance of notch from end of specimen [mm]	27.5	± 0.42
Angle between plane of symmetry of notch and longitudinal axis of test specimen	90°	± 2°
Ref. Fig.3.1.1		

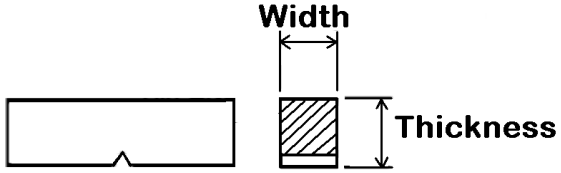

Fig.3.1.1

Table 3.1.2 : Dimensions and tolerances for charpy U-notch impact test specimens		
Dimensions	**Nominal**	**Tolerance**
Length [mm]	55	± 0.60
Width [mm]	10	± 0.11
Thickness [mm]	10	± 0.11
Depth of notch [mm]	5	± 0.09
Root radius [mm]	1	± 0.07
Distance of notch from end of test specimen [mm]	27.5	± 0.42
Angle between plane of symmetry of notch and longitudinal axis of test specimen	90°	± 2°
Ref. Fig.3.1.1		

3.2 Testing procedure

3.2.1 All impact tests are to be carried out on Charpy machines having a striking energy of not less than 150J and complying with following requirements:-

a) Distance between supports 40 + 5 [mm] - 0

b) Radius of curvature of supports 1 -1.5 [mm]

c) Taper of supports 1 in 5

d) Angle at tip of hammer 30 ± 1°

e) Radius of curvature of hammer 1.0-2.5[mm]

f) Speed of hammer at the instant of striking 4.5-7 [m/sec].

Note: Charpy machines complying with the requirements of recognized national or international standards such as ISO 148-2:2016 are acceptable.

3.2.2 Charpy U-notch impact tests are generally to be carried out at ambient temperature. Charpy V- notch impact tests may be carried out at ambient or lower temperatures in accordance with specific requirements given in subsequent Chapters. Where the test temperature is other than ambient, the temperature of the test specimen is to be controlled to within ± 2°C for sufficient time to ensure uniformity throughout the cross section of the test specimen, and suitable precautions are to be taken to prevent any significant change in temperature during the actual test. In cases of dispute, ambient temperature is to be considered as 18°C -27°C.

3.2.3 When reporting results, the units used for expressing the energy absorbed and the testing temperature are to be clearly stated. It is preferred that energy values for both charpy V-notch and charpy U-notch impact tests be expressed in Joules and not [J/cm^2].

3.2.4 The minimum average values for specimens are as given in Table 3.2.4.

3.3 Charpy Re-test procedure

3.3.1 When the average value of the three initial Charpy V-notch impact specimens fails to meet the stated requirements, or the value for more than one specimen is below the required average value, or when the value of any one specimen is below 70% of the specified average value, three additional specimens from the same material may be tested and the results added to those previously obtained to form a new average. If this new average complies with the requirements and if not more than two individual results are lower than the required average and of these, not more than one result is below 70% of the specified average value the piece or batch (as specified for each product) may be accepted.

3.4 Drop Weight Specimens

3.4.1 Drop weight specimens for determination of no–break performance according to ASTM E-208:2019 are to comply with this ASTM

standard and have one of the following dimensions (mm):

Type P-1: 25 by 90 by 360
Type P-2: 19 by 50 by 130
Type P-3: 16 by 50 by 130

The following is to be noted if not otherwise specified: the specimen sides are to be saw-cut or machined (minimum 25 mm to flame-cut surface) the machining of the plate to prescribed specimen thickness is to be on one side only the specimens may be of any orientation, but the orientation is to be the same for all specimens.

Table 3.2.4

Charpy V-notch specimen size	Minimum energy, average of 3-specimens
10 mm x 10 mm	E
10 mm x 7.5 mm	5E/6
10 mm x 5.0 mm	2E/3

Notes:

E = the values of energy specified for full thickness 10 mm x 10 mm specimens
All other dimensions and tolerances are to be as specified in Table 3.1.1.
Only one individual value may be below the specified average value provided it is not less than 70% of that value.
In all cases, the largest size Charpy specimens possible for the material thickness shall be machined

Section 4

Ductility Testing of Pipes and Tubes

4.1 Bend tests

4.1.1 The test specimens are to be cut as circum- ferential strips of full wall thickness and with a width of not less than 40 [mm]. For thick walled pipes, the thickness of the test specimens may be reduced to 20 [mm] by machining. The edges of specimen may be rounded to a radius of 1.6 [mm].

4.1.2 Testing is to be carried out at ambient temperature, and the specimens are to be doubled over, in the direction of the original curvature, around a former. The diameter of the former is to be in accordance with the specific requirements for the material. The test is to be considered satisfactory if, after bending, the specimens are free from cracks and laminations. Small cracks at the edges of the test specimen are to be disregarded.

4.2 Flattening tests

4.2.1 The test specimens are to be cut with the ends perpendicular to the axis of the pipe or tube. The length of the specimen is to be not less than 10 [mm] or greater than 100 [mm].

4.2.2 Testing is to be carried out at ambient temperature and is to consist of flattening the specimens in a direction perpendicular to the longitudinal axis of the pipe. (Reference is made to ISO 8492:2013). Flattening is to be carried out between two plain parallel and rigid platens which extend over both the full length and width after flattening of the test specimen. Flattening is to be continued until the distance between the platens, measured under load, is not greater than the value given by the formula:-

$$H = \frac{t(1+C)}{C + \frac{t}{D}}$$

where,

H = distance between platens [mm];

t = specified thickness of the pipe [mm];

D = Specified outside diameter [mm];

C = a constant dependent on the steel type and detailed in the specific requirements.

After flattening, the specimens are to be free from cracks or other flaws. Small cracks at the ends of the test specimens may be disregarded.

4.2.3 For welded pipes or tubes, the weld is to be placed at an angle of 90° to the direction of the pressure.

4.3 Drift expanding test

4.3.1 The test specimens are to be cut with the ends perpendicular to the axis of the tube. The edges of the end to be tested may be rounded by filing.

Metallic tubes: The length 'L' equal to twice the external diameter 'D' of the tube if the angle of the drift is 30° and L equal to 1.5D if the angle of the drift is 45° or 60°. (Reference ISO 8493:1998). The test piece may be shorter if after testing the remaining cylindrical portion is not less than 0.5D.

The rate of penetration of the mandrel is not to exceed 50 [mm]/minute.

4.3.2 Testing is to be carried out at ambient temperature and is to consist of expanding the end of the tube symmetrically by means of a hardened conical steel mandrel having a total included angle of 45° or 60°. The mandrel is to be forced into the test specimen until the percentage increase in the outside diameter of the end of the test specimen is not less than the value given in the specific requirements for boiler and superheater tubes. The mandrel is to be lubricated, but there is to be no rotation of the tube or mandrel during the test. The expanded portion of the tube is to be free from cracks or other flaws.

4.4 Flanging tests

4.4.1 The test specimens are to be cut with the ends perpendicular to the axis of the tube. The length of the specimens is to be approximately 1.5D. The length may be shorter provided that after testing the remaining cylindrical portion is not less than O.5D (Reference ISO 8494:2013).

The edges of the end to be tested may be rounded by filing. The rate of penetration shall not exceed 50 [mm]/minute.

4.4.2 Testing is to be carried out at ambient temperature and is to consist of flanging the end of the tube symmetrically by means of hardened conical steel mandrels.

4.4.3 The first stage of flanging is to be carried out with a conical angled mandrel having an included angle of approximately 90° (See Fig.4.4.3(a)) The completion of the test is achieved with a second forming tool as shown in Fig.4.4.3(b). The mandrels are to be lubricated and there is to be no rotation of the tube or mandrels during the test. The test is to continue until the drifted portion has formed a flange perpendicular to the axis of the test specimens. The percentage increase in the external diameter of the end of specimens is not to be less than the value given in the specific requirements for boiler and superheater tubes. The cylindrical and flanged portion of the tube is to be free from cracks or other flaws.

4.5 Ring expanding test

4.5.1 The test piece consists of a ring having a length of between 10 to 16 [mm]. (Reference ISO 8495:2013). The rate of penetration of the mandrel is not to exceed 30 [mm]/second.

4.6 Ring tensile test

4.6.1 The ring is to have a length of about 15 [mm] with plain and smoothed ends cut perpendicular to the tube axis. The ring is to be drawn to fracture by means of two mandrels placed inside the ring and pulled in tensile testing machine. The rate shall not exceed 5 [mm]/second. (Reference ISO 8496:2013).

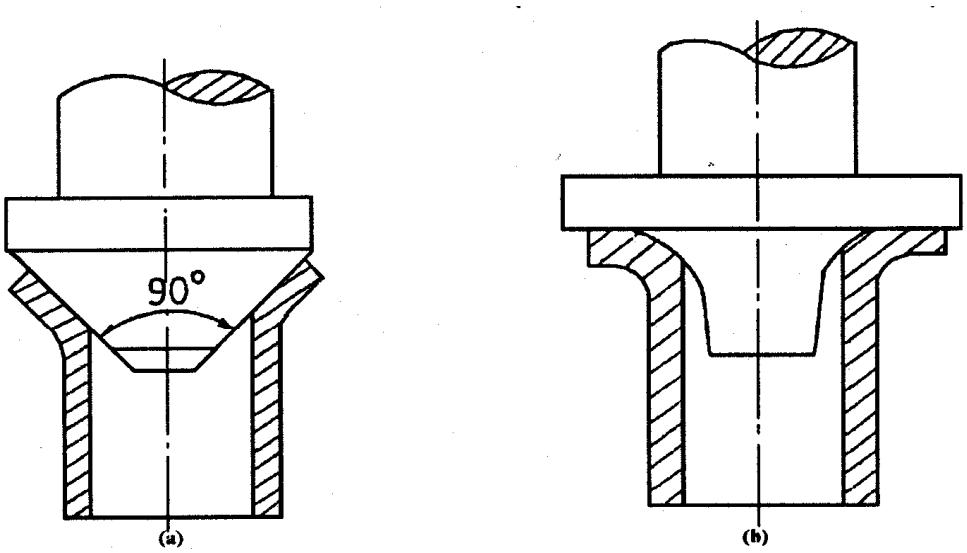

Fig.4.4.3 : Flanging test

Section 5

The Brittle Crack Arrest Toughness Test

5.1 Scope

5.1.1 This Section is applicable to hull structural steels with the thickness over 50 [mm] and not greater than 100 [mm] specified in Chapter 3. ISO20064: 2019 provides a test method for the determination of brittle crack arrest toughness of steel by using wide plates with a temperature gradient. The test procedures for brittle crack arrest toughness (i.e. K_{ca}) of steel using fracture mechanics parameter and determination method of Kca at a specific temperature (as specified in ISO 20064:2019) are provided. Additionally, the method of evaluation of Kca of test plate is also specified ..

5.2 Test Procedures

5.2.1 The test procedures including testing equipment, test specimens, test methods, determination of arrest toughness, reporting of test results, etc. are to be in accordance with ISO 20064: 2019. As a method for initiating a brittle crack, a secondary loading mechanism can be used in accordance with Annex D of ISO 20064: 2019, except that the first sentence in Annex B.2.4 of ISO 20064: 2019 is revised to "Obtain the value $\{K_{ca} /[K_0 *\exp(-c/T_{caK})]\}$ for each data point" (where T_K [K] (= T [C]+273), c and K_0 are constants).

5.3 Determination of Kca at a specific temperature and its evaluation

5.3.1 Method

5.3.1.1 The method for conducting multiple tests to obtain Kca value at a specific temperature is to be in accordance with Annex B of ISO 20064: 2019.

5.3.2 Evaluation

5.3.2.1 The straight-line approximation of Arrhenius plot for valid K_{ca} data by interpolation method are to comply with either the following (1) or (2):

(1) The evaluation temperature of K_{ca} (i.e. - 10 degree C) is located between the upper and lower limits of the arrest temperature, with the K_{ca} corresponding to the evaluation temperature not lower than the required K_{ca} (e.g. 6,000 N/mm$^{3/2}$ or 8,000 N/mm$^{3/2}$), as shown in Fig.5.3.2.1(a).

(2) The temperature corresponding to the required K_{ca} (e.g. 6,000 N/mm$^{3/2}$ or 8,000 N/mm$^{3/2)}$ is located between the upper and lower limits of the arrest temperature, with the temperature corresponding to the required K_{ca} not higher than the evaluation temperature (i.e. -10 degree C), as shown in Fig. 5.3.2.1(b).

If both of (1) and (2) above are not satisfied, conduct additional tests to satisfy this condition.

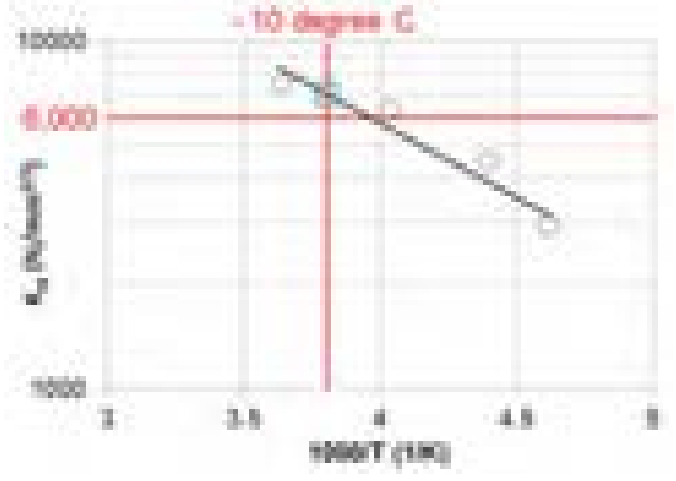

Fig. 5.3.2.1(a) Example for evaluation of K_{ca} at - 10 degree C

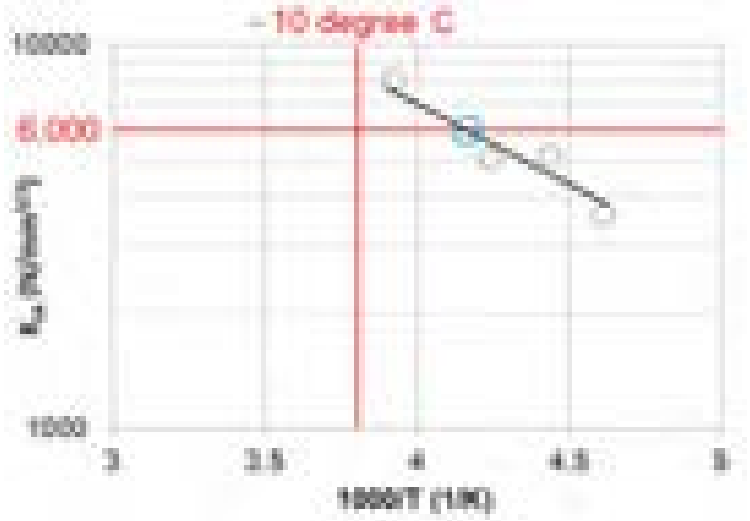

Fig. 5.3.2.1(b) Example for evaluation of temperature corresponding to the required K_{ca}

Section 6

Isothermal Crack Arrest Temperature (CAT) Test

6.1 Scope

6.1.1 This Section is applicable to steels with thickness over 50 [mm] and not greater than 100 [mm] for evaluating brittle crack arrest properties by the Crack Arrest Temperature (CAT) method.

6.1.2 Requirements for test procedures and test conditions when using the isothermal crack arrest test to determine a valid test result under isothermal conditions and in order to establish the crack arrest temperature (CAT) are specified in this Section.

6.1.3 This method uses an isothermal temperature in the test specimen being evaluated. Unless otherwise specified in this Section, the other test parameters are to be in accordance with ISO 20064:2019.

6.1.4 Chapter 3, Section 10, Table 10.1.3 specifies the relevant requirements for the brittle crack arrest property described by the crack arrest temperature (CAT).

6.1.5 The manufacturer is to submit the test procedure to IRS for review prior to testing.

6.2 Symbols

Table 6.2 supplements Table 1 in ISO 20064:2019 with specific symbols for the isothermal test

Table 6.2: Symbols used and their meanings (These are supplementary to Table 1 in ISO 20064:2019)		
Symbol	Unit	Significance
t	mm	Test specimen thickness
L	mm	Test specimen length
W	mm	Test specimen width
a_{MN}	mm	Machined notch length on specimen edge
L_{SG}	mm	Side groove length on side surface from the specimen edge. L_{SG} is defined as a groove length with constant depth except a curved section in depth at side groove end.
d_{SG}	mm	Side groove depth in section with constant depth
$L_{EB\ -\ min}$	mm	Minimum length between specimen edge and electron beam re-melting zone front
$L_{EB\text{-}s1,\ -s2}$	mm	Length between specimen edge and electron beam re-melting zone front appeared on both specimen side surfaces
L_{LTG}	mm	Local temperature gradient zone length for brittle crack runway
a_{arrest}	mm	Arrested crack length
T_{target}	°C	Target test temperature
T_{test}	°C	Defined test temperature
T_{arrest}	°C	Target test temperature at which valid brittle crack arrest behaviour is observed
σ	N/mm^2	Applied test stress at cross section of W x t
SMYS	N/mm^2	Specified minimum yield strength of the tested steel grade to be approved
CAT	°C	Crack arrest temperature, the lowest temperature, T_{arrest}, at which running brittle crack is arrested

6.3 Testing equipment

6.3.1 The test equipment to be used is to be of the hydraulic type of sufficient capacity to provide a tensile load equivalent to ⅔ of SMYS of the steel grade to be approved.

6.3.2 The temperature control system is to be equipped to maintain the temperature in the specified region of the specimen within ±2ºC from T_{target}.

6.3.3 Methods for initiating the brittle crack may be of drop weight type, air gun type or double tension tab plate type.

6.3.4 The detailed requirements for testing equipment are to be in accordance with ISO 20064:2019.

6.4 Test specimens

6.4.1 Impact type crack initiation

6.4.1.1 Test specimens are to be in accordance with ISO 20064:2019 unless otherwise specified in this Section.

6.4.1.2 Specimen dimensions are indicated in Fig. 6.4.1.2. The test specimen width is to be 500 [mm]. The test specimen length, L is to be equal or greater than 500 [mm].

6.4.1.3 V-shape notch for brittle crack initiation is machined on the specimen edge of the impact side. The whole machined notch length is to be equal to 29 [mm] with a tolerance range of ±1 [mm].

6.4.1.4 The requirements for side grooves are specified in 6.4.4.

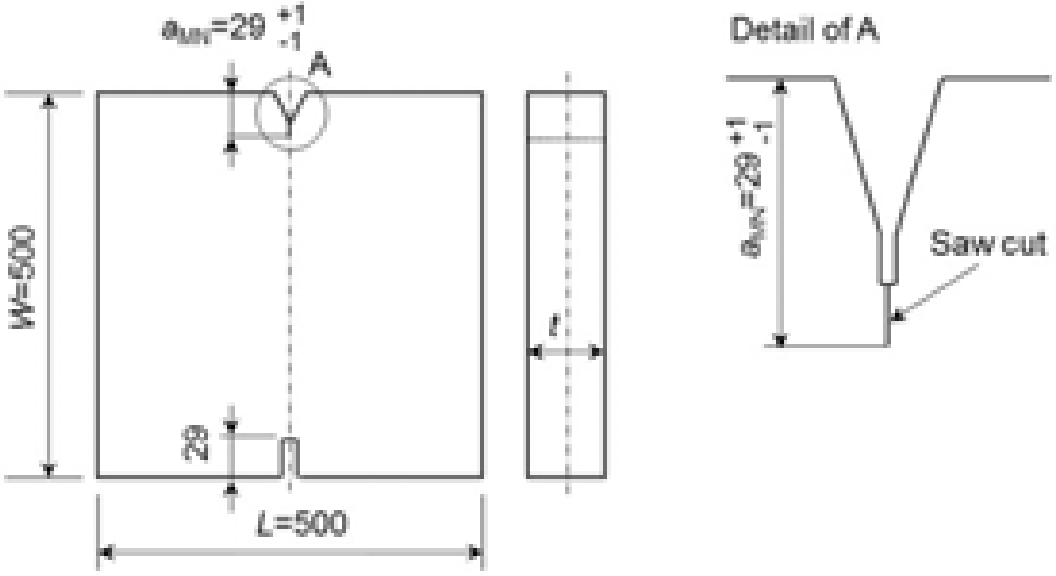

Fig. 6.4.1.2: Test specimen dimensions for an impact type specimen

Note: Saw cut notch radius may be machined in the range 0.1mmR and 1mmR in order to control a brittle crack initiation at test.

6.4.2 Double tension type crack initiation

6.4.2.1 Annex D of ISO 20064:2019 may be referred for the shape and sizes in secondary loading tab and secondary loading method for brittle crack initiation.

6.4.2.2 In a double tension type test, the secondary loading tab plate may be subject to further cooling to enhance an easy brittle crack initiation.

6.4.3 Embrittled zone setting

6.4.3.1 An embrittled zone is to be applied to ensure the initiation of a running brittle crack. Either Electron Beam Welding (EBW) or Local Temperature Gradient (LTG) may be adopted to facilitate the embrittled zone.

6.4.3.2 In EBW embrittlement, electron beam welding is applied along the expected initial crack propagation path, which is the centre line of the specimen in front of the machined V-notch.

6.4.3.3 The complete penetration through the specimen thickness is required along the embrittled zone. One side EBW penetration is preferable, but dual sides EB penetration may also be adopted when the EBW power is not enough to achieve the complete penetration by one side EBW.

6.4.3.4 The EBW embrittlement is recommended to be prepared before specimen contour machining.

6.4.3.5 In EBW embrittlement, zone is to be of an appropriate quality.

Note: EBW occasionally behaves in an unstable manner at start and end points. EBW line is recommended to start from the embrittled zone tip side to the specimen edge with an increasing power control or go/ return manner at start point to keep the stable EBW.

6.4.3.6 In LTG system, the specified local temperature gradient between machined notch tip and isothermal test region is regulated after isothermal temperature control. LTG temperature control is to be achieved just before brittle crack initiation, nevertheless the steady temperature gradient through the thickness shall be ensured.

6.4.4 Side grooves

6.4.4.1 Side grooves on side surface can be machined along the embrittled zone to keep brittle crack propagation straight. Side grooves

are to be machined in the specified cases as specified in this sub-section.

6.4.4.2 In EBW embrittlement, side grooves are not necessarily mandatory. Use of EBW avoids the shear lips. However, when shear lips are evident on the fractured specimen, e.g. shear lips over 1 [mm] in thickness in either side then side grooves are to be machined to suppress the shear lips.

6.4.4.3 In LTG embrittlement, side grooves are mandatory. Side grooves with the same shape and size are to be machined on both side surfaces.

6.4.4.4 The length of side groove, L_{SG} is to be no shorter than the sum of the required embrittled zone length.

6.4.4.5 When side grooves would be introduced, the side groove depth, the tip radius and the open angle are not regulated, but are adequately selected in order to avoid any shear lips over 1mm thickness in either side. An example of side groove dimensions is shown in Fig. 6.4.4.5.

6.4.4.6 Side groove end is to be machined to make a groove depth gradually shallow with a curvature larger than or equal to groove depth, d_{SG}. Side groove length, L_{SG} is defined as a groove length with constant depth except a curved section in depth at side groove end.

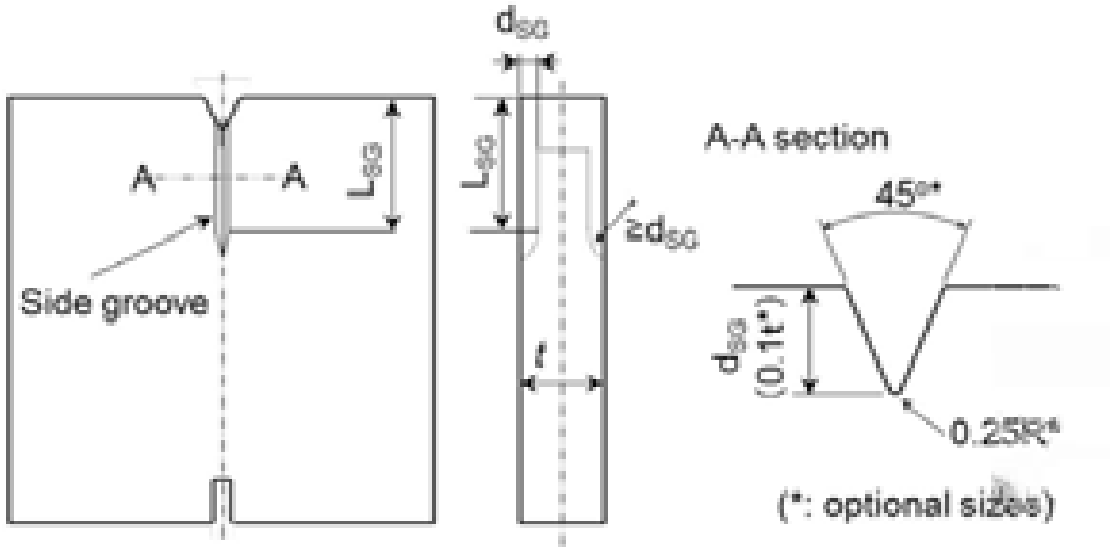

Figure 6.4.4.5: Side groove configuration and dimensions

6.4.5 Nominal length of embrittled zone

6.4.5.1 The length of embrittled zone is to be at least 150 [mm] .

6.4.5.2 EBW zone length is regulated by three measurements on the fracture surface after test as shown in Figure 6.4.5.2, $L_{EB\text{-}min}$ between specimen edge and EBW front line, and $L_{EB\text{-}s1}$ and $L_{EB\text{-}s2}$.

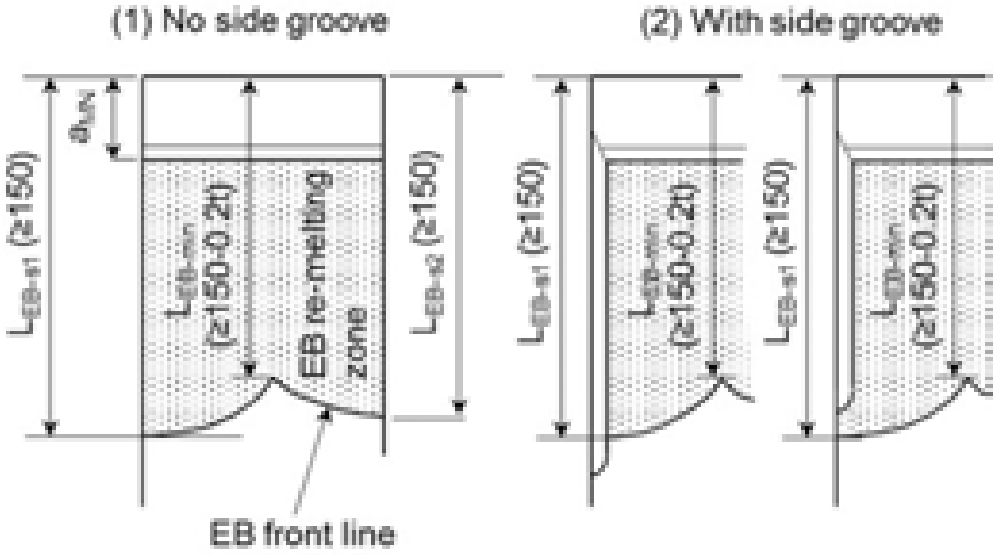

Fig. 6.4.5.2: Definition of EBW length

6.4.5.3 The minimum length between specimen edge and EBW front line, $L_{EB\text{-}min}$ should be no smaller than 150 [mm]. However, it can be acceptable even if $L_{EB\text{-}min}$ is no smaller than 150mm-0.2*t*, where *t* is specimen thickness. When $L_{EB\text{-}min}$ is smaller than 150 [mm], a temperature safety margin is to be considered into T_{test} (See Cl. 6.8.1.2).

6.4.5.4 Another two are the lengths between specimen edge and EBW front appeared on both side surfaces, as denoted with $L_{EB\text{-}s1}$ and $L_{EB\text{-}s2}$. Both of $L_{EB\text{-}s1}$ and $L_{EB\text{-}s2}$ are to be no smaller than 150 [mm].

6.4.5.5 In LTG system, L_{LTG} is set as 150 [mm].

6.4.6 Tab plate / pin chuck details and welding of test specimen to tab plates

6.4.6.1 The configuration and size of tab plates and pin chucks may be referred to ISO 20064:2019. The welding distortion in the integrated specimen, which is welded with specimen, tab plates and pin chucks, is to be also within the requirements in ISO 20064:2019.

6.5 Test Method

6.5.1 Preloading

6.5.1.1 Preloading at room temperature can be applied to avoid unexpected brittle crack initiation at test. The applied load value is to be no greater than the test stress. Preloading can be applied at higher temperature than ambient temperature when brittle crack initiation is expected at preloading process. However, the specimen is not to be subjected to temperature higher than 100 [^{o}C].

6.5.2 Temperature measurement and control

6.5.2.1 Temperature control plan showing the number and position of thermocouples is to be in accordance with this sub-section.

6.5.2.2 Thermocouples are to be attached to both sides of the test specimen at a maximum interval of 50 [mm] in the whole width and in the longitudinal direction at the test specimen centre position (0.5 *W*) within the range of ±100 [mm] from the centreline in the longitudinal direction, refer to Fig. 6.5.2.2.

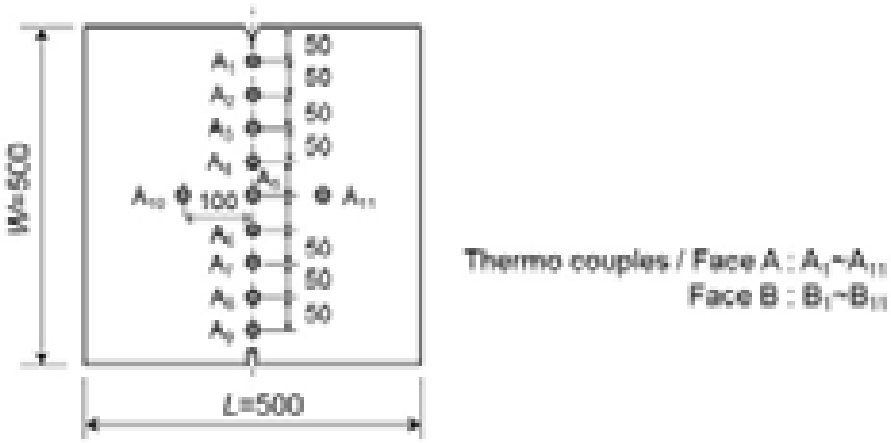

Fig. 6.5.2.2: Locations of temperature measurement

6.5.2.3 For EBW embrittlement

.1 The temperatures of the thermocouples across the range of 0.3*W*~0.7*W* in both width and longitudinal directions are to be controlled within ± 2°C of the target test temperature, T_{target}.

.2 When all measured temperatures across the range of 0.3*W*~0.7*W* have reached T_{target}, steady temperature control is to be kept at least for 10 + 0.1 x *t* [mm] minutes to ensure a uniform temperature distribution into mid-thickness prior to applying test load.

.3 The machined notch tip can be locally cooled to easily initiate brittle crack. Nevertheless, the local cooling is not to disturb the steady temperature control across the range of 0.3*W*~0.7*W*.

6.5.2.4 For LTG embrittlement

.1 In LTG system, in addition to the temperature measurements shown in Fig. 6.5.2.2, the additional temperature measurement at the machine notch tip, A_0 and B_0 is required. Thermocouples positions within LTG zone are indicated in Fig. 6.5.2.4.1.

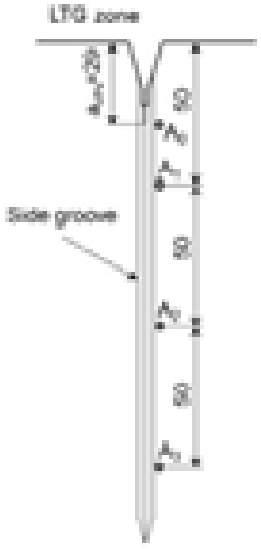

Figure 6.5.2.4.1: Detail of LTG zone and additional thermocouple A_0

.2 The temperatures of the thermocouples across the range of 0.3*W*~0.7*W* in both width and longitudinal directions are to be controlled within ± 2°C of the target test temperature, T_{target}. However, the temperature measurement at 0.3*W* (location of A_3 and B_3) is to be in accordance with 6.5.2.4.6 below.

.3 Once the all measured temperatures across the range of 0.3*W*~0.7*W* have reached T_{target}, steady temperature control is to be kept at least for 10 + 0.1 x *t* [mm] minutes to ensure a uniform temperature distribution into mid-thickness, then the test load is to be applied.

.4 LTG is controlled by local cooling around the machined notch tip. LTG profile is to be recorded by the temperature measurements from A_0 to A_3 shown in Fig. 6.5.2.4.4 below.

.5 LTG zone is established by temperature gradients in three zones, Zone I, Zone II and Zone III. The acceptable range for each temperature gradient is listed in Table 6.5.2.4.5.

.6 Temperature measurements at A_2, B_2 and A_3, B_3 are to satisfy the following requirements:

T at A_3, T at $B_3 < T_{target} - 2°C$
T at $A_2 < T$ at $A_3 - 5°C$
T at $B_2 < T$ at $B_3 - 5°C$

.7 There are no requirements for T at A_0 and T at A_1 temperatures when T at A_3 and T at A_2 satisfy the requirements above. Similar requirements are applicable for Face B.

.8 The temperatures from A_0, B_0 to A_3, B_3 are to be decided at test planning stage. Table 6.5.2.4.5 may be referred for the recommended temperature gradients in three zones, Zone I, Zone II and Zone III in LTG zone.

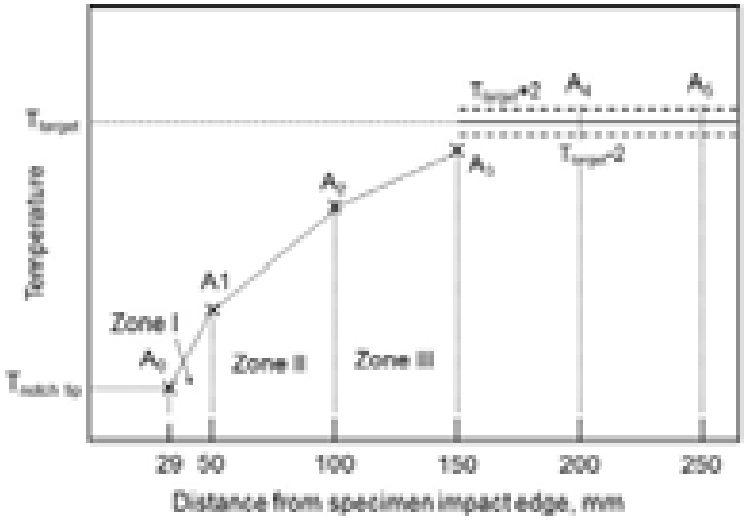

Fig. 6.5.2.4.4: Schematic temperature gradient profile in LTG zone

Table 6.5.2.4.5: Acceptable LTG range

Zone	Location from edge	Acceptable range of temperature gradient
Zone I	29mm – 50mm	2.00 ˚C/mm – 2.30 ˚C/mm
Zone II	50mm – 100mm	0.25 ˚C/mm – 0.60 ˚C/mm
Zone III[1)]	100mm – 150mm	0.10 ˚C/mm – 0.20 ˚C/mm

Note: The zone III arrangement is mandatory

.9 The temperature profile in LTG zone mentioned above is to be ensured after holding time at least for 10 + 0.1 x *t* [mm] minutes to ensure a uniform temperature distribution into mid-thickness before brittle crack initiation.

.10 The acceptance of LTG in the test is to be decided from Table 6.5.2.4.5 based on the measured temperatures from A_0 to A_3.

6.5.2.5 For double tension type crack initiation specimen:

.1 Temperature control and holding time at steady state is to be the same as the case of EBW embrittlement specified in 6.5.2.3 or the case of LTG embrittlement specified in Section 6.5.2.4.

6.5.3 Loading and brittle crack initiation

6.5.3.1 Prior to testing, a target test temperature (T_{target}) is to be selected.

6.5.3.2 Test procedures are to be in accordance with ISO 20064:2019 except that the applied stress is to be ⅔ of SMYS of the steel grade tested.

6.5.3.3 The test load is to be held at the test target load or higher for a minimum of 30 seconds prior to crack initiation.

6.5.3.4 Brittle crack can be initiated by impact or secondary tab plate tension after all of the temperature measurements and the applied force are recorded.

6.6 Measurements after test and test validation judgement

6.6.1 Brittle crack initiation and validation

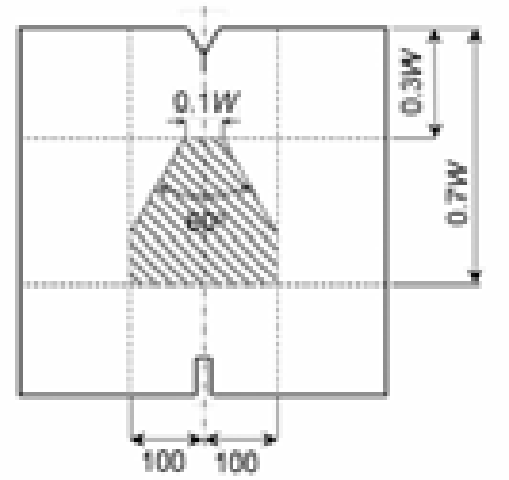
6.6.1.1 If brittle crack spontaneously initiates before the test force is achieved or the specified hold time at the test force is not achieved, the test would be considered as invalid.

6.6.1.2 If brittle crack spontaneously initiates without impact or secondary tab tension but after the specified time at the test force is achieved, the test would be considered as a valid initiation. The following validation judgments of crack path and fracture appearance are to be examined.

6.6.2 Crack path examination and validation

6.6.2.1 When brittle crack path in embrittled zone deviates from EBW line or side groove in LTG system due to crack deflection and/ or crack branching, the test would be considered as invalid.

6.6.2.2 All of the crack path from embrittled zone end is to be within the range shown in Fig. 6.6.2.2. If not, the test would be considered as invalid.



Fig, 6.6.2.2: Allowable range of main crack propagation path

6.6.3 Fracture surface examination, crack length measurement and their validation

6.6.3.1 Fracture surface is to be observed and examined. The crack "initiation" and "propagation" are to be checked for validity and judgements recorded. The crack "arrest" positions are to be measured and recorded.

6.6.3.2 When crack initiation trigger point is clearly detected at side groove root, other than the V-notch tip, the test would be invalid.

6.6.3.3 In EBW embrittlement setting, EBW zone length is quantified by three measurements of $LEB\text{-}_{s1}$, $LEB\text{-}_{s2}$ and $LEB\text{-}_{min}$, which are defined in 6.4.5. When either or both of LEB_{-s1} and LEB_{-s2} are smaller than 150 [mm], the test would be invalid. When LEB_{-min} is smaller than 150mm-0.2t, the test would be invalid.

6.6.3.4 When the shear lip with thickness over 1 [mm] in either side near side surfaces of embrittled zone are visibly observed independent of the specimens with or without side grooves, the test would be invalid.

6.6.3.5 In EBW embrittlement setting, the penetration of brittle crack beyond the EBW front line is to be visually examined. When any brittle fracture appearance area continued from the EB front line is not detected, the test would be invalid.

6.6.3.6 The weld defects in EBW embrittled zone are to be visually examined. If detected, they are to be quantified. A projecting length of defect on the thickness line through EB weld region along brittle crack path is to be measured, and the total occupation ratio of the projected defect part to the total thickness is defined as defect line fraction (See Fig. 6.6.3.6). When the defects line fraction is larger than 10 %, the test would be invalid.

6.6.3.7 In EBW embrittlement by dual sides' penetration, if a gap on embrittled zone fracture surface which is induced by miss meeting of dual fusion lines, is visibly detected at an overlapped line of dual side penetration, the test would be invalid.

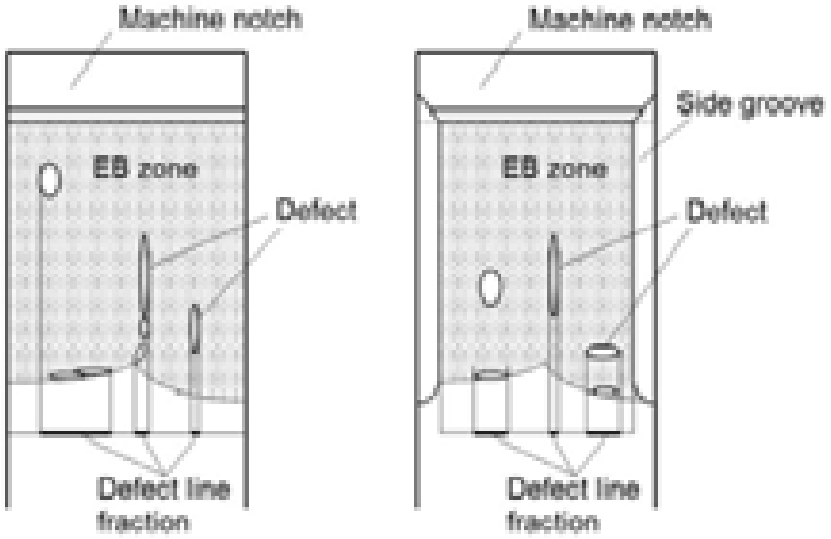


Fig. 6.6.3.6: Counting procedure of defect line fraction

6.7 Judgement of 'arrest' or 'propagate'

6.7.1 The judgment of "arrest", "propagate" or "invalid" would be decided based on the requirements indicated in 6.7.2 through 6.7.6.

6.7.2 If initiated brittle crack is arrested and the tested specimen is not broken into two pieces, the fracture surfaces should be exposed with the procedures specified in ISO 20064:2019.

6.7.3 When the specimen is not broken into two pieces during testing, the arrested crack length, a_{arrest} is to be measured on the fractured surfaces. The length from the specimen edge of impact side to the arrested crack tip (the longest position) is defined as a_{arrest}.

6.7.4 For LTG and EBW, a_{arrest} is to be greater than L_{LTG} and $L_{EB\text{-}s1}$, $L_{EB\text{-}s2}$ or $L_{EB\text{-}min}$. If not, the test would be considered as invalid.

6.7.5 Even when the specimen is broken into two pieces during testing, it can be considered as "arrest" when brittle crack re-initiation is clearly evident. Even in the fracture surface all occupied by brittle fracture, when a part of brittle crack surface from embrittled zone is continuously surrounded by thin ductile tear line, the test can be judged as re-initiation behaviour. If so, the maximum crack length of the part surrounded tear line can be measured as a_{arrest}. If re-initiation is not visibly evident, the test is judged as "propagate".

6.7.6 The test would be judged as "arrest" when the value of a_{arrest} is no greater than 0.7W. If not, the test would be judged as "propagate".

6.8 T_{test}, T_{arrest} and CAT determination

6.8.1 T_{test} determination

6.8.1.1 It shall be ensured on the thermocouple measured record that all temperature measurements across the range of 0.3W ~ 0.7W in both width and longitudinal direction are in the range of T_{target} ±2°C at brittle crack initiation. If not, the test shall be invalid. However, the temperature measurement at 0.3W (location of A_3 and B_3) in LTG system shall be exempted from this requirement.

6.8.1.2 If $L_{EB\text{-}min}$ in EBW embrittlement is no smaller than 150 [mm], T_{test} can be defined to equal with T_{target}. If not, T_{test} shall be equaled with T_{target} + 5°C.

6.8.1.3 In LTG embrittlement, T_{test} can be equaled with T_{target}.

6.8.1.4 The final arrest judgment at T_{test} is concluded by at least two tests at the same test condition which are judged as "arrest".

6.8.2 T_{arrest} **determination**

6.8.2.1 When at least repeated two "arrest" tests appear at the same T_{target}, brittle crack arrest behaviour at T_{target} will be decided (T_{arrest} = T_{target}).When a "propagate" test result is included in the multiple test results at the same T_{target}, the T_{target} cannot to be decided as T_{arrest}.

6.8.3 CAT determination

6.8.3.1 When CAT is determined, one "propagate" test is needed in addition to two "arrest" tests. The target test temperature, T_{target} for "propagate" test is recommended to select 5°C lower than T_{arrest}. The minimum temperature of T_{arrest} is determined as CAT.

6.8.3.2 With only the "arrest" tests, without "propagation" test, it is decided only that CAT is lower than T_{test} in the two "arrest" tests, i.e. not deterministic CAT.

6.9 Reporting

6.9.1 The following items are to be reported:

(i) Test material: grade and thickness

(ii) Test machine capacity

(iii) Test specimen dimensions: thickness t; width W and length L; notch details and length a_{MN}, side groove details if machined;

(iv) Embrittled zone type: EBW or LTG embrittlement

(v) Integrated specimen dimensions: Tab plate thickness, tab plate width, integrated specimen unit length including the tab plates, and distance between the loading pins, angular distortion and linear misalignment

(vi) Brittle crack trigger information: impact type or double tension. If impact type, drop weight type or air gun type, and applied impact energy.

(vii) Test conditions; Applied load; preload stress, test stress
- Judgements for preload stress limit, hold time requirement under steady test stress.

(viii) Test temperature: complete temperature records with thermocouple positions for measured temperatures (figure and/or table) and target test temperature.

- Judgements for temperature scatter limit in isothermal region.

- Judgement for local temperature gradient requirements and holding time requirement after steady local temperature gradient before brittle

crack trigger, if LTG system is used.

(ix) Crack path and fracture surface: tested specimen photos showing fracture surfaces on both sides and crack path side view; Mark at “embrittled zone tip” and “arrest” positions.

- Judgment for crack path requirement.

- Judgment for cleavage trigger location (whether side groove edge or V-notch edge).

(x) Embrittled zone information:

When EBW is used: $L_{EB\text{-}s1}$, $L_{EB\text{-}s2}$ and $L_{EB\text{-}min}$

- Judgement for shear lip thickness requirement

- Judgment whether brittle fracture appearance area continues from the EBW front line

- Judgement for EBW defects requirement

- Judgement for EBW lengths, $L_{EB\text{-}s1}$, $L_{EB\text{-}s2}$ and $L_{EB\text{-}min}$ requirements

When LTG is used: L_{LTG}

- Judgment for shear lip thickness requirement

Test results:

When the specimen did not break into two pieces after brittle crack trigger, arrested crack length a_{arrest}

When the specimen broke into two pieces after brittle crack trigger,

- judgement whether brittle crack re-initiation or not.

If so, arrested crack length a_{arrest}:

- Judgement for a_{arrest} in the valid range ($0.3W < a_{arrest} \leq 0.7W$)

- Final judgement either “arrest”, “propagate” or “invalid”

(xi) Dynamic measurement results: History of crack propagation velocity, and strain change at pin chucks, if needed

6.10 Use of test for material qualification testing

Where required, the method can also be used for determining the lowest temperature at which a steel can arrest a running brittle crack (the determined CAT) as the material property characteristic in accordance with 6.8.3.

Section 1

General Requirements

1.1 Scope

1.1.1 This Chapter gives general requirements for hot rolled plates, wide flats, strips and sections intended for use in the construction of ships, boilers, pressure vessels and machinery structures. These requirements are also applicable to hot rolled bars, except where such materials are intended for the manufacture of bolts, shafts, etc. by machining operations only. When used for this purpose hot rolled bars are to comply with the requirements of Ch. 5.

1.2 Manufacture

1.2.1 The steel is to be manufactured at the approved works by the open hearth, electric furnace or one of the basic oxygen processes or by other processes specially approved by IRS.

The approval of the steel works is to be carried out in accordance with IRS Classification Notes: 'Approval scheme for the manufacturing process of normal and higher strength hull structural steels'. Also refer Chapter 1, Section 1, Cl. 1.3.2.

1.2.2 The suitability of each grade of steel for forming and welding is to be demonstrated during the initial approval tests at the steel works. The type and the extent of testing required is at the discretion of IRS.

1.2.3 It is the manufacturer's responsibility to assure that effective process and production controls in operation are adhered to in accordance with the manufacturing specifications. Where control imperfection that may lead to inferior quality of product occurs, the manufacturer is to identify the cause and establish counter measure to prevent its occurrence. Also the complete investigation report is to be submitted to the Surveyor. Each affected piece considered for further usage is to be tested to the Surveyor's satisfaction.

The frequency of testing may be increased to gain confidence for subsequent products as considered necessary.

1.3 Quality of materials

1.3.1 Defects not prejudicial to the proper application of steel are not, except by special agreement, to be grounds for rejection. Where necessary, suitable methods of non-destructive examination may be used for the detection of harmful surface and internal defects. The extent of this examination, together with appropriate acceptance standards, is to be agreed between the purchaser, manufacturer and Surveyors.

1.4 Thickness tolerance of plates and wide flats with width ≥ 600 [mm]

1.4.1 Following requirements are applicable to the tolerance on thickness of steel plates and wide flats with widths of 600 [mm] or greater (herein after referred to as: product or products) with thickness of 5 [mm] and over, covering the following :

(i) Normal and higher strength hull structural steels (Refer Sec 2, and Sec 3)
(ii) High strength steels for welded structure (Refer Sec 4)
(iii) Steel for machinery structures (Refer Sec 7)

These requirements do not apply to products intended for the construction of boilers, pressure vessels and independent tanks, e.g. for the transportation of liquefied gases or chemicals.

These requirements do not apply to products intended for the construction of lifting appliances.

1.4.2 The tolerance on thickness of a given product are defined as follows:

a) Minus tolerance is the lower limit of the acceptable range below the nominal thickness.
b) Plus tolerance is the upper limit of the acceptable range above the nominal thickness.

Note : Nominal thickness is stated by the purchaser at the time of enquiry and order.

1.4.3 The minus tolerance for products for normal strength, higher strength and high strength quenched and tempered steels is 0.3 [mm] irrespective of nominal thickness.

1.4.4 The minus tolerance for products intended for machinery structures are to be in accordance with Table 1.4.4.

1.4.5 The tolerance for thickness below 5 [mm] is to be in accordance with a national or international standard, e.g. Class B of ISO 7452:2013. However, the minus tolerance is not to exceed 0.3 [mm].

Table 1.4.4

Nominal thickness [mm]	Minus tolerance on nominal thickness [mm]
≥ 3 to < 5	-0.3
≥ 5 to < 8	-0.4
≥ 8 to < 15	-0.5
≥ 15 to < 25	-0.6
≥ 25 to < 40	-0.7
≥ 40 to < 80	-0.9
≥ 80 to < 150	-1.1
≥ 150 to < 250	-1.2
≥ 250	-1.3

1.4.6 The plus tolerance on nominal thickness is to be in accordance with a recognized national or international standard or as specified.

1.4.7 The tolerance on sections (except for wide flats) are to be in accordance with the requirements of recognized international or national standard.

1.4.8 The tolerances on nominal thickness are not applicable to areas repaired by grinding. For areas repaired by grinding, the requirements of Sec.2, 2.7.4.1 are to be applied, unless stricter requirements as per a recognized standard are specified by the purchaser.

1.4.9 For materials intended for applications as detailed in Sec. 5 and 6, no minus tolerance is permitted in the thickness of plates and strip.

1.4.10 The responsibility for verification and maintenance of the production within the required tolerance rests with the manufacturer. The Surveyor may require to witness some measurements.

1.4.11 The responsibility for storage and maintenance of the delivered products with acceptable level of surface conditions rests with

the shipyard before the products are used in fabrication.

1.4.12 Where zero minus tolerance is applied in accordance with Class C of ISO 7452-2013 or equivalent national or international standards, the requirements of 1.4.13 to 1.4.15 need not be applied.

Additionally, if Class C of ISO 7452-2013 is applied, it is required that the steel mill demonstrates to the satisfaction of IRS that the number of measurements and measurement distribution is appropriate to establish that the mother plates produced are at or above the specified nominal thickness.

1.4.13 Average thickness

1.4.13.1 The average thickness of products is defined as the arithmetic mean of the measurements made in accordance with the requirements of 1.4.14.

1.4.13.2 The average thickness of products for hull structural steels is not to be less than the nominal thickness.

1.4.14 Thickness measurements

1.4.14.1 The thickness is to be measured at locations of products as defined in 1.4.15.

1.4.14.2 Automated method or manual method may be applied to the thickness measurements.

1.4.14.3 The procedure and the records of measurements are to be made available to the Surveyor and copies provided on request.

1.4.15 Thickness measuring locations

1.4.15.1 The requirements of 1.4.15.2 are to be applied to the thickness measuring locations for the thickness tolerance and the average thickness of the product.

1.4.15.2 At least two lines among Line 1, Line 2 or Line 3 as shown in Fig.1.4.15.2 are to be selected for the thickness measurements and at least three points on each selected line are to be selected for thickness measurement. If more than three points are taken on each line the number of points are to be equal on each line.

Note : The measurement locations apply to a product rolled directly from one slab or steel ingot even if the product is to be later cut by the manufacturer. Examples of the original measurements relative to later cut products are shown in Fig.1.4.15.2b), It is to be noted that the examples shown are not representative of all possible cutting scenarios.

For automated methods, the measuring points at sides are to be located not less than 10 [mm] but not greater than 300 [mm] from the transverse or longitudinal edges of the product.

For manual methods, the measuring points at sides are to be located not less than 10 [mm] but not greater than 100 [mm] from the transverse or longitudinal edges of the product.

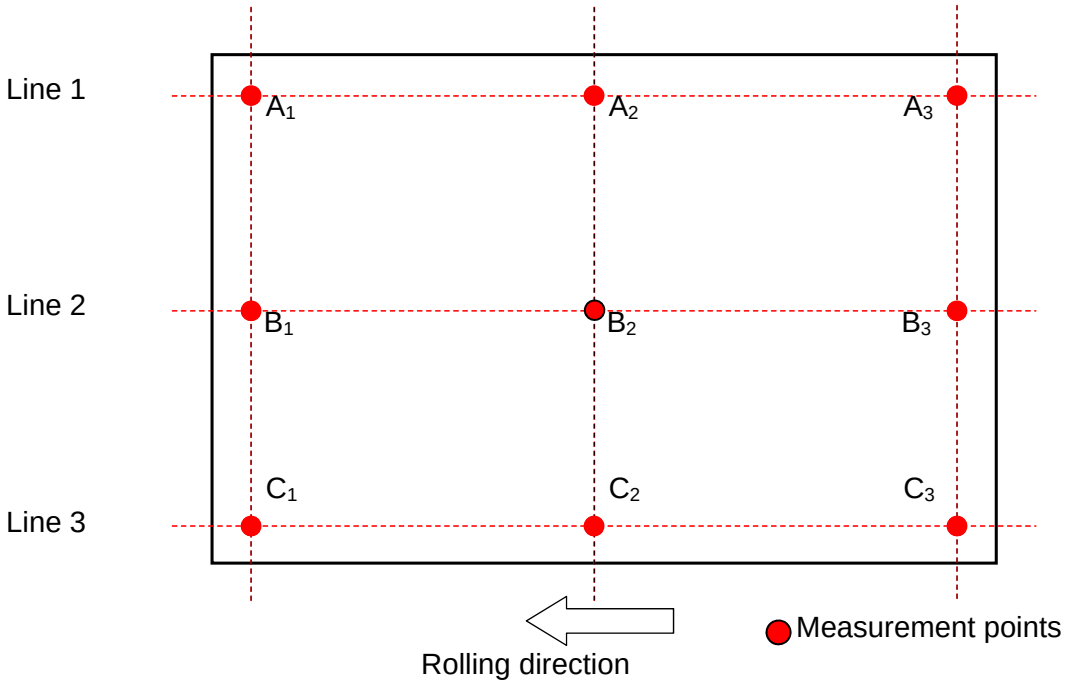

Fig. 1.4.15.2a) : Locations of Thickness Measuring Points for the Original Steel Plates

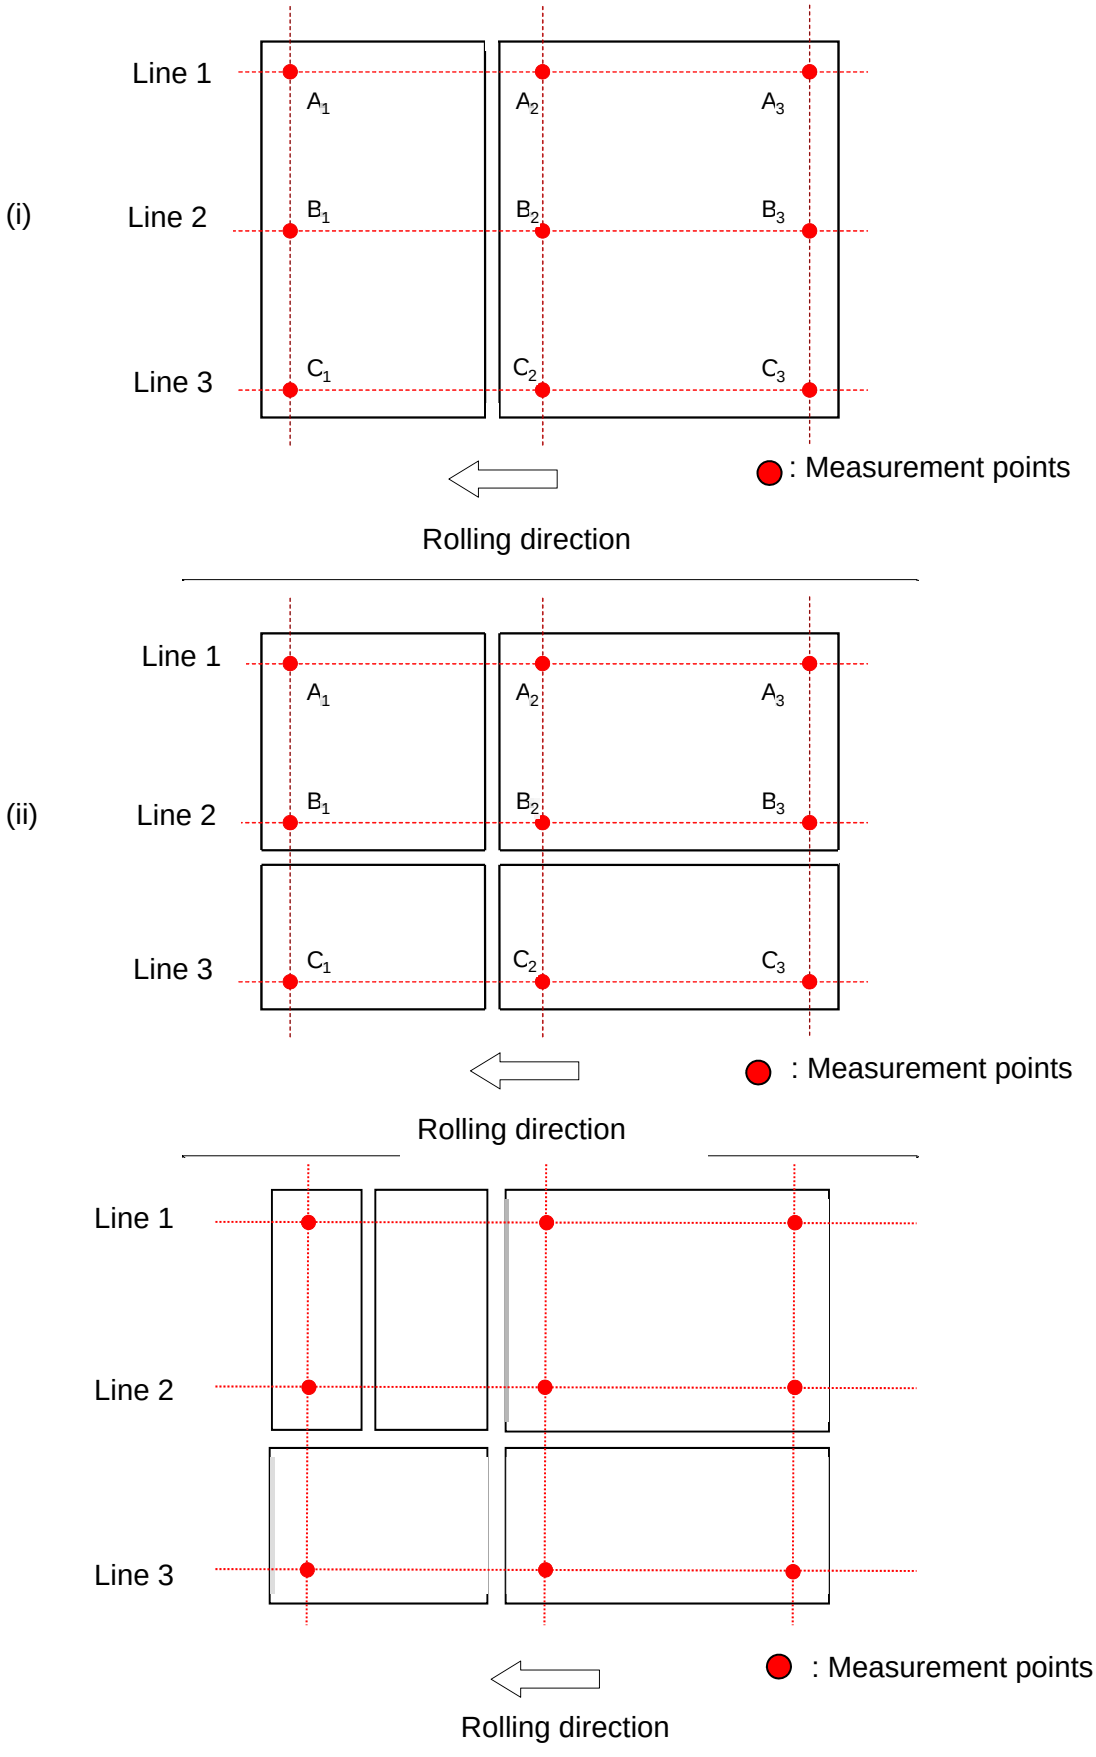
Fig. 1.4.15.2b) : Locations of Thickness Measuring Points for the Cut Steel Products



1.5 Heat treatment, condition of supply

1.5.1 All materials are to be supplied in the heat treated conditions described in the subsequent sections of this chapter unless supply in the as-rolled condition is allowed.

1.5.2 Where the material is supplied in the as rolled condition and intended for subsequent hot forming, the manufacturer is to carry out any heat treatment which may be necessary to prevent hydrogen cracking or make the material in a safe condition for transit and Surveyors are to be advised of any such heat treatment carried out. This requirement is applicable mainly to carbon and carbon-manganese steel products over 50 [mm] thick and to alloy steel products.

1.5.3 Where controlled rolling or thermo-mechanical processing is permitted as an alternative to normalising, these procedures may be used subject to full details being submitted and a test program being carried out under the supervision of the Surveyors and the test results being found satisfactory by IRS. These rolling processes are defined as follows:

(See Fig.1.5.3).

a) As Rolled, AR - this procedure involves steel being cooled as it is rolled with no further heat treatment. The rolling and finishing temperatures are typically in the austenite recrystalisation region and above the normalising temperature. The strength and toughness properties of steel produced by this process are generally less than steel heat treated after rolling or than steel produced by advanced processes.

b) Normalising, N - normalising involves heating rolled steel above the critical temperature, Ac3 and in the lower end of the austenite recrystalisation region for a specific period of time, followed by air-cooling. The process improves the mechanical properties of as rolled steel by refining the grain size and homogenizing the microstructure.

c) Controlled rolling, CR (Normalizing Rolling, NR) - A rolling procedure in which the final deformation is carried out in the normalising temperature range, allowed to cool in air, resulting in a material condition generally equivalent to that obtained by normalising.

d) Quenching and Tempering, QT – Quenching involves a heat treatment process in which steel is heated to an appropriate temperature above the Ac3, held for specific period of time and then cooled with an appropriate coolant for the purpose of hardening the microstructure. Tempering subsequent to quenching is a process in which the steel is reheated to an appropriate temperature not higher than the Ac1, maintained at that temperature for a specific period of time to restore toughness properties by improving the microstructure and reduce the residual stress caused by the quenching process.

e) Thermo-mechanical Rolling, TM – Thermo-mechanical controlled processing - this is a procedure which involves the strict control of both the steel temperature and the rolling reduction. Generally, a high proportion of the rolling reduction is carried out close to or below the AR3 transition temperature and may involve rolling towards the lower end of the temperature range of the inter critical duplex phase region thus permitting little if any recrystallisation of the austenite. Unlike controlled rolled (normalised rolling) the properties conferred by TM (TMCP) cannot be reproduced by subsequent normalising or other heat treatment.

   The use of accelerated cooling on completion of TM-rolling may also be accepted subject to the special approval of IRS. The same applies for use of tempering after completion of the TM-rolling.

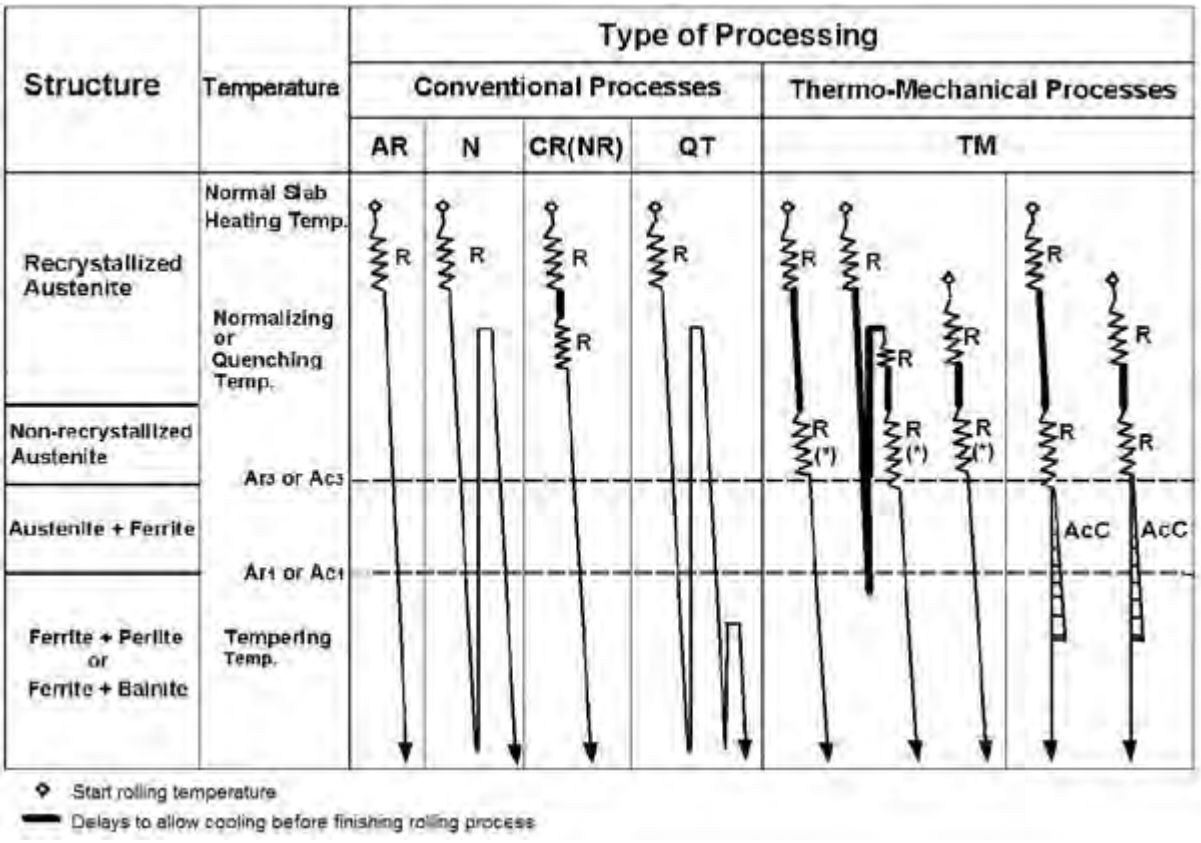
f) Accelerated cooling AcC - accelerated cooling is a process, which aims to improve mechanical properties by controlled cooling with rates higher than air cooling immediately after the final TM-rolling operation. Direct quenching is excluded from the accelerated cooling.

   The material properties conferred by TM and AcC cannot be reproduced by subsequent normalising or other heat treatment.

1.5.3.1 Where NR (CR) and TM with/without AcC are applied, the programmed rolling schedules are to be verified by IRS at the steel works and are to be made available when required by the attending Surveyor. On the manufacturer's responsibility, the programmed

rolling schedules are to be adhered to during the rolling operation. (Refer 1.2.3). To this effect, all the records of actual rolling are to be reviewed by the manufacturer and occasionally by the Surveyor.

When deviation from the programmed rolling schedules or normalizing or quenching and tempering procedures occurs, the manufacturer shall take further measures required in 1.2.3 to the Surveyor's satisfaction.



Notes:

AR:	As Rolled
N:	Normalizing
CR(NR):	Controlled Rolling (Normalizing Rolling)
QT:	Quenching and Tempering
TM:	Thermo-Mechanical Rolling (Thermo-Mechanical Controlled Process)
R:	Reduction
(*):	Sometimes rolling in the dual-phase temperature region of austenite and ferrite
AcC:	Accelerated Cooling

Fig.1.5.3 : Schematic Diagrams of Thermo-Mechanical and Conventional Processes

1.5.3.2 The conditions of supply and the impact test requirements are detailed in subsequent sections of the Chapter.

1.6 Test material

1.6.1 All material in a batch presented for acceptance tests are to be of the same product form e.g. plates, flats, sections. etc., from the same cast and in the same condition of supply.

1.6.2 Test samples

a) The test samples are to be fully representative of the material and, where appropriate, are not to be cut from the

material until heat treatment has been completed.

b) The test specimens are not to be separately heat treated in any way.

1.6.3 Unless otherwise agreed, the test samples are to be taken from the following position :

1.6.3.1 **Plates and flats with a width ≥ 600 [mm]** : The test samples are to be taken from one end at a position approximately midway between the axis in the direction of the rolling and the edge of the rolled product (See Fig.1.6.1 a). Unless otherwise agreed the tensile test specimens are to be prepared with their longitudinal axis transverse to the final direction of rolling.

1.6.3.2 **Flats with a width < 600 [mm], bulb flats and other sections** : For flats having a width of 600 [mm] or less, bulb flats and other sections the test specimens are to be taken from one end at a position approximately one third from the outer edge (See Figs.1.6.1 b,c,d), or in the case of small sections as near as possible to this position. In the case of channels, beams or bulb angles the test samples may alternatively be taken from a position approximately one quarter of the width from the web centreline or axis (See Fig.1.6.1 c). The tensile test specimens may be prepared with their longitudinal axis either parallel or transverse to the final direction of rolling.

1.6.3.3 **Bars and other similar products**: The test specimens are to be taken so that the axis of the test specimen is parallel to the direction of rolling. For small sizes, the test specimen may consist of a suitable length of the full cross section of the product (the impact test specimen receiving nevertheless the necessary machining). For larger sizes, the test samples are to be taken so that the axis of the test specimen lies as near as possible to the following :

a) for non-cylindrical sections, at one third of the half diagonal from the outside.

b) for cylindrical sections, at one third of the radius from outside (See Fig.1.6.1 e).

1.6.3.4 For plates and flats with thicknesses in excess of 40 [mm], full thickness specimens may be prepared, but when instead a machined round specimen is used then the axis is to be located at a position lying one-quarter of the product thickness from the surface as shown in Fig.1.6.1.f.

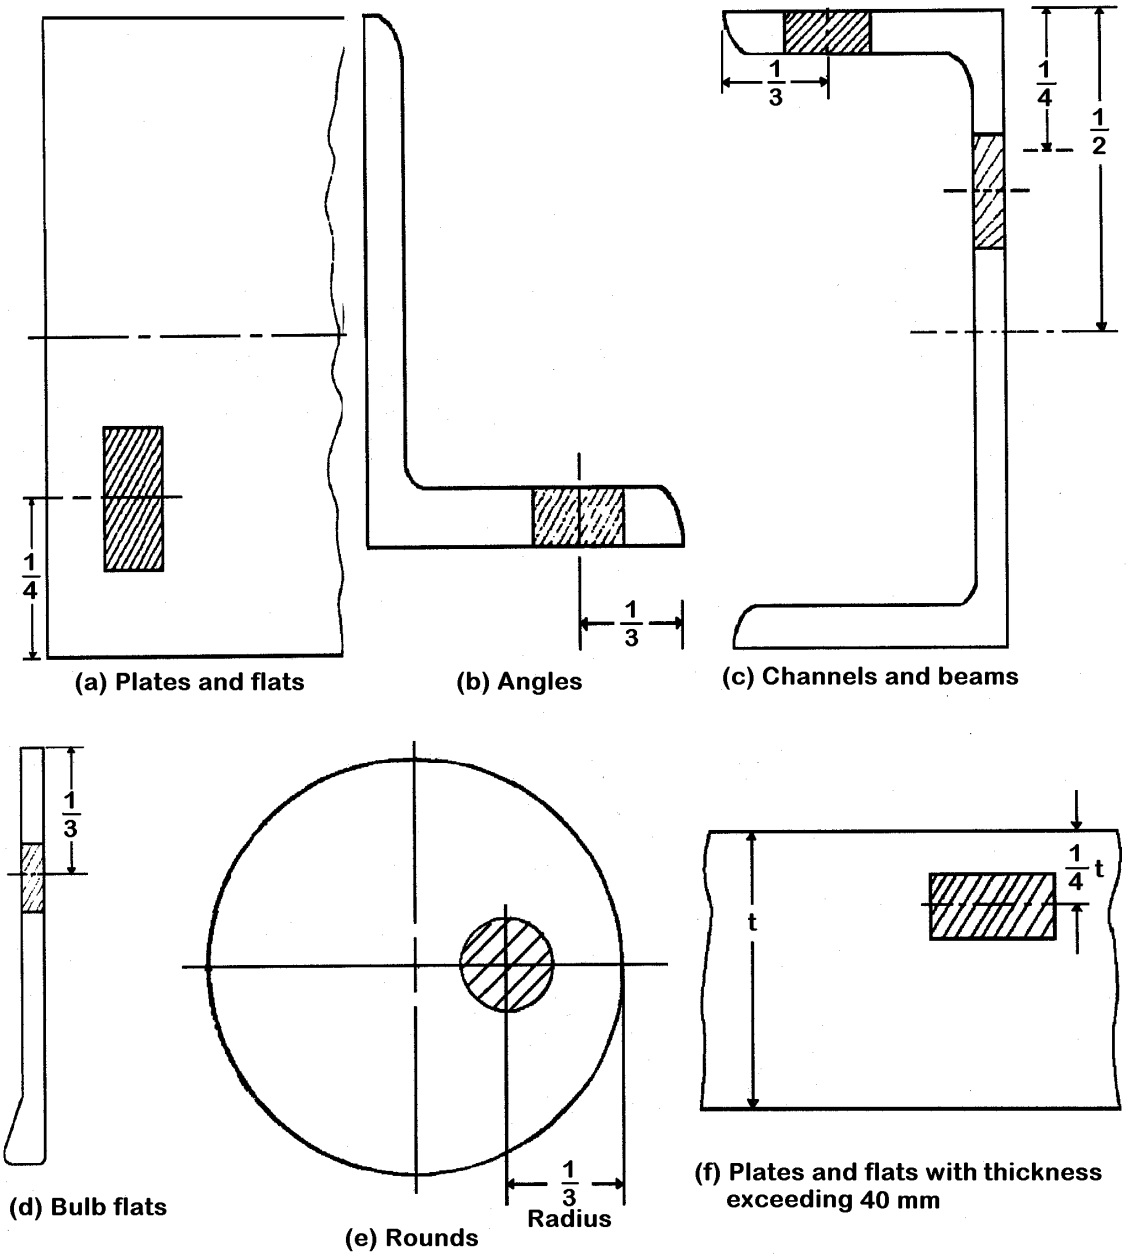


Fig.1.6.1 : Samples for testing

1.7 Mechanical test specimens

1.7.1 The tensile test specimens are to be machined to the dimensions detailed in Ch. 2.

1.7.2 Impact test specimens: The impact test specimens are to be of the charpy V-notch type machined to the dimensions detailed in Ch. 2 and cut with their longitudinal axis either parallel or transverse to the final direction of rolling of the material. They are to be taken from a position close to one of the rolled surfaces, except that for plates and sections over 40 [mm] thick the axis of test specimens are to be one quarter of the thickness from one of the rolled surfaces. For bars and other similar products the axis of the test specimens are to be as specified in 1.6.3.3. The notch is to be cut in a face of the test specimen which was originally perpen-dicular to the rolled surface. The position of the notch is to be not nearer than 25 [mm] to a flame-cut or sheared edge.

1.8 Surface inspection and dimensions

1.8.1 Surface inspection and verification of dimensions are the responsibility of the steel-maker, and acceptance by the Surveyors of material later found to be defective shall not absolve the steel maker from this responsibility.

The manufacturer is also responsible for compliance with the general requirements concerning freedom from harmful internal defects.

1.9 Freedom from defects

1.9.1 All products must have a workmanlike finish and must be free from defects and imperfections which may impair their proper workability and use. This may however, include some discontinuties of a harmless nature, minor imperfections e.g. pittings, rolling in scale, indentations, roll marks, scratches and grooves which cannot be avoided completely despite proper manufacturing and which will not be objected to provided they do not exceed the acceptable limits contained herein.

1.9.2 **Imperfections** : Notwithstanding this, the products may have imperfections exceeding the discontinuities inherent to the manufacturing process, as defined under 1.9.1. In such cases, limits for their acceptability are to be agreed with IRS, taking the end use of the product into consideration.

1.9.3 **Defects** : Cracks, shells, sand patches and sharp edged seams are always considered defects which would impair the end use of the product and which require rejection or repair, irrespective of their size and number. The same applies to other imperfection exceeding the acceptable limits.

1.10 Special quality plate material ('z' quality)

1.10.1 When plate material, intended for welded construction, will be subject to significant strains in a direction perpendicular to the rolled surfaces, it is recommended that consideration be given to the use of special plate material with specified through thickness properties. These strains are usually associated with thermal contraction and restraint during welding, particularly for full penetration "T"- butt welds, but may also be associated with loads applied in service or during construction. Requirements for these materials are detailed in Sec. 8 and it is the responsibility of shipbuilder or fabricator to make provision for the use of this material.

1.11 Branding of materials

1.11.1 Every finished item is to be clearly marked by the manufacturer in at least one place with IRS brand IR and the following particulars:

a) The manufacturer's name or trade mark;

b) Identification mark for the grade of steel, (material supplied in the thermo-mechanically controlled process condition is to have the letter TM added after the identification mark) ;

c) Cast or identification number and/or initials which enable the full history of the item to be traced;

d) If required by the purchaser, his order number or other identification marks.

e) Steels, which have been specially approved and which differ from the requirements given in this Chapter are to have the letter "S" marked after the agreed identification mark.

f) Steel plates that have complied with the requirements for corrosion resistant steel will be identified by adding a corrosion designation to the unified identification mark for the grade of steel. The corrosion resistant steel is to be designated according to its area of application as follows:

- Lower surface of strength deck and surrounding structures; **RCU**
- Upper surface of inner bottom plating and surrounding structures; **RCB**
- For both strength deck and inner bottom plating; **RCW**

1.11.2 Products complying with the requirements of Sec. 8 are to be marked "Z 25" or 'Z 35' as appropriate, in addition to the material grade designation e.g. 'EH36Z25' or 'EH36Z35'.

1.11.3 The above particulars, but excluding the manufacturer's name or trade mark where this is embossed on finished products, are to be encircled with paint or otherwise marked so as to be easily recognizable.

1.11.4 In the event of any material bearing IRS brand failing to comply with the test requirements, the brand name is to be unmistakably defaced.

1.12 Test certificates or other documentation

1.12.1 The Surveyor is to be supplied, in duplicate, copies of the test certificates or other documentation for all accepted materials, IRS may require separate documents for each grade of steel. These documents are to contain, in addition to the description, dimensions, etc. of the material at least the following particulars:

a) Purchaser's order number and if known the ship number for which the material is intended;

b) Identification number and/or initials;

c) Identification of steel works;

d) Identification of the grade of steel;

e) Cast number and ladle analysis;

f) For steel with a corrosion resistant steel designation the weight percentage of each element added or intentionally controlled for improving corrosion resistance.

g) Condition of supply when other than as rolled e.g. normalized or controlled rolled;

h) If the material is of rimming quality, this should be stated;

i) Test results.

In the case of 'Z' quality steel, notation 'Z25' or 'Z35' as appropriate, is to be indicated with the steel grade and test results are to include through thickness reduction in area (%).

1.12.2 Before the test certificates or shipping statements are signed by the Surveyor, the manufacturer is required to furnish him with a written declaration stating that the material has been made by an approved process and that it has been subjected to and has withstood satisfactorily the required tests in the presence of the Surveyor or his authorized deputy. The following form of declaration will be accepted if stamped or printed on each test certificate or shipping statement with the name of steelworks and initialed by the makers or an authorized deputy:
"We hereby certify that the material has been made by an approved process in accordance with the Rules of Indian Register of Shipping and has been tested satisfactorily in the presence of the surveyors of Indian Register of Shipping".

1.12.3 When steel is not produced at the works at which it is rolled a certificate is to be supplied to the Surveyor at the rolling mill stating the process by which it was manufactured and the name of the manufacturer, the number of cast from which it was made and the ladle analysis. The Surveyors are to have access to the works at which the steel was produced and the works must be approved by IRS. Also refer Chapter 1, Section1, Cl. 1.3.2.

Section 2

Normal Strength Steels for Ship Structures

2.1 General

2.1.1 Requirements of this section are applicable to weldable normal strength hot-rolled steel plates, wide flats, sections and bars intended for use in hull construction. Steel differing in chemical composition, deoxidation practice, heat treatment or mechanical properties may be accepted, subject to special agreement by IRS.

2.1.2 These requirements are primarily intended to apply to steel plates and wide flats not exceeding 100 [mm] in thickness and sections and bars not exceeding 50 [mm] in thickness. For greater thickness, certain variations in the requirements may be allowed or required in particular cases after consideration of the technical circumstances involved.

2.1.3 Requirements of this section also apply to normal strength Corrosion Resistant steels when such steel is used as the alternative means of corrosion protection for cargo oil tanks as specified in the performance standard MSC.289 (87) of Regulation 3-11, Part A-1, Chapter II-1 of the SOLAS Convention (Corrosion protection of cargo oil tanks of crude oil tankers). Corrosion Resistant steels as defined within this section, are steels whose corrosion resistance performance in the bottom

or top of the internal cargo oil tank is tested and approved to satisfy the requirements in MSC.289 (87) in addition to other relevant requirements for hull structural steels, structural strength and construction. It is not intended that such steels be used for corrosion resistant applications in other areas of a vessel that are outside of those specified in the performance standard MSC.289 (87) of Regulation 3-11, Part A-1, Chapter II-1 of the SOLAS Convention. These requirements apply to plates, wide flats, sections and bars in all grades up to a maximum thickness of 50 [mm].

2.2 Approval

2.2.1 Normal strength steel for ship hull structure is to be approved in accordance with requirements given in Section 1.

2.3 Method of Manufacture

2.3.1 Steel is to be manufactured by the basic oxygen, electric furnace or open hearth processes or by other processes specially approved by IRS.

2.3.2 The definitions of applicable rolling procedures and the schematic diagrams are given in Sec 1.

2.3.3 The de-oxidation practice used for each grade is to comply with the appropriate requirements of Table 2.4.1.

2.3.4 The rolling practice applied for each grade is to comply with the appropriate condition of supply of Table 2.5.1

2.4 Chemical composition

2.4.1 The chemical composition of samples taken from each ladle of each cast is to be determined by the manufacturer in an adequately equipped and competently staffed laboratory and is to comply with appropriate requirements of Table 2.4.1. For steel plates and wide flats over 50 [mm] thick, slight deviations in the chemical composition may be allowed as approved by IRS.

2.4.2 The manufacturer's declared analysis will be accepted subject to occasional checks if required by the surveyor.

2.5 Condition of supply

2.5.1 All materials are to be supplied in a condition complying with Table 2.5.1 and Table 2.5.2. Where alternative arrangements are permitted these are at the option of the steelmaker, unless otherwise expressly stated in the order for the material.

2.6 Mechanical Properties

2.6.1 For tensile test either the upper yield stress (ReH) or where ReH cannot be determined, the 0.2 percent proof stress (Rp 0.2) is to be determined and the material is considered to comply with the requirements if either value meets or exceeds the specified minimum value for yield strength (Re).

2.6.2 Results obtained from tensile tests are to comply with the appropriate requirements of Table 2.6.1.

2.6.3 Minimum average energy values are specified for Charpy V-notch impact test specimens taken in either the longitudinal or transverse directions. Generally, only longitudinal test specimens need be prepared and tested except for special applications where transverse test specimens may be required. Transverse test results are to be guaranteed by the manufacturer. The tabulated values are for standard specimens 10 [mm] x 10 [mm]. For plate thicknesses lower than 10 [mm], sub-size specimens may be used with reduced requirements as follows:

Specimen 10 x 7.5 [mm] : 5/6 of tabulated energy
Specimen 10 x 5 [mm] : 2/3 of tabulated energy.

2.6.4 For impact tests, the average value obtained from one set of three impact tests is to comply with the requirements given in Table 2.6.1. One individual value may be less than the required average value provided that it is not less than 70 per cent of this average value. See also Chapter 1.

2.6.5 Generally, impact tests are not required when the nominal plate thickness is less than 6 [mm].

Table 2.4.1 : Deoxidation and chemical composition

Grade	A	B	D	E
Deoxidation practice	For t ≤ 50 mm Any method except rimmed steel[1]	For t ≤ 50 mm Any method except rimmed steel	For t ≤ 25 [mm] killed,	Killed and fine grain treated
	For t > 50 mm Killed	For t > 50 mm Killed	For t > 25 mm Killed and fine grain treated	
Chemical composition per cent [4,7,8] (ladle samples)				
Carbon max.	0.21[2]	0.21	0.21	0.18
Manganese min	2.5 x Carbon %	0.80[3]	0.60	0.70
Silicon max	0.50	0.35	0.35	0.10 - 0.35
Phosphorus max	0.035	0.035	0.035	0.035
Sulphur max	0.035	0.035	0.035	0.035
Aluminium (acid soluble min)	-	-	0.015[5,6]	0.015[6]
Carbon + 1/6 of the manganese content is not to exceed 0.40 per cent				

Notes :

1 Grade A sections up to thickness of 12.5 mm may be accepted in rimmed steel subject to the special approval of IRS.
2 Max. 0.23% for sections.
3 When Grade B steel is impact tested the minimum manganese content may be reduced to 0.60%
4 When any grade of steel is supplied in the thermo-mechanically rolled condition variations in the specified chemical composition may be allowed or required by IRS.
5 Aluminium is required for thickness above 25 [mm].
6 The total aluminium content may be determined instead of the acid soluble content. In such cases the total aluminium content is to be not less than 0.020 per cent.
7 IRS may limit the amount of residual/trace elements which may have an adverse effect on the working and use of the steel, e.g. copper and tin.
8 Where additions of any other element have been made as part of the steelmaking practice, the content is to be specified.

Table 2.5.1 : Condition of supply for normal strength steel (1)

Grades	Thickness	Condition of supply
A	≤ 50 mm	Any
	> 50 mm ≤ 100 mm	Normalized, controlled rolled or thermo-mechanically rolled (2)
B	≤ 50 mm	Any
	> 50 mm ≤ 100 mm	Normalized, controlled rolled or thermo-mechanically rolled (2)
D	≤ 35 mm	Any
	> 35 mm ≤ 100 mm	Normalized, controlled rolled or thermo-mechanically rolled (3)
E	≤ 100 mm	Normalized or thermo-mechanically rolled (3)

Notes:

1) These conditions of supply and the impact test requirements are summarised in Table 2.5.2

2) Subject to the special approval of IRS, Grades A and B steel plates may be supplied in the as rolled condition. See 2.14.2.2.

3) Subject to the special approval of IRS, sections in Grade D steel may be supplied in the as rolled condition provided satisfactory results are consistently obtained from Charpy V-notch impact tests. Similarly sections in Grade E steel may be supplied in the as rolled or controlled rolled condition. For the frequency of impact tests see 2.14.3.2 and 2.14.3.3.

Table 2.5.2 : Required condition of supply and number of impact tests for normal strength steels

Grade	Deoxidation Practice	Pro-ducts	Condition of supply (batch for impact tests) (1)(2)							
			Thickness [mm]							
			10	12.5	20	25	30	35	40	50	100
A	Rimmed	Sections	A(-)	Not applicable							
	For t ≤ 50 mm Any method except rimmed For t > 50 mm Killed	Plates	A(-)								N(-) TM(-)[3] CR(50), AR*(50)
		Sections	A(-)								Not applicable
B	For t ≤ 50 mm Any method except rimmed For t > 50 mm Killed	Plates	A(-)			A(50)					N(50) TM(50) CR(25), AR*(25)
		Sections	A(-)			A(50)					Not applicable
D	Killed	Plates Sections	A(50)								Not applicable
D	Plates Killed and fine grain treated	Plates	A(50)						N(50) CR(50) TM(50)		N(50) TM(50) CR(25)
D		Sections	A(50)						N(50) CR(50) TM(50) AR*(25)		Not applicable
E	Killed and fine grain treated	Plates	N(Each piece) TM(Each piece)								
		Sections	N(25) TM(25) AR*(15), CR*(15)								Not applicable

Remarks:

1. Condition of Supply

A - Any (Not Specified)
N - Normalised Condition
CR - Controlled Rolled Condition
TM - Thermo-Mechanical Rolling
AR* - As Rolled Condition subject to special approval of IRS
CR* - Controlled Rolled Condition subject to special approval of IRS.

2. Number of Impact Tests

One set of impact tests is to be taken from each batch of the specified weight in ( ) in tones or fraction thereof.

3. See Note 5 of Table 2.6.1

Table 2.6.1 : Mechanical properties for normal strength steels

Grade	Yield strength ReH [N/mm²] min.	Tensile strength Rm [N/mm²]	Elongation 5.65 $\sqrt{S_o}$ A5 (%)	Impact Test					
				Test Temp. °C	Average impact energy (J) min.				
					t ≤ 50 mm		50 < t ≤ 70 mm		70 < t ≤ 100 mm	
					Long (3)	Trans (3)	Long (3)	Trans (3)	Long (3)	Trans (3)
A	235	400/520 (1)	22(2)	+20	-	-	34(5)	24(5)	41(5)	27(5)
B				0	27(4)	20(4)	34	24	41	27
D				-20	27	20	34	24	41	27
E				-40	27	20	34	24	41	27

Notes:

1) For all thicknesses of Grade A sections the upper limit for the specified tensile strength range may be exceeded at the discretion of IRS.

2) For full thickness flat tensile test specimens with a width of 25 mm and a gauge length of 200 mm the elongation is to comply with the following minimum values:

Thickness [mm]		> 5	> 10	> 15	> 20	> 25	> 30	> 40	
	≤ 5	≤ 10	≤ 15	≤ 20	≤ 25	≤ 30	≤ 40	≤ 50	
Elongation	14	16	17	18	19	20	21	22	

3) See 2.6.3.

4) Charpy V-notch impact tests are generally not required for Grade B steel with thickness of 25 mm or less.

5) Impact tests for Grade A over 50 mm thick are not required when the material is produced using fine grain practice and furnished normalised. TM rolling may be accepted without impact testing at the discretion of IRS.

2.7 Surface Quality

2.7.1 The steel is to be free from surface defects prejudicial to the use of the material for the intended application. The finished material is to have a surface quality in accordance with a recognized standard such as EN 10163 parts 1, 2 and 3, or an equivalent standard accepted by IRS, unless otherwise specified in this section.

2.7.2 The responsibility for meeting the surface finish requirements rests with the manufacturer of the material, who is to take the necessary manufacturing precautions and is to inspect the products prior to delivery. At that stage, however, rolling or heat treatment scale may conceal surface discontinuities and defects. If, during the subsequent descaling or working operations, the material is found to be defective, IRS may require materials to be repaired or rejected.

2.7.2.1 The surface quality inspection method is to be in accordance with recognized national or international standards agreed between purchaser and manufacturer, accepted by IRS.

2.7.2.2 If agreed between the manufacturer and purchaser, steel may be ordered with improved surface finish over and above these requirements.

2.7.3 Acceptance Criteria

2.7.3.1 Imperfections

2.7.3.1.1 Imperfections of a harmless nature, for example pitting, rolled-in scale, indentations, roll marks, scratches and grooves, regarded as being inherent of the manufacturing process, are permissible irrespective of their number, provided the maximum permissible limits of Class A of EN 10163-2 or limits specified in a recognized equivalent standard accepted by IRS, are not exceeded and the remaining plate or wide flat thickness remains within the average allowable minus thickness tolerance specified in Sec 1, 1.4. Total affected area with imperfection not exceeding the specified limits are not to exceed 15 % of the total surface in question.

2.7.3.2 Defects

2.7.3.2.1 Affected areas with imperfections with a depth exceeding the limits of Class A of EN 10163-2 or the maximum permissible limits specified in a recognized equivalent standard accepted by IRS, are to be repaired irrespective of their number. Cracks, injurious surface flaws, shells (over lapping material with non-metallic inclusion), sand patches, laminations and sharp edged seams (elongated defects) visually evident on surface and/or edge of plate are considered defects, which would impair the end use of the product and which require rejection or repair, irrespective of their size and number.

2.7.4 Repair

2.7.4.1 Grinding repair

2.7.4.1.1 Grinding may be applied provided all the conditions below are adhered to:

(a) The nominal product thickness will not be reduced by more than 7% or 3 mm, whichever is the less.

(b) Each single ground area does not exceed 0.25 [m^2].

(c) All ground areas do not exceed 2% of the total surface in question.

(d) Ground areas lying in a distance less than their average breadth to each other are to be regarded as one single area.

(e) Ground areas lying opposite each other on both surfaces are not to decrease the product thickness by values exceeding the limits as indicated in (a).

Defects or unacceptable imperfections are to be completely removed by grinding and the remaining plate or wide flat thickness is to remain within the average allowable minus thickness tolerance specified in Sec.1, 1.4. The ground areas are to be a smooth transition to the surrounding surface of the product. Complete elimination of the defect is to be verified by magnetic particle or by liquid penetrant testing.

2.7.4.2 Welding repair

2.7.4.2.1 Weld repair procedures and the method are to be reported and be approved by the IRS. Repair of defects such as unacceptable imperfections, cracks, shells or seams are to be followed by magnetic particle or liquid penetrant testing. Local defects which cannot be repaired by grinding as stated in 2.7.4.1 may be repaired by welding with the agreement of IRS subject to the following conditions:

(a) Any single welded area is not to exceed 0.125 [m^2] and the sum of all areas is not to exceed 2% of the surface side in question.

(b) The distance between two welded areas is not to be less than their average width.

(c) The weld preparation is not to reduce the thickness of the product below 80% of the nominal thickness. For occasional defects with depths exceeding the 80% limit, special consideration at the Surveyor's discretion will be necessary.

(d) If weld repair depth exceeds 3 [mm], UT may be requested by IRS. If required, UT is to be carried out in accordance with an approved procedure.

(e) The repair is to be carried out by qualified welders using an approved procedure for the appropriate steel grade. The electrodes are to be of low hydrogen type and are to be dried in accordance with the manufacturer's requirements and protected against re-humidification before and during welding.

2.7.5 The surface quality and condition requirement herein are not applied to products in forms of bars and tubulars, which will be subject to manufacturers' conformance standards.

2.8 Internal soundness

2.8.1 If plates and wide flats are ordered with ultrasonic inspection, this is to be made in accordance with an accepted standard at the discretion of IRS.

2.8.2 Verification of internal soundness is the responsibility of the manufacturer. The acceptance of internal soundness by surveyor does not absolve the manufacturer from this responsibility.

2.9 Tolerances

2.9.1 Unless otherwise agreed or specially required the thickness tolerances as per Sec.1, 1.4 are applicable.

2.10 Identification of Materials

2.10.1 The steelmaker is to adopt a system for the identification of ingots, slabs and finished pieces which will enable the material to be traced to its original cast.

2.10.2 The Surveyor is to be given full facilities for so tracing the material when required.

2.11 Testing and Inspection

2.11.1 Facilities for Inspection

2.11.1.1 The manufacturer is to afford the Surveyor all necessary facilities and access to all relevant parts of the works to enable him to verify that the approved process is adhered to, for the selection of test materials, and the witnessing of tests, as required by the Rules, and for verifying the accuracy of the testing equipment.

2.11.2 Testing Procedures

2.11.2.1 The prescribed tests and inspections are to be carried out at the place of manufacture before dispatch. The test specimens and procedures are to be in accordance with Ch.2. All the test specimens are to be selected and stamped by the Surveyor and tested in his presence, unless otherwise agreed.

2.11.3 Through Thickness Tensile Tests

2.11.3.1 If plates and wide flats with thickness of 15 [mm] and over are ordered with through thickness properties, the through thickness tensile test in accordance with Sec.8 is to be carried out.

2.11.4 Dimensions

2.11.4.1 Verification of dimensions are the responsibility of the steel maker. The acceptance by Surveyor does not absolve the steel maker from this responsibility.

2.12 Test Material

2.12.1 Definitions

2.12.1.1 Refer to Ch1 for the definitions of piece and batch.

2.12.2 Test Samples

2.12.2.1 Refer to Sec 1, for the requirements related to test samples.

2.13 Mechanical Test specimens

2.13.1 Tensile Test Specimens. The dimensions of the tensile test specimens are to be in accordance with Ch.2. Generally, for plates, wide flats and sections flat test specimens of full product thickness are to be used. Round test specimens may be used when the product thickness exceeds 40 [mm] or for bars and other similar products. Alternatively, for small sizes of bars, etc. test specimens may consist of a suitable length of the full cross section of the product.

2.13.2 Impact Test Specimens. The impact test specimens are to be of the Charpy V-notch type cut with their edge within 2 [mm] from the “as rolled” surface with their longitudinal axes either parallel (indicated “Long” in Table 2.6.1) or transverse (indicated "Trans" in Tables 2.6.1) to the final direction of rolling of the material. The notch is to be cut in a face of the test specimen which was originally perpendicular to the rolled surface. The position of the notch is not to be nearer than 25 [mm] to a flame cut or sheared edge (see also 2.6.3). Where the product thickness exceeds 40 [mm], the impact test specimens are to be taken with their longitudinal axis at a quarter thickness position.

2.14 Number of Test Specimens

2.14.1 Number of Tensile Tests

2.14.1.1 For each batch presented. except where specially agreed by IRS. one tensile test is to be made from one piece unless the weight of finished material is greater than 50 tonnes in which case one extra test piece is to be made from a different piece from each 50 tonnes or fraction thereof. Additional tests are to be made for every variation of 10 [mm] in thickness of plate or diameter of products from the same cast. For sections the thickness to be considered is the thickness of the product at the point at which samples are taken for mechanical tests.

2.14.2 Number of Impact Tests (except for Grade E)

2.14.2.1 For each batch presented, except where specially agreed by IRS at least one set of three Charpy V-notch test specimens is to be made from one piece unless the weight of finished material is greater than 50 tonnes in which case one extra set of three test specimens is to be made from a different piece from each 50 tonnes or fraction thereof. The piece selected for the preparation of test specimen is to be the thickest of each batch. Where steel plates except for Grade 'A' steel over 50 [mm] in thickness is supplied in the controlled rolled condition, the frequency of impact test is to be made from a different piece from each 25 tonnes or fraction thereof.

2.14.2.2 When subject to the special approval of IRS, material is supplied in the as rolled condition the frequency of impact tests is to be increased to one set from each batch of 25 tonnes or fraction thereof. However, for Grade 'A' steel over 50 [mm] thickness when supplied in the "as rolled" condition, one set of three charpy V-notch test specimens may be taken from each batch of 50 tonnes or fraction thereof.

2.14.2.3 The piece selected for the preparation of the test specimens is to be the thickest in each batch.

2.14.3 Number of Impact Tests (for Grade E)

2.14.3.1 For steel plates supplied in the normalized or TM condition, one set of impact test specimens is to be taken from each piece.

2.14.3.2 For sections, one set of impact tests is to be taken from each batch of 25 tonnes or fraction thereof.

2.14.3.3 When, subject to the special approval of IRS, sections are supplied in the as-rolled or controlled rolled condition.one set of impact tests is to be taken from each batch of 15 tonnes or fraction thereof.

2.14.3.4 For 2.14.3.2 and 2.14.3.3 above the piece selected for the preparation of the test specimens is to be the thickest in each batch.

2.15 Retest Procedures

2.15.1 Retest procedures are to be as per the requirements provided in Chapter 1.

Section 3

Higher Strength Steels for Ship Structures

3.1 General

3.1.1 Requirements of this section is applicable to weldable higher strength hot-rolled steel plates, wide flats, sections and bars intended for use in hull construction.

3.1.2 The requirements of this section are primarily intended to apply to plates and wide flats not exceeding 100 [mm] in thickness in general, and sections and bars not exceeding 50 [mm] in thickness. For greater thickness, these requirements may be applied with certain variations, as may be agreed by IRS.

3.1.3 Steel differing in chemical composition, deoxidation practice, heat treatment or mechanical properties may be accepted, subject to special approval by IRS. Such steel is to be given special designation.

3.1.4 Provision is made for three strength levels (315, 355 and 390 N/mm^2) each subdivided into four grades, AH, DH, EH and FH based on impact test temperature.
The additional requirements for high strength plates having specified minimum yield point of 460 [N/mm^2] with thickness over 50 [mm] and not greater than 100 [mm] for use in longitudinal structural members in the upper deck region of container ships (such as hatch side coaming, hatch coaming, hatch coaming top and attached longitudinals) and denoted by Grade EH47 are also given in this section.

Brittle Crack Arrest Steels: Brittle crack arrest steels are defined as steel plate with the specified brittle crack arrest properties measured by either the brittle crack arrest toughness Kca or Crack Arrest Temperature (CAT). Additional requirements for brittle crack arrest steels are specified in Section 10. Brittle crack arrest steels are to be used for container ships, as indicated in Pt. 5, Ch. 5 of the Rules.

3.1.5 Requirements of this section also apply to high strength Corrosion Resistant steels when such steel is used as the alternative means of corrosion protection for cargo oil tanks as specified in the performance standard MSC.289 (87) of Regulation 3-11, Part A-1, Chapter II-1 of the SOLAS Convention (Corrosion protection of cargo oil tanks of crude oil tankers). Corrosion Resistant steels as defined within this section, are steels whose corrosion resistance performance in the bottom or top of the internal cargo oil tank is tested and approved to satisfy the requirements in MSC.289 (87) in addition to other relevant requirements for hull structural steels, structural strength and construction. It is not intended that such steels be used for corrosion resistant applications in other areas of a vessel that are outside of those specified in the performance standard MSC.289 (87) of Regulation 3-11, Part A-1, Chapter II-1 of the SOLAS Convention. These requirements apply to plates, wide flats, sections and bars in all grades up to a maximum thickness of 50 [mm].

3.2 Approval

3.2.1 Higher strength steel for ship hull structure is to be approved in accordance with requirements given in Section 1.

3.2.2 It should be noted that when fatigue loading is present, the effective fatigue strength of a welded construction of higher strength steels may not be greater than that of a construction fabricated from the normal strength steels. Precautions against corrosion fatigue may also be necessary.

Note: Before subjecting steels produced by thermo-mechanical rolling to further heating for forming or stress relieving or using high heat-input welding, special consideration must be given to the possibility of a consequent reduction in mechanical properties.

3.3 Method of Manufacture

3.3.1 Steel is to be manufactured by the basic oxygen, electric furnace or open hearth processes or by other processes specially approved by IRS.

3.3.2 The definitions of applicable rolling procedures and the schematic diagrams are given in Sec 1.

3.3.3 The deoxidation practice used for each grade is to comply with the appropriate requirements of Table 3.4.1.

3.3.4 The rolling practice applied for each grade is to comply with the appropriate condition of supply of Table 3.5.1

3.4 Chemical composition

3.4.1 The chemical composition of samples taken from each ladle of each cast is to be determined by the manufacturer in an adequately equipped and competently staffed laboratory and is to comply with appropriate requirements of Table 3.4.1. For steel plates and wide flats over 50 [mm] thick, slight deviations in the chemical composition may be allowed as approved by IRS.

The chemical composition of EH 47 steel plates would be specially considered.

3.4.2 The manufacturer's declared analysis will be accepted subject to occasional checks if required by the surveyor.

3.4.3 When required, the carbon equivalent value is to be calculated from the ladle analysis using the following formula.

$$\text{Carbon eq.} = C + \frac{Mn}{6} + \frac{Cr + Mo + V}{5} + \frac{Ni + Cu}{15} \ \%$$

Note: This formula is applicable only to steels which are basically of the carbon manganese type and gives a general indication of the weldability of the steel.

Table 3.4.1 : Chemical composition and deoxidation practice for higher strength steels			
Grade[1)]	**AH32/DH32/EH32 AH36/DH36/EH36 AH40/DH40/EH40**	**FH32 FH36 FH40**	**EH47**
Deoxidation practice	Fully killed and fine grain refined		
Chemical Composition per cent (Ladle sample)[5),6)]			
C max. Mn Si max. P max. S max.	0.18 0.90 - 1.60[2)] 0.50 0.035 0.035	0.16 0.90 - 1.60 0.50 0.025 0.025	0.18 0.9 – 2.00 0.55 0.020 0.020
Grain refining elements[5)]			
Al (acid soluble) min.	0.015[3),4)]		
Nb V Ti max. Total (Nb + V + Ti)	0.02 - 0.05[4)] 0.05 - 0.10[4)] 0.02 0.12 max.		
Residual elements			
Cu max. Cr max. Ni max. Mo max. N max.	0.35 0.20 0.40 0.08 -	0.35 0.20 0.80 0.08 0.009 (0.012 if Al is present)	0.35 0.25 1.0 0.08 -

Notes:

1) The number following the grade designation indicates the yield point to which the steel is ordered or produced in [Kg/mm^2].

2) For thickness upto and including 12.5 [mm] the minimum manganese content may be reduced to 0.70 percent.

3) The total aluminium content may be determined instead of the acid soluble content. In such cases the total aluminium content is to be not less than 0.020 percent

4) The steel is to contain aluminium, niobium, vanadium or other suitable grain refining elements, either single or in combination. When used singly the steel is to contain the specified minimum content of the grain refining element. When used in combination, the specified minimum content of a fine graining element is not applicable.

5) When any grade of higher strength steel is supplied in the thermo-mechanically rolled condition variations in the specified chemical composition may be allowed or required by IRS

6) Where additions of any other element have been made as part of the steel making practice, the content is to be indicated.

3.4.4 For TM (TMCP) steels the following special requirements apply:

i) The carbon equivalent value is to be calculated from the ladle analysis using the following formula and to comply with the requirements of the following table:

Carbon equivalent for higher strength steels upto 100 mm in thickness produced by TM		
Grade	**Carbon equivalent Max. (%)[1)]**	
	t ≤ 50	**50 < t ≤ 100**
AH32, DH32, EH32, FH32	0.36	0.38
AH36, DH36, EH36, FH36	0.38	0.40
AH40, DH40, EH40, FH40	0.40	0.42
EH47	NA	0.49
t = thickness [mm]		
Note: 1) It is a matter for the manufacturer and shipbuilder to mutually agree in individual cases as to whether they wish to specify a more stringent carbon equivalent.		

$$\text{Carbon eq.} = C + \frac{Mn}{6} + \frac{Cr + Mo + V}{5} + \frac{Ni + Cu}{15} \ \%$$

ii) Other means such as cold cracking susceptibility P_{cm} (in %), may be considered instead of the carbon equivalent for evaluating the weldability.

$$P_{cm} = C + \frac{Si}{30} + \frac{Mn}{20} + \frac{Cu}{20} + \frac{Ni}{60} + \frac{Cr}{20} + \frac{Mo}{15} + \frac{V}{10} + 5B$$

3.4.5 The carbon equivalent of EH47 grade steel calculated as per 3.4.3 is not to exceed 0.49%. The cold cracking susceptibility P_{cm} calculated using the formula mentioned in 3.4.4.(ii) is not to exceed 0.22%.

3.5 Condition of supply

3.5.1 All materials are to be supplied in a condition complying with the requirements given in Table 3.5.1.

Table 3.5.1 : Condition of supply for Higher strength steel [1)]

Grades	Grain Refining Elements Used	Thickness	Condition of supply
A32 A36	Nb and/or V	≤ 12.5 mm	Any
		> 12.5 mm ≤ 100 mm	Normalized, controlled rolled or thermo-mechanically rolled [(3)]
	Al alone or with Ti	≤ 20 mm	Any
		> 20 mm ≤ 35 mm	Any, as rolled subject to special approval of IRS [(2)]
		> 35 mm ≤ 100 mm	Normalized, controlled rolled or thermo-mechanically rolled [(3)]
A40	Any	≤ 12.5 mm	Any
		> 12.5 mm ≤ 50 mm	Normalized, controlled rolled or thermo-mechanically rolled
		> 50 mm ≤ 100 mm	Normalized, thermo-mechanically rolled or quenched and tempered
D32 D36	Nb and/or V	≤ 12.5 mm	Any
		> 12.5 mm ≤ 100 mm	Normalized, controlled rolled or thermo-mechanically rolled [(3)]
	Al alone or with Ti	≤ 20 mm	Any
		> 20 mm ≤ 25 mm	Any, as rolled subject to special approval of IRS [(2)]
		> 25 mm ≤ 100 mm	Normalized, controlled rolled or thermo-mechanically rolled [(3)]

Table 3.5.1 : (Contd.)

Grades	Grain Refining Elements Used	Thickness	Condition of supply
D40	Any	≤ 50 mm	Normalized, controlled rolled or thermo-mechanically rolled
		> 50 mm ≤ 100 mm	Normalized, thermo-mechanically rolled or quenched and tempered
E32 E36	Any	≤ 50 mm	Normalized or thermo-mechanically rolled (3)
		> 50 mm ≤ 100 mm	Normalized, thermo-mechanically rolled
E40	Any	≤ 50 mm	Normalized, thermo-mechanically rolled or quenched and tempered
		> 50 mm ≤ 100 mm	Normalized, thermo-mechanically rolled or quenched and tempered
F32 F36 F40	Any	≤ 50 mm	Normalized, thermo-mechanically rolled or quenched and tempered (4)
		> 50 mm ≤ 100 mm	Normalized, thermo-mechanically rolled or quenched and tempered

Notes:

(1) These conditions of supply and the requirements for impact tests are summarised in Table 3.5.2.
(2) The frequency of impact tests is to be in accordance with 3.14.2 (ii).
(3) Subject to the special approval of IRS, sections in Grades AH32, AH36, DH32 and DH36 steels may be supplied in the as rolled condition provided satisfactory results are consistently obtained from Charpy V-notch impact tests. Similarly sections in Grades EH32 and EH36 steels maybe supplied in the as rolled or controlled rolled condition. The frequency of impact tests is to be in accordance with 3.14.2 (ii) and 3.14.2 (iii) respectively.
(4) Subject to the special approval of IRS, sections in Grades FH32 and FH36 steels may be supplied in the controlled rolled condition. The frequency of impact tests is to be in accordance with 3.14.3 (iii).

Table 3.5.2 : Required condition of supply and number of impact tests for higher strength steels

Grade	Deoxi-dation Practice	Grain Refining Elements	Pro-ducts	Condition of supply (batch for impact tests) (1)(2)								
				Thickness [mm]								
				10	12.5	20	25	30	35	40	50	100

Remarks

1. Condition of Supply

A - Any (Not Specified)

N - Normalised Condition

CR - Controlled Rolled Condition

TM - Thermo-Mechanical Rolling

QT - Quenched and Tempered Condition

AR* - As Rolled Condition subject to special approval of IRS

CR* - Controlled Rolled Condition subject to special approval of IRS.

2. Number of Impact Tests

One set of impact tests is to be taken from each batch of the "specified weight" in ( ) in tones or fraction thereof.

For Grades A32 and A36 steels charpy impact tests are not generally required provided that satisfactory results are obtained from occasional check tests selected by the Surveyor.

3.6 Mechanical Properties

3.6.1 For tensile test either the upper yield stress (ReH) or where ReH cannot be determined, the 0.2 percent proof stress (Rp 0.2) is to be determined and the material is considered to comply with the requirements if either value meets or exceeds the specified minimum value for yield strength (Re).

3.6.2 Results obtained from tensile tests are to comply with the appropriate requirements of Table 3.6.1.

Table 3.6.1 : Mechanical properties for higher strength steels

Grade	Yield stren-gth ReH [N/mm^2] min.	Tensile strength Rm [N/mm^2]	Elon-gation 5.65 $\sqrt{S_o}$ A5 (%)	Impact Test						
				Test Temp. °C	Average impact energy (J) min.					
					t ≤ 50 mm		50 < t ≤ 70 mm		70 < t ≤ 100 mm	
					Long (2)	Trans (2)	Long (2)	Trans (2)	Long (2)	Trans (2)
AH32	315	440/570	22(1)	0	31(3)	23(3)	38	26	46	31
DH32				-20	31	22	38	26	46	31
EH32				-40	31	22	38	26	46	31
FH32				-60	31	22	38	26	46	31
AH36	355	490/630	21(1)	0	34(3)	24(3)	41	27	50	34
DH36				-20	34	24	41	27	50	34
EH36				-40	34	24	41	27	50	34
FH36				-60	34	24	41	27	50	34
AH40	390	510/660	20(1)	0	39	27	46	31	55	37
DH40				-20	39	27	46	31	55	37
EH40				-40	39	27	46	31	55	37
FH40				-60	39	27	46	31	55	37

t = thickness [mm]

NOTES:

1) For full thickness flat tensile test specimens with a width of 25 [mm] and a gauge length of 200 [mm] the elongation [%] is to comply with the following minimum values:

Grade	Thickness [mm]							
	≤ 5	> 5 ≤ 10	> 10 ≤ 15	> 15 ≤ 20	> 20 ≤ 25	> 25 ≤ 30	> 30 ≤ 40	> 40 ≤ 50
AH32, DH32, EH32 & FH32	14	16	17	18	19	20	21	22
AH36, DH36, EH36 & FH36	13	15	16	17	18	19	20	21
AH40, DH40, EH40 & FH40	12	14	15	16	17	18	19	20

2) See 3.6.3.

3) For Grades AH32 and AH36 steels a relaxation in the number of impact tests for acceptance purposes may be permitted by special agreement with IRS provided that satisfactory results are obtained from occasional check tests.

Table 3.6.2 : Conditions of supply, grade and mechanical properties for EH47 steel plates

Supply Condition	Grade	Mechanical Properties			Impact Test			
		Yield Strength [N/mm^2]min	Tensile Strength [N/mm^2]	Elongation (%) min.	Test Temp. (^{o}C)	Average Impact Energy [J] min.		
						50<t≤ 70	70<t≤8 5	85<t≤ 100
TMCP	EH 47	460	570/720	17	-40^{o}C	53	64	75

Note : t: Thickness [mm]

1). The additional requirements for EH47 steel with brittle crack arrest properties are specified in Section 10.

3.6.3 Minimum average energy values are specified for Charpy V-notch impact test specimens taken in either the longitudinal or transverse directions. Generally, only longitudinal test specimens need be prepared and tested except for special applications where transverse test specimens may be required. Transverse test results are to be guaranteed by the manufacturer. The tabulated values are for standard specimens 10 [mm] x 10 [mm]. For plate thicknesses lower than 10 [mm], sub-size specimens may be used with reduced requirements as follows :

Specimen 10 x 7.5 [mm] : 5/6 of tabulated energy
Specimen 10 x 5 [mm] : 2/3 of tabulated energy.

3.6.4 For impact tests, the average value obtained from one set of three impact tests is to comply with the requirements given in Table 3.6.1. One individual value may be less than the required average value provided that it is not less than 70 per cent of this average value. See also Chapter 1.

3.6.5 Generally, impact tests are not required when the nominal plate thickness is less than 6 [mm].

3.7 Surface Quality

3.7.1 Requirements of 2.7 are applicable.

3.8 Internal Soundness

3.8.1 Requirements of 2.8 are applicable.

3.9 Tolerances

3.9.1 Requirements of 2.9 are applicable.

3.10 Identification of Materials

3.10.1 Requirements of 2.10 are applicable

3.11 Testing and Inspection

3.10.1 Requirements of 2.11 are applicable

3.12 Test Material

3.12.1 Requirements of 2.12 are applicable

3.13 Mechanical tests specimens

3.13.1 Tensile Test Specimens. The dimensions of the tensile test specimens are to be in accordance Ch.2. Generally for plates, wide flats and sections flat test specimens of full product thickness are to be used. Round test specimens may be used when the product thickness exceeds 40 [mm] or for bards and other similar products. Alternatively for small sizes of bars, etc. test specimens may consist of a suitable length of the full cross section of the product.

3.13.2 Impact Test Specimens. The impact test specimens are to be of the Charpy V-notch type cut with their edge within 2 [mm] from the “as rolled” surface with their longitudinal axes either parallel (indicated “Long” in Table 3.6.1) or transverse (indicated "Trans" in Table 3.6.1) to the final direction of rolling of the material. The notch is to be cut in a face of the test

specimen which was originally perpendicular to the rolled surface. The position of the notch is not to be nearer than 25 [mm] to a flame cut or sheared edge (see also 3.6.3). Where the product thickness exceeds 40 [mm], the impact test specimens are to be taken with their longitudinal axis at a quarter thickness position.

3.14 Number of Test Specimens

3.14.1 Number of Tensile Tests. For each batch presented, except where specially agreed by IRS, one tensile test is to be made from one piece unless the weight of finished material is greater than 50 tonnes in which case one extra test piece is to be made from a different piece from each 50 tonnes or fraction thereof. Additional tests are to be made for every variation of 10 [mm] in thickness of plate or diameter of products from the same cast. For sections, the thickness to be considered is the thickness of the product at the point at which samples are taken for mechanical tests.

3.14.2 Number of Impact Tests (except for Grades EH32, EH36, EH40, EH47, FH32, FH36 and FH40):

i) Except where otherwise specified or specially agreed by IRS, for each batch presented, at least one set of three Charpy V-notch impact test specimen is to be made from one piece unless the weight of finished material is greater than 50 tonnes, in which case one extra set of three test specimens is to be made from a different piece from each 50 tonnes or fraction thereof. When steel plates over 50 [mm] in thickness is supplied in the controlled rolled condition, the frequency of impact test is to be made from a different piece from each 25 tonnes or fraction therof.

ii) For steel plates of Grades AH40 and DH40 with thickness over 50 [mm] in normalized or TM condition, one set of impact test specimens is to be taken from each batch of 50 tonnes or fraction thereof. For those in QT condition, one set of impact test specimens is to be taken from each length as heat treated.

iii) When, subject to special approval of IRS, material is supplied in the as rolled condition, the frequency of impact tests is to be increased to one set from each batch of 25 tonnes or fraction thereof.

iv) The piece selected for the preparation of test specimens is to be the thickest in each batch.

3.14.3 Number of Impact Tests (Grades EH32, EH36, EH40, FH32, FH36 and FH40):

i) For plates supplied in the normalized or TM condition one set of three Charpy V-notch impact test specimens is to be taken from each piece. For quenched and tempered steel plates one set of impact test specimens is to be taken from each length as heat treated.

ii) For sections one set of impact tests is to be taken from each batch of 25 tonnes or fraction thereof.

iii) When, subject to special approval of IRS, sections other than Grades EH40 and FH40 are supplied in the as-rolled or controlled rolled condition, one set of impact tests is to be taken from each batch of 15 tonnes or fraction thereof.

iv) For (ii) and (iii) above the piece selected for the preparation of test specimens is to be the thickest in each batch.

3.15 Manufacturing approval scheme for EH47 steels

3.15.1 Approval scheme

3.15.1.1 Manufacturing approval scheme for EH47 steels is to be in accordance with Part 2 of the IRS Classification Note: '*Approval Scheme for the Manufacturing Process of Normal and Higher Strength Hull Structural Steels',* unless otherwise specified in this sub-section.

3.15.2 Approval tests

3.15.2.1 *Extent of Approval tests* :

.1 Cl. 2.1 (c) and (d) of Part 2 of subject Classification Note are not to be applied to manufacturing approval of EH47 steels.

.2 The products for testing are to represent the maximum thickness for approval. If the target chemical composition changes with the thickness, the maximum thickness for each specified chemical composition specification is to be tested.

3.15.2.2 *Type of tests*

(a) *Brittle fracture initiation test*: Deep notch test or Crack Tip Opening Displacement (CTOD) test is to be carried out. The test method is to be acceptable to IRS.

(b) *Y-groove weld cracking test (Hydrogen crack test):* The test method is to be in accordance with recognized national standards such as ISO 17642-2:2005.

In addition to the requirements specified in (a) and (b) above, the approval tests specified in Part 2 of the IRS Classification Note: '*Approval Scheme for the Manufacturing Process of Normal and Higher Strength Hull Structural Steels',* are also to be carried out. Additional tests may be required when deemed necessary by IRS.

3.16 Retest Procedures

3.16.1 Retest procedures are to be as per the requirements provided in Chapter 1.

Section 4

High Strength Steels for Welded Structures

4.1 General

4.1.1 These requirements apply to hot-rolled, fine-grain, weldable high strength structural steels, intended for use in marine and offshore structural applications. These requirements do not apply to steels intended for hull structure of commercial ships whose requirements are specified in previous sections.

4.1.2 The steel covered by the scope of these requirements are specified in yield strength levels of 420, 460, 500, 550, 620, 690,890 and 960 [N/mm^2]. For each yield strength level grades AH, DH, EH and FH are specified, based on the impact test temperature, except for yield strength level of 890 and 960 [N/mm^2] for which grade F is not applicable. The full list of grades are:

AH420	**DH420**	**EH420**	**FH420**
AH460	**DH460**	**EH460**	**FH460**
AH500	**DH500**	**EH500**	**FH500**
AH550	**DH550**	**EH550**	**FH550**
AH620	**DH620**	**EH620**	**FH620**
AH690	**DH690**	**EH690**	**FH690**
AH890	**DH890**	**EH890**	
AH960	**DH960**	**EH960**	

4.1.3 Steels covered by the scope may be delivered in Normalized (N)/Normalized rolled (NR); Thermo-mechanical controlled rolled (TM) or Quenched and Tempered (QT) condition.

Note: TM is a generic delivery condition that may not include accelerated cooling, and may or may not include direct quenching followed by tempering after TM-rolling.

4.1.4 Product forms include plates, wide flats, sections bars and seamless tubulars.

4.1.5 Steels with a thickness beyond the maximum thicknesses as given in Table 4.5.3 may be approved at the discretion of the IRS.

4.1.6 Steels differing in chemical composition, deoxidation practice, delivery condition and mechanical properties may be accepted, subject to the special approval of the IRS. Such steels are to be given a special designation.

4.2 Approval

4.2.1 For applications subjected to Classification, all steels are to be manufactured at steel works which have been approved by IRS for the type and grade of steel which is being supplied. The procedure for approval is available in Classification Note "*Manufacturing Approval Scheme of High Strength Steels for Welded Structures"*. Also refer Chapter 1, Section 1, Cl. 1.3.2.

4.2.2 It is the steelmaker's responsibility to assure that effective quality, process and production controls during manufacturing are adhered to within the manufacturing specification. The manufacturing specification is to be submitted to IRS at the time of initial approval.

4.2.3 Where non-conformities arise, the manufacturer is to identify the root cause and establish countermeasures to prevent its recurrence. The non-conformities and the countermeasures are to be documented and reported to IRS.

4.2.4 When the semi-finished products were not manufactured by the approved manufacturer of the finish rolled and heat treated products, the manufacturer of the semi-finished product is also to be subject to approval by IRS.

Note 1: The attention of the users must be drawn to the fact that when fatigue loading is present, the effective fatigue strength of a welded joint of high strength steel may not be greater than that of a welded joint in normal strength steels.

Note 2: Before subjecting steels produced by thermos-mechanical rolling or quenched and tempered after rolling to further heating for forming or stress relieving, or using high heat-input welding, special consideration must be given to the possibility of a consequent reduction in mechanical properties

4.3 Method of manufacture

4.3.1 Steel making process

4.3.1.1 The steel is to be manufactured by the basic oxygen, basic electric arc furnace or by processes specially approved by IRS.

4.3.1.2 Vacuum degassing is to be used for any of the following:

a) all steels with enhanced through-thickness properties, and

b) all steels of grade H690, H890 and H960.

4.3.2 Deoxidation

4.3.2.1 The steel shall be fully killed .

4.3.3 Grain size

4.3.3.1 The steel is to be fine grain treated, and is to have a fine grain structure. The fine grain practice is to be as detailed in the manufacturing specification.

Note: A fine grain structure has an equivalent index ≥ 6 determined by micrographic examination in accordance with ISO 643 or alternative test method.

4.3.4 Nitrogen control

4.3.4.1 The steels are to contain nitrogen binding elements as detailed in the manufacturing specification. Also see note 4 in Table 4.4.1.

4.4 Chemical composition

4.4.1 The chemical composition is to be determined by the steel maker, in an adequately equipped competently staffed laboratory. The method of sampling is to follow that carried out for the initial approval tests, either from the ladle, the tundish or the mould in the case of continuous casting. The aim analysis is to be in accordance with the manufacturing specification. All the elements listed in the Table 4.4.1 are to be reported.

4.4.2 Elements used for alloying, nitrogen binding, and fine grain treatment, and as well as the residual elements are to be as detailed in the manufacturing specification, e.g. When boron is deliberately added for enhancement of hardenability of the steels, the maximum content of the boron content is not to be higher than 0.005%; and the analysis result is to be reported.

4.4.3 The carbon equivalent value is to be calculated from the ladle analysis. Maximum values are specified in Table 4.4.2.

a) For all steel grades the following formula of IIW may be used:

$$Ceq = C + \frac{Mn}{6} + \frac{Cr + Mo + V}{5} + \frac{Ni + Cu}{15}\ (\%)$$

b) For steel grades H460 and higher, CET may be used instead of Ceq at the discretion of the manufacturer, and is to be calculated according to the following formula:

$$CET = C + \frac{(Mn + Mo)}{10} + \frac{(Cr + Cu)}{20} + \frac{Ni}{40}\ (\%)$$

Note: The CET is included in the standard EN 10011-2:2001 used as one of the parameters for pre-heating temperature determination which is necessary for avoiding cold cracking.

c) For TM and QT steels with carbon content not more than 0.12%, the cold cracking susceptibility *P*cm for evaluating weldability may be used instead of carbon equivalent of *Ceq* or *CET* at manufacturer's discretion and is to be calculated using the following formula:

$$P_{cm} = C + \frac{Si}{30} + \frac{Mn}{20} + \frac{Cu}{20} + \frac{Ni}{60} + \frac{Cr}{20} + \frac{Mo}{15} + \frac{V}{10} + 5B$$

Table 4.4.1 : Chemical composition

Oxygen ppm max[7)]	Not applicable		Not applicable	50	Not applicable	30

Note 1 See section 4.5 for definition of delivery conditions

Note 2 The chemical composition is to be determined by ladle analysis and is to meet the approved manufacturing specification at the time of approval.

Note 3 For sections the P and S content can be 0.005 % higher than the value specified in the table.

Note 4 The total aluminium to nitrogen ratio shall be a minimum of 2:1. When other nitrogen binding elements are used, the minimum Al value and Al/N ratio do not apply.

Note 5 Total Nb+V+Ti ≤ 0.26 % and Mo+Cr ≤0.65%, not applicable for QT steels.

Note 6 Higher Ni content may be approved at the discretion of IRS.

Note 7 The requirement on maximum Oxygen content is only applicable to DH890; EH890; DH960 and EH960.

Note: N.A = Not applicable								

4.5 Delivery Condition - Rolling Process and Heat Treatment

4.5.1 Steel is to be delivered in accordance with the processes approved by IRS. These processes include:

- Normalized (N)/Normalized rolled (NR)
- Thermo-mechanical controlled rolled (TM)/with Accelerated cooling (TM+AcC)/with direct quenching followed by tempering (TM+DQ), or
- Quenched and Tempered condition (QT)

The definition of these delivery conditions are defined in previous sections.

Note: Direct quenching after hot-rolling followed by tempering is considered equivalent to conventional quenching and tempering.

4.5.2 Rolling reduction ratio

4.5.2.1 The rolling reduction ratio of slab, billet, bloom or ingot is not to be less than 3:1 unless agreed at the time of approval.

4.5.3 Thickness limits for approval

4.5.3.1 The maximum thickness of slab, billet or bloom from the continuous casting process is to be at the manufacturer's discretion.

4.5.3.2 Maximum thickness of plates, sections, bars and tubulars over which a specific delivery condition is applicable are shown in Table 4.5.3.

Table 4.5.3 : Maximum thickness limits				
Delivery condition	**Maximum thickness (mm)**			
	Plates	**Sections**	**Bars**	**Tubulars**
N	250[2)]	50	250	65
NR	150	[1)]		
TM	150	50	Not applicable	Not applicable
QT	150[2)]	50	Not applicable	50

Note 1 The maximum thickness limits of sections, bars and tubulars produced by NR process route are less than those manufactured by N route, and are to be at the discretion of IRS.

Note 2 Approval for N steels with thickness larger than 250 [mm] and QT steels with thickness larger than 150 [mm] is subject to the special consideration of IRS.

4.6 Mechanical Properties

4.6.1 Test specimens and test procedures for mechanical properties are in accordance with Chapter 2 and Section 3 of this chapter.

4.6.2 Tensile test

4.6.2.1 Test specimens are to be cut with their longitudinal axes transverse to the final direction of rolling, except in the case of sections, bars, tubulars and rolled flats with a finished width of 600 [mm] or less, where the tensile specimens may be taken in the longitudinal direction.

4.6.2.2 Full thickness flat tensile specimens are to be prepared. The specimens are to be prepared in such a manner as to maintain the rolling scale at least at one side. When the capacity of the test machine is exceeded by the use of a full thickness specimen, sub-sized flat tensile specimens representing either the full thickness or half of the product thickness retaining one rolled surface are to be used. Alternatively, machined round test specimens may be used. The specimens are to be located at a position lying at a distance of t/4 from the surface and additionally at t/2 for thickness above 100 [mm] or as near as possible to these positions.

4.6.2.3 The results of the tests are to comply with the appropriate requirements of Table 4.6.2.3. In the case of product forms other than plates and wide flats where longitudinal tests are agreed, the elongation values are to be 2 percentage units above those transverse requirements as listed in Table 4.6.2.3.

Table 4.6.2.3 : Tensile properties at ambient temperature for all steel grades

Mechanical properties / Steel grade & delivery condition		Minimum yield strength *R*eH[1] (N/mm²)			Ultimate tensile strength *R*m (N/mm²)		Minimum Percentage elongation After fracture (%) $L_0=5.65\sqrt{S_0}$ [2]		Charpy V-notch impact test

Note 1 For tensile test either the upper yield stress (R_{eH}) or where R_{eH} cannot be determined, the 0.2 percent proof stress (*R*p0.2) is to be determined and the material is considered to comply with the requirement if either value meets or exceeds the specified minimum value of yield strength.

Note 2 For full thickness flat test specimens with a width of 25 [mm] and a gauge length of 200 [mm] the elongation is to comply with the minimum values shown in Table 4.6.2.4.

Note 3 In the case that the tensile specimen is parallel to the final rolling direction, the test result shall comply with the requirement of elongation for longitudinal (L) direction.

Note 4 For plates and sections for applications, such as racks in offshore platforms etc, where the design requires that tensile properties are maintained through the thickness, a decrease in the minimum specified tensile properties is not permitted with an increase in the thickness.

Table 4.6.2.4 : Elongation minimum values for a width of 25 [mm] and a 200 [mm] gauge length[1)]

Strength Grade	Thickness [mm]						
	≤ 10	**> 10 ≤ 15**	**> 15 ≤ 20**	**> 20 ≤ 25**	**> 25 ≤ 40**	**> 40 ≤ 50**	**> 50 ≤ 70**
H420	11	13	14	15	16	17	18
H460	11	12	13	14	15	16	17
H500	10	11	12	13	14	15	16
H550	10	11	12	13	14	15	16
H620	9	11	12	12	13	14	15
H690	9[2)]	10[2)]	11[2)]	11	12	13	14

Note 1 The tabulated elongation minimum values are the requirements for testing specimen in transverse direction. H890 and 960 specimens and specimens which are not included in this table is to be proportional specimens with a gauge length of $L_0=5.65\sqrt{S_0}$.

Note 2 For H690 plates with thickness ≤ 20 [mm], round specimen in accordance with Chapter 2 may be used instead of the flat tensile specimen. The minimum elongation for testing specimen in transverse direction is 14%.

4.6.3 Impact test

4.6.3.1 The Charpy V-notch impact test specimens for plates and wide flats over 600 [mm] in width are to be taken with their axes transverse to the final rolling direction and the results should comply with the appropriate requirements for transverse direction of Table 4.6.2.3. For other product forms, the impact tests are to be in the longitudinal direction, the results of the tests are to comply with the appropriate requirements for longitudinal direction of Table 4.6.2.3.

4.6.3.2 Sub-surface test specimens will be taken in such a way that one side is not further away than 2 [mm] from a rolled surface, however, for material with a thickness in excess of 50 [mm], impact tests are to be taken at the quarter thickness (t/4) location and mid-thickness (t/2).

4.6.3.3 Impact test for a nominal thickness less than 6 [mm] are normally not required.

4.6.4 Test frequency

4.6.4.1 Tensile test sample is to be randomly selected from each batch, as defined in section 3, that is to be less than or equal to 25 tonnes, and to be from the same cast, in the same delivery condition and of the same thickness.

4.6.4.2 Impact test

a) For steels plates in N/NR or TM condition test sample is to be taken from each piece.

b) For steels in QT condition test sample is to be taken from each individually heat treated part thereof.

c) For sections, bars and tubulars, test sample is to be taken from each batch of 25 tonnes or fraction thereof.

Note 1: If the mass of the finished material is greater than 25 tonnes, one set of tests from each 25 tonnes and/or fraction thereof is required. (e.g. for consignment of 60 tonnes would require 3 plates to be tested).

Note 2: For continuous heat treated product special consideration may be given to the number and location of test specimens required by the manufacturer to be agreed by IRS.

4.6.5 Traceability

4.6.5.1 Traceability of test material, specimen sampling and test procedures including test equipment with respect to mechanical properties testing, is to be in accordance with section 3.

4.6.6 Re-test procedures

4.6.6.1 Re-test procedures for tensile tests and Charpy impact tests are to be in accordance with Chapter 2.

4.6.7 Through thickness tensile test

4.6.7.1 For steels designated with improved through thickness properties, through thickness tensile tests are to be performed in accordance with Section 8.

4.6.7.2 Subject to the discretion of IRS, through thickness tensile strength may be required to be not less than 80% of the specified minimum tensile strength.

4.7 Tolerances

4.7.1 Unless otherwise agreed or specially required, the thickness tolerances in Sec 1, 1.4 are applicable.

4.8 Surface Quality

4.8.1 All materials are to be free from cracks, injurious surface flaws, injurious laminations and similar defects.

4.8.2 The surface quality inspection method is to be in accordance with recognised national or international standards agreed between purchaser and manufacturer.

a) Welding repair procedures and the method for reporting repairs are to be approved by the IRS.

b) Where repair by grinding is carried out then the remaining plate thickness below the ground area must be within the allowable under thickness tolerance.

4.8.3 Surface finish requirement are to be in accordance with the relevant requirements in Section 3.

4.8.4 Surface inspection is the responsibility of the manufacturer. The acceptance by IRS's Surveyor of material later found to be defective shall not absolve the manufacturer of this responsibility.

4.9 Internal Soundness

4.9.1 Verification of internal soundness is the responsibility of the manufacturer. The acceptance by the IRS's Surveyor shall not absolve the manufacturer of this responsibility.

4.9.2 Ultrasonic examination

4.9.2.1 If required by the IRS, ultrasonic examination should be carried out in accordance with Section 2 for the requirement of internal soundness, and is to be performed in accordance with an approved standard.

4.10 Stress relieving heat treatment and other heat treatments

4.10.1 Steels approved by the procedures given in Classification Note "*Manufacturing Approval Scheme of High Strength Steels for Welded Structures"* with respect to Heat Treatment are suitable for stress relieving heat treatment such as post-weld heat treatment and stress relieving heat treatment after cold forming for the purpose of reducing the risk of brittle fracture, increasing the fatigue lifetime and dimensional stability for machining.

Note: Products can be susceptible to deterioration in mechanical strength and toughness if they are subjected to incorrect post-weld heat treatment procedures or other processes involving heating such as flame straightening, rerolling, etc. where the heating temperature and the holding time exceed the limits given by the manufacturer.

4.11 Facilities for Inspection

4.11.1 Testing is to be carried out under the witness of the Surveyor, or an authorised deputy, in order to verify whether the test results meet the specified requirements.

4.11.2 The manufacturer is to afford the Surveyor all necessary facilities and access to all relevant parts of the steel works to enable him to verify the approved process is adhered to, for the selection of test materials, and the witnessing of tests, as required by this Section. Also for verifying the accuracy of the testing, calibration of inspection equipment and traceability of materials.

4.12 Identification of Materials

4.12.1 The manufacturer is to adopt a system for the identification of ingots, slabs, billet or bloom and finished products, which will enable

the material to be traced to its original cast. The Surveyor is to be given full facilities for so tracing the material when required.

4.13 Branding

4.13.1 Each finished piece is to be clearly marked by the manufacturer with the following particulars:

a) IRS's brand mark

b) Unified identification mark for the grade of steel (e.g. EH620)

c) Name or initials to identify the steelworks

d) Cast number/Heat number, plate number or equivalent identification mark

e) Delivery condition (N/NR, TM/TM+AcC/TM+DQ or Q&T)

The entire markings are to be encircled with paint or otherwise marked so as to be easily recognised. Steels which have been specially approved by IRS and which differ from these requirements (see 4.1.6) are to have the letter "S" after the identification mark (e.g. EH620S)

4.14 Documentation of Inspection Tests

4.14.1 The Surveyor is to be supplied with two copies, of the test certificates or shipping statements for all accepted materials. In addition to the description, dimensions, etc., of the material, the following particulars are to be included:

a) Purchaser's order number

b) Identification of the cast and piece

c) Manufacturer's identification

d) Identification of the grade of steel

e) Chemical analysis, *Ceq*, *CET* or *P*cm value

f) Delivery condition with heat treatment temperatures

g) Mechanical properties test results, including traceable test identification

h) Surface quality and inspection results

i) UT result, where applicable

4.14.2 Before the test certificates are signed by the Surveyor, the steelmaker is required to provide a written declaration stating that the material has been made by an approved process, and that it has been subjected to and has withstood satisfactorily the required tests in the presence of the Surveyor, or an authorised deputy. The following form of declaration will be accepted if stamped or printed on each test certificate with the name of the steelworks and signed by an authorised representative of the manufacturer:
"We hereby certify that the material has been made by an approved process and has been satisfactorily tested in accordance with the Rules of IRS".

Section 5

Steel for Low Temperature Service

5.1 General

5.1.1 This section gives specific requirements for carbon-manganese and nickel alloy steels with toughness properties at low temperatures and intended for use in the construction of cargo tanks and process pressure vessels for liquefied gases.

5.1.2 The requirements of this section are also applicable for other types of pressure vessels where the use of steels with guaranteed impact properties at low temperature is required.

5.1.3 Provision is made for plates and sections up to 40 [mm] thick.

5.1.4 Steel differing in chemical composition, condition of supply or mechanical properties may be accepted, subject to special agreement by IRS.

5.2 Deoxidation and chemical composition

5.2.1 All steels are to be in the fully killed and fine grain refined condition.

5.2.2 The chemical composition of carbon-manganese steels are to comply with the appropriate requirements of grades AH, DH, EH and FH strength levels 32, 36 and 40 (See Table 3.2.1). However, these grades are to be designated as L T -AH, L T -DH, L T -EH and L T -FH respectively for the uses defined in 5.1.1.

5.2.3 The chemical compositions of nickel alloy steels are to comply with the appropriate requirements of Table 5.2.1.

Table 5.2.1 : Chemical composition of nickel alloy steels

Elements	1.5 Ni	3.5 Ni	5 Ni	9 Ni
C max.	0.18	0.15	0.12	0.10
Si	0.10 - 0.35	0.10 - 0.35	0.10 - 0.35	0.10 - 0.35
Mn	0.30 - 1.50	0.30 - 0.90	0.30 - 0.90	0.30 - 0.90
Ni	1.30 - 1.70	3.20 - 3.80	4.70 - 5.30	8.50 - 10.0
P max.	0.025	0.025	0.025	0.025
S max.	0.020	0.020	0.020	0.020
Al min. (acid soluble)[1)]	0.015	0.015	0.015	0.015
Residual elements				
Cr max.	0.25	0.25	0.25	0.25
Cu max.	0.35	0.35	0.35	0.35
Mo max.	0.08	0.08	0.08	0.08
Total of residual elements max.	0.60	0.60	0.60	0.60

1) The total aluminium content may be determined by other methods instead of the acid soluble method. In such cases the total aluminium content is to be not less than 0.020 percent.

5.3 Heat treatment

5.3.1 All materials are to be supplied in a condition complying with Table 5.3.1.

Table 5.3.1 : Conditions of supply

Grade	Plates	Sections and Bars
LT-AH	N, TMCP	Any
LT-DH	N, TMCP	Any
LT-EH	N[2], TMCP, QT	N, TMCP
LT-EH	N[2], TMCP, QT	N, TMCP
1.5 Ni	N[2], QT, normalized and tempered	
3.5 Ni	N[2], QT, normalized and tempered	
5 Ni	N[2], QT, normalized and tempered	
9 Ni	QT, Double normalized and tempered	

1 N = Normalized
TMCP = Thermo-mechanically controlled process
QT = Quenched and tempered
2 The term "Normalized" does not include normalized rolling.

5.4 Mechanical tests

5.4.1 Test pieces for tensile testing of plates are to be cut with their principal axes transverse to the final direction of rolling.

5.4.2 For each batch of plate presented, one tensile test is to be made from one end of each piece unless the mass and length of the piece exceeds 5 tonnes and 15 m in which case test pieces are to be taken from both ends of each piece.

5.4.3 Sections and bars are to be presented for acceptance test in batches containing not more than 50 lengths, as supplied. The material in each batch is to be of the same section size, from the same cast and in the same condition of supply. One tensile test specimen is to be taken from material representative of each batch, except that additional tests are to be taken when the mass of a batch exceeds 10 tonnes.

5.4.4 One set of three Charpy V-notch impact test specimens are to be taken for each tensile test specimen required. For plates, these are to be cut with their principal axis perpendicular to the final direction of rolling and for sections. these are to be taken longitudinally.

5.4.5 The results of all tensile tests are to comply with appropriate requirements given in Table 5.4.1. The ratio between the yield stress and the tensile strength is not to exceed 0.9 for normalized and TMCP steels and 0.94 for Q & T steels.

5.4.6 The average energy value from each set of three impact tests are to comply with appropriate requirements given in Table 5.4.1.

5.4.7 When standard subsidiary impact specimens are necessary (See Sec. 2).

5.4.8 When steel with improved through thickness properties is required or specified in the order, the materials are to be tested as detailed in Sec. 8.

Table 5.4.1 : Mechanical properties for acceptance purposes

Grade of Steel		Yield stress [N/mm^2] min.	Tensile strength [N/mm^2]	Elongation on 5.65$\sqrt{S_o}$ % min.	Charpy V-notch impact test	
					Test temp.°C	Impact Energy min.
LT-AH	32	315	440 - 590	22	0	Plates transverse tests Average energy 27 J Sections and bars longitudinal tests Average energy 41 J
	36	355	490 - 620	21		
	40	390	510 - 650	20		
LT-DH	32	315	440 - 590	22	-20	
	36	355	490 - 620	21		
	40	390	510 - 650	20		
LT-EH	32	315	440 - 590	22	-40	
	36	355	490 - 620	21		
	40	390	510 - 650	20		
LT-FH	32	315	440 - 590	22	-60	
	36	355	490 - 620	21		
	40	390	510 - 650	20		
1.5 Ni		275	490 - 640	22	-80	
3.5 Ni		285	450 - 610	21	-95	
5 Ni		390	540 - 740	21	-110	
9 Ni		490	640 - 790	18	-196	

Notes:

1 These requirements are applicable to products not exceeding 40 [mm] in thickness. The requirements for thicker products are subject to agreement.

2 The minimum design temperatures at which plates of different thicknesses in the above grades may be used are given in Pt.3, Ch.2, Table 2.4.1 and Pt.5, Ch.4, Table 6.1.2 and Table 6.1.3. Consideration will be given to the use of thicknesses greater than those in the table or to the use of temperatures below - 165°C

Section 6

Steels for Boilers and Pressure Vessels

6.1 General

6.1.1 The following requirements are for carbon, carbon-manganese and alloy steels intended for use in the construction of boilers and pressure vessels. In addition to specifying mechanical properties at ambient temperature for the purpose of acceptance testing, these requirements also give details of appropriate mechanical properties at elevated temperatures which may be used for design purposes.

6.1.2 Where it is proposed to use a carbon or carbon-manganese steel with a specified minimum tensile strength intermediate to the following specified properties, corresponding minimum values for yield and elongation and mechanical properties at elevated temperatures may be obtained by interpolation.

6.1.3 Carbon and carbon-manganese steels with a specified minimum tensile strength of greater than 490 [N/mm^2] but not exceeding 520 [N/mm^2] may be accepted provided that details of proposed specifications are submitted for approval.

6.1.4 Where it is proposed to use alloy steels other than those specified herein, details of the specifications are to be submitted for approval. In such cases the specified minimum tensile strength is not to exceed 600 [N/mm^2].

6.1.5 Materials intended for use in the construction of the cargo tanks and process pressure vessels, storage tanks for liquefied gases and for other low temperature applications are to comply with the requirements of Sec. 5.

6.2 Deoxidation and chemical composition

6.2.1 The method of deoxidation and the chemical analysis of ladle samples is to comply with the requirements of Table 6.2.1.

Table 6.2.1 : Deoxidation and chemical composition

Grade of steel	Deoxidation	Chemical composition per cent						
C and C-Mn steel		**C max.**	**Si**	**Mn**	**P max.**	**S max.**	**Al**	**Residual elements**
360 AR	Any method except rimmed steel	0.18	0.50 max.	0.40-1.30	0.040	0.04	-	Cr 0.25 max. Cu 0.30 max. Mo 0.10 max. Ni 0.30 max. Total 0.70 max.
410 AR		0.21	0.50 max.	0.40-1.30	0.040	0.040	-	
460 AR		0.23	0.50 max.	0.80-1.50	0.040	0.040	-	
360	Any method except rimmed steel	0.17	0.35 max.	0.40-1.20	0.035	0.035	-	
410		0.20	0.35 max.	0.50-1.30	0.035	0.035	-	
460		0.20[1]	0.40 max.	0.80-1.40	0.035	0.035	-	
490	Killed	0.20[1]	0.10-0.50	0.90-1.60	0.035	0.035		
360 FG	Killed fine grained	0.17	0.35 max.	0.40-1.20	0.035	0.035	See note 2	
410 FG		0.20	0.35 max.	0.50-1.30	0.035	0.035	See note 2	
460 FG		0.20[1]	0.40 max.	0.80-1.50	0.035	0.035	See note 2	
490 FG		0.20[1]	0.10-0.50	0.90-1.60	0.035	0.035	See note 2	

Alloy steels	**Deoxi-dation**	**C**	**Si**	**Mn**	**P max.**	**S max.**	**Al**	**Cr**	**Mo**	**Residual elements**
1 Cr 1/2 Mo 470	Killed	0.10-0.18	0.15-0.35	0.4-0.8	0.035	0.035	See note 3	0.70-1.30	0.40-0.60	Cu 0.30 max. Ni 0.30 max.
2 1/4 Cr 1 Mo 480		0.08-0.18	0.15-0.50	0.4-0.8	0.035	0.035	See note 3	2.00-2.50	0.90-1.10	

Notes:

1 For thickness greater than 30 [mm], carbon 0.22 percent max.

2 Aluminium (acid soluble) 0.015 per cent min, or Aluminium (total) 0.018 percent min. Niobium, Vanadium or other suitable grain refining elements may be used either in place of or in addition to aluminium.

3 Aluminium (acid soluble or total) 0.020 percent max.

6.3 Heat treatment, condition of supply

6.3.1 All materials are to be supplied in a condition complying with the requirements of Table 6.3.1.

However, when agreed, material intended for hot forming may be supplied in the as rolled condition.

Table 6.3.1 : Heat treatment

Grade of steel	Condition of supply
Carbon and carbon- manganese 360 AR to 460 AR	As rolled, maximum thickness or diameter is 40 [mm]
Carbon and carbon- manganese 360 to 490	Normalized or controlled rolled
Carbon and carbon- manganese 360 FG to 490 FG	Normalized or controlled rolled
1Cr 1/2 Mo 470	Normalized and tempered
2 1/4 Cr 1 Mo 480	Normalized and tempered

6.4 Mechanical tests

6.4.1 For plates a tensile test specimen is to be taken from one end of each piece when the weight does not exceed 5 tonnes and the length does not exceed 15 [m]. When either of these limits is exceeded, tensile test specimens are to be taken from both ends of each piece. A piece is to be regarded as the rolled product from a single slab or a single ingot, if this is rolled directly into plates.

6.4.2 For strips, tensile test specimens are to be taken from both ends of each coil.

6.4.3 Sections and bars are to be presented for acceptance tests in batches containing not more than 50 lengths, as supplied. The material in each batch is to be of the same section size, from the same cast and in the same condition of supply. One tensile test specimen is to be taken from material representative of each batch, except that additional tests are to be taken when the weight of a batch exceeds 10 tonnes.

6.4.4 Where plates are required for hot forming and it has been agreed that the heat treatment will be carried out by the fabricator, the tests at the steel works are to be made on material which has been cut from the plates and given a normalizing or normalizing and tempering heat treatment in a manner simulating the treatment which will be applied to the plates.

6.4.5 If required by the Surveyors or by the fabricator test material may be given a simulated stress relieving heat treatment prior to the preparation of the test specimens. This has to be stated on the order together with agreed details of the simulated heat treatment and the mechanical properties which can be accepted.

6.4.6 The results of the tensile tests are to comply with the appropriate requirements given in Table 6.4.1, Table 6.4.2 and Table 6.4.3.

Table 6.4.1 : Mechanical properties for acceptance purposes : carbon and carbon-manganese steels - as rolled

Grade of steel	Thick-ness [mm]	Yield stress [N/mm^2] min.	Tensile strength [N/mm^2]	Elongation on 5.65$\sqrt{So}$ % min.
360 AR	$\leq$ 40	190	360-480	24
410 AR	$\leq$ 40	215	410-530	22
460 AR	$\leq$ 40	240	460-580	21

Table 6.4.2 : Mechanical properties for acceptance purposes : carbon and carbon-manganese steels-normalized or controlled rolled

Grade of steel	Thickness [mm] (see Note)	Yield stress [N/mm^2] min.	Tensile strength [N/mm^2]	Elongation on 5.65√So % min.
360	> 3 ≤ 16 > 16 ≤ 40 > 40 ≤ 63	205 195 185	360 - 480	26 26 25
410	> 3 ≤ 16 > 16 ≤ 40 > 40 ≤ 63	235 225 215	410 - 530	24 24 23
460	> 3 ≤ 16 > 16 ≤ 40 > 40 ≤ 63	285 255 245	460 - 580	22 22 21
490	> 3 ≤ 16 > 16 ≤ 40 > 40 ≤ 63	305 275 265	490 - 610	21 21 20
360 FG	> 3 ≤ 16 > 16 ≤ 40 > 40 ≤ 63	235 215 195	360 - 480	26 26 25
410 FG	> 3 ≤ 16 > 16 ≤ 40 > 40 ≤ 63	265 245 235	410 - 530	24 24 23
460 FG	> 3 ≤ 16 > 16 ≤ 40 > 40 ≤ 63	295 285 275	460 - 580	22 22 21
490 FG	> 3 ≤ 16 > 16 ≤ 40 > 40 ≤ 63	315 315 305	490 - 610	21 21 21

Note:

For thicknesses greater than 63 [mm], the minimum values for yield stress may be reduced by 1 per cent for each 5 [mm] increment in thickness over 63 [mm]. The minimum elongation values may also be reduced one unit, e.g. 20 percent reduced to 19 percent for all thicknesses over 63 [mm]. For thicknesses over 100 [mm], the above values are to be agreed.

Table 6.4.3 : Mechanical properties for acceptance purposes : alloy steels-normalized and tempered

Grade of steel	Thickness [mm] (see Note)	Yield stress [N/mm^2] min.	Tensile strength [N/mm^2]	Elongation on 5.65√So % min.
1 CR 1/2 Mo 470	> 3 ≤ 16 > 16 ≤ 40 > 40 ≤ 63	305 305 305	470 - 620	20 20 19
2 1/4 Cr 1 Mo 480	> 3 ≤ 16 > 16 ≤ 40 > 40 ≤ 63	275 265 265	480 - 630	18 18 17

Table 6.4.3 (Contd.)

Note:

For thicknesses greater than 63 [mm], the minimum values for yield stress may be reduced by 1 per cent for each 5 [mm] increment in thickness over 63 [mm]. The minimum elongation values may also be reduced one unit, e.g. 20 percent reduced to 19 percent for all thicknesses over 63 [mm]. For thicknesses over 100 [mm], the above values are to be agreed.

6.5 Mechanical properties for design purposes at elevated temperatures

6.5.1 Nominal values for the minimum lower yield or 0.2 per cent proof stress at temperatures of 50°C and higher are given in the following tables :

Table 6.5.1 Carbon and carbon manganese steels - As rolled (applicable only when the design temperature does not exceed 350°C).

Table 6.5.2 Carbon and carbon-manganese steels normalized or controlled rolled.

Table 6.5.3 Alloy steels. Normalized and tempered.

6.5.2 These values are intended for design purposes only and verification is not required except for materials complying with National or proprietary specifications where the elevated temperature properties used for design purposes are higher than those given in Table 6.5.1 to Table 6.5.3. The extent of testing in such cases would have to be specially agreed by IRS.

6.5.3 Values for the estimated average stress to rupture in 100,000 hours are given in Table 6.5.4 and may be used for design purposes.

Table 6.5.1 : Mechanical properties for design purposes - Carbon and carbon - manganese steels - as rolled

Grade of steel	Thickness [mm]	Design temperature°C (See Note)						
		50	**10**	**150**	**200**	**250**	**300**	**350**
		Nominal minimum lower yield or 0.2 percent proof stress [N/mm^2]						
360 AR	≤ 40	154	153	152	145	128	108	102
410 AR		186	183	181	174	155	134	127
460 AR		218	213	210	203	182	161	153

Note : Maximum permissible design temperature is 350°C

Table 6.5.2 : Mechanical properties for design purposes - carbon and carbon - manganese steels - normalized or controlled rolled

Grade of steel	Thickness [mm] (see Note)	Design temperature °C								
		50	100	150	200	250	300	350	400	450
		Nominal minimum lower yield or 0.2 percent proof stress [N/mm^2]								
360	> 3 ≤ 16	183	175	172	168	150	128	117	115	113

Section 7

Steels for Machinery Structures

7.1 General

7.1.1 Steel plates, strips, sections or bars intended for use in the construction of welded machinery structures are to comply with one of the following alternatives:

a) Any grade of normal strength structural steel or high strength structural steel as detailed in Sec. 2 and 3.

b) Any grade of carbon or carbon-manganese steel as detailed in Sec. 6 except that for this application batch testing is acceptable and the same is to be carried out in accordance with the requirements of Sec. 2.

Section 8

Plates with Specified minimum through Thickness Properties ('Z' quality)

8.1 General

8.1.1 Following requirements are for special quality plate material with improved ductility in the through thickness or "Z direction.

8.1.2 The use of this material known as 'Z' quality steel, is recommended when plate material, intended for welded construction, will be subject to significant strain in a direction perpendicular to the rolled surfaces. These strains are usually associated with thermal contraction and restraint during welding, particularly for full penetration "T"- butt welds but may also be associated with loads applied in service or during construction. Where these strains are of sufficient magnitude, lamellar tearing may occur. Two 'Z' quality steels are specified; Z25 for normal ship applications and 'Z35' for more severe applications.

Through thickness properties are characterized by specified values for reduction of area in a through thickness tensile test.

8.1.3 This special quality material is to comply with the requirements of Sec. 2, 3, 4, 5, 6 and 7 as appropriate and the following additional requirements.

8.2 Manufacture

8.2.1 All plates are to be manufactured at works which have been approved by IRS for this quality of material. Also refer Chapter 1, Section 1, Cl. 1.3.2.

8.2.2 The sulphur content is not to exceed 0.008 per cent, as determined by ladle analysis. It is recommended that the steel should be efficiently vacuum de-gassed.

8.3 Test material

8.3.1 Unless otherwise agreed, through thickness tensile tests are only required for plate materials where the thickness exceeds 15 [mm]. A test sample large enough to provide six test specimens are to be cut from the centre of one end of each rolled piece representing the batch. (See Fig.8.3.1). Where appropriate the end selected should be representative of the top end of an ingot or the start of a concast strand. Generally three through thickness tensile test specimens are to be prepared while the rest of the sample remains for possible retests.

8.3.2 The batch size is to be determined depending on the product and sulphur content as given in Table 8.3.2.

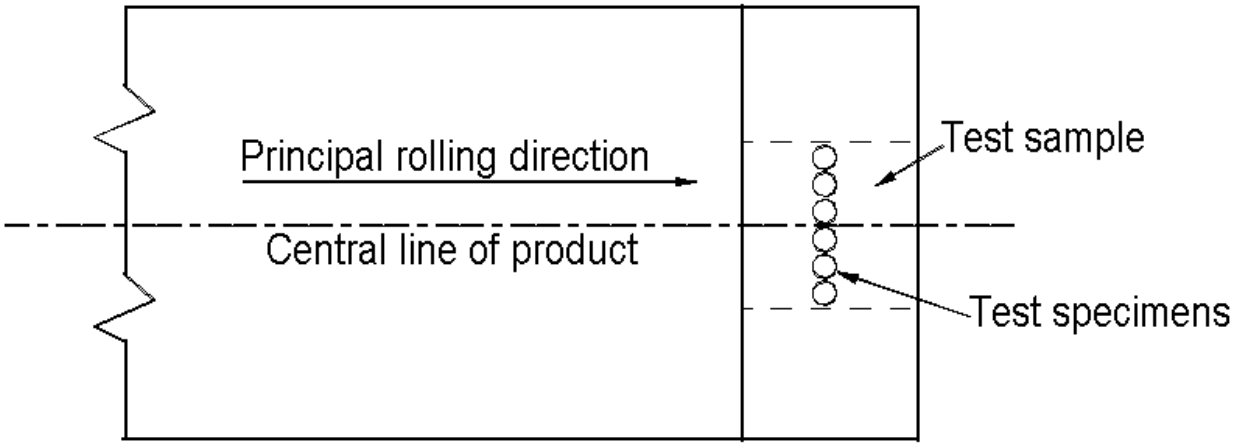

Fig.8.3.1 : Plate and wide flat sampling position

Table 8.3.2 : Batch size dependent on product and sulphur content

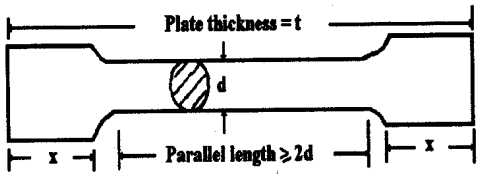
Product	S > 0.005%	S ≤ 0.005%
Plates	Each piece (parent plate)	Maximum 50t of products of the same cast, thickness and heat treatment
Wide flats of nominal thickness ≤ 25 mm	Maximum 10t of products of the same cast, thickness and heat treatment	Maximum 50t of products of the same cast, thickness and heat treatment
Wide flats of nominal thickness > 25 mm	Maximum 20t of products of the same cast, thickness and heat treatment	Maximum 50t of products of the same cast, thickness and heat treatment

8.4 Dimensions of through thickness tensile test specimens

8.4.1 At the option of the steel maker test specimens (Fig.8.4.1a) or test specimens with welded extensions (Fig.8.4.1b) may be used. For both types of test specimens, the diameter of the parallel portion is not to be less than 6 [mm] when plate thickness is less than or equal to 25 [mm] and 10 [mm] when the plate thickness is greater than 25 [mm].

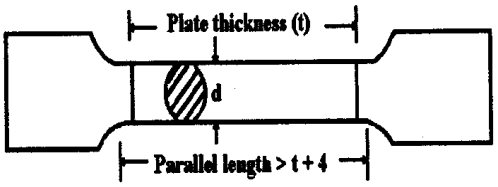
Alternatively, round test specimens, including those with welded extensions, may be prepared in accordance with a recognized standard.

8.4.2 The tolerances on specimen dimensions are to be in accordance with ISO 6892-98 or other recognised standards as appropriate.



t = thickness of plate [mm]
d = 6 mm; when 15 mm ≤ t ≤ 25 [mm]
d = 10 mm min. when t > 25 [mm]
x = 5 mm max. when d = 6 [mm]
x = 8 mm max. when d = 10 [mm]

Fig 8.4.1 (a) : Plain test specimen



t = Thickness of plate [mm]
d = 6 mm; when 15 mm ≤ t ≤ 25 [mm]
d = 10 mm when t 25 [mm]

Fig 8.4.1 (b) : Test specimen with welded extension

8.5 Mechanical tests

8.5.1 The acceptable minimum average value for the reduction of area of the three tensile test specimens taken in the through thickness direction are given in Table 8.5.1. Only one individual value may be below the minimum average, but not less than the minimum individual value for the appropriate grade.

Table 8.5.1 : Reduction of area acceptance values

Grade	Z25	Z35
Minimum average	25%	35%
Minimum individual	15%	25%

8.5.2 A value less than minimum individual value will require rejection of the piece. However, in case of batch testing each remaining piece in the batch may be individually tested.

8.5.3 Depending on the test results, retest may be permitted in the cases shown in Fig.8.5.3. In these instances, three more tensile tests are to be taken from the remaining test sample. The average of all 6 tensile tests is to be greater than the required minimum average with not more than two results below the minimum average.

In case of failure after retest, either the batch represented by the piece is rejected or each piece within batch may be retested.

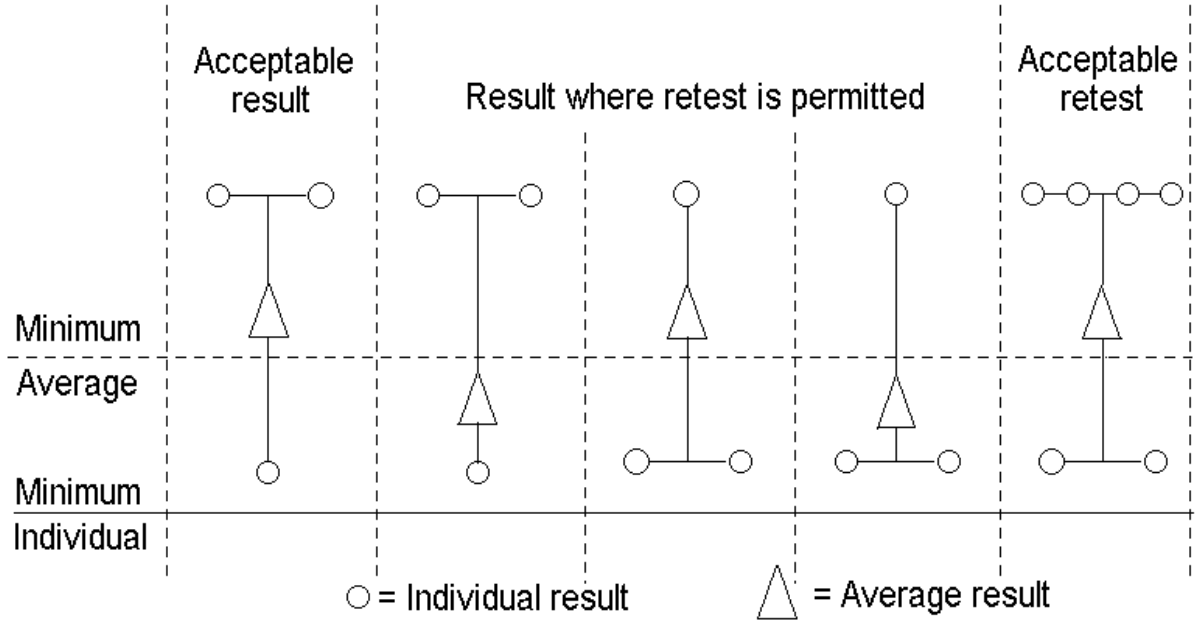


Fig.8.5.3 : Diagram showing acceptance / rejection and retest criteria

8.6 Non-destructive examination

8.6.1 All special 'Z' quality plates are to be ultrasonically tested in the final supply condition, with a probe of frequency 4 MHz. The ultrasonic testing is to be carried out in accordance with either EN 10160:1999 Level S1/E1 or ASTM A578:2017 Level C.

Section 9

Austenitic and Duplex Stainless Steels

9.1 Scope

9.1.1 This section gives the requirements for rolled products in austenitic and duplex (austenite plus ferrite) stainless steels intended for use in the construction of cargo tanks, storage tanks and process pressure vessels for chemicals and liquefied gases.

9.1.2 Austenitic stainless steels are suitable for applications where the lowest design temperature is not lower than –165°C.

9.1.3 Austenitic stainless steels are also suitable for service at elevated temperatures and for such applications the proposed specification should contain, in addition to the requirements of 9.1.6, minimum values for 0.2 and 1.0 per cent proof stresses at the design temperature.

9.1.4 Duplex stainless steels are suitable for applications where the lowest design temperature is above 0°C. Any requirement to use duplex stainless steels below 0°C will be subject to special consideration.

9.1.5 Duplex stainless steels are also suitable for service at temperatures upto 300°C and for such applications the proposed specification should include, in addition to the requirements of 9.1.6, a minimum value for 0.2 per cent proof stress at the design temperature.

9.1.6 A specification giving details of the chemical composition, heat treatment and

mechanical properties, including for the austenitic grades, both the 0.2 and 1.0 percent proof stresses, is to be submitted for consideration and approval.

9.2 Chemical composition

9.2.1 The chemical composition of ladle samples is to comply with the requirements given in Table 9.2.1.

9.3 Heat treatment

9.3.1 All materials are to be supplied in the solution treated condition.

Table 9.2.1 : Chemical composition

Type and grade of steel	Chemical composition % (see Note)									
	C max	Si max	Mn max	P max	S max	Cr	Ni	Mo	N	Other
Austenitic										
304L	0.03	}	}	}	}	17.0-20.0	8.0-13.0	-	0.10	-

9.4 Mechanical tests

9.4.1 Tensile test specimens are to be taken in accordance with the appropriate requirements of 5.4 and 6.4.1.

9.4.2 For the duplex grades, one set of three Charpy V-notch impact test specimens machined in the longitudinal direction from each tensile test piece is to be tested at –20°C. The average energy value of the three specimens is to be not less than 41 Joules.

For austenitic grades of steel, impact tests are only required for design temp. below –105°C. In such cases, impact tests carried out at a temperature of –196°C on a set of three charpy V-notch specimens are to comply with the following:

a) Plates : Transverse test pieces; minimum average energy value 27 Joules.
b) Strips, sections and bars : Longitudinal test pieces, minimum average energy value 41 Joules.

9.4.3 Where standard subsidiary Charpy V-notch test specimens are necessary, see Chapter 2, Sec.3.1.2.

9.4.4 The results of all tensile tests are to comply with the requirements of Table 9.4.1 or the approved specification.

9.5 Through thickness tests

9.5.1 Where material will be strained in a through thickness direction during welding or in service, through thickness tests are required on

plates over 10 [mm] thick in all the grades of steels listed in Table 9.2.1, apart from Grades 304L, 304LN, 321 and 347.

9.5.2 Testing is to conform with the requirements of Section 8, with the exception given in 9.5.3.

9.5.3 When the reduction in area is less than 35 per cent, metallographic or other evidence is required to show that no significant amount of any detrimental phase, such as sigma, is present.

Table 9.4.1 : Mechanical properties for acceptance purposes

Type and grade of steel	0.2% proof stress [N/mm^2] minimum	1% proof stress [N/mm^2] minimum	Tensile strength [N.mm^2] minimum	Elongation on 5.65 $\sqrt{S_o}$ % minimum

UNS S 32750	550	-	795	15

9.6 Intergranular corrosion tests

9.6.1 For certain specific applications such as storage tanks for chemicals, it may be necessary to demonstrate that the material used is not susceptible to intergranular corrosion resulting from grain boundary precipitation of chromium-rich carbides.

9.6.2 When required, one test of this type is to be carried out for each tensile test. The testing is to be carried out in accordance with ASTM A262, practice E, copper-copper sulphate-sulphuric acid or another recognized standard. The bent specimen is to be free from cracks indicating the presence of intergranular attack. The material for the test is to be taken adjacent to that for the tensile test.

9.7 Dimensional tolerances

9.7.1 The minimum tolerance on thickness is to be as given in Table 1.4.1.

9.8 Clad plates

9.8.1 Carbon or carbon-manganese steel plates, clad on one or both surfaces with a suitable grade of austenitic or duplex stainless steel, may be used for the construction of cargo or storage tanks for chemicals.

9.8.2 The carbon or carbon-manganese steel base plates are to comply with the requirements of Section 6 and the austenitic or duplex cladding material generally with the requirements of this section.

9.8.3 The process of manufacture is to be specially approved and may be either by roll cladding or by explosive bonding.

9.8.4 Where the use of clad materials is proposed, the material specification is to be submitted for consideration, together with details of the extent and the acceptance standards for non-destructive examination.

9.9 Identification of materials

9.9.1 The particulars detailed in 1.12 are to be marked on all materials which have been accepted.

9.10 Certification of materials

9.10.1 Each test certified or shipping statement is to give the information detailed in 1.13, together with general details of heat treatment and where applicable, the results obtained from intercrystalline corrosion tests. The chemical composition is to include the content of all the elements detailed in Table 9.2.1.

Section 10

Brittle Crack Arrest Steels

10.1 General

10.1.1 Brittle crack arrest steels are defined as steel plate with the specified brittle crack arrest properties measured by either the brittle crack arrest toughness Kca or Crack Arrest Temperature (CAT).

10.1.2 In addition to the required mechanical properties indicated in Section 3 for EH36, EH40 and EH47 steels, brittle crack arrest steels are to comply with the requirements specified in Table 10.1.3 and Table 10.1.4 of this Section.

10.1.3 The brittle crack arrest properties specified in Table 10.1.3 are to be evaluated and approved by IRS. Test specimens are to be taken from each piece (means "the rolled product from a single slab or ingot if this is rolled directly into plates" as defined in Chapter 1, Section 1.9.1).

10.1.4 The chemical composition and deoxidation practice for brittle crack arrest steels is indicated in Table 10.1.4.

Table 10.1.3 : Requirement of brittle crack arrest properties for brittle crack arrest steels

Suffix to the steel grade[1)]	Thickness range [mm]	Brittle crack arrest properties[2), 6)]	
		Brittle Crack Arrest Toughness K_{ca} at -10 °C [N/mm$^{3/2}$] [3)]	Crack Arrest Temperature CAT [°C] [4)]
BCA1	50 < t ≤ 100	6,000 min.	-10 or below
BCA2	80 < t ≤ 100[(7)]	8,000 min.	See Note 5.

t : thickness [mm]

Notes:

1) Suffix "BCA1" or "BCA2" is to be affixed to the steel grade designation (for e.g. EH40-BCA1, EH47-BCA1, EH47-BCA2, etc.).

2) Brittle crack arrest properties for brittle crack arrest steels are to be verified by either the brittle crack arrest toughness Kca or Crack Arrest Temperature (CAT).

3) Kca value is to be obtained by the brittle crack arrest test specified in Chapter 2, Section 5.

4) CAT is to be obtained by the test method specified in Chapter 2, Section 6.

5) Criterion of CAT for brittle crack arrest steels corresponding to Kca=8,000 N/mm$^{3/2}$ is to be approved by IRS.

6) Where small-scale tests are used for product testing (batch release testing), these test methods are to be approved by IRS in accordance with Annex 1.

7) Approval for lower thicknesses would be specially considered.

Table 10.1.4 : Chemical composition and deoxidation practice for brittle crack arrest steels

Grade	**EH36-BCA**	**EH40-BCA**	**EH47-BCA**
Deoxidation Practice	Killed and fine grain treated		
Chemical Composition % [1), 7)] (ladle samples)			
C max.	0.18		0.18
Mn	0.90 – 2.00		0.90 – 2.00
Si max.	0.50		0.55
P max.	0.020		0.020
S max.	0.020		0.020
Al (acid soluble min)	0.015 [2), 3)]		0.015 [2), 3)]
Nb	0.02 – 0.05 [3), 4)]		0.02 – 0.05 [3), 4)]
V	0.05 – 0.10 [3), 4)]		0.05 – 0.10 [3), 4)]
Ti max.	0.02[(4)]		0.02 [4)]
Cu max.	0.50		0.50
Cr max.	0.25		0.50
Ni max.	2.0		2.0
Mo max.	0.08		0.08
C_{eq} max.[5)]	0.47	0.49	0.55
P_{cm} max.[6)]	-		0.24

Notes :

1. Chemical composition of **brittle crack arrest steels** is to comply with this Table, regardless of chemical composition for EH36, EH40 and EH47 steels specified in Section 3.

2. The total aluminium content may be determined instead of the acid soluble content. In such cases the total aluminium content is to be not less than 0.020%.

3. The steel is to contain aluminium, niobium, vanadium or other suitable grain refining elements, either singly or in any combination. When used singly the steel is to contain the specified minimum content of the grain refining element. When used in combination, the specified minimum content of a fine graining element is not applicable.

4. The total niobium, vanadium and titanium content is not to exceed 0.12%.

5. The carbon equivalent C_{eq} value is to be calculated from the ladle analysis using the following formula:

$$C_{eq} = C + \frac{Mn}{6} + \frac{Cr + Mo + V}{5} + \frac{Ni + Cu}{15}(\%)$$

6. Cold cracking susceptibility P_{cm} value is to be calculated using the following formula:

$$P_{cm} = C + \frac{Si}{30} + \frac{Mn}{20} + \frac{Cu}{20} + \frac{Ni}{60} + \frac{Cr}{20} + \frac{Mo}{15} + \frac{V}{10} + 5B(\%)$$

7. Where additions of any other element have been made as part of the steelmaking practice, the content is to be indicated.

10.2 Manufacturing Approval Scheme

10.2.1 Scope

The Manufacturing approval scheme for brittle crack steels is to be in accordance with Part 2 of the IRS Classification Note: '*Approval Scheme for the Manufacturing Process of Normal and Higher Strength Hull Structural Steels'* and requirements of this sub-section.

10.2.2 Approval application

10.2.2.1 Documents to be submitted

The manufacturer is to submit to IRS, the following documents together with those required in Cl. 1.1 of Part 2 of the IRS Classification Note: *'Approval Scheme for the Manufacturing Process of Normal and Higher Strength Hull Structural Steels'*:

a) In-house test reports of the brittle crack arrest properties of the steels intended for approval
b) Approval test program for the brittle crack arrest properties (see 3.1 below)
c) Production test procedure for the brittle crack arrest properties.

10.2.3 Approval tests

10.2.3.1 Extent of Approval Tests

.1 The extent of the test program is specified in 10.2.3.2 and 10.2.3.3. Cl. 2.1 of Part 2 of the IRS Classification Note: *'Approval Scheme for the Manufacturing Process of Normal and Higher Strength Hull Structural Steels'* is to be complied with for the extent of the approval tests, if the manufacturing process and mechanism to ensure the brittle crack arrest properties for the steels intended for approval are the same. For EH47 steels with brittle crack arrest properties, Cl. 2.1 c) and d) of Part 2 the IRS Classification Note: *'Approval Scheme for the Manufacturing Process of Normal and Higher Strength Hull Structural Steels'* are not applied.

.2 The products for testing are to represent the maximum thickness for approval. If the target chemical composition changes with the thickness, the maximum thickness for each specified chemical composition specification is to be tested.

.3 The number of test samples and test specimens may be increased when deemed necessary by IRS, based on the in-house test reports of the brittle crack arrest properties of the steels intended for approval specified in 10.2.2.1 a).

10.2.3.2 Type of tests

.1 Brittle crack arrest tests are to be carried out in accordance with 10.2.3.3, in addition to the approval tests specified in Part 2 of the IRS Classification Note: *'Approval Scheme for the Manufacturing Process of Normal and Higher Strength Hull Structural Steels'* and/ or Cl. 3.15.2 of Section 3.

.2 In the case of applying for addition of the specified brittle crack arrest properties for EH36, EH40 and EH47 steels of which, manufacturing process has been approved by IRS (i.e. The aim analyses and method of manufacture are similar and the steelmaking process, deoxidation and fine grain practice, casting method and condition of supply are the same), brittle crack arrest tests, chemical analyses, tensile test and Charpy V-notch impact test are to be carried out in accordance with this sub-section and Part 2 of the IRS Classification Note: *'Approval Scheme for the Manufacturing Process of Normal and Higher Strength Hull Structural Steels'*:

10.2.3.3 Testing procedure and test specimens for brittle crack arrest tests

.1 The test specimens of the brittle crack arrest tests are to be taken with their longitudinal axis parallel to the final rolling direction of the test plates.

.2 The loading direction of brittle crack tests is to be parallel to the final rolling direction of the test plates.

.3 The thickness of the test specimens of the brittle crack arrest tests is to be the full thickness of the test plates.

.4 The test specimens and repeat test specimens are to be taken from the same steel plate. Where the brittle crack arrest properties are evaluated by Kca, and the brittle crack arrest test result fails to meet the requirement, further brittle crack arrest tests may be carried out. In this case, the judgment of acceptance is to be made on the arrest toughness value Kca of all test specimens (results of the initial test, failed tests and additional tests are to be included in the testing report.).

.5 The thickness of the test specimen is to be the maximum thickness of the steel plate requested for approval.

.6 In the case where the brittle crack arrest properties are evaluated by K_{ca}, the brittle crack arrest test method is to be in accordance with Chapter 2, Section 5. In the case where the brittle crack arrest properties are evaluated by CAT, the test method is to be in accordance with Chapter 2, Section 6.

10.2.4 Results

10.2.4.1 Part 2, of the IRS Classification Note: *'Approval Scheme for the Manufacturing Process of Normal and Higher Strength Hull Structural Steels'* is to be complied for the results.

10.2.4.2 Additionally, results of test items and the procedures are to comply with the test program approved by IRS. In the case where the brittle crack arrest properties are evaluated by K_{ca} or CAT, the manufacturer is to submit to IRS, the brittle crack arrest test reports in accordance with Chapter 2, Section 5 for Kca and Chapter 2 Section 6 for CAT respectively.

10.2.5 Approval and Certification

10.2.5.1 Upon satisfactory completion of the survey and tests, approval would be granted by IRS with the grade designation having the suffix "BCA1" or "BCA2" (e.g. EH40-BCA1, EH47-BCA1, EH47-BCA2, etc.).

10.2.5.2 General conditions for approval and certification would be in accordance with IRS Classification Note: *'Approval Scheme for the Manufacturing Process of Normal and Higher Strength Hull Structural Steels'.*

10.2.6 Renewal of approval

10.2.6.1 The manufacturer is also to submit to IRS actual manufacturing records of the approved brittle crack arrest steels within the term of validity of the manufacturing approval certificate.

Note: Chemical composition, mechanical properties, brittle crack arrest properties (e.g. brittle crack arrest test results or small-scale test results) and nominal thickness are to be described in the form of histogram or statistics

Annex 1

Approval Scheme of Small-scale Test Methods for Brittle Crack Arrest Steels

A1.1. Scope

A1.1.1 This Annex specifies the approval scheme of small-scale test methods which are used for product testing (batch release testing) of brittle crack arrest steels specified as Table 10.1.3 .

A1.1.2 Unless otherwise specified in this Annex, 3.15 and/or 10.2 of this Chapter are to be followed.

A1.2. Approval Application

A1.2.1 The manufacturer is to submit the following documents:

a) Application for approval of small-scale test procedure specification

b) Small-scale test procedure specification including the following items at least the following items:

- Applicable material grades, thickness range, deoxidation practice, heat treatment, etc.
- Types and methods of small-scale tests
- Sampling positions in plate thickness direction and final rolling direction of test specimens
- Size and dimension of test specimens
- Number of test specimens
- Test conditions, such as test temperature
- Acceptance criterion
- Example of format of test report
- Example of product inspection certificate including small-scale test results
- Handling of the products when small-scale test results do not satisfy the criterion

c) Mechanism of achieving the brittle crack arrest properties of brittle crack arrest steels

d) Technical background for enabling the evaluation of brittle crack arrest properties by small-scale test methods considering the mechanism specified in above c).

e) Procedure of the evaluation for the brittle crack arrest properties of brittle crack arrest steels by small-scale test results.

f) Data records which validate the correlation between small-scale test results and the large brittle crack arrest test results of brittle crack arrest steels whose number can satisfy the requirement for minimum data number given in A1.3.3

g) Proposed test plan for approval

A1.2.2 Small-scale test procedure specification is to be prepared in accordance with A1.3.

A1.2.3 Where the manufacturer proposes to change any part of the approved small-scale test procedure specification, then the manufacturer is to submit the documents which can cover all items specified in A1.2.1.

A1.2.4 The documents confirming the reason for the change is to be submitted to identify the impact of those changes on the existing procedure, and the proposed actions to address any such impacts.

A1.3. Establishment of Procedure Specification for Small-scale Testing

A1.3.1 General

A1.3.1.1 Small-scale test methods are to be determined based on the manufacturer's own technical philosophy with regard to achieving the brittle crack arrest properties of brittle crack arrest steels. Furthermore, description of an appropriate correlation between large scale brittle crack arrest properties and small-scale test results is to be required, and the acceptance criterion of the small-scale test are to be determined, based on the followings:

- Mechanism of achieving the suitable brittle crack arrest properties
- Sampling position and direction
- Frequency of sampling
- Small-scale test methodology
- Demonstrated correlation between brittle crack arrest test results and small-scale test results
- Derivation of small scale testing acceptance criterion based on the statistical analysis

A1.3.1.2 The manufacturer is to prepare the small-scale test procedure specification in accordance with the following A1.3.2 through A1.3.5.

A1.3.2 Types and Methods of Testing

A1.3.2.1 Types, methods, dimension and positions as well as direction of test specimens, etc. of small-scale tests are to be specified by the manufacturer, and approved.

A1.3.2.2 In general, the test method is to reproduce the crack initiation, propagation and arrest feature by such as the following test method.

- Combination of test methods, e.g. NRL drop weight test and V-notch Charpy impact test

- One test method, e.g. press-notch Charpy impact test or side-section drop weight test

A1.3.2.3 In general, brittle crack arrest properties of brittle crack arrest steels are to be predicted using a regression equation on the relationship between small scale test result (e.g. transition temperature obtained by small scale tests) and large scale brittle crack arrest test result (e.g. K_{ca} or temperature corresponding to the specific brittle crack arrest properties).

Note: Table A1.3.2.3.1, Table A1.3.2.3.2 and Table A1.3.2.3.3 give the examples of small scale test methods.

A1.3.2.4 For determination of test methods, the manufacturer is to confirm the applicability of these test methods to their brittle crack arrest steels theoretically taking into account the methodology of test methods, their own mechanism of achieving the brittle crack arrest properties, and sampling positions of test specimens (See A1.3.1.1). Then, the manufacturer is also to submit the technical background for determination of small-scale test methods as given in A1.2.1.

A1.3.3 Testing Data

A1.3.3.1 Selection of test plates

A1.3.3.1.1 Brittle crack arrest tests and small-scale tests are to be conducted for each material grade (including all suffixes) of brittle crack arrest steels in accordance with A1.3.3.

A1.3.3.1.2 Brittle crack arrest tests and small-scale tests are to be carried out on at least 12 test plates, in accordance with A1.3.3.1.3, by which these test results can reliably estimate brittle crack arrest properties of brittle crack arrest steels.

Note: "*One test plate*" means "*the rolled product from a single slab or ingot if this is rolled directly into plates*" as defined in Section 2 and 3.

A1.3.3.1.3 In order to ensure appropriate correlation between small-scale test results and brittle crack arrest properties with various manufacturing conditions of steel plates, the steel plates are to be representative for each combination of thickness range and heat sample to include:

- The intended maximum and minimum plate thickness;
- Different heats are to be chosen for each thickness.

Furthermore, the above test plates are to include a fixed number of steel plate(s) whose brittle crack arrest properties (i.e. brittle crack arrest test results) do not comply with the requirements specified in Table 10.1.3. Such a number is to be at least one, but not exceeding one quarter of all test plates. Manufacturing process of these test plates can be different (or intentionally altered from the approved manufacturing process) from that of the brittle crack arrest steels to which the small-scale test method is applied. It is recommended that the strength grade of these test plates (non-compliant with the relevant requirements of brittle crack arrest properties) are similar to that of the brittle crack arrest steels.

Where the manufacturer has requested approval for only a single thickness, the thickness of test plates can be only a single thickness. In this case, at least four steel plates for each combination of thickness (single thickness) and heats (three different heats) is to be used, and the applicable thickness of the small scale test is only that single thickness condition.

A1.3.3.1.4 Brittle crack arrest steels used for the approval test of manufacturing process of these steels (and its approval test results) can also be used as the test plates specified in A1.3.3.1.3

A1.3.3.1.5 Brittle crack arrest test specimens and small-scale test specimens are to be taken from the same test plate.

A1.3.3.1.6 A decrease of the total of the indicated number of test plates may be accepted in the following (a) or (b) cases:

(a) When the manufacturer applies a small-scale test procedure specification to multiple material grades, and the manufacturing process and mechanism to ensure the brittle crack arrest properties of these different material grades are the same.
(b) When a small-scale test procedure specification is already approved by IRS for one or some material grades, and the manufacturer applies similar small-scale test procedure specification to the other material grade(s), and the manufacturing process and mechanism to ensure the brittle crack arrest properties of these different material grades are same.

A1.3.3.2 Brittle crack arrest tests

A1.3.3.2.1 Brittle crack arrest tests are to be carried out for each test plate in accordance with 10.2.3.3.

A1.3.3.2.2 Where brittle crack arrest tests are carried out for evaluation of K_{ca}, K_{ca} at a specific temperature is to be obtained in accordance with Ch.2, Sec.5.3.

A1.3.3.2.3 Where brittle crack arrest tests are carried out for evaluation of CAT, deterministic (actual) CAT is to be obtained in accordance with Ch.2, Sec.6.8.3.

A1.3.3.3 Small-scale tests

A1.3.3.3.1 Small-scale tests are to be carried out in accordance with small-scale test procedure specification to be approved for each test plate.

A1.3.3.3.2 In general, the test specimens of small-scale tests are to be taken with their

longitudinal axis parallel to the final rolling direction of the test plates.

A1.3.3.3.3 The test specimens of small-scale tests are to be taken from the specified positions in plate thickness direction of the test plates, as given in A1.3.2.3.

A1.3.4 Validation of Correlation

A1.3.4.1 A regression equation on the relationship between brittle crack arrest property obtained from brittle crack arrest test and single or multiple small-scale test results is to be established. For brittle crack arrest properties, a specific temperature (e.g. $T_{Kca6000}$ in BCA1, $T_{Kca8000}$ in BCA2 or CAT) or the K_{ca} value at -10℃ may be used.

A1.3.4.2 The validity of the regression equation is to be examined to predict brittle crack arrest properties with enough accuracy. The correlation in brittle crack arrest properties between the calculated values from small scale tests and the brittle crack arrest test results is to be assured by using the value of twice the standard deviation (2σ). When using temperature for brittle crack arrest property, 2σ is not to be greater than 20℃. In other cases (e.g. K_{ca} value at -10℃), an upper limit of 2σ is to be established with the agreement of IRS.

NOTE:
Calculation procedure of the standard deviation (σ) is given as follows:

$$\sigma = \sqrt{\frac{1}{(n-1)}\sum_{i=1}^{n}(y_i - x_i)^2}$$

n: number of test plates
y_i: brittle crack arrest property obtained from brittle crack arrest test for one test plate
x_i: brittle crack arrest property estimated from small scale tests for one test plate

A1.3.5 Acceptance Criterion

A1.3.5.1 Acceptance criterion of brittle crack arrest steels by the small-scale tests is to be proposed by the manufacturer based on the regression equation which is assured in the correlation with brittle crack arrest properties in A1.3.4 above. The criterion is to be determined so that regression equation can predict brittle crack arrest properties on safety side, considering the scatter of brittle crack arrest properties from the predicted value by the regression equation.

A1.3.5.2 Unless otherwise agreed by IRS, an acceptance criterion of small-scale tests is to be determined by following procedures:

(a) For correlation by means of temperature

(i) The required temperature (see Fig A1.3.5.2 a) is obtained by subtracting 2σ (℃) from the brittle crack arrest steel specification in Table 10.1.3 , that is -10-2σ (℃), where 2σ is given in A1.3.4.2.
$T_{Kca6000}$ and $T_{Kca8000}$ in Fig. A5-1 are the temperatures at which the K_{ca} value of steel plates equals 6000N/mm$^{3/2}$ and 8000N/mm$^{3/2}$, respectively.

(ii) The temperature predicted from the small-scale test results through the regression equation is to be no higher than the value of -10-2σ(℃).

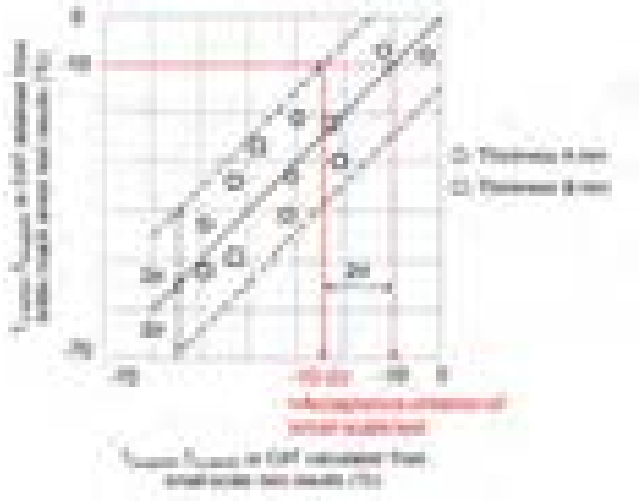

Fig. A1.3.5.2 a): Example for determination of acceptance criterion of small-scale test for correlation by means of temperature (Note: This is only a schematic and may not represent the actual data obtained)

(b) For correlation by means of brittle crack arrest toughness (K_{ca}):

(i) The required K_{ca} (see Fig. A1.3.5.2 b) is obtained by adding 2σ (N/mm$^{3/2}$) to the brittle crack arrest steel specification in Table 10.1.3, that is either 6000+2σ(N/mm$^{3/2}$) in BCA1 or 8000+2σ(N/mm$^{3/2}$) in BCA2, where 2σ is given in A1.3.4.2.

(ii) The K_{ca} value predicted from the small-scale test results through the regression equation is to be no smaller than the value

of $6000+2\sigma(N/mm^{3/2})$ for BCA1, or $8000+2\sigma(N/mm^{3/2})$ for BCA2.

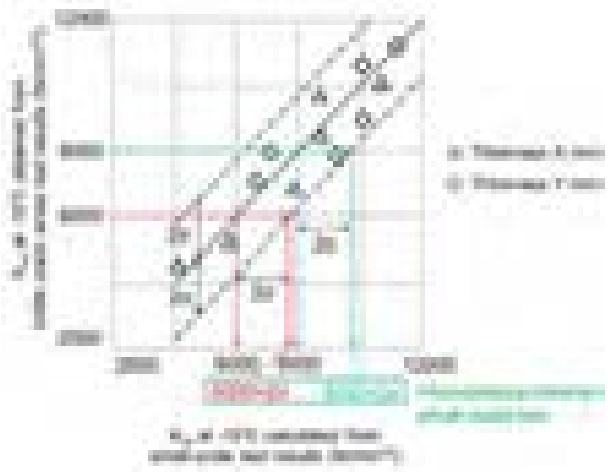

Fig. A1.3.5.2 b) Example for determination of acceptance criteria of small-scale test for correlation by means of brittle crack arrest toughness (K_{ca}) (Note: This is only a schematic and may not represent the actual data obtained)

A1.4. Approval Tests

A1.4.1 General

A1.4.1.1 In order to confirm the validity of the submitted technical documents specified in A1.2.1, approval tests are to be carried out.

A1.4.1.2 Approval test plan is to be approved by IRS prior to testing.

A1.4.1.3 Considering the contents of the submitted technical documents specified in A1.2.1, IRS may require additional tests in the following cases:

a) When IRS determines that the number of brittle crack arrest tests or small-scale tests is too few to adequately confirm the validity of the acceptance criterion of small-scale tests (See A1.3.3.1);

b) When IRS determines that the testing data obtained for setting the acceptance criterion of small-scale tests varies too widely (See A1.3.4.2), or that the data is clustered producing a biased correlation curve;

c) When IRS determines that the validity of brittle crack arrest test results or small-scale test results for setting the acceptance criterion of small-scale tests is insufficient, or has some flaws during tests and/or for test results (See A1.3.3.2 and A1.3.3.3); and

d) Others as deemed necessary by IRS.

A1.4.2 Extent of the approval tests

A1.4.2.1 Extent of the approval tests is to be in accordance with 3.15.2.1 and 10.2.3.1.

A1.4.3 Type of tests

A1.4.3.1 Brittle crack arrest tests

A1.4.3.1.1 Brittle crack arrest tests are to be carried out in accordance with 10.2.3.3.

A1.4.3.1.2 Where brittle crack arrest tests are carried out for evaluation of K_{ca}, K_{ca} at a specific temperature ($T_{Kca6000}$ or $T_{Kca8000}$) is to be obtained in accordance with Ch.2, 5.3.

A1.4.3.1.3 Where brittle crack arrest tests are carried out for evaluation of CAT, deterministic CAT is to be obtained in accordance with Ch.2, 6.8.3.

A1.4.3.2 Small-scale tests

A1.4.3.2.1 Small-scale tests are to be carried out in accordance with A1.3.3.3.

A1.5. Results

A1.5.1 Results of test items and the procedures are to comply with the test program approved by IRS.

A1.5.2 For the brittle crack arrest test results, the manufacturer is to submit to IRS the brittle crack arrest test reports in accordance with Ch.2, Sec.5 for K_{ca} and Ch.2, Sec.6 for CAT.

A1.5.3 For small-scale test results, the manufacturer is to submit to IRS the small-scale test reports in accordance with the example of format of test reports submitted as specified in A1.2.1 b).

A1.6. Approval

Upon satisfactory completion of the survey and tests, and satisfactory confirmation of the submitted technical documents, the approval for small scale test procedure specification is granted.

Table A1.3.2.3.1 : Example of small-scale test method using NRL drop weight test and V-notch Charpy impact test (Informative)	
Test type:	NRL drop weight test and V-notch Charpy impact test
Standard:	ASTM E208:2020 and ISO 148-1:2016
Sampling positions of test specimens:	NRL drop weight test: at surface V-notch charpy impact test: 1/4 of thickness
Length direction of test specimen:	Parallel to the final rolling direction of test plate
Regression equation:	$T_{Kca} = \alpha \cdot (NDTT + 10) + \beta \cdot {}_{v}Trs + 153(t-5)^{1/13} - 170.5$ T_{Kca}: Temperature at K_{ca} of 6,000N/mm$^{3/2}$ or K_{ca} of 8,000N/mm$^{3/2}$, (℃) *NDTT*: Nil-ductility transition temperature (℃) ${}_{v}T_{rs}$: Transition temperature of the absorbed energy (℃) *t*: thickness α, β[(1)]: constant
Notes:	(1) α and β are determined by comparing small-scale test results with brittle crack arrest test results.

Table A1.3.2.3.2 : Example of small-scale test method using pressed-notch Charpy impact test (Informative)	
Test type:	Pressed-notch Charpy impact test
Standard:	Dimension, shape, introducing method of notch: Manufacturer's proposal Others: ISO148-1:2016
Sampling position of test specimen:	1/2 of thickness
Length direction of test specimen:	Parallel to the final rolling direction of test plate
Regression equation:	$T_{Kca} = \alpha\, {}_{p}T_{E\gamma J} + \beta$ T_{Kca}: Temperature at K_{ca} of 6,000N/mm$^{3/2}$ or K_{ca} of 8,000N/mm$^{3/2}$, (℃) ${}_{p}T_{E\gamma J}$: Test temperature at absorbed energy of γ (J), (℃) α and β: Constant γ: Absorbed energy at brittle fracture surface ratio of δ (%),(J)
Notes:	(1) α, β, γ and δ are determined by comparing small-scale test results with brittle crack arrest test results.

Table A1.3.2.3.3 : Example of small-scale test method using Side-section drop weight test (Informative)	
Test type:	Side-section drop weight test
Standard:	Dimension: P-2 type of ASTM E 208 2020
Sampling positions of test specimens:	1/2 of thickness and side-section Length direction of test specimen:	Parallel to the final rolling direction of test plate
Regression equation :	$T_{Kca} = \alpha + \beta \cdot T_{NDT}^{side} + \gamma \cdot t^{1.5}$ T_{Kca}: Temperature at K_{ca} of 6000N/mm$^{3/2}$ or K_{ca} of 8000N/mm$^{3/2}$, (℃) T_{NDT}^{side} : Nil-ductility transition temperature obtained by side-section drop weight test, (℃) t : thickness α, β,γ(1): constant
Notes:	(1) α, β and γ are to be determined by comparing small-scale test results with brittle crack arrest test results.

Section 1

General Requirements

1.1 Scope

1.1.1 All important steel castings, as defined in the relevant construction rules are to be manufactured and tested in accordance with the requirements of this Chapter.

1.1.2 Where required by the relevant Rules dealing with design and construction, castings are to be manufactured and tested in accordance with Ch.1 and Ch.2, together with the general requirements given in this Section and the appropriate specific requirements given in Sec.2 to 5.

1.1.3 As an alternative to 1.1.3, castings which comply with national or proprietary specifications may be accepted provided that these specifications give reasonable equivalence to the requirements of this chapter or alternatively are approved for a specific application. Generally, survey and certification are to be carried out in accordance with the requirements of Ch.1.

1.2 Manufacture

1.2.1 Castings are to be made by manufacturer approved by IRS. Also refer Chapter 1, Section 1, Cl. 1.3.2.

1.2.2 The steel is to be manufactured by a process approved by IRS.

1.2.3 All flame cutting, scarfing or arc-air gouging to remove surplus metal is to be undertaken in accordance with recognized good practice and is to be carried out before the final heat-treatment. Preheating is to be employed when necessitated by the chemical composition and/or thickness of the castings. If necessary, the affected areas are to be either machined or ground smooth.

1.2.4 For certain components including steel castings subjected to surface hardening process, the proposed method of manufacture may require special approval by IRS.

1.2.5 When two or more castings are joined by welding to form a composite the proposed welding procedure is to be submitted for approval. Welding procedure qualification tests may be required.

1.3 Quality of castings

1.3.1 All castings are to be free from surface or internal defects which would be prejudicial to their proper application in service. The surface finish is to be in accordance with good practice and any specific requirements of the approved plan.

1.3.2 The surfaces are not to be treated in any way which may obscure defects.

1.4 Chemical composition

1.4.1 All castings are to be made from killed steel and the chemical composition is to be appropriate for the type of steel and the mechanical properties specified for the castings. The chemical composition of each heat is to be determined by the manufacturer on a sample taken preferably during the pouring to the heat. When multiple heats are tapped into a common ladle, the ladle analysis shall apply.

1.5 Inspection

1.5.1 All castings are to be cleaned and adequately prepared for examination; suitable methods include pickling, caustic cleaning, wire brushing, local grinding, shot or sand blasting. The surfaces are not to be hammered, peened or treated in any way which may obscure defects.

1.5.2 Before acceptance all castings are to be presented to the Surveyors for visual examination. Where applicable, this is to include the examination of internal surfaces. Unless otherwise agreed, the verification of dimensions is the responsibility of the manufacturer.

1.5.3 When required by the relevant construction Rules, or by the approved procedure for welded composite components appropriate non-destructive testing is also to be carried out before acceptance and the results are to be reported by the manufacturer. The castings to be examined, extent of testing and acceptance criteria are detailed in IRS Classification Notes on “Guidelines for Non-Destructive Testing of Steel Castings for Marine Application.

1.5.4 When required by the relevant construction Rules castings are to be pressure tested before final acceptance. These tests are to be carried out in the presence of the Surveyors and are to be to their satisfaction.

1.5.5 In the event of any casting proving defective during subsequent machining or testing, it is to be rejected notwithstanding any previous certification.

1.6 Hydraulic pressure testing

1.6.1 When required by the relevant construction Rules, castings are to be pressure tested before final acceptance. These tests are to be carried out in the presence of the Surveyors and are to be to their satisfaction.

1.7 Rectification of defective castings

1.7.1 General

i) Steel casting defects are to be removed with or without weld repair before considering suitable for use subject to approval of IRS. Where castings are to be repaired, the manufacturer is to exercise adequate control of all activities with respect to dimensions, heat treatment, inspection and quality control (as considered necessary).

ii) Where the defective area is to be repaired by welding, the excavations are to be suitably shaped to allow good access for welding. The resulting grooves are to be subsequently ground smooth and complete elimination of the defective material is to be verified by MT or PT.

iii) Defects and unacceptable indications are to be repaired as indicated below:

Defective parts of material may be removed by grinding, or by chipping and grinding, or by arc air-gouging and grinding. Thermal methods of metal removal are only allowed before the final heat treatment. All grooves are to have a bottom radius of approximately three times the groove depth and are to be smoothly blended to the surface area with a finish equal to that of the adjacent surface.

iv) For NDT of steel castings after repair, see 1.5.3.

v) Shallow grooves or depressions resulting from the removal of defects may be accepted provided that they will cause no appreciable reduction in the strength of the casting or affect the intended use, and the depth of defect removal is not over 15mm or 10% of wall thickness, whichever is less. The resulting grooves or depressions are to be subsequently ground smooth and complete elimination of the defective material is to be verified by MT or PT. Small surface irregularities sealed by welding are to be treated as weld repairs, see 1.7.2.

1.7.2 Weld repairs

In addition to the requirements given in 1.7.1, the following apply for weld repairs:

i) For C and C-Mn steel castings, weld repairs are to be suitably classified as major or minor. For alloy steel castings, repair requires approval from IRS.

a. Major repairs are those where:

- the depth is greater than 25% of the wall thickness or 25mm whichever is less, or

- the total weld area on a casting exceeds 0.125 m^2 of the casting surface noting that where a distance between two welds is less than their average width, they are to be considered as one weld.

b. Minor weld repairs: Weld repairs not classified as major are considered as minor and need to be carried out in accordance with a qualified welding procedure.

c. All weld repairs (major and minor) are to be carried out before the final delivery heat treatment condition.

ii) The following is required for major repairs:

a. To comply with requirements in (iv) below

b. Before welding is started, full details of the extent and location of the repair, the proposed welding procedure, heat treatment and subsequent inspection procedures are to be submitted for approval.

(iii) The following is required for minor repairs:

a. With the exception of alloy steels, do not require prior approval by IRS, except as given in (b)

b. IRS may request minor repairs in critical areas to be treated as major repairs.

iv) The following requirements apply for all weld repairs (major and minor):

a. All castings in alloy steels and all castings for crankshafts are to be suitably pre-heated prior to welding. Castings in carbon or carbon-manganese steel may also require to be pre-heated depending on their chemical composition and the dimensions and position of the weld repairs.

b. Welding procedures are to be qualified and are to match the delivery condition of the casting. Qualification of welding procedures is subject to agreement with IRS or in accordance with a recognized standard such as ISO 11970:2016.

c. Welding is to be done under cover in positions free from draughts and adverse weather conditions by qualified welders with adequate supervision. As far as possible, all welding is to be carried out in the downhand (flat) position.

d. The welding consumables used are to be of an appropriate composition, giving a weld deposit with mechanical properties similar and in no way inferior to those of the parent castings. Welding procedure tests are to be carried out by the manufacturer to demonstrate that satisfactory mechanical properties can be obtained after heat treatment as detailed in Sec.2.

e. After welding has been completed the castings are to be given either a suitable heat treatment in accordance with the requirements of Sec.2 or a stress relieving heat treatment at a temperature of not less than 550°C for C and C-Mn steel castings. For alloy steel castings, the heat treatment has to be agreed with IRS. The type of heat treatment employed will be dependent on the chemical composition of the casting and the dimensions, positions and nature of the repairs and should not affect the properties of the casting.

Subject to the prior agreement of IRS special consideration may be given to the omission of postweld heat treatment or to the acceptance of local stress relieving heat treatment where the repaired area is small and machining of the casting has reached an advanced stage.

f. On completion of heat treatment the weld repairs and adjacent material are to be ground smooth and examined by magnetic particle or liquid penetrant testing. Supplementary examination by ultrasonics or radiography may also be repaired depending on the dimensions and nature of the original defect. Satisfactory results are to be obtained from all forms of non-destructive testing used.

g. The manufacturer is to maintain full records detailing the extent and location of repairs made to each casting and details of weld procedures and heat treatments applied for repairs. These records are to be available to the Surveyor and copies provided on request.

1.7.3 Recommendation for welding

For steels with C ≥ 0.23 or Ceq ≥ 0.45, the WPQT on which the WPS is based, is to be qualified on a base material having a Ceq as follows:

the Ceq of the base material is not to fall below more than 0.02 of the material to be welded. (Example: WPQT for a material with actual Ceq = 0.50 may be qualified on a material with Ceq ≥ 0.48.)

1.8 Identification of castings

1.8.1 The manufacturer is to adopt a system of identification which will enable all finished castings to be traced to the original cast and Surveyors are to be given full facilities for so tracing the castings when required.

1.8.2 Before acceptance, all castings which have been tested and inspected with satisfactory results are to be clearly marked by the manufacturer with the following particulars:

i) Steel quality.

ii) Identification number, cast number or other marking which will enable the full history of the casting to be traced.

iii) Manufacturer’s name or trade mark.

iv) The IRS brand name ‘IR’.

v) Abbreviated name of the IRS local office.

vi) Personal stamp of Surveyors responsible for inspection.

vii) Where applicable, test pressure.

1.8.3 When small castings are manufactured in large numbers, modified arrangements for identification may be specially agreed with IRS.

1.9 Certification

1.9.1 The manufacturer is to provide the Surveyor with a test certificate or shipping statement giving the following particulars for each casting or batch of castings which has been accepted:-

a) Purchaser's name and order number;

b) Description of castings and steel quality;

c) Identification number;

d) Steel making process, cast number and chemical analysis of ladle samples;

e) Results of mechanical testing;

f) General details of heat treatment;

g) Where applicable, test pressure.

Section 2

Hull and Machinery Steel Castings for General Applications

2.1 Scope

2.1.1 The requirements given in this section are applicable to C, C-Mn and alloy steel castings intended for hull and machinery applications specified in the relevant Chapters of the Rules. Grades that are intended for fabrication by welding, as well as grades not intended for welding are also considered in this Section.

2.1.2 Additional requirements may be necessary, especially when the castings are intended for service at low or elevated temperatures, e.g. for ships with ice-class or for boilers. Additional requirements will typically be required for castings for offshore units depending on applicable service temperature and environment.

2.1.3 Similarly, C and C-Mn steel castings and alloy steel castings which comply with national or proprietary specifications may be accepted provided such specifications give reasonable equivalence to these requirements or are otherwise specially approved or required by IRS.

2.2 Manufacture

2.2.1 Castings are to be made at a manufacturer approved by IRS.

2.2.2 The steel is to be manufactured by a process approved by IRS.

2.2.3 All flame cutting, scarfing or arc-air gouging to remove surplus metal is to be undertaken in accordance with recognized good practices and is to be carried out before the final heat treatment. Preheating is to be employed when necessitated by the chemical composition and/or thickness of the castings. If necessary, the affected areas are to be either machined or ground smooth.

2.2.4 For certain components including steel castings subjected to surface hardening process, the proposed method of manufacture may require special approval by IRS.

2.2.5 Joining of two or more castings by welding to form a composite component: Welding procedure qualification tests are subject to agreement with IRS. Welders for hull structural steel castings are to be qualified in accordance with IRS Classification Notes: *'Qualification Scheme for Welders of Hull Structural Steel'*. Requirements for other WPS and qualification thereof, for welder certification and for type approval of welding consumables are at the discretion of IRS.

2.2.6 Temporary welds made for operations such as lifting, handling, staging, etc., are to be in accordance with approved welding procedures and qualified welders, and are to be removed, ground, and inspected using suitable NDT methods.

2.3 Quality of Castings

2.3.1 All castings are to be free from surface or internal defects, which would be detrimental to their proper application in service. The surface finish is to be in accordance with good practice and any specific requirements of the approved plan.

2.4 Chemical composition

2.4.1 All castings are to be made from killed steel and the chemical composition is to be appropriate for the type of steel and the mechanical properties specified for the castings.

2.4.2 The chemical composition of each heat is to be determined by the manufacturer on a sample taken preferably during the pouring of the heat. When multiple heats are tapped into a common ladle, the ladle analysis shall apply.

2.4.3 The chemical composition is to comply with the overall limits given in Table 2.4.1 and Table 2.4.2, respectively, or, where applicable, the requirements of the approved specification.

2.4.4 Suitable grain refining elements such as aluminium may be used at the discretion of the manufacturer or as agreed with IRS.

Table 2.4.1 : Chemical composition limits for hull and machinery steel castings (%): C, C-Mn steels

Steel type	Applications	C (max.)	Si (max.)	Mn	S (max.)	P (max.)	Residual elements (max.)				Total residuals (max.)
							Cu	Cr	Ni	Mo	
C, C-Mn	Castings for non-welded construction	0.40	0.60	0.50 – 1.60	0.035	0.035	0.30	0.30	0.40	0.15	0.80
	Castings for welded construction	0.23	0.60	0.5- 1.60	0.035	0.035	0.30	0.30	0.40	0.15	0.80

Table 2.4.2 : Chemical composition limits for hull and machinery steel castings (%) : Alloy steels

Steel type	Applications	C (max.)	Si (max.)	Mn	S (max.)	P (max.)	Alloying elements[1)] (min.)			
							Cu	Cr	Ni	Mo
Alloy	Castings for non-welded construction	0.45	0.60	0.50 – 1.60	0.030	0.035	0.30	0.40	0.40	0,15
	Castings for welded construction	Alloying element values to be agreed with IRS								

1) At least one of the elements is to comply with the minimum content.

2.5 Heat treatment (including straightening)

2.5.1 Castings are to be supplied in one of the following delivery conditions:

(a) Carbon and carbon-manganese steels:
Fully annealed
Normalised
Normalised and tempered
Quenched and tempered

(b) Alloy steels:
Normalized
Normalized and tempered
Quenched and tempered

For all types of steel, the tempering temperature is to be not less than 550°C.

The delivery condition is to meet the design and application requirements. It is the manufacturers responsibility to select the appropriate heat treatment method to obtain the required mechanical properties.

2.5.2 Castings for component such as crankshafts and engine bedplates, where dimensional stability and freedom from internal stresses are important are to be given a stress relief heat treatment. This is to be carried out at a temperature of not less than 550°C followed by furnace cooling to 300°C or lower.

2.5.3 Heat treatment is to be carried out in properly constructed furnaces which are efficiently maintained and have adequate means for control and recording of temperature. The furnace dimensions are to be such as to allow the whole casting to be uniformly heated to the necessary temperature. In the case of very large castings alternative methods for heat treatment will be specially considered by IRS. Sufficient thermocouples are to be connected to the furnace charge to measure and record that its temperature is adequately uniform unless the temperature uniformity of the furnace is verified at regular intervals.

2.5.4 If a casting is locally reheated or any straightening operation is performed after the final heat treatment, a subsequent stress relieving heat treatment may be required in order to avoid the possibility of harmful residual stresses. The manufacturer is to have

strict control of this temperature in order to avoid any detrimental effects to the final heat treatment and resultant microstructure and mechanical properties of the casting.

2.5.5 The manufacturer's works is to maintain records of heat treatment identifying the furnace used, furnace charge, date, temperature and time at temperature. The records are to be presented to the Surveyor on request.

2.6 Mechanical tests

2.6.1 Test material, sufficient for the required tests and for possible retest purposes is to be provided for each casting or batch of castings.

2.6.2 At least one test block is to be provided for each casting. Unless otherwise agreed these test blocks are to be either integrally cast or gated to the castings.

2.6.3 The size of the test blocks for mechanical testing is to be such that the heat treatment and microstructure is representative for the section of the casting with the ruling section, i.e. the section for which the specified mechanical properties apply, (see also ISO 683-1:2018 and ISO 683-2:2018).

For C, C-Mn steel castings this is in general to be achieved as follows:

The test block is to have a thickness (t_S) of not less than the ruling section of the casting, or 30 mm, whichever is larger.

For large thickness castings other than stern tube, stern frame, anchor and rudder horn, t_S normally need not exceed 150 mm. Length and width of the test block is normally to be at least three times t_S, unless otherwise agreed with IRS, as shown in Fig. 2.6.1 (Note that longer or wider test blocks may be necessary to accommodate the required test specimens).

For castings for stern tube, stern frame, anchor and rudder horn the test block thickness t_S is to represent the ruling section.

Guidance:

Shorter width or length may be accepted for test blocks where actual casting width or length (t_A) is in the range between t_S and $3t_S$.

Example 1: For a general casting with dimensions 140 x 160 x 1250 mm the required test block size would typically be 140 x 160 x 420 mm (that is: t_S x t_A x $3t_S$).

Example 2: For a stern tube casting with ruling section t_S = 170 mm and width/height/length $t_{A2}/t_{A1}/t_{A3}$ = 1000/600/1800 mm, the required test block size would typically be 170 x 510 x 510 mm (i.e. t_S x $3t_S$ x $3t_S$) see Fig. 2.6.2.

For alloy steel castings, the manufacturer is to propose dimensions for the test block and demonstrate the representative nature of it.

2.6.4 For test blocks with thickness ≤ 56 mm, the longitudinal axis of the test specimens is to be located at ≥ 14 mm from the surface in the thickness direction. For test blocks with thickness > 56 mm, the longitudinal axis of the test specimens is to be located at ≥ ¼ t_S from the surface. Test specimens are to be taken in such a way that no part of the gauge length is machined from material closer than t_S to any of the other surfaces. For impact testing, this requirement applies to the complete test specimen (refer Fig. 2.6.1 for location of test specimens in relation to the test block).

2.6.5 Where the casting is of complex design or where the finished mass exceeds 10 tonnes, two cast on test blocks are to be provided from the heaviest section, located as far as practicable from each other.

2.6.6 Where large castings are made from two or more casts, which are not mixed in a ladle prior to pouring, two or more test blocks are to be provided corresponding, the number of the casts involved. These are to be integrally cast at locations as widely separated as possible.

2.6.7 For castings where the method of manufacture has been specially approved by IRS in accordance with 1.2.4, the number and position of test blocks is to be agreed with IRS having regard to the method of manufacture employed.

2.6.8 As an alternative to 2.6.2, where several small castings of about the same size, each of which is under 1000 [kg] in mass are made from one cast and heat treated in the same furnace charge, a batch testing procedure may be adopted using separately cast test blocks of suitable dimensions. At least one test block is to be provided for each batch of castings.

2.6.9 The test blocks are not to be detached from the casting until the specified heat

treatment has been completed and they have been properly identified.

2.6.10 One tensile test specimen and one set impact tests are to be taken from each test block.

2.6.11 The preparation of test specimens and the procedures used for mechanical testing are to comply with the relevant requirements of Ch.2. Unless otherwise agreed all tests are to be carried out in the presence of the Surveyors.

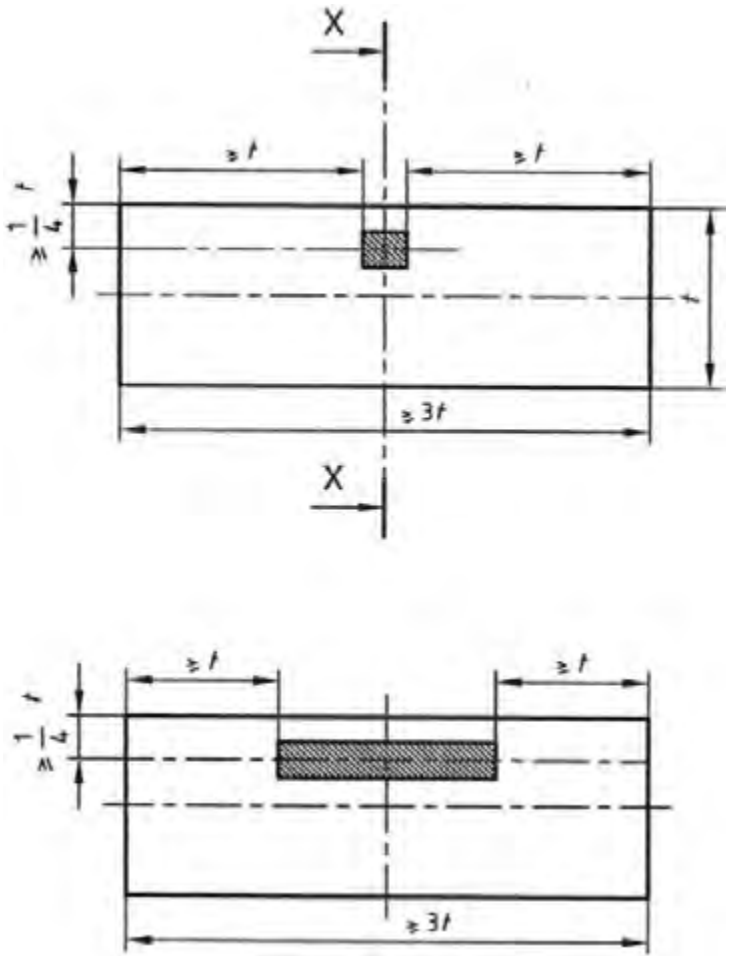

Fig. 2.6.1: Specimen positions relative to the test block in accordance with ISO 4990:2015*

***** Figure taken from ISO 4990:2015, *Steel castings - General technical delivery requirements*, is reproduced with the permission of the International Organization for Standardization, ISO. Copyright remains with ISO.

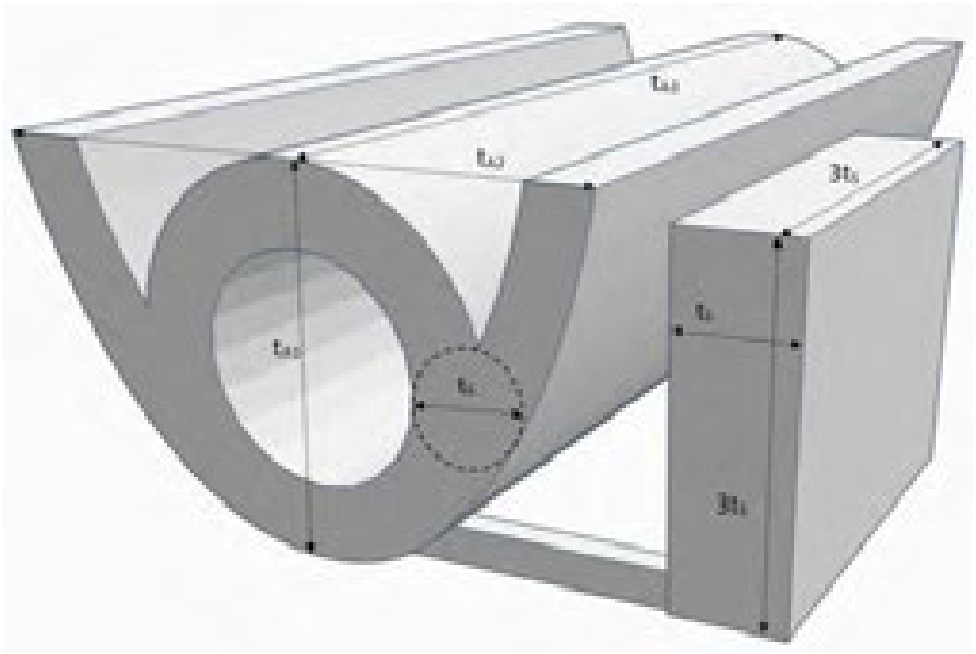

Fig. 2.6.2: Example 2: test block gated to stern tube casting

2.7 Mechanical properties

2.7.1 Table 2.7.1 and Table 2.7.2 give the minimum requirements for yield stress, elongation, reduction of area and impact test energy values corresponding to steel types and different strength levels. Where it is proposed to use a steel with a specified minimum tensile strength intermediate to those given, corresponding minimum values for the other properties may be obtained by interpolation.

2.7.2 Castings may be supplied to any specified minimum tensile strength selected within the general limits detailed in Table 2.7.1 and Table 2.7.2, respectively but subject to any additional requirements of the relevant construction rules.

2.7.3 The mechanical properties are to comply with the requirements of Table 2.7.1 and Table 2.7.2, respectively, appropriate to the specified minimum tensile strength or, where applicable, the requirements of the approved specification.

2.7.4 Re-test requirements for tensile tests are to be in accordance Chapter 2.

2.7.5 The additional tests detailed in 2.7.4 are to be taken, preferably from the same, but alternatively from another, test sample representative of the casting or batch of castings.

2.7.6 At the option of the manufacturer, when a casting or batch of castings has failed to meet the test requirements, it may be reheat treated and re-submitted for acceptance tests.

Table 2.7.1: Mechanical properties for steel castings intended for welding

Steel Type	Specified minimum tensile strength (1) [N/mm^2]	Yield stress [N/mm^2] min.	Elongation on 5.65 √So (%) min.	Reduction of area (%) min.	Charpy V-notch impact test2)	
					Test temperature(°C)	Minimum average energy(J)
C, C-Mn	400	200	25	40	0	27
	440	220	22	30		
	480	240	20	27		
	520	260	18	25		
	560	300	15	20		
	600	320	13	20		
Alloy	550	355	18	30	0	27
	600	400	16	30		
	650	450	14	30		
	700	540	12	28		

Note:
(1) A tensile strength range of 150 [N/mm^2] may additionally be specified.

(2) Special consideration may be given to alternative requirements for Charpy V-notch impact test, depending on design and application, and subject to agreement with IRS.

Table 2.7.2: Mechanical properties for steel castings not intended for welding

Steel Type	Specified minimum tensile strength (1) [N/mm^2]	Yield stress [N/mm^2] min.	Elongation on 5.65 √So (%) min.	Reduction of area (%) min.	Charpy V-notch impact test2)	
					Test temperature(°C)	Minimum average energy(J)
C, C-Mn	400	200	25	40	AT3)	27
	440	220	22	30		
	480	240	20	27		
	520	260	18	25		
	560	300	15	20		
	600	320	13	20		
Alloy	550	340	16	35	AT3)	27
	600	400	16	35		
	650	450	14	32		
	700	540	12	28		

Note:
(1) A tensile strength range of 150 [N/mm^2] may additionally be specified.

(2) Special consideration may be given to alternative requirements for Charpy V-notch impact test, depending on design and application, and subject to agreement with IRS.

3) AT refers to Ambient Temperature (i.e. 23°C±5°C), which is specified in ISO 148-1:2016

Section 3

Ferritic Steel Castings for Low Temperature Services

3.1 General

3.1.1 This Section gives the requirements for castings in carbon-manganese and nickel alloy steels intended for use in liquefied gas piping systems where the design temperature is lower than 0°C and for other applications where guaranteed impact properties at low temperatures is required.

3.1.2 Other steel types may also be accepted upon consideration in each case.

3.2 Chemical composition

3.2.1 The chemical composition of ladle samples is to comply with the overall limits given in Table 3.2.1. The carbon-manganese steel is to be fine grain treated.

Table 3.2.1 : Chemical composition of ferritic steel castings for low temperature service

Type of steel	Chemical composition %						
	C max.	Si max.	Mn	S max.	P max.	Ni	Residual elements max.
Carbon-manganese	0.25	0.60	0.70-1.60	0.030	0.030	0.80 max.	
$2\frac{1}{4}$ Ni	0.25	0.60	0.50-0.80	0.025	0.030	2.00-3.00	Cr 0.25 Cu 0.30 Mo 0.15 V 0.03 Total 0.60
$3\frac{1}{2}$ Ni	0.15	0.60	0.50-0.80	0.020	0.025	3.00-4.00	

3.3 Heat treatment

3.3.1 Castings are to be supplied in one of the following conditions :

a) normalized.
b) normalized and tempered.
c) quenched and tempered.

3.4 Mechanical tests

3.4.1 The mechanical properties of steel castings are to comply with requirements given in Table 3.4.1.

3.4.2 The tensile test is to be carried out at ambient temperature and the impact tests are to be carried out at the temperature specified in the table.

3.4.3 The average energy value from a set of three charpy V-notch impact test specimens is not to be lower than the required average value given in Table 3.4.1. One individual value may be less than the required average value provided that it is not less than 70 per cent of this average value.

3.5 Non-destructive testing

3.5.1 The non-destructive testing of castings is to be carried out in accordance with the appropriate requirements of 1.7 and additionally agreed between the manufacturer, purchaser and Surveyor.

Table 3.4.1 : Mechanical properties for acceptance purposes : ferritic steel castings for low temperature service

Type of steel	Grade	Yield stress [N/mm^2] min.	Tensile strength [N/mm^2]	Elongation on 5.65√So% min.	Reduction of area % min.	Charpy V-notch impact test	
						Test temp.^{o}C	Average energy J min.
Carbon-manganese	400 430 450	200 215 230	400 - 550 430 - 580 460 - 610	25 23 22	40 35 30	-60 (see Note)	27
$2\frac{1}{4}$ Ni	490	275	490 - 640	20	35	-70	34
$3\frac{1}{2}$ Ni	490	275	490 - 640	20	35	-95	34

Note : The temperature for carbon-maganese steels may be 5^{o}C below the design temperature if the latter is above -55^{o}C, with a maximum test temperature of -20^{o}C.

Section 4

Steel Castings for Propellers

4.1 Scope

4.1.1 These requirements are applicable to the manufacture, inspection and repair procedures of cast steel propellers, blades and bosses.

4.1.2 Where the use of alternative alloys is proposed, particulars of chemical composition, mechanical properties and heat treatment are to be submitted for approval.

4.1.3 These requirements may also be used for the repair of propellers damaged in service, subject to prior approval of IRS.

4.2 Foundry Approval

4.2.1 All propellers, blades and bosses are to be manufactured by foundries approved in accordance with Ch.1. Also refer Chapter 1, Section 1, Cl. 1.3.2. The castings are to be manufactured and tested in accordance with the requirements of this Section.

4.2.2 It is the manufacturer's responsibility to assure that effective quality, process and production controls during manufacturing are adhered to within the manufacturing specification. The manufacturing specification is to be submitted to IRS at the time of initial approval, and is to at least include the following particulars:

a) description of the foundry facilities,

b) steel material specification,

c) runner and feeder arrangements,

d) manufacturing procedures,

e)non-destructive testing and repair procedures.

4.2.3 The scope of the approval test is to be agreed with IRS. This is to include the presentation of cast test coupons of the propeller materials in question for approval testing in order to verify that the chemical composition and the mechanical properties of these materials comply with this section.

4.2.4 The foundry is to have an adequately equipped laboratory, manned by experienced personnel, for the testing of moulding materials chemical analyses, mechanical testing, microstructural testing of metallic materials and non-destructive testing. Where testing activities are assigned to other companies or other laboratory, additional information required by IRS is to be included.

4.3 Quality of castings

4.3.1 Freedom from defects

4.3.1.1 All castings are to have a workmanlike finish and are to be free from imperfections and defects which would be prejudicial to their proper application in service. Minor casting defects which may still be visible after machining such as small sand and slag inclusions, small cold shuts and scabs are to be trimmed off by the manufacturer in accordance with 4.11.

4.3.2 Removal of defects

4.3.2.1 Casting defects which may impair the service performance of the castings, e.g. major non-metallic inclusions, shrinkage cavities, blow holes and cracks, are not permitted. They may be removed by one of the methods described in 4.11 and repaired within the limits and restrictions for the severity zones. Full description and documentation must be available for the surveyor.

Table 4.2.1 : Typical chemical composition for steel propeller castings

Alloy type	C max. (%)	Mn max. (%)	Cr (%)	Mo[1)] max. (%)	Ni (%)
Martensitic (12 Cr 1 Ni)	0.15	2.0	11.5 - 17.0	0.5	Max. 2.0
Martensitic (13 Cr 4 Ni)	0.06	2.0	11.5 - 17.0	1.0	3.5 - 5.0
Martensitic (16 Cr 5 Ni)	0.06	2.0	15.0 - 17.5	1.5	3.5 - 6.0
Austenitic (19 Cr 11 Ni)	0.12	1.6	16.0 - 21.0	4.0	8.0 - 13.0

Note 1) Minimum values are to be in accordance with recognised national or international standards

Table 4.2.2 : Mechanical properties for steel propeller castings

Alloy type	Proof stress $R_{p0.2}$ min. [N/mm^2]	Tensile strength R_m min. [N/mm^2]	Elongation A_5 min. (%)	Red. Of area Z min. (%)	Charpy V-notch[1)] Energy min. (J)
(12 Cr 1 Ni)	440	590	15	30	20
(13 Cr 4 Ni)	550	750	15	35	30
(16 Cr 5 Ni)	540	760	15	35	30
(19 Cr 11 Ni)	180[2)]	440	30	40	-

Notes:

1) Not required for general service and the lowest ice class notations. For other ice class notations, tests are to be made -10^{o}C.

2) $R_{p1.0}$ value is 205 [N/mm^2].

4.4 Dimensions, dimensional and geometrical tolerances

4.4.1 The verification of dimensions, the dimensional and geometrical tolerances is the responsibility of the manufacturer. The report on the relevant examinations is to be submitted to the Surveyor, who may require checks to be made in his presence.

4.4.2 Static balancing is to be carried out on all propellers in accordance with the approved drawing. Dynamic balancing may be necessary for propellers running above 500 rpm.

4.5 Chemical Composition

4.5.1 Typical cast steel propeller alloys are grouped into four types depending on their chemical composition as given in Table 4.2.1. Cast steel whose chemical composition deviate from the typical values of Table 4.2.1 must be specially approved by IRS.

4.5.2 The manufacturer is to maintain records of the chemical analyses of the production casts, which are to be made available to the Surveyor so that he can satisfy himself that the chemical composition of each casting is within the specified limits.

4.6 Heat treatment

4.6.1 Martensitic castings are to be austenitized and tempered. Austenitic castings should be solution treated.

4.7. Mechanical properties

4.7.1 The mechanical properties are to comply with values given in Table 4.2.2. These values refer to the test specimens machined from integrally cast test coupons attached to the hub or on the blade. The thickness of test coupon is to be in accordance with a recognized standard.

4.7.2 Where possible, the test coupons attached on blades are to be located in an area between 0.5 to 0.6R, where R is the radius of the propeller.

4.7.3 The test bars are not to be detached from the casting until the final heat treatment has been carried out. Removal is to be by non-thermal procedures.

4.7.4 Separately cast test bars may be used subject to prior approval of IRS. The test bars are to be cast from the same heat as the castings represented and heat treated with the castings represented.

4.7.5 At least one set of mechanical tests is to be made on material representing each casting in accordance with Ch.2.

4.7.6 As an alternative to 4.7.5, where a number of small propellers of about the same size, and less than 1[m] in diameter, are made from one cast and heat treated in the same furnace charge, a batch testing procedure may be adopted using separately cast test samples of suitable dimensions. At least one set of mechanical tests is to be provided for each multiple of five castings in the batch.

4.8 Definition of skew, severity zones

4.8.1 In order to relate the degree of inspection to the criticality of imperfections in propeller blades and to help reduce the risk of failure by fatigue cracking after repair, propeller blades are divided into three severity zones designated A, B and C. Definition of skew, and, severity zones are given in Ch.8, 3.9.

4.9 Non-destructive examination

4.9.1 Qualification of personnel involved in NDT

4.9.1.1 Refer to IRS Classification Note "*Requirements for NDT Suppliers*".

4.9.2 Visual Testing

4.9.2.1 All finished castings are to be 100% visually inspected by the manufacturer. Castings are to be free from cracks, hot tears or other imperfections which, due to their nature, degree or extent, will interfere with the use of the castings. A general visual examination is to be carried out by the Surveyor.

4.9.3 Liquid penetrant testing

4.9.3.1 Liquid penetrant testing procedure is to be submitted to IRS and is to be in accordance with ISO 3452-1:2013 or a recognized standard. The acceptance criteria are specified in 4.10.

4.9.3.2 For all propellers, separately cast blades and hubs, the surfaces covered by severity zones A, B and C are to be liquid penetrant tested. Testing of zone A is to be undertaken in the presence of the Surveyor, whilst testing of zone B and C may be witnessed by the Surveyor upon his request.

4.9.3.3 If repairs have been made either by grinding or by welding, the repaired areas are additionally to be subjected to the liquid penetrant testing independent of their location and/or severity zone. Weld repairs are, independent of their location, always to be assessed according to zone A.

4.9.4 Magnetic particle testing

4.9.4.1 Magnetic particle testing may be used in lieu of liquid penetrant testing for examination of martensitic stainless steels

castings. Magnetic particle testing procedure is to be submitted to IRS and is to be in accordance with ISO 9934-1:2016 or a recognized standard.

4.9.5 Radiographic and ultrasonic testing

4.9.5.1 When required by IRS or when deemed necessary by the manufacturer, further non-destructive testing (e.g. radiographic and/or ultrasonic testing) are to be carried out. The acceptance criteria or applied quality levels are then to be agreed between the manufacturer and IRS in accordance with a recognized standard.
Note: due to the attenuating effect of ultrasound within austenitic steel castings, ultrasonic testing may not be practical in some cases, depending on the shape/type/thickness, and grain-growth direction of the casting.

4.10 Acceptance criteria for liquid penetrant testing and magnetic particle testing

4.10.1 Definitions of liquid penetrant indications

4.10.1.1 **Indication:** In the liquid penetrant testing an indication is the presence of detectable bleed-out of the penetrant liquid from the material discontinuities appearing at least 10 minutes after the developer has been applied.

4.10.1.2 **Relevant indication:** only indications which have any dimension greater than 1.5mm shall be considered relevant for the categorization of indications.

4.10.1.3 **Non-linear indication:** an indication with a largest dimension less than three times its smallest dimension (i.e. $l < 3\ w$).

4.10.1.4 **Linear indication:** an indication with a largest dimension three or more times its smallest dimension (i.e. $l \geq 3\ w$).

4.10.1.5 **Aligned indications**:

a) Non-linear indications form an alignment when the distance between indications is less than 2 [mm] and at least three indications are aligned. An alignment of indications is considered to be a unique indication and its length is equal to the overall length of the alignment.

b) Linear indications form an alignment when the distance between two indications is smaller than the length of the longest indication.

Illustration of liquid penetrant indications is given in Fig. 4.10.1.

4.10.2 Acceptance standard

4.10.2.1 The surface to be inspected is to be divided into reference areas of 100 [cm^2]. Each reference area may be square or rectangular with the major dimension not exceeding 250 [mm]. The area is to be taken in the most unfavourable location relative to the indication being evaluated.

4.10.2.2 The relevant indications detected with respect to their size and number, are not to exceed the values given in the Table 4.10.1. Areas which are prepared for welding are independent of their location always to be assessed according to zone A. The same applies to the welded areas after being finished machined and/or grinded.

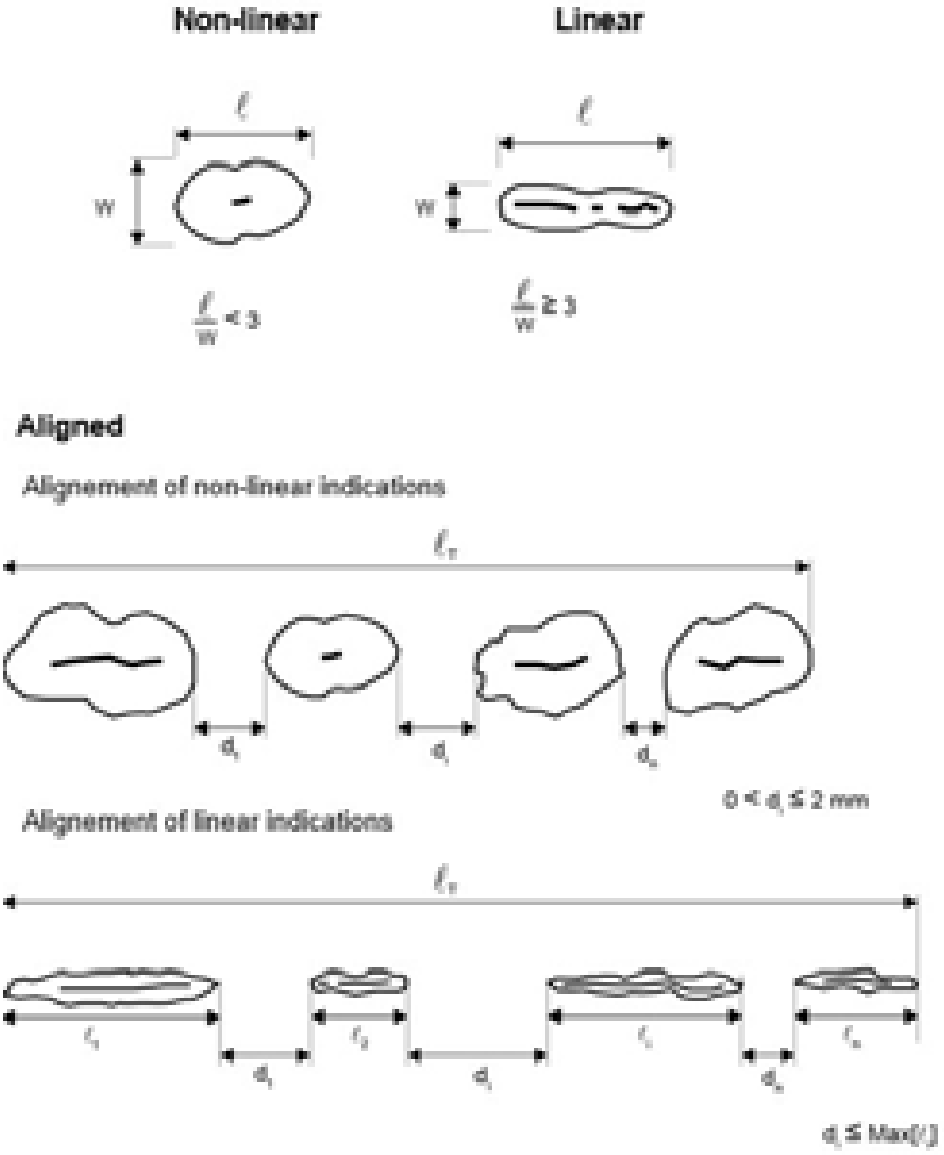

Fig.4.10.1 : Shape of indications

Table 4.10.1 : Allowable number and size of relevant indications in a reference area of 100 cm², depending on severity zones

Severity zone	Max. total number of indications	Type of Indication	Max. number for each type[1),2)]	Max. dimension of indication [mm]
A	7	Non-linear	5	4
		Linear	2	3
		Aligned	2	3
B	14	Non-linear	10	6
		Linear	4	6
		Aligned	4	6
C	20	Non-linear	14	8
		Linear	6	6
		Aligned	6	6

Table 4.10.1 (Contd.)

Notes:

1) Single non-linear indications less than 2 [mm] in Zone A and less than 3 [mm] for the other zones are not considered relevant.

2) The total number of non-linear indications may be increased to the maximum total number, or part thereof, represented by the absence of linear or aligned indications.

4.11 Repair of defects

4.11.1 Defective castings are to be repaired in accordance with the requirements given in 4.11.2 to 4.11.7 and, where applicable, the requirements of 4.12.

4.11.2 In general the repairs are to be carried out by mechanical means, e.g. by grinding, chipping or milling. The resulting grooves are to be blended into the surrounding surface so as to avoid any sharp contours. Complete elimination of the defective material is to be verified by liquid penetrant testing, or magnetic particle testing, if applicable.

4.11.3 Weld repairs are to be undertaken only when they are considered to be necessary and have prior approval of the Surveyor.

4.11.4 The excavations are to be suitably shaped to allow good access for welding. The resulting grooves are to be subsequently ground smooth and complete elimination of the defective material is to be verified by liquid penetrant testing. Welds having an area less than 5 [cm^2] are to be avoided.

4.11.5 Grinding in severity Zone A may be carried out to an extent that maintains the blade thickness. Repair welding is generally not permitted in severity Zone A and will only be allowed after special consideration.

4.11.6 Defects in severity Zone B that are not deeper than t/40 [mm] ("t" is the minimum local thickness according to the Rules) or 2 [mm], whichever is greatest, are to be removed by grinding. Those defects that are deeper may be repaired by welding subject to prior approval from IRS.

4.11.7 Repair welding is generally permitted in severity Zone C.

4.11.8 Repair documentation

4.11.8.1 The foundry is to maintain records of inspections, welding, and any subsequent heat treatment, traceable to each casting. Before welding is started, full details of the extent and location of the repair, the proposed welding procedure, heat treatment and subsequent inspection procedures are to be submitted to the IRS for approval.

4.12 Welding repair procedure

4.12.1 Before welding is started, manufacturer is to submit to IRS a detailed welding procedure specification covering the weld preparation, welding positions, welding parameters, welding consumables, preheating, post weld heat treatment and inspection procedures.

4.12.2 All weld repairs are to be carried out in accordance with qualified procedures, and by welders who are qualified to a recognized standard. Welding Procedure Qualification Tests are to be carried out in accordance with 4.15 and witnessed by the Surveyor. Defects to be repaired by welding are to be ground to sound material according to 4.10. The welding grooves are to be prepared in such a manner which will allow a good fusion of the groove bottom. The resulting ground areas are to be examined in the presence of the Surveyor by liquid penetrant testing in order to verify the complete elimination of defective material.

4.12.3 Welding is to be done under controlled conditions free from draughts and adverse weather.

4.12.4 Metal arc welding with electrodes or filler wire used in the procedure tests is to be used. The welding consumables are to be stored and handled in accordance with the manufacturer's recommendations.

4.12.5 Slag, undercuts and other imperfections are to be removed before depositing the next run.

4.12.6 The martenistic steels are to be furnace re-tempered after weld repair. Subject to prior approval, however, local stress relieving may be considered for minor repairs.

4.12.7 On completion of heat treatment the weld repairs and adjacent material are to be ground smooth. All weld repairs are to be liquid penetrant tested.

4.13 Identification and marking

4.13.1 The manufacturer is to adopt a system for the identification of all castings, which enable the material to be traced to its original cast. The Surveyor is to be given full facilities for so tracing the castings when required. Each finished casting propeller is to be marked by the manufacturer at least with the following particulars:

a) Heat number or other marking which will enable the full history of the casting to be traced;

b) Grade of cast material or corresponding abbreviated designation

c) The IRS certificate number and abbreviated name of local IRS office;

d) Ice class symbol, where applicable;

e) Skew angle for high skew propellers;

f) Date of final inspection.

4.13.2 The IR stamp is to be put on when the casting has been accepted.

4.14 Document and Certification

4.14.1 The manufacturer is to provide the Surveyor with an inspection certificate giving the following particulars for each casting which has been accepted:

a) Purchaser's name and order number;

b) Vessel identification, where known;

c) Description of the casting with drawing number;

d) Diameter, number of blades, pitch, direction of turning;

e) Skew angle for high skew propellers;

f) Final weight;

g) Alloy type, heat number and chemical composition;

h) Casting identification number;

i) Details of time and temperature of heat treatment;

j) Results of the mechanical tests.

k) Results of non-destructive tests and details of test procedure where applicable.

4.15 Welding procedure qualification test for repair of cast steel propeller

4.15.1 General

4.15.1.1 This sub-section provides requirements for qualification tests of welding procedures intended for the repair of cast steel propellers.

4.15.1.2 For the welding procedure approval the welding procedure qualification tests are to be carried out with satisfactory results. The qualification tests are to be carried out with the same welding process, filler metal, preheating and stress-relieving treatment as those intended applied by the actual repair work. Welding procedure specification is to refer to the test results achieved during welding procedure qualification testing.

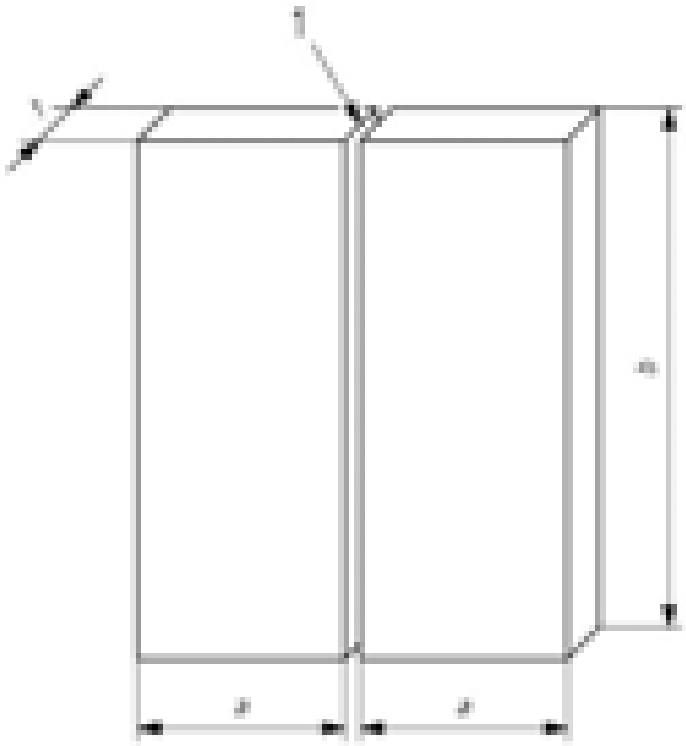
4.15.1.3 Welding procedures qualified at a manufacturer are valid for welding in workshops under the same technical and quality management.

4.15.2 Test piece and welding of sample

4.15.2.1 The test assembly, consisting of cast samples, is to be of a size sufficient to ensure a reasonable heat distribution and according to Fig. 4.15.2.1 with the minimum dimensions. The dimensions and shape of the groove is to be representative of the actual repair work.

4.15.2.2 Preparation and welding of test pieces are to be carried out in accordance with the general condition of repair welding work which it represents.

4.15.2.3 Welding of the test assemblies and testing of test specimens are to be witnessed by the Surveyor.



1: Joint preparation and fit-up as detailed in the preliminary Welding Procedure Specification
a: minimum value 150mm
b: minimum value 350mm
t: material thickness

Fig.4.15.2.1 : Test piece for welding repair procedure

4.15.3 Examinations and tests

4.15.3.1 Test assembly is to be examined non-destructively and destructively in accordance with Table 4.15.3.1 and Fig. 4.15.3.1.

4.15.3.2 Non-destructive testing

.1 Test assembly is to be examined by visual and liquid penetrant testing, or magnetic particle testing if applicable, prior to the cutting of test specimen. In case, that any post-weld heat treatment is required or specified, non-destructive testing is to be performed after heat treatment. No cracks are permitted. Imperfections detected by liquid penetrant testing, or magnetic particle testing if applicable, are to be assessed in accordance with 4.10.

4.15.3.3 Tensile test

.1 Two flat transverse tensile test specimens are be prepared. Testing procedures are to be in accordance with Ch.2. Alternatively tensile test specimens according to recognized standards acceptable to IRS may be used. The tensile strength is to meet the specified minimum value of the base material. The location of fracture is to be reported, i.e. weld metal, HAZ or base material.

4.15.3.4 Bend test

.1 Transverse bend tests for butt joints are to be in accordance with Ch.2, or, according to a recognized standard. The mandrel diameter shall be 4 x thickness except for austenitic steels, in which case the mandrel diameter is to be 3 x thickness. The bending angle is to be 180°. After testing, the test specimens are not to reveal any open defects in any direction

greater than 3 [mm]. Defects appearing at the corners of a test specimen during testing are to be investigated case by case. Two root and two face bend specimens are to be tested. For thickness 12 [mm] and over, four side bend specimens may alternatively be tested.

4.15.3.5 Macro-examination

.1 Two macro-sections are to be prepared and etched on one side to clearly reveal the weld metal, the fusion line, and the heat affected zone. Cracks and lack of fusion are not permitted. Imperfections such as slag inclusions, and pores greater than 3 [mm] are not permitted.

4.15.3.6 Impact test

.1 Impact test is required, where the base material is impact tested. Charpy V-notch test specimens are to be in accordance with Ch.2. Two sets are to be taken, one set with the notch positioned in the center of the weld and one set with the notch positioned in the HAZ (i.e. the mid-point of the notch is to be at 1 [mm] to 2 [mm] from the fusion line), respectively. The test temperature, and impact energy are to comply with the requirement specified for the base material.

4.15.3.7 Hardness test

.1 The macro-section representing the start of welding is to be used for HV 10 hardness testing. Indentations are to traverse 2 [mm] below the surface. At least three individual indentations are to be made in the weld metal, the HAZ (both sides) and in the base metal (both sides). The values are to be reported for information.

4.15.3.8 Re-testing

.1 If the test piece fails to comply with any of the requirements for visual or non-destructive testing one further test piece is to be welded and subjected to the same examination. If this additional test piece does not comply with the relevant requirements, the pWPS (preliminary welding procedure specification) is to be regarded as not capable of complying with the requirements without modification.

.2 If any test specimens fail to comply with the relevant requirements for destructive testing due to weld imperfections only, two further test specimens are to be obtained for each one that failed. These specimens can be taken from the same test piece if there is sufficient material available or from a new test piece, and are to be subjected to the same test. If either of these additional test specimens does not comply with the relevant requirements, the pWPS is to be regarded as not capable of complying with the requirements without modification.

.3 If a tensile test specimen fails to meet the requirements, the re-testing is to be in accordance with Ch.2.

.4 If there is a single hardness value above the maximum values allowed, additional hardness tests are to be carried out (on the reverse of the specimen or after sufficient grinding of the tested surface). None of the additional hardness values is to exceed the maximum hardness values required.

.5 The re-testing of Charpy impact specimens are to be carried out in accordance with Ch.2.

.6 Where there is insufficient welded assembly remaining to provide additional test specimens, a further assembly is to be welded using the same procedure to provide the additional specimens.

Table 4.15.3.1 Type of tests and extent of testing

Type of test	Extent of testing
Visual testing	100% as per 4.15.3.2
Liquid penetrant testing (1)	100% as per 4.15.3.2
Transverse tensile test	Two specimens as per 4.15.3.3
Bend test (2)	Two root and two face specimens as per 4.15.3.4
Macro examination	Three specimens as per 4.15.3.5
Impact test	Two sets of three specimens as per 4.15.3.6
Hardness test	As per 4.15.3.7

(1) Magnetic particle testing may be used in lieu of liquid penetrant testing for martensitic stainless steels.
(2) For t≥12mm, the face and root bend may be substituted by 4 side bend test specimens.

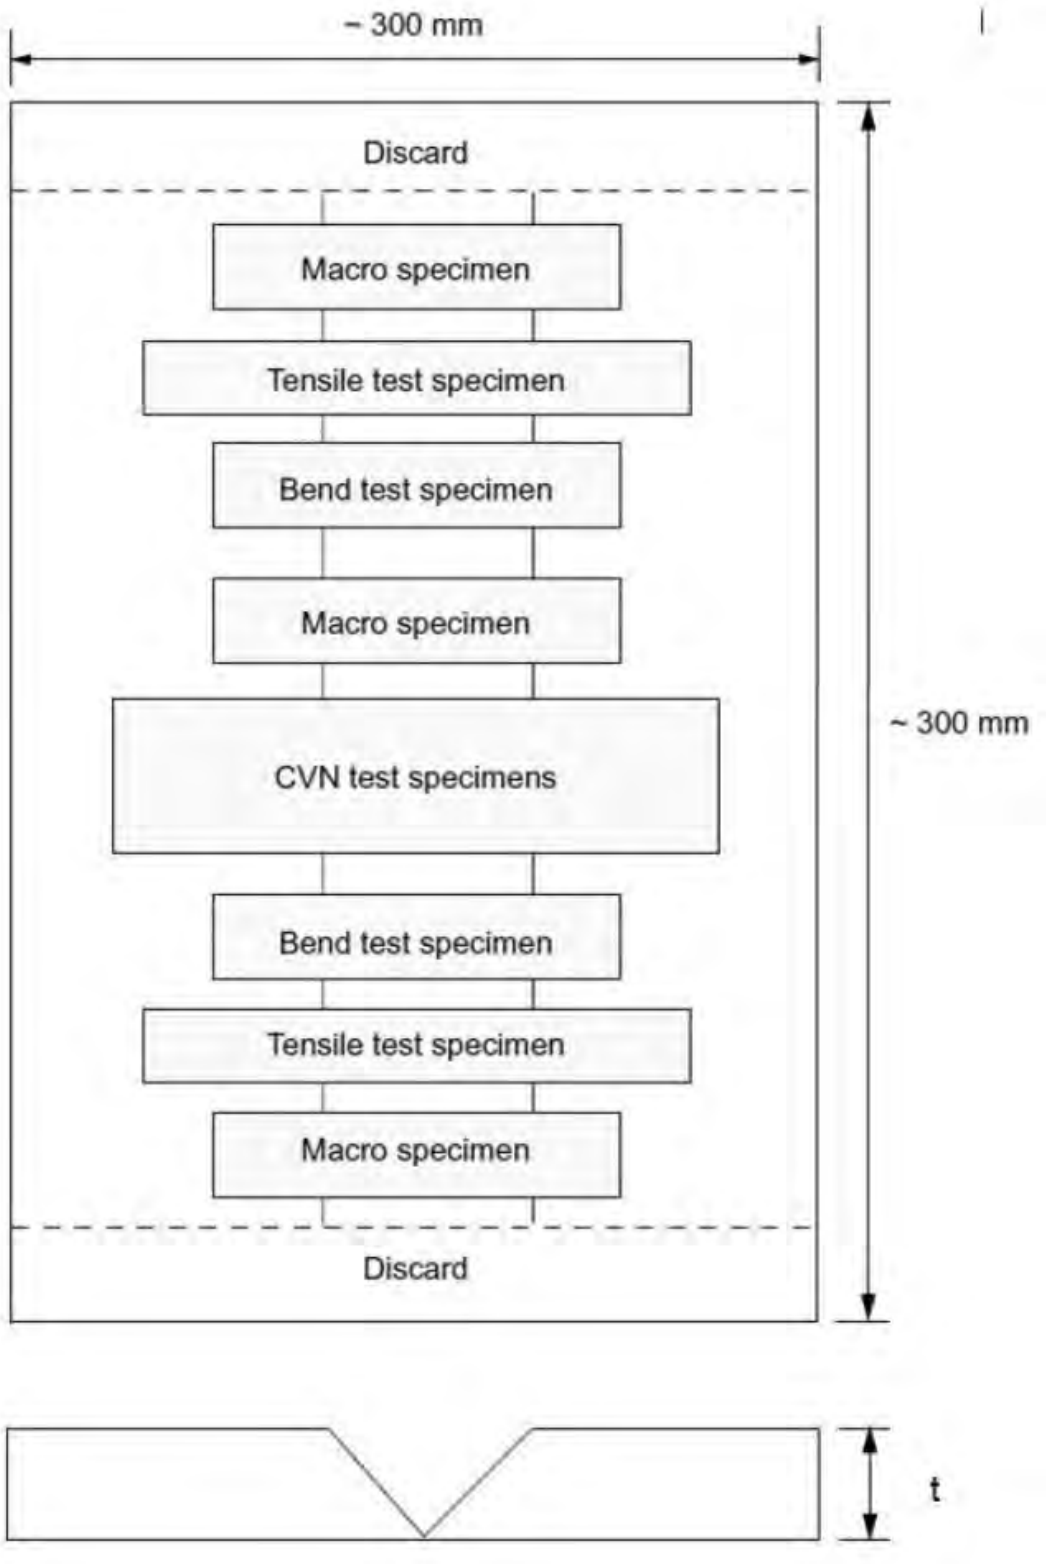


Fig.4.15.3.1 : Weld test assembly

4.15.4 Test record

4.15.4.1 Welding conditions for test assemblies and test results are to be recorded in welding procedure qualification. Forms of welding procedure qualification records may be in accordance with recognised standards.

4.15.4.2 A statement of the results of assessing each test piece, including repeat

tests, is to be made for each welding procedure qualification records. The relevant items listed for the WPS are to be included.

4.15.4.3 The welding procedure qualification record is to be signed by the Surveyor witnessing the test and is to include IR identification.

4.15.5 Range of approval

4.15.5.1 General

.1 All the conditions of validity stated below are to be met independently of each other. Changes outside of the ranges specified are to require a new welding procedure test. A qualification of a WPS obtained by a manufacturer is valid for welding in workshops or sites under the same technical and quality control of that manufacturer.

4.15.5.2 Base metal

.1 Range of approval for steel cast propeller is limited to steel grade tested.

4.15.5.3 Thickness

.1 The qualification of a WPS carried out on a weld assembly of thickness t is valid for the thickness range given in Table 4.15.5.3.

Table 4.15.5.3 Range of qualification for thickness

Thickness of the test piece, t (mm)	Range of approval
15<t≤30	3mm to 2t
t>30	0.5t to 2t or 200mm, whichever is the greater

4.15.5.4 Welding position

.1 Approval for a test made in any position is restricted to that position.

4.15.5.5 Welding process

.1 The approval is only valid for the welding process used in the welding procedure test. Single run is not qualified by multi-run butt weld test used in this Section.

4.15.5.6 Filler metal

.1 The approval is only valid for the filler metal used in the welding procedure test.

4.15.5.7 Heat input

.1 The upper limit of heat input approved is 15% greater than that used in welding the test piece. The lower limit of heat input approved is 15% lower than that used in welding the test piece.

4.15.5.8 Preheating and interpass temperature

.1 The minimum preheating temperature is not to be less than that used in the qualification test. The maximum interpass temperature is not to be higher than that used in the qualification test.

4.15.5.9 Post-weld heat treatment

.1 The heat treatment used in the qualification test is to be specified in pWPS. Holding time may be adjusted as a function of thickness.

Section 5

Austenitic Stainless Steel Castings

5.1 Scope

5.1.1 This section gives the requirements for castings in austenitic stainless steels for piping systems in ships for liquefied gases where the design temperature is not lower than –165°C and in bulk chemical carriers.

5.1.2 Where it is proposed to use alternative steels, particulars of the specified chemical composition, mechanical properties and heat treatment are to be submitted for approval.

5.2 Chemical composition

5.2.1 The chemical composition of ladle samples is to comply with the requirements given in Table 5.2.1.

Table 5.2.1 : Chemical composition of austenitic stainless steel castings

Type of steel	Chemical composition %								
	C max.	Si	Mn	S	P	Cr	Mo	Ni	Others
304L	0.03	0.20-1.5	0.50-2.0	0.40 max.		17.0-21.0	-	8.0-12.0	-
304	0.08						-	8.0-12.0	-
316L	0.03						2.0-3.0	9.0-13.0	-
316	0.08						2.0-3.0	9.0-13.0	-
317	0.08						3.0-4.0	9.0-12.0	-
347 (see Note)	0.06						-	9.0-12.0	Nb ≥8xC≤0.90

Note: When guaranteed impact values at low temperature are not required, the maximum carbon content may be 0.08% and the maximum niobium may be 1.00%.

5.3 Heat treatment

5.3.1 All castings are to be solution treated at a temperature of not less than 1000°C and cooled rapidly in air, oil or water.

5.4 Mechanical tests

5.4.1 One tensile test specimen is to be prepared from material representing each casting or batch of castings. In addition, where the castings are intended for liquefied gas applications, where the design temperature is lower than –55°C, one set of three Charpy V-notch impact test specimens is to be prepared.

5.4.2 The tensile test is to be carried out at ambient temperature and the results are to comply with the requirements given in Table 5.4.2.

5.4.3 The average value for impact test specimens is to comply with the appropriate requirements given in Table 5.4.2. One individual value may be less than the required average value provided that it is not less than 70 percent of this average value. See Ch.1, 1.10 for re-test procedures.

Table 5.4.2 : Mechanical properties for acceptance purposes : austenitic stainless steel castings

Type of steel	Tensile strength [N/mm^2] minimum	1.0% proof stress [N/mm^2] minimum	Elongation on 5.65 $\sqrt{S_o}$ % minimum	Reduction of area % minimum	Charpy V-notch impact tests	
					Test temp. °C	Average energy J minimum
304L	430	215	26	40	-196	41
304	480	220				
316L	430	215	26	40	-196	41
317	480	240				
347	480	215	22	35	-196	41

5.5 Intergranular corrosion tests

5.5.1 Where corrosive conditions are anticipated in service, intergranular corrosion tests are required on castings in grades 304, 316 and 317. Such tests may not be required for grades 304L, 316L and 347.

5.5.2 Where an intergranular corrosion test is specified, it is to be carried out in accordance with the standard referred in 9.6.2 of Chapter 3.

5.6 Non-destructive examination

5.6.1 The non-destructive examination of castings is to be carried out in accordance with the appropriate requirements of Classification Notes “Guidelines for non-destructive testing of steel castings for marine application” and additionally agreed between the manufacturer, purchaser and Surveyor.

Section 6

Castings for other Applications

6.1 General

6.1.1 Details of chemical composition, heat treatment, mechanical properties of steel castings for crankshafts and those intended for elevated temperature service are to be submitted for approval of IRS.

Steel Forgings

Contents

Section

1 *General Requirements*

2 *Hull and Machinery Steel Forgings for General Applications*

3 *Ferritic Steel Forgings for Low Temperature Service*

4 *Austenitic Stainless Steel Forgings*

Section 1

General Requirements

1.1 Scope

1.1.1 All important steel forgings, as defined in the relevant construction Rules, are to be manufactured and tested in accordance with the requirements of this Chapter.

1.1.2 Where required by the relevant Rules dealing with design and construction, forgings are to be manufactured and tested in accordance with Ch.1 and 2, together with the general requirements given in this Chapter.

1.1.3 Alternatively, forgings which comply with National or proprietary specifications may be accepted provided such specifications give reasonable equivalence to these requirements or are otherwise specially approved for a specific application by IRS.

1.2 Manufacture

1.2.1 Forgings are to be made at the works approved by IRS. Also refer Chapter 1, Section 1, Cl. 1.3.2.

1.2.2 The steel used in the manufacture of forgings is to be made by a process approved by IRS. The works at which the steel was produced is to be approved by IRS. Where the steel is produced at a separate works to the forging, the steel manufacturer is also to be approved by IRS. Also refer Chapter 1, Section 1, Cl. 1.3.2.

1.2.3 Adequate top and bottom discards are to be made to ensure freedom from piping and harmful segregations in the finished forgings.

1.2.4 The plastic deformation is to be such as to ensure soundness, uniformity of structure and satisfactory mechanical properties after heat treatment. The reduction ratio is to be in accordance with the following Table:

Method of manufacture	**Total reduction ratio (See Notes 1, 2 & 3)**
Made directly from ingots or forged blooms or billets	3:1 where L > D 1.5:1 where L ≤ D
Made from rolled products	4:1 where L > D 2:1 where L ≤ D

Notes

1 L and D are the length and diameter respectively of the part of the forging under consideration.

2 the reduction ratio is to be calculated with reference to the average cross-sectional area of the ingot. Where an ingot is initially upset, this reference area may be taken as the average cross-sectional area after this operation.

3 For rolled bars used as a substitute for forgings (see 1.1.1) the reduction ratio is not to be less than 6 : 1

4 For forgings made by upsetting, the length after upsetting is to be not more than one-third of the length before upsetting or, in the case of an initial forging reduction of at least 1.5:1, not more than one half of the length before upsetting.

1.2.5 For crankshafts, where grain flow is required in the most favourable direction having regard to the mode of stressing in service, the proposed method of manufacture may required special approval by IRS. In such cases, tests may be required to demonstrate that a satisfactory structure and grain flow are obtained.

1.2.6 The shaping of forgings or rolled slabs and billets by flame cutting, scarfing or arc-air gouging is to be undertaken in accordance with recognized good practice and unless otherwise approved, is to be carried out before the final heat treatment. Preheating is to be employed when necessitated by the composition and/or thickness of the steel.

1.2.7 For certain components, subsequent machining of all flame cut surfaces may be required.

1.2.8 When two or more forgings are joined by welding to form a composite component the proposed welding procedure specification is to be submitted for approval. Welding procedure qualification tests are to be carried out.

1.2.9 Welders intended to be engaged in fusion welding of steel forgings for hull structures are to be qualified in accordance with IRS Classification Note "*Qualification Scheme for Welders of Hull Structural Steel*".

1.3 Quality of forgings

1.3.1 All forgings are to be free from surface or internal defects which would be prejudicial to their proper application in service.

1.4 Chemical composition

1.4.1 All forgings are to be made from killed steel, and the chemical composition is to be appropriate for the type of steel, dimensions and required mechanical properties of the forgings being manufactured.

1.4.2 The chemical composition of each heat is to be determined by the manufacturer on a sample taken preferably during the pouring of the heat. When multiple heats are tapped into a common ladle, the ladle analysis is applicable.

1.5 Heat treatment (including surface hardening and straightening)

1.5.1 At an appropriate stage of manufacture, after completion of all hot working operations, forgings are to be suitably heat treated to refine the grain structure and to obtain the required mechanical properties. Heat treatment is to be carried out in properly constructed furnaces which are efficiently maintained and have adequate means for control and recording of temperature. The furnace dimensions are to be such as to allow the whole furnace charge to be uniformly heated to the necessary temperature. In the case of very large forgings alternative methods of heat treatment will be specially considered by IRS.

1.5.2 Except as provided in 1.5.7 and 1.5.8 forgings are to be supplied in one of the following conditions:

a) Carbon and carbon-manganese steels

Fully annealed
Normalized
Normalized and tempered
Quenched and tempered

b) Alloy steels

Normalized
Normalized and tempered
Quenched and tempered

For all types of steel the tempering temperature is not less than 550°C.

The delivery condition is to meet the design and application requirements, it is the manufacturers responsibility to select the appropriate heat treatment method to obtain the required mechanical properties. Where forgings for gearing are not intended for surface hardening, lower tempering temperature may be allowed.

1.5.3 Sufficient thermocouples are to be connected to the furnace charge to measure and record that its temperature is adequately uniform unless the temperature uniformity of the furnace is verified at regular intervals.

1.5.4 If for any reasons a forging is subsequently heated for further hot working the forging is to be re-heat treated.

1.5.5 If any straightening operation is performed after the final heat treatment, a subsequent stress relieving heat treatment to avoid harmful residual stresses is to be carried out, unless otherwise agreed.

1.5.6 Where it is intended to surface harden forgings, full details of the proposed procedure and specification are to be submitted for the approval of IRS. For the purpose of this approval, the manufacturer may be required to demonstrate by test that the proposed procedure gives a uniform surface layer of the required hardness and depth and that it does not impair the soundness and properties of the steel.

1.5.7 Where induction hardening or nitriding is to be carried out after machining, forgings are to be heat treated at an appropriate stage to a condition suitable for this subsequent surface hardening.

1.5.8 Where carburizing is to be carried out after machining, forgings are to be heat treated at an appropriate stage (generally either by full annealing or by normalising and tempering) to a condition suitable for subsequent machining and carburizing.

1.5.9 If a forging is locally reheated or any straightening operation is performed after the final heat treatment, consideration is to be given to a subsequent stress relieving heat treatment. The manufacturer is to have strict control of this temperature to avoid any detrimental effects to the final heat treatment and resultant microstructure and mechanical properties of the forging.

1.5.10 The manufacturer is to maintain records of heat treatment identifying the furnace used, furnace charge, date, temperature and time at the beginning and end of heat treatment cycle. The records are to be presented to the Surveyor on request.

1.6 Mechanical tests

1.6.1 The requirements of Mechanical tests and mechanical properties are given in Section 2 and 3.

1.7 Inspection

1.7.1 All forgings should be subjected to a 100% visual examination of all accessible surfaces by the manufacturer and made available to the Surveyor. Where applicable, this visual examination is to include the examination of internal surfaces and bores. Unless otherwise agreed, the verification of the dimensions is the responsibility of the manufacturer.

1.7.2 When required by the relevant construction Rules, or by the approved procedure for welded composite components appropriate non-destructive testing is also to be carried out before acceptance and the results are to be reported by the manufacturer.

1.7.3 Where required by appropriate part of the rules or IRS Classification Notes *“Guidelines for Non- Destructive Testing of Hull and Machinery Steel Forgings*”, ultrasonic examination is to be carried out after the forgings have been machined to a condition suitable for this type of examination and after

the final heat treatment. Both radial and axial scanning are to be carried out where appropriate for the shape and the dimensions of the forgings being examined.

1.7.4 The method and the extent of inspection, NDT and acceptance criteria are to be agreed with IRS. IRS Classification Notes *"Guidelines for Non- Destructive Testing of Hull and Machinery Steel Forgings"* is regarded as an example of an acceptable standard.
For mass produced forgings the extent of examination will be specially considered in each case.

1.7.5 Unless otherwise agreed, examinations are to be carried out by the manufacturer, although Surveyors may be present in order to verify that the examination is being carried out in accordance with the agreed procedures.

1.7.6 If the forging is supplied in the 'as forged' condition for machining at a separate works, the manufacturer is to ensure that a suitable ultrasonic examination is carried out to verify the internal quality of the forging.

1.7.7 Where advanced ultrasonic testing methods are applied, e.g. PAUT or TOFD, reference is made to IRS Classification Notes *"Requirements for Non-Destructive Testing",* Section 2 "Advanced non-destructive testing of materials and welds".
In such cases, acceptance levels regarding accept/reject criteria may be as per the applicable section in the IRS Classification Notes "*Guidelines for Non- Destructive Testing of Hull and Machinery Steel Forgings*".

1.7.8 When required by the conditions of approval for surface hardened forgings, (1.5.6) additional test samples are to be processed at the same time as the forgings which they represent. These test samples are subsequently to be sectioned in order to determine the hardness, shape and depth of the locally hardened zone and which are to comply with the requirements of the approved specification.

1.7.9 In the event of any forging proving defective during subsequent machining or testing, it is to be rejected notwithstanding any previous certification.

1.8 Rectification of defective forgings

1.8.1 Defects may be removed by grinding or chipping and grinding provided the component dimensions are acceptable. The resulting grooves are to have a bottom radius of approximately three times the groove depth and are to be blended into the surrounding surface so as to avoid any sharp contours. Complete elimination of the defective material is to be verified by magnetic particle testing or liquid penetrant testing.

1.8.2 Repair welding of forgings subjected to torsional fatigue, such as crankshaft forgings and propeller shaft forgings is not permitted. In the case of other forgings repair welding may be allowed subject to prior approval of IRS. In such cases, full details of the extent and location of the repair, the proposed welding procedure, heat treatment and subsequent inspection procedures are to be submitted for the approval.

1.8.3 The forging manufacturer is to maintain records of repairs and subsequent inspections traceable to each forging repaired. The records are to be presented to the Surveyor on request.

a) Purchaser's name and order number;

b) Description of forgings and steel quality identification number;

c) Steel making process, cast number and chemical analysis of ladle sample;

d) Results of mechanical tests;

e) General details of heat treatment;

f) Identification number.

1.9 Identification of forgings

1.9.1 Before acceptance, all forgings, which have been tested and inspected with satisfactory results, are to be clearly marked in at least one place with the IRS brand IR and the following particulars:

a) The manufacturer's name or trade mark;

b) Identification mark for the grade of steel;

c) Identification number and/or initials which enable the full history of the forging to be traced;

d) Personal stamp of Surveyor responsible for inspection;

e) Test pressure, where applicable;

f) Date of final inspection;

g) The 'IRS' name;

h) Abbreviated name of IRS local office.

1.9.2 Where small forgings are manufactured in large numbers, modified arrangements for identification may be specially agreed with IRS.

1.10 Certification

1.10.1 The manufacturer is to provide the Surveyor, in duplicate, with a test certificate or shipping statement giving the following particulars for each forging or batch of forgings which has been accepted:

a) Purchaser's name and order number;

b) Description of forgings and steel quality identification number;

c) Steel making process, cast number and chemical analysis of ladle sample;

d) Results of mechanical tests;

e) General details of heat treatment;

f) Identification number.

Section 2

Hull and Machinery Steel Forgings for General Applications

2.1 Scope

2.1.1 The requirements given in this section are applicable to steel forgings intended for hull and machinery applications such as rudder stocks, pintles, propeller shafts, crankshafts, connecting rods, piston rods, gearing etc. Where relevant, these requirements are also applicable to material for forging stock and to rolled bars intended to be machined into components of simple shape.

2.1.2 These requirements are applicable only to steel forgings where the design and acceptance tests relate to mechanical properties at ambient temperature. For other applications, additional requirements may be necessary especially when the forgings are intended for service at low or elevated temperatures.

2.2 Chemical Composition

2.2.1 The chemical composition is to comply with the overall limits given in Tables 2.2.1 and Table 2.2.2 or, where applicable, the requirements of the approved specification.

2.2.2 At the option of the manufacturer, suitable grain refining elements such as aluminium, niobium or vanadium may be added. The content of such elements is to be reported.

2.2.3 Elements designated as residual elements in the individual specifications are not to be intentionally added to the steel. The content of such elements is to be reported.

Table 2.2.1 : Chemical composition limits [1] for hull steel forgings [6]

Steel type	C	Si	Mn	P	S	Cr [4]	Mo [4]	Ni [4]	Cu [4]	Total residuals
C, C-Mn	0.23 [2], [3]	0.45	0.20-1.50	0.035	0.035	0.30	0.15	0.40	0.30	0.85
Alloy	[5]	0.45	[5]	0.035	0.035	[5]	[5]	[5]	0.30	-

[1] Composition in percentage mass by mass maximum unless shown as a range.

[2] The carbon content may be increased above this level provided that the carbon equivalent (Ceq) is not more than 0.41%, calculated using the following formula:

$$Ceq = C + \frac{Mn}{6} + \frac{Cr + Mo + V}{5} + \frac{Ni + Cu}{15} (\%)$$

[3] The carbon content of C and C-Mn steel forgings not intended for welded construction may be 0.65 maximum.

[4] Elements are considered as residual elements.

[5] Specification is to be submitted for approval.

[6] Rudder stocks and pintles should be of weldable quality.

Table 2.2.2 : Chemical composition limits [1] for machinery steel forgings

Steel type	C	Si	Mn	P	S	Cr [4]	Mo [4]	Ni [4]	Cu [4]	Total residuals
C, C-Mn	0.23 [2], [3]	0.45	0.30-1.50	0.035	0.035	0.30	0.15	0.40	0.30	0.85
Alloy [5]	0.45	0.45	0.30-1.00	0.035	0.035	Min 0.40 [6]	Min 0.15 [6]	Min 0.40 [6]	0.30	-

[1] Composition in percentage mass by mass maximum unless shown as a range or as a minimum.

[2] The carbon content may be increased above this level provided that the carbon equivalent (Ceq) is not more than 0.41%.

[3] The carbon content of C and C-Mn steel forgings not intended for welded construction may be 0.65 maximum.

[4] Elements are considered as residual elements unless shown as a minimum.

[5] Where alloy steel forgings are intended for welded constructions, the proposed chemical composition is subject to approval by IRS.

[6] One or more of the elements is to comply with the minimum content.

2.3 Mechanical tests

2.3.1 Adequate number of test coupons are to be provided for carrying out tests including for retest purposes, with a cross-sectional area of not less than that part of the forging which it represents. This test material is to be integral with each forging except as provided in 2.3.8 and 2.3.11. Where batch testing is permitted according to 2.3.11 the test material may alternatively be a production part or separately forged. Separately forged test material is to have a reduction ratio similar to that used for the forgings represented.

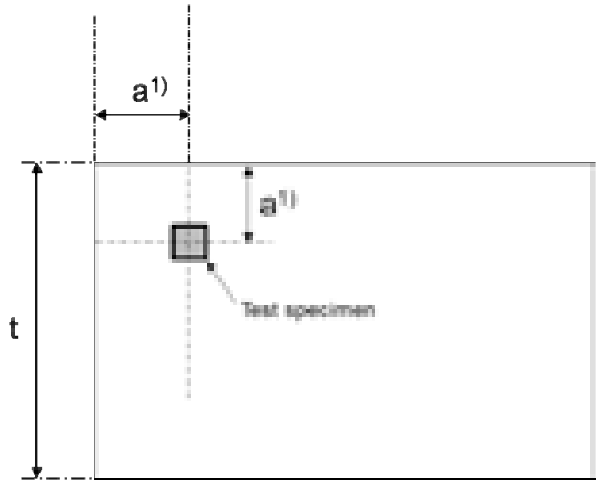
2.3.2 For the purpose of these requirements a set of tests is to consist of one tensile test specimen and when required in other sections of Rules three Charpy V-notch impact test specimens.

2.3.3 Test specimens are normally to be cut with their axes either parallel (longitudinal test) or tangential (tangential test) to the principal axial direction of each product.

2.3.4 The test specimen is to be positioned as follows:

a) For forgings having a thickness, t, or diameter D up to maximum 50mm, the longitudinal axis of the test specimen is to be located at a distance of t/2 or D/2 below the heat treated surfaces.
b) For forgings having a thickness, t, or diameter D greater than 50mm, the longitudinal axis of the test specimen is to be located at a distance of t/4 or D/4 (mid-radius) or 80mm, whichever is less, below any heat treated surface. Test specimen is to be located with its longitudinal axis at a distance from any heat treated surface as shown in Fig. 2.3.4.
c) For ring and disc forgings (noting that the test specimen locations for these shaped forgings may be different to elongated or free form forgings), tangential sample is to be taken at t/2 for thickness ≤ 25mm and 12.5mm below the surface for thickness >25mm, in both the vertical and horizontal direction. Where achievable, for thickness >25mm, no part of the test material is to be closer than 12.5 mm to any heat treated surface, as shown in Fig. 2.3.4.

2.3.5 Where the manufacturer can demonstrate that a proposed testing location or orientation is more representative of the required mechanical properties of a component, this may be agreed with IRS. In such cases, the heat treatment process, a proposed testing location or orientation, and technical justification is to be submitted to IRS for approval.



1) "a" is the distance from the test specimen to heat treated surface based on the above b) or c).

Fig.2.3.4 : Position of the test specimen

2.3.6 Except as provided in 2.3.11 the number and direction of tests is to be as follows:

a) Hull components such as rudder stocks, pintles etc. General machinery components such as shafting, connecting rods, etc.
One set of tests is to be taken from the end of each forging in a longitudinal direction except that, at the discretion of the manufacture the alternative directions or positions as shown in Fig.2.3.5a, Fig.2.3.5b and Fig.2.3.5c may be used. Where a forging exceeds both 4 tonnes in mass and 3 [m] in length one set of tests is to be taken from each end. These limits refer to the 'as forged' mass and length but excluding the test material.

b) Pinions - Where the finished machined diameter of the toothed portion exceeds 200 [mm] one set of tests is to be taken from each forging in a tangential direction adjacent to the toothed portion (test position B in Fig.2.3.5d). Where the dimensions preclude the preparation of tests from this position, tests in a tangential direction are to be taken from the end of the journal (test position C in Fig.2.3.5d). If however, the journal diameter is 200 [mm] or less the tests are to be taken in a longitudinal direction (test position A in Fig.2.3.5d). Where the finished length of the toothed portion exceed 1.25 [m], one set of tests is to be taken from each end.

c) Small pinions - Where the finished diameter of the toothed portion is 200 [mm] or less one set of tests is to be taken in a longitudinal direction (test position A in Fig.2.3.5d).

d) Gear wheels - One set of tests is to be taken from each forging in tangential direction (test position A or B in Fig.2.3.5e).

e) Gear wheel rims (made by expanding)
One set of tests is to be taken from each forging in a tangential direction (test position A or B in Fig.2.3.5.f). Where the finished diameter exceeds 2.5 [m] or the mass (as heat treated including test material) exceeds 3 tonnes, two sets of tests are to be taken from diametrically opposite positions (test positions A and B in Fig. 2.3.5f). The mechanical properties for longitudinal test are also to be applied.

f) Pinion sleeves - One set of tests is to be taken from each forging in tangential direction (test position A or B in Fig.2.3.5g). Where the finished length exceeds 1.25 [m] one set of tests is to be taken from each end.

g) Crankwebs
One set of tests is to be taken from each forging in a tangential direction.

h) Solid open die forged crankshafts
One set of tests is to be taken in a longitudinal direction from the driving shaft end of each forging (test position A in Fig.2.3.5h).
Where the mass (as heat treated but excluding test material) exceeds 3 tonnes tests in a longitudinal direction are to be taken from each end (test positions A and B in Fig.2.3.5h). Where, however, the crankthrows are formed by machining or flame cutting, the second set of tests is to be taken in a tangential direction from material removed from the crankthrow at the end opposite the driving shaft end (test position C in Fig.2.3.5h).

i) Forged Rings (such as slewing rings)
One set of tests is to be taken from each forging in a tangential direction (test positions are shown in Fig. 2.3.5i). Where the finished diameter exceeds 2.5 [m] or the mass (as heat treated, including test material) exceeds 3 tonnes then two sets of tests are to be taken in diametrically opposite positions.

2.3.7 For closed die crankshaft forgings and crankshaft forgings where the method of manufacture has been specially approved in accordance with 1.2.5, the number and position of test specimens is to be agreed with IRS having regard to the method of manufacture employed.

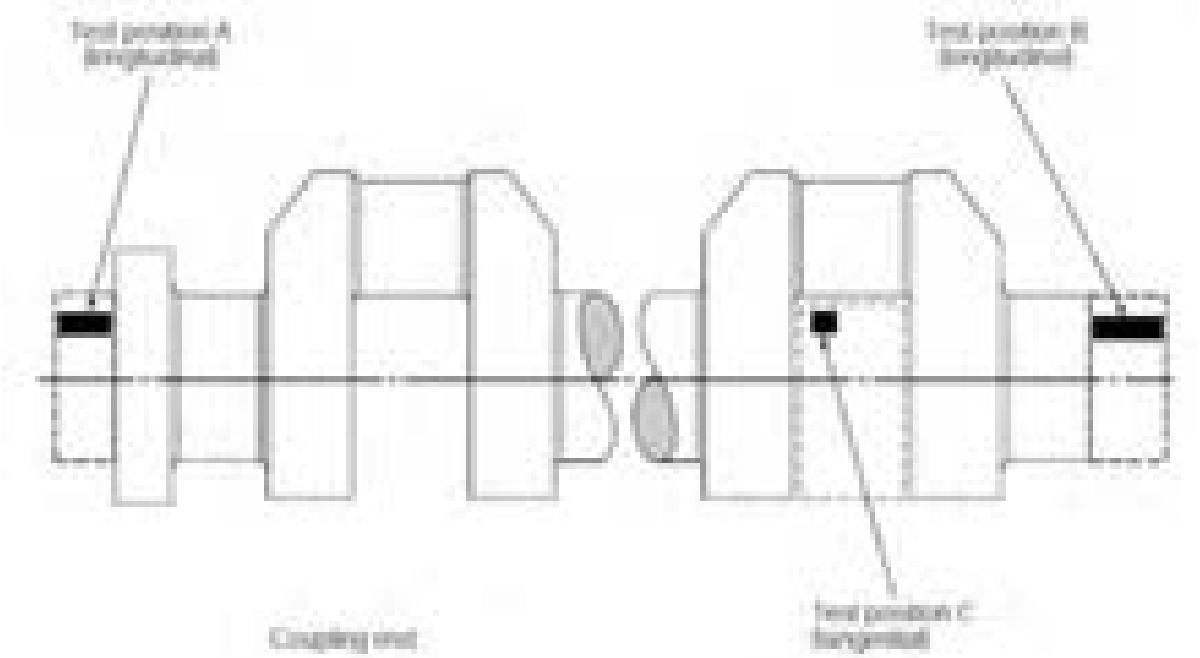

Fig. 2.3.5h Solid forged crankshaft

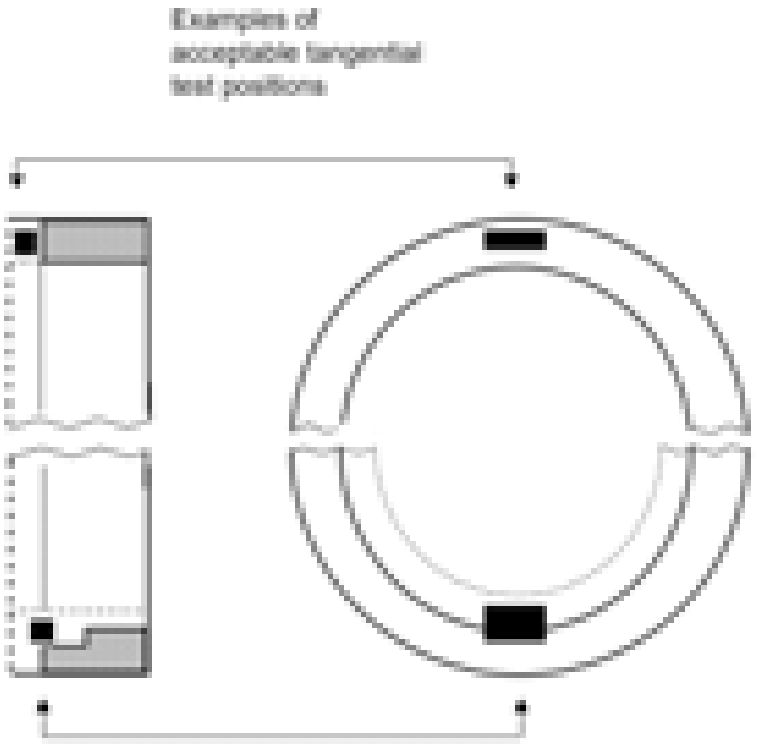

Fig.2.3.5i Forged rings

2.3.8 When a forging is subsequently divided into a number of components, all of which are heat treated together in the same furnace charge, for test purposes this may be regarded as one forging and the number of tests required is to be related to the total length and mass of the original multiple forging.

2.3.9 Except for components which are to be carburized or for hollow forgings where the ends are to be subsequently closed, test material is not to be cut from a forging until all heat treatment has been completed.

2.3.10 When forgings are to be carburized sufficient test material is to be provided for both preliminary tests in the as forged condition and for final tests after completion of carburizing.

For this purpose duplicate sets of test material are to be taken from positions as detailed in 2.3.6, except that irrespective of the dimensions or mass of the forging, tests are required from one position only and in the case of forgings with integral journals, are to be cut in a longitudinal direction.

This test material is to be machined to a diameter of D/4 or 60 [mm], whichever is less, where D is the finished diameter of the toothed portion.

For preliminary tests, one set of test material should be given a blank carburizing and it should undergo same heat treated cycle which the forged material will be subjected to.

For final acceptance tests, the second set of test material is to be blank carburized and heat treated along with the forgings which they represent.

At the discretion of the forge master or gear manufacturer test samples of larger cross section may be either carburized or blank carburized, but these are to be machined to the required diameter prior to the final quenching and tempering heat treatment.

Alternative procedures for testing of forgings which are to be carburized may be specially agreed with IRS.

2.3.11 Normalized forgings with mass upto 1000 [kg] each and quenched and tempered forgings with mass upto 500 [kg] each may be batch tested. A batch is to consist of forgings of similar shape and dimensions, made from the same heat of steel, heat treated in the

same furnace charge and with a total mass not exceeding 6 tonnes for normalized forgings and 3 tonnes for quenched and tempered forgings respectively.

2.3.12 A batch testing procedure may also be used for hot rolled bars. A batch is to consist of either:

i) material from the same rolled ingot or bloom provided that where this is cut into individual lengths, these are all heat treated in the same furnace charge, or

ii) bars of the same diameter and heat, heat treated in the same furnace charge and with a total mass not exceeding 2.5 tonnes.

2.3.13 The preparation of test specimens and the procedures used for mechanical testing are to comply with the relevant requirements of Pt.2, Ch.2. Unless otherwise agreed all tests are to be carried out in the presence of the Surveyor.

2.4 Mechanical properties

2.4.1 Table 2.4.1 and Table 2.4.2 gives the minimum requirements for yield stress, elongation, reduction of area and impact test energy values corresponding to different strength levels but it is not tended that these should necessarily be regarded as specific grades. Where it is proposed to use a steel with a specified minimum tensile strength intermediate to those given, corresponding minimum values for the other properties may be obtained by interpolation.

2.4.2 Forgings may be supplied to any specified minimum tensile strength selected within the general limits detailed in Table 2.4.1 and Table 2.4.2 but subject to any additional requirements of the relevant construction rules.

2.4.3 The mechanical properties are to comply with the requirements of Table 2.4.1 and Table 2.4.2 appropriate to the specified minimum tensile strength or, where applicable the requirements of the approved specification.

2.4.4 At the discretion of IRS hardness tests may be required in the following cases:

i) Gear forgings after completion of heat treatment and prior to machining the gear teeth:

The hardness is to be determined at four positions equally spaced around the circumference of the surface where teeth will subsequently be cut. Where the finished diameter of the toothed portion exceeds 2.5 [m], the above number of test positions is to be increased to eight. Where the width of a gear wheel rim forging exceeds 1.25 [m], the hardness is to be determined at eight positions at each end of the forging.

ii) Small crankshaft and gear forgings which have been batch tested:

In such cases at least one hardness test is to be carried out on each forging.

The results of hardness tests are to be reported and, for information purposes, typical Brinell hardness values are given in Table 2.4.2.

2.4.5 Hardness tests may also be required on forgings which have been induction hardened, nitrided or carburized. For gear forgings these tests are to be carried out on the teeth after, where applicable, they have been ground to the finished profile. The results of such tests including depth of hardening are to comply with the approved specifications. (See 1.5.6).

2.4.6 Where the result of a tensile test does not comply with the requirements, two additional tests may be taken. If satisfactory results are obtained from both of these additional tests the forging or batch of forgings is acceptable. If one or both retests fail the forging or batch of forgings is to be rejected.

2.4.7 Where the results from a set of three impact test specimens do not comply with the requirements an additional set of three impact test specimens may be taken provided that not more than two individual values are less than the required average value and of these not more than one is less than 70% of this average value. The results obtained are to be combined with the original results to form a new average which, for acceptance of the forgings or batch forgings, is to be not less than the required average value.

Additionally, for these combined results not more than two individual values are to be less than the required average value and of these not more than one is to be less than 70% of this average value.

2.4.8 The additional tests detailed in 2.4.6 and 2.4.7 are to be taken, preferably from material adjacent to the original tests, but alternatively from another test position or sample representative of the forging or hatch of forgings.

2.4.9 At the option of the manufacturer, when a forging or a batch of forgings has failed to meet the test requirements, it may be re- heat treated and re-submitted for acceptance tests.

Table 2.4.1 : Mechanical properties for hull steel forgings

Steel type	Tensile strength [1] R_m min. [N/mm^2]	Yield stress R_e min. [N/mm^2]	Elongation as min. %		Reduction of area Z min. %		Charpy V-notch impact test [2]

	1100	770	11	7	35	24	320-385			

Table 2.4.2 (Contd.)

[1)] The following ranges for tensile strength may be additionally specified:

specified minimum tensile strength :	< 900 [N/mm^2]	≥ 900 [N/mm^2]
tensile strength range :	150 [N/mm^2]	200 [N/mm^2]

[2)] For materials used for machinery exposed to sea water temperature, such as propeller shafts and shaft bolts, intended for ships with ice class notation HAT(B), HT(B), HM(B) and Ha(B), Charpy V-notch impact testing is to be carried out for all steel types at –10°C and the average energy value is to be minimum 20J (longitudinal test). One individual value may be less than the required average value provided that it is not less than 70% of this average value.

[3)] The hardness values are typical and are given for information purposes only.

[4)] Special consideration may be given to alternative requirements for Charpy V-notch test, depending on design and application, and subject to agreement by IRS.

[5)] Ambient Temperature (i.e. 23°C±5°C), which is specified in ISO 148-1:2016.

Section 3

Ferritic Steel Forgings for Low Temperature Service

3.1 Scope

3.1.1 The requirements for carbon-manganese and nickel steels suitable for low temperature service are detailed in this section. They are applicable to all forgings with material thickness up to and including 50 [mm] used for the construction of cargo tanks, storage tanks and process pressure vessels for liquefied gases and where the design temperature is less than 0°C, to forgings for the piping systems.

3.1.2 The requirements are also applicable to forgings for other pressure vessels and pressure piping systems where the use of steels with guaranteed impact properties at low temperatures is required.

3.2 Chemical composition

3.2.1 The chemical composition of ladle samples is, in general, to comply with the requirements given in Table 3.2.1 of Ch.3.

3.3 Heat treatment

3.3.1 Forgings are to be normalized, normalized and tempered or quenched and tempered in accordance with the approved specification.

3.4 Mechanical tests

3.4.1 At least one tensile and three V-notch impact test specimens are to be taken from each forging or each batch of forgings. Where the dimensions and shape allow, the test specimens are to be cut in a longitudinal direction.

3.4.2 The impact tests are to be carried out at a temperature appropriate to the type of steel and for the proposed application. Where forgings are intended for ships for liquefied gases the test temperature is to be in accordance with the requirements given in Table 5.4.1 of Ch.3, Sec.5.

3.4.3 The results of all tensile tests are to comply with the approved specification.

3.4.4 The average energy values for impact tests are also to comply with the approved specification and generally with the requirements of Ch.3, Sec.5. See also Ch.2.

3.4.5 For material thickness above 50 [mm], the material properties are to be agreed.

3.5 Pressure tests

3.5.1 When applicable, pressure tests are to be carried out in accordance with the requirements of the relevant construction Rules.

Section 4

Austenitic Stainless Steel Forgings

4.1 General

4.1.1 Forgings in austenitic stainless steels are acceptable for use in the construction of cargo tanks, storage tanks and piping systems for chemicals and liquefied gases. They may also be accepted for elevated temperature service in boilers.

4.1.2 Where it is proposed to use forgings in these types of steels, details of the chemical composition, heat treatment and mechanical properties are to be submitted for approval. These are to comply in general, with the requirements of Chapter 3, Section 9 for austenitic steel plates.

4.1.3 Unless otherwise specified, impact tests are not required for acceptance purposes. Where they are required tests are to be made on longitudinal specimens at minus 196°C and the minimum average energy requirements is to be 41J.

4.2 Mechanical properties for design purposes

4.2.1 Where austenitic stainless steel forgings are intended for service at elevated temperatures, the nominal values for the minimum one per cent proof stress at temperatures of 100°C and higher given in Table 4.2.1 may be used for design purposes. Verification of these values is not required except for material complying with a National or proprietary specification in which the elevated temperature properties proposed for design purposes are higher than those given in Table 4.2.1.

4.3 Non-destructive testing

4.3.1 Non-destructive testing is to be carried out in accordance with the requirements of Classification Notes “Guidelines for non-destructive testing of hull and machinery steel forgings” or as otherwise agreed between the manufacturer, purchaser and IRS.

4.4 Intergranular corrosion tests

4.4.1 Where corrosive conditions are anticipated in service, intergranular corrosion tests are required on forgings in Grades 304, 316 and 317. Such tests may not be required for Grades 304L, 316L, 321 and 347.

4.4.2 When an intergranular corrosion test is specified, it is to be carried out in accordance with the standard referred in Section 9.6.2 of Chapter 3.

Table 4.2.1 : Mechanical properties for design purposes : austenitic stainless steels

Grade	Nominal 1% proof stress [N/mm^2] at a temperature												
	100°C	150°C	200°C	250°C	300°C	350°C	400°C	450°C	500°C	550°C	600°C	650°C	700°C

Section 1

General Requirements

1.1 Scope

1.1.1 The requirements of this Chapter are applicable to boiler tubes, superheater tubes and pipes intended for use in the construction of boilers, pressure vessels and ship and machinery pressure piping systems.

1.1.2 In addition to specifying mechanical properties for the purpose of acceptance testing, these requirements give details of appropriate mechanical properties at elevated temperatures to be used for design purposes.

1.1.3 Except for pipes for Class III pressure systems (as defined in Pt.4, Ch.2) all pipes and tubes are to be manufactured and tested in accordance with the requirements of Ch.1 and 2 of this Part, the general requirements of this Section and the appropriate requirements given in Sec.1 to 5.

1.1.4 Steels, intended for the cargo and process piping systems of ships for liquefied gases where the design temperature is less than 0°C, are to comply with specific requirements of Sec.5.

1.1.5 Pipes and tubes, which comply with national or proprietary specifications may be accepted provided that these specifications give reasonable equivalence to the requirements of this Section or are otherwise specially approved for a specific application and provided that survey is carried out in accordance with Ch.1 of this Part.

1.1.6 At the discretion of the Surveyor, a modified testing procedure may be adopted for small quantities of materials. In such cases, these may be accepted on the manufacturer's declared chemical composition and hardness tests or other evidence of satisfactory properties.

1.1.7 Pipes for Class III pressure systems are to be manufactured and tested in accordance with the requirements of an acceptable national specification. The manufacturer's test certificate will be acceptable and is to be provided for each consignment of material. Forge butt welded pipes are not acceptable for certain applications as detailed in Pt.4, Ch.2 and Pt.5, Ch.23.

1.2 Manufacture

1.2.1 Pipes for Class I and II pressure systems, boilers and superheater tubes are to be manufactured at works approved by IRS. Also refer Chapter 1, Section 1, Cl. 1.3.2. The steel used is to be manufactured in accordance with Ch.3, Sec.1.

1.2.2 Unless a particular method is requested by the purchaser, pipes and tubes may be manufactured by any of the following methods:-

a) hot finished seamless;

b) cold finished seamless;

c) electric resistance or induction welded;

d) cold finished electric resistance or induction welded;

e) electric fusion welded.

1.2.3 Care is to be taken during manufacture that the pipe or tube surfaces coming in contact with any non-ferrous metals or their compounds are not contaminated to such an extent as could prove harmful during subsequent fabrication and operation.

1.3 Quality

1.3.1 All pipes and tubes are to have a workmanlike finish and are to be clean and free from such surface and internal defects as can be established by the specified tests.

1.3.2 All pipes and tubes are to be reasonably straight. The ends are to be cut nominally square with the axis of the pipes or tubes, and are to be free from excessive burrs.

1.3.3 The tolerances on the wall thickness and diameter of pipes and tubes are to be in accordance with an acceptable national / international standards.

1.4 Chemical composition

1.4.1 The requirements for the chemical composition of the ladle sample and the acceptable method of de-oxidation is to comply with the requirements detailed in the relevant Section of this Chapter.

1.5 Heat treatment

1.5.1 All pipes and tubes are to be supplied in the condition detailed in the relevant specific requirements.

1.6 Test material

1.6.1 Pipes and tubes are to be presented for test in batches. The size of a batch and the number of tests to be performed are dependent on the application.

1.6.2 Where heat treatment has been carried out, a batch is to consist of pipes or tubes of the same size, manufactured from the same type of steel and subjected to the same finishing treatment in a continuous furnace, or heat treated in the same furnace charge in a batch type furnace.

1.6.3 Where no heat treatment has been carried out, a batch is to consist of pipes or tubes of the same size manufactured by the same method from material of the same type of steel.

1.6.4 For pipes for class I pressure systems and boiler and superheater tubes, at least 2 per cent of the number of lengths in each batch is to be selected at random for the preparation of tests at ambient temperature.

1.6.5 For pipes for class II pressure systems, each batch is to contain not more than the number of lengths given in the following Table. Tests are to be carried out on at least one pipe selected at random from each batch or part thereof.

Outside diameter [mm]	Number of pipes in a batch
$\leq$ 323.9	200 pipes as made
> 323.9	100 pipes as made

1.7 Test specimens and testing procedures

1.7.1 The procedures for mechanical tests and the dimensions of the test specimens are to be in accordance with Ch.2.

1.8 Visual and non-destructive testing

1.8.1 All pipes for Class I and II pressure systems, boiler and superheater tubes are to be presented for visual examination and verification of dimensions. The manufacturer is to provide adequate lighting conditions to enable an internal and external examination of the pipes and tubes to be carried out.

1.8.2 For welded pipes and tubes the manufacturer is to employ suitable non-destructive methods for the quality control of the welds. It is preferred that this examination is carried out on a continuous basis.

1.9 Hydraulic tests

1.9.1 Each pipe and tube is to be subjected to a hydraulic test at the manufacturer's works.

1.9.2 The hydraulic test pressure is to be determined by the following formula, except that the maximum test pressure need not exceed 14 [N/mm^2].

$$P = \frac{2st}{D}$$

where,

P = test pressure [N/mm^2];

D = nominal outside diameter [mm];

t = nominal wall thickness [mm];

s = 80 per cent of the specified minimum yield stress [N/mm^2], for ferritic steels and 70 per cent of the specified minimum 1.0 per cent proof stress [N/mm^2] for austenitic steels. These relate to the values specified for acceptance testing at ambient temperature.

1.9.3 The test pressure is to be maintained for sufficient time to permit proof and inspection. Unless otherwise agreed, the manufacturer's certificate of satisfactory hydraulic test will be accepted. Where it is proposed to adopt a test pressure other than determined as in 1.9.2, the proposal will be subject to special consideration.

1.10 Rectification of defects

1.10.1 Surface imperfections may be removed by grinding provided that the thickness of the pipe or tube after dressing is not less than the required minimum thickness. The dressed area is to be blended into the contour of the tube.

1.10.2 By agreement with the Surveyor, the repair of minor defects by welding can be accepted. Welding procedures, including preheating, post weld heat treatment and inspection, are to be to the complete satisfaction of the Surveyor. In all cases, the area is to be tested by magnetic particle examination, or in case of austenitic steels, by liquid penetrant examination on completion of welding, heat treatment and surface grinding.

1.11 Identification

1.11.1 Pipes and tubes are to be clearly marked by the manufacturer in accordance with the requirements of Ch.1. The following details are to be shown on all materials which have been accepted:-

a) IR;

b) Manufacturer's name or trade mark;

c) Identification mark for the specification or grade of steel;

d) Identification number and/or initials which will enable the full history of the item to be traced;

e) The personal stamp of the Surveyor responsible for the final inspection.

1.11.2 It is recommended that hard stamping be restricted to the end face, but it may be accepted in other positions in accordance with national standards and practices.

1.12 Certification

1.12.1 The manufacturer is to provide the Surveyor with copies of test certificate or shipping statement for all material which has been accepted.

1.12.2 Each test certificate is to contain the following particulars:-

a) Purchaser's name and order number;

b) The yard number for which the material is intended, if known;

c) Address to which material is despatched;

d) Specification or the grade of material;

e) Description and dimensions;

f) Identification number and/or initials;

g) Cast number and chemical composition of ladle samples;

h) Mechanical test results, and results of the intercrystalline corrosion tests where applicable;

i) Condition of supply.

1.12.3 The chemical composition stated on the certificate is to include the content of all the elements detailed in the specific requirements. Where rimmed steel is supplied, this is to be stated on the certificate.

1.12.4 When steel is not produced at the pipe or tube mill, a certificate is to be supplied by the steelmaker stating the process of manufacture, the cast number and the ladle analysis.

1.12.5 The works at which the steel was produced must be approved by IRS. Also refer Chapter 1, Section 1, Cl. 1.3.2.

Section 2

Seamless Pressure Pipes

2.1 General

2.1.1 Following requirements are applicable for seamless pressure pipes in carbon, carbon-manganese and low alloy steels.

2.1.2 Where pipes are used for the manufacture of pressure vessel shells and headers, the requirements of forgings in Ch.5 are applicable where the wall thickness exceeds 40 [mm].

2.2 Manufacture and chemical composition

2.2.1 Tubes are to be manufactured by a seamless process and may be hot or cold finished.

2.2.2 The method of de-oxidation and the chemical composition of ladle samples are to comply with the appropriate requirements given in Table 2.2.1.

2.3 Heat treatment

2.3.1 Pipes are to be supplied in the condition given in Table 2.3.1.

Table 2.3.1 : Heat treatment

Type of steel	Condition of supply
Carbon and carbon-manganese	
Hot finished	Not finished[1]
	Normalized[2]
Cold finished	Normalized[2]
Alloy steels	
1 Cr $\frac{1}{2}$ Mo	Normalized and tempered
2 $\frac{1}{4}$ Cr 1 Mo	
Grade 410	Fully annealed
Grade 490	Normalized and tempered 650-750°C
$\frac{1}{2}$ Cr $\frac{1}{2}$ Mo $\frac{1}{4}$ V	Normalized and tempered

Notes:

1. Provided that the finishing temperature is sufficiently high to soften the material.
2. Normalized and tempered at the option of the manufacturer.

Table 2.2.1 : Chemical composition of seamless pressure pipes

Type of steel	Grade	Method of deoxi-dation	Chemical composition of ladle samples %											
			C	Si	Mn	S max	P max	Residual elements						
Carbon and carbon-manganese	320	Semi-killed or killed	≤ 0.16	-	0.40 - 0.70	0.050	0.050	Ni 0.30 max., Cr 0.25 max., Mo 0.10 max., Cu 0.30 max. Total 0.70 max.						
	360		≤ 0.17	≤ 0.35	0.40 - 0.80	0.045	0.045							
	410	Killed	≤ 0.21	≤ 0.35	0.40 - 1.20	0.045	0.045							
	460	Killed	≤ 0.22	≤ 0.35	0.80 - 1.40	0.045	0.045							
	490	Killed	≤ 0.23	≤ 0.35	0.80 - 1.50	0.045	0.045							
								Ni	Cr	Mo	Cu	Sn	V	Al
1 Cr $\frac{1}{2}$ Mo	440	Killed	0.10-0.18	0.10-0.35	0.40-0.70	0.040	0.040	0.30 max.	0.70-1.10	0.45-0.65	0.25 max.	0.03 max.	-	≤ 0.020
2 $\frac{1}{4}$ Cr 1 Mo	410 490	Killed	0.08-0.15	0.10-0.50	0.40-0.70	0.040	0.040	0.30 max.	2.0-2.5	0.90-1.20	0.25 max.	0.03 max.	-	≤ 0.020
$\frac{1}{2}$ Cr $\frac{1}{2}$ Mo $\frac{1}{4}$ V	460	Killed	0.10-0.18	0.10-0.35	0.40-0.70	0.040	0.040	0.30 max.	0.30-0.60	0.50-0.70	0.25 max.	0.03 max.	0.22 - 0.32	≤ 0.020

2.4 Mechanical tests

2.4.1 All pipes are to be presented in batches as defined in Sec.1.

2.4.2 Each pressure pipe selected for test is to be subjected to tensile and flattening or bend tests.

2.4.3 The results of all mechanical tests are to comply with the appropriate requirements given in Table 2.4.1.

2.5 Mechanical properties for design

2.5.1 Values for nominal minimum lower yield or 0.2 per cent proof stress at 50°C and higher are given in Table 2.5.1 and are intended for design purposes only. Verification of these values is not required, except for materials complying with national or proprietary specifications where the elevated temperature properties used for design are higher than those given in Table 2.5.1.

2.5.2 In such cases, at least one tensile test at the proposed design or other agreed temperature is to be made on each cast. The test specimen is to be taken from material adjacent to that used for tests at ambient temperature and tested in accordance with the procedures given in Ch.2. If tubes or pipes of more than one thickness are supplied from one cast, the test is to be made on the thickest tube or pipe.

2.5.3 As an alternative to 2.5.2, a manufacturer may carry out an agreed comprehensive test program for a stated grade of steel to demonstrate that the specified minimum mechanical properties at elevated temperatures can be consistently obtained. This test program is to be carried out under the supervision of the Surveyors, and the results submitted for assessment and approval. When a manufac-turer is approved on this basis, tensile tests at elevated temperatures are not required for acceptance purposes, but at the discretion of the Surveyors, occasional check tests of this type may be requested.

2.5.4 Values for the estimated average stress to rupture in 100,000 hours are given in Table 2.5.2 and may be used for design purposes.

Table 2.4.1 : Mechanical properties for acceptance purposes : Seamless pressure pipes (maximum wall thickness 40 mm)

Type of steel	Grade	Yield stress [N/mm^2] min.	Tensile strength [N/mm^2]	Elongation on $5.65\sqrt{S_o}$% min.	Flattening test constant C	Bend test diameter of former (t = thickness)
Carbon and carbon-manganese	320	195	320-440	25	0.10	4t
	360	215	360-480	24	0.10	4t

580	-	-	-	44	44	46

Note : When tempering temperature exceeds 750°C, the values for Grade 410 are to be used.

Section 3

Welded Pressure Pipes

3.1 General

3.1.1 Following requirements are applicable to welded pressure pipes in carbon, carbon-manganese and low alloy steels.

3.1.2 Where it is proposed to use submerged arc longitudinally welded pipes, details of the specification are to be submitted.

3.2 Manufacture and chemical composition

3.2.1 Pipes are to be manufactured by the electric or induction welding process and, if required, may be subsequently hot reduced or cold finished.

3.2.2 The method of de-oxidation and the chemical composition of ladle samples are to comply with the appropriate requirements given in Table 3.2.1.

3.2.3 Where rimmed steel is used, the strips are to be rolled in single widths and not slit longitudinally, except to trim the edges.

Table 3.2.1 : Chemical composition of welded pressure pipes

Type of steel	Grade	Method of deoxi-dation	Chemical composition of ladle samples %										
			C	Si	Mn	S max.	P max.	Residual elements					
Carbon and carbon-manga-nese	320	Any method (see Note)	≤ 0.16	-	0.30-0.70	0.050	0.050	Ni 0.30 max., Cr 0.25 max., Mo 0.10 max., Cu 0.30 max. Total 0.70 max.					
	360		≤ 0.17	≤ 0.35	0.40-1.00	0.045	0.045						
	410	Killed	≤ 0.21	≤ 0.35	0.40-1.20	0.045	0.045						
	460	Killed	≤ 0.22	≤ 0.35	0.80-1.40	0.045	0.045						
								Ni	Cr	Mo	Cu	Sn	Al
1 Cr $\frac{1}{2}$ Mo	440	Killed	0.10-0.18	0.10-0.35	0.40-0.70	0.040	0.040	0.30 max.	0.70-1.10	0.45-0.65	0.25 max.	0.03 max.	≤ 0.020
Note : For rimmed steels the carbon content may be increased to 0.19% max.													

3.3 Heat treatment

3.3.1 Pipes are to be supplied in the heat treated condition given in Table 3.3.1.

Table 3.3.1 : Heat treatment : Welded pressure pipes

Type of steel	Condition of supply
Carbon and carbon-manganese	Normalized (Normalized and tempered at the option of the manufacturer)
1 Cr $\frac{1}{2}$ Mo	Normalized and tempered

3.4 Mechanical tests

3.4.1 All pipes are to be presented in batches as defined in Sec.1.

3.4.2 Each pressure pipe selected for test is to be subjected to tensile and flattening or bend tests.

3.4.3 The results of all mechanical tests are to comply with the appropriate requirements given in Table 3.4.1.

3.5 Mechanical properties for design

3.5.1 The mechanical properties at elevated temperature for carbon and carbon-manganese steels in Grades 320 [N/mm^2] to 460 [N/mm^2] and 1 Cr $\frac{1}{2}$ Mo steel can be taken from the appropriate Tables in Sec.2.

3.5.2 Where rimmed steel is used, the design temperature is limited to 400°C.

Table 3.4.1 : Mechanical properties for acceptance purposes : Welded pressure pipes

Type of steel	Grade	Yield stress [N/mm^2]	Tensile strength [N/mm^2]	Elongation on 5.65$\sqrt{S_o}$% minimum	Flattening test constant C
Carbon and carbon-manganese	320	195	320 - 440	25	0.10
	360	215	360 - 480	24	0.10
	410	235	410 - 530	22	0.08
	460	265	460 - 580	21	0.07
1 Cr $\frac{1}{2}$ Mo	440	275	440 - 590	22	0.07

Section 4

Boiler and Superheater Tubes

4.1 General

4.1.1 The following requirements are applicable for boiler and superheater tubes in carbon, carbon-manganese and low alloy steels.

4.1.2 Austenitic stainless steels may also be used for this type of service. Where such applications are proposed, details of the chemical composition, heat treatment and mechanical properties are to be submitted for consideration and approval.

4.2 Manufacture and chemical composition

4.2.1 Tubes are to be seamless or welded and are to be manufactured in accordance with the requirements of Sec.2 and 3 respectively.

4.2.2 The method of de-oxidation and the chemical composition of ladle samples are to comply with the requirements given in Table 2.2.1 or Table 3.2.1, as appropriate.

4.3 Heat treatment

4.3.1 All tubes are to be supplied in accordance with the requirements given in Table 2.3.1 or Table 3.3.1 as appropriate, except that 1 Cr $\frac{1}{2}$ Mo steel may be supplied in the normalized only condition when the carbon content does not exceed 0.15 per cent.

4.4 Mechanical tests

4.4.1 Tubes are to be presented for test in batches as defined in Sec.1.

4.4.2 Each boiler and superheater tube selected for test is to be subjected to at least the following:

a) Tensile test;

b) Flattening or bending tests at the manufacturer's option;

c) Expanding or flanging tests at the manufacturer's option.

4.4.3 The results of all mechanical tests are to comply with the appropriate requirements given in Table 4.4.1.

4.5 Mechanical properties for design

4.5.1 The mechanical properties at elevated temperature for carbon and carbon-manganese steels in Grades 320 [N/mm^2] to 460 [N/mm^2], 1 Cr $\frac{1}{2}$ Mo and 2 $\frac{1}{4}$ Cr 1 Mo steels can be taken from the appropriate Tables in Sec.2.

4.5.2 Where rimmed steel is used, the design temperature is limited to 400°C.

Table 4.4.1 : Mechanical properties for acceptance purposes : Boilers and superheater tubes

Type of steel	Grade	Yield stress [N/mm^2]	Tensile strength [N/mm^2]	Elongation on $5.65\sqrt{S_o}$ % minimum	Flattening test constant C	Bend test diameter of former (t=thickness)	Drift expanding and flanging test minimum % increase in outside diameter		
							Ratio : Inside diameter / Outside diameter		
							≤ 0.6	> 0.6 ≤ 0.8	> 0.8
Carbon and carbon-manganese	320	195	320-440	25	0.10	4t	12	15	19
	360	215	360-480	24	0.10	4t	12	15	19
	410	235	410-530	22	0.08	4t	10	12	17
	460	265	460-580	21	0.07	4t	8	10	15
1 Cr $\frac{1}{2}$ Mo	440	275	440-590	22	0.07	4t	8	10	15
2 $\frac{1}{4}$ Cr 1 Mo	410 [1]	135	410-560	20	0.07	4t	8	10	15
	490 [2]	275	490-640	16	0.07	4t	8	10	15

Notes:

1. Annealed condition
2. Normalized and tempered condition

Section 5

Tubes and Pipes for Low Temperature Services

5.1 Scope

5.1.1 This Section gives the requirements for seamless and welded carbon, carbon-manganese and nickel alloy steel pipes not exceeding 25 [mm] in thickness intended for use in liquefied gas piping systems where the design temperature is lower than 0°C and also for other pressure piping systems where guaranteed impact properties at low temperature is required.

5.2 Manufacture

5.2.1 The pipes are to be manufactured seamless or by a welding process, and may be hot or cold finished.

5.3 Chemical composition

5.3.1 The chemical composition of ladle samples is in general to comply with the requirements given in Table 5.3.1. Steels for the production of tubes and pipes are to be killed.

Table 5.3.1 : Chemical composition

Type of steel	Grade	Method of deoxi-dation	Chemical composition of ladle sample %							
			C max.	Si	Mn	P max.	S max.	Ni	Al met	Residual Elements
Carbon	360	Fully killed	0.17	0.10-0.35	0.40-1.00	0.045	0.045	-	≥ 0.015 see note	Cr 0.25 Cu 0.30 Mo 0.10 Ni 0.30 Total 0.70
Carbon-manganese	410 & 460		0.2	0.10-0.35	0.60-1.40	0.045	0.045	-	≥ 0.015 see note	
3.5 Ni	440		0.15	0.15-0.35	0.30-0.90	0.040	0.040	3.25-3.75	-	Cr 0.25 Cu 0.30 Mo 0.10 Total 0.60
9 Ni	690		0.3	0.15-0.30	0.30-0.90	0.040	0.040	8.50-9.50	-	

Note : Where a minimum Al_{met} of 0.015% is specified, the determination of the total aluminium is acceptable provided that the result is not less than 0.018%.

5.4 Heat treatment

5.4.1 Pipes are to be supplied in the condition given in Table 5.4.1.

Table 5.4.1 : Heat treatment

Type of Steel	Condition of Supply
Carbon and Carbon-manganese	Hot finished Normalized Normalized and tempered
3.5 Ni	Normalized Normalized and tempered
9 Ni	Double normalized and tempered Quenched and tempered

5.5 Mechanical tests

5.5.1 All pipes are to be presented for test in batches as defined in Sec.1 pressure piping systems.

5.5.2 At least two percent of the number of lengths in each batch is to be selected at random for the preparation of the tests.

5.5.3 Each pipe or tube selected for test is to be subjected to following tests:

- Seamless pipes and tubes:
  - one tensile test
  - one set of impact tests
  - one flattening test or bend test or ring tensile test
  - one drift or one ring expanding test where appropriate.
- Welded tubes and pipes:
  - one tensile test on the base material
  - one tensile test on the weld for pipes with D ≥ 508 [mm]
  - one set of impact tests
  - two flattening tests or bend tests or one ring tensile test (ERW and IW)
  - one drift or one ring expanding test (ERW and IW) -two bend tests (SAW).

5.5.4 Ring tensile test may be carried out in conformity with ISO 8495 or other equivalent standard.

5.5.5 The impact tests are to consist of a set of three Charpy V-notch test specimens cut in the longitudinal direction with the notch perpendicular to the original surface of the pipe. The dimension of the test specimens are to be in accordance with the requirements of Ch.2. Impact testing is not required for wall thickness below 6 [mm].

5.5.6 The impact values are to be determined at the lowest test temperature specified for the steel grade and the wall thickness in question.

5.5.7 The results of all mechanical tests are to comply with the appropriate values given in Table 5.5.1.

5.5.8 The energy value from a set of three Charpy V-notch impact test specimens is not to be lower than the required average value given in Table 5.5.1. One individual value may be less than the required average value provided that it is not less than 70 per cent of this average value.

Table 5.5.1 : Mechanical properties for acceptance purposes

Type of steel	Grade	Yield stress [N/mm^2]	Tensile strength [N/mm^2]	Elongation on 5.65 $\sqrt{S_o}$% min.	Flattening test constant C	Bend test diameter of former (t=thickness)	Charpy V-notch impact tests	
							Test temperature °C	Average energy J minimum

Section 6

Austenitic Stainless Steel Pressure Pipes

6.1 Scope

6.1.1 This section gives the requirements for austenitic stainless steel pipes suitable for use in the construction of the piping systems for chemicals and for liquefied gases where the design temperature is not less than –165°C.

6.1.2 Austenitic stainless steels are also suitable for service at elevated temperatures. Where such applications are proposed, details of the chemical composition, heat treatment and mechanical properties are to be submitted for consideration and approval. See also Pt.4, Ch.2, 1.9.5.

6.1.3 Where it is intended to supply seamless pipes in the direct quenched condition, a programme of tests for approval is to be carried out under the supervision of the Surveyors, and the results are to be to the satisfaction of IRS.

6.2 Manufacture and chemical composition

6.2.1 Pipes are to be manufactured by a seamless or a continuous automatic electric fusion welding process.

6.2.2 Welding is to be in a longitudinal direction, with or without the addition of filler metal.

6.2.3 The chemical composition of the ladle samples is to comply with the appropriate requirements of Table 6.2.1.

Table 6.2.1 : Chemical composition										
Type of steel	**Grade**	**Chemical composition of ladle sample %**								
		C max.	**Si**	**Mn**	**P max.**	**S max.**	**Cr**	**Mo**	**Ni**	**Others**
304L	490	0.03	<1.00	<2.00	0.045	0.030	17.0-19.0	-	9.0-13.0	-
316L	490	0.03	<1.00	<2.00	0.045	0.030	16.0-18.5	2.0-3.0	11.0-14.5	-
321	510	0.08	<1.00	<2.00	0.045	0.030	17.0-19.0	-	9.0-13.0	Ti $\geq$ 5 xC $\leq$ 0.80
347	510	0.08	<1.00	<2.00	0.045	0.030	17.0-19.0	-	9.0-13.0	Nb$\geq$10 x C$\leq$1.00

6.3 Heat treatment

6.3.1 Pipes are generally to be supplied by the manufacturer in the solution treated condition over their full length.

6.3.2 Alternatively, seamless pipes may be direct quenched immediately after hot forming, while the temperature of the pipes is not less than the specified minimum solution treatment temperature.

6.4 Mechanical tests

6.4.1 All pipes are to be presented in batches as defined in Section 1 for Class I and II piping systems.

6.4.2 Each pipe selected for test is to be subjected to tensile and flattening or bend tests.

6.4.3 The results of all mechanical tests are to comply with the appropriate requirements given in Table 6.4.1.

Where the design temperature is less than –105°C, impact tests are to be carried out on a set of three Charpy V-notch specimens. The tests are to be made on longitudinal specimens at –196°C and the average energy is to be not less than 41 Joules.

Table 6.4.1 : Mechanical properties for acceptance purposes							
Type of steel	**Grade**	**0.2% proof stress [N/mm^2] (see Note)**	**1.0% proof stress [N/mm^2]**	**Tensile strength [N/mm^2]**	**Elongation on 5.65 $\sqrt{S_o}$ % minimum**	**Flattening test constant**	**Bend test diameter of former (t=thickness)**
304L	490	175	205	490-690	30	0.09	3t
316L	490	185	215	490-690	30	0.09	3t
321	510	195	235	510-710	30	0.09	3t
347	510	205	245	510-710	30	0.09	3t
Note : The 0.2% proof stress values given for information purposes and unless otherwise agreed are not required to be verified by test.							

6.5 Intergranular corrosion tests

6.5.1 For materials used for piping systems for chemicals, intercrystalline corrosion tests are to be carried out on one per cent of the number of pipes in each batch, with a minimum of one pipe.

6.5.2 For pipes with an outside diameter not exceeding 40 [mm], the test specimens are to consist of a full cross section. For larger pipes, the test specimens are to be cut as circumferential strips of full wall thickness and having a width of not less than 12.5 [mm]. In both cases, the total surface areas is to be between 15 and 35 [cm^2].

6.5.3 When required, one test of this type is to be carried out for each tensile test. The testing is to be carried out in accordance with ASTM A262, practice E, copper-copper sulphate-sulphuric acid or another recognized standard. The bent specimen is to be free from cracks indicating the presence of intergranular attack. The material for the test is to be taken adjacent to that for the tensile test.

6.5.4 After immersion, the full cross-section test specimens are to be subjected to a flattening test in accordance with the requirements of Chapter 2. The strip test specimens are to be subjected to a bend test through 90° over a mandrel of diameter equal to twice the thickness of the test specimen.

6.6 Fabricated pipework

6.6.1 Fabricated pipework is to be produced from material manufactured in accordance with 6.2, 6.3, 6.4 and 6.5.

6.6.2 Welding is to be carried out in accordance with an approved and qualified procedure by suitably qualified welders.

6.6.3 Fabricated pipework may be supplied in the as-welded condition without subsequent solution treatment provided that welding procedure tests have demonstrated satisfactory material properties including resistance to intercrystalline corrosion.

6.6.4 In addition, butt welds are to be subjected to 5 per cent radiographic examination for Class I and 2 per cent for Class II pipes.

6.6.5 Fabricated pipework in the as-welded condition and intended for systems located on deck is to be protected by a suitable corrosion control coating.

End of Chapter

Chapter 7

Iron Castings

Contents

Section

1 *General Requirements*

Section 1

General Requirements

1.1 Scope

1.1.1 This Chapter gives the requirements for both grey and spheroidal or nodular graphite iron castings intended for ship and machinery construction.

1.1.2 All important iron castings, as defined in the relevant parts of the Rules dealing with design and construction, are to be manufactured and tested in accordance with the requirements of Ch.1 and 2 and the requirements given in the following paragraphs.

1.1.3 As an alternative to 1.1.2, castings which comply with National or Proprietary specifications may be accepted, provided that such specifications give reasonable equivalence to these requirements or otherwise are specially approved or required by IRS.

1.1.4 Where small castings are produced in large quantities, the manufacturer may adopt alternative procedure for testing and inspection, subject to the approval of IRS.

1.1.5 These requirements are applicable only to castings where the design and acceptance tests are related to mechanical properties at ambient temperature. For other applications additional requirements may be necessary, especially when the castings are intended for service at low or elevated temperatures.

1.2 Manufacture

1.2.1 All castings, as designated in1.1.2, are to be manufactured at foundries approved by IRS.

1.2.2 Suitable mechanical methods are to be employed for the removal of surplus material from the castings. Thermal cutting processes are not acceptable, except as a preliminary operation to the mechanical methods.

1.2.3 Where castings of the same type are regularly produced in quantity, the manufacturer is to make any tests necessary to prove the quality of the prototype castings and is also to make periodical examinations to verify the continued efficiency of the manufacturing technique. The Surveyor is to be given the opportunity to witness these tests.

1.3 Quality of castings

1.3.1 Castings are to be free from surface or internal defects which could be prejudicial to their proper application in service. The surface finish is to be in accordance with good practice and any specific requirements of the approved plan.

1.4 Chemical composition

1.4.1 The chemical composition of the iron used is left to the discretion of the manufacturer, who is to ensure that it is suitable to obtain the mechanical properties specified for the castings.

1.5 Heat treatment

1.5.1 Except as required by 1.5.2, castings may be supplied in either the as cast or heat treated condition.

1.5.2 For some applications, such as high temperature service or where dimensional stability is important, castings may be required to be given a suitable tempering or stress relieving heat treatment. This is to be carried out after any refining heat treatment and before machining. The special qualities with 350 [N/mm^2] and 400 [N/mm^2] nominal tensile strength and impact test are to undergo ferritizing heat treatment.

1.5.3 Where it is proposed to locally harden the surface of castings, full details of the proposed procedure and specifications are to be submitted for approval by IRS.

1.6 Mechanical tests

1.6.1 Separately cast test samples are to be used unless otherwise agreed between the manufacturer and the purchaser. The test samples are generally to be one of the standard types detailed in Fig.1.6.1, Fig.1.6.2 and Fig.1.6.3 with a thickness of 25 [mm]. Test samples of dimensions, other than as detailed in Fig.1.6.1 to Fig.1.6.3 may, however, be specially required for some components. For grey cast iron the test samples are to be in the form of cylindrical bars of 30 [mm] diameter and of suitable length. When two or more test samples are cast simultaneously in a single mould, the bars are to be at least 50 [mm] apart as indicated in Fig.1.6.4.

1.6.2 Integrally cast samples may be used when a casting is more than 20 [mm] thick and its mass exceeds 200 [kgs] subject to agreement between the manufacturer and the purchaser. The type and location of the test sample are to be selected to provide approximately the same cooling conditions as for the casting it represents.

1.6.3 At least one test sample is to be provided for each casting or batch of castings. A batch consists of castings poured from a single ladle of metal provided they are all of similar type and dimensions. A batch should not normally exceed two tonnes of fettled castings and a single casting will constitute a batch if its mass is two tonnes or more.

1.6.4 For continuous melting of same grade of cast iron in large tonnages the mass of the batch may be increased to the output of two hours of pouring. If production is carefully monitored by systematic checking of the melting process, such as chill testing, chemical analysis or thermal analysis, test samples may be taken at longer intervals.

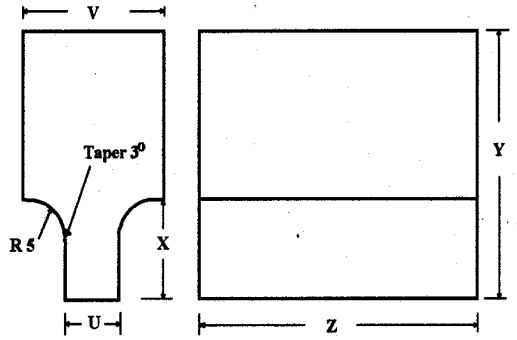
1.6.5 For large castings where more than one ladle of treated metal is used, additional test samples are to be provided so as to be representative of each ladle used.

1.6.6 All test samples are to be suitably marked to identify them with the castings which they represent.

1.6.7 Where castings are supplied in the heat treated condition, the test samples are to be heat treated together with the castings which they represent.

1.6.8 The test samples are to be cast in moulds made from the same type of material as used for the castings and are not to be stripped from the moulds until the metal temperature is below 500°C.

1.6.9 One tensile test specimen is to prepared from each test sample. The dimensions of the test specimens and the testing procedures used are to be in accordance with Ch.2.



Standardsample		Alternative samples, when required		
U	25	12	50	75
V	55	40	90	125
X	40	30	60	65
Y	100	80	150	185
Z	To suit testing machine (approx. 150 [mm])			

Fig.1.6.1 : Standard test specimen

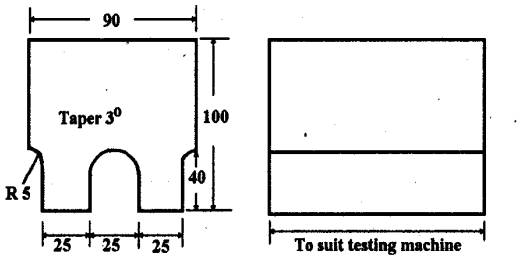


Fig.1.6.2 : Standard test specimen

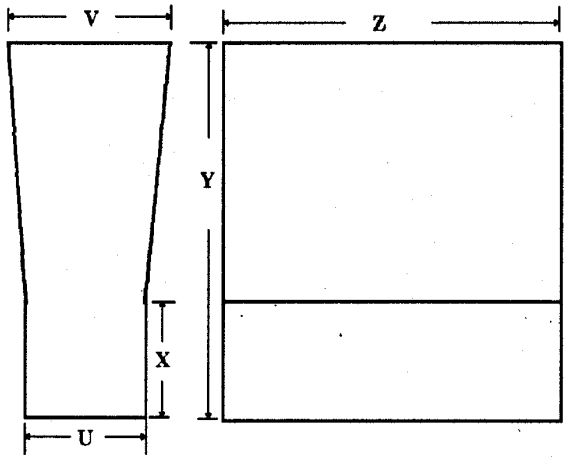

Standardsample		Alternative samples, when required		
U	25	12	50	75
V	55	40	90	125
X	40	25	50	65
Y	140	135	150	175
Z	To suit testing machine (approx. 150 [mm])			

Fig.1.6.3 : Standard test specimen

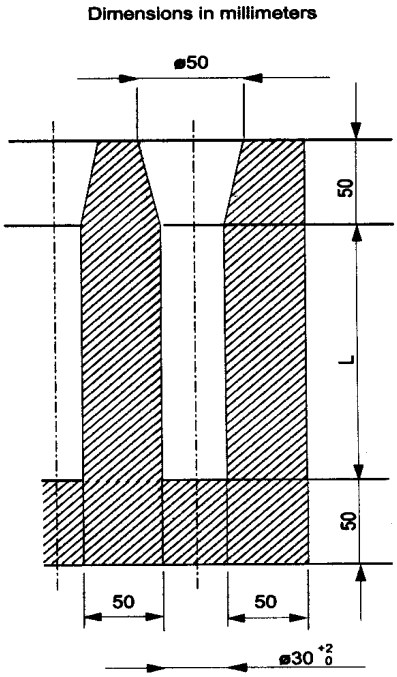

Fig.1.6.4 : Test sample for grey cast iron

1.7 Mechanical properties

1.7.1 For grey iron castings, only the tensile strength is to be determined and the results obtained are to comply with the minimum value specified for the castings being supplied. The specified minimum tensile strength is to be not less than 200 [N/mm^2] and not more than 350 [N/mm^2]. The fractured surfaces of all tensile test specimens are to be granular and grey in appearance.

1.7.2 For spheroidal or nodular graphite iron castings the tensile strength and elongation are to be determined. The results of all tests are to comply with the requirements of Table 1.7.1, but subject to any additional requirements of the relevant construction rules. Typical ranges of hardness values are also given in Table 1.7.1 and are intended for information purposes.

1.7.3 Retest requirements for tensile tests are to be in accordance with 1.10 of Chapter 1.

1.8 Visual and non-destructive examination

1.8.1 All castings are to be cleaned and adequately prepared for examination. The surfaces are not to be hammered, peened or treated in any way which may obscure defects.

Table 1.7.1 : Mechanical properties for acceptance purposes (spheroidal or nodular graphite iron)

Specified Minimum Tensile Strength [N/mm²]		0.2% proof stress (see Note) [N/mm²]	Elongation on $5.65\sqrt{S_o}$ % min.	Typical Hardness Brinell (see para 1.7.2)	Impact Energy		Typical structure of matrix (see para 1.9.2)
					Test Temp. °C	J Min.[2]	
Ordinary qualities	370	230	17	120 - 180	-	-	Ferrite
	400	250	12	140 - 200	-	-	Ferrite
	500	320	7	170 - 240	-	-	Ferrite/Pearlite
	600	370	3	190 - 270	-	-	Ferrite/Pearlite
	700	420	2	230 - 300	-	-	Pearlite
	800	480	2	250 - 350	-	-	Pearlite or Tempered Structure
Special qualities	350	220	22[3]	110 - 170	20	17(14)	Ferrite
	400	250	18[3]	140 - 200	20	14(11)	Ferrite

Notes:

1. For intermediate values of specified minimum tensile strength, the minimum values for 0.2% proof and elongation may be obtained by interpolation.
2. The average value measured on 3 Charpy V-notch specimens. One result may be below the average value but not less than the minimum shown in brackets.
3. In the case of integrally cast samples, the elongation may be 2 percentage points less.

1.8.2 Before acceptance, all castings are to be visually examined including, where applicable, the examination of internal surfaces. Unless otherwise agreed the verification of dimensions is the responsibility of the manufacturer.

1.8.3 Supplementary examination of castings by suitable non-destructive testing procedures is generally not required except in circumstances where there is reason to suspect the soundness of the casting.

1.8.4 When required by the relevant construction Rules, castings are to be pressure tested before final acceptance.

1.8.5 Cast crankshafts are to be subjected to a magnetic particle inspection. Crack like indications are not permitted.

1.9 Metallographic examination

1.9.1 For spheroidal or nodular graphite iron castings, a representative sample from each ladle of treated metal is to be prepared for metallographic examination. These samples may conveniently be taken from the tensile test specimens but alternative arrangement for the provision of the samples may be adopted provided that they are taken from the ladle towards the end of the casting period.

1.9.2 Examination of the samples is to show that at least 90 per cent of the graphite is in a dispersed spheroidal or nodular form. Details of the typical matrix structure are given in Table 1.7.1 and are intended for information purposes only.

1.10 Rectification of defective castings

1.10.1 At the discretion of the Surveyor, small surface blemishes may be removed by local grinding.

1.10.2 Subject to the prior approval of the Surveyor, castings containing local porosity may be rectified by impregnation with a suitable plastic filler, provided that the extent of the porosity is such that it does not adversely affect the strength of the castings.

1.10.3 Repairs by welding are generally not permitted, but may be considered in special circumstances. In such cases, full details of

the proposed repair procedure are to be submitted for approval prior to commencement of the proposed rectification.

1.11 Identification of castings

1.11.1 The manufacturer is to adopt a system of identification which will enable all finished castings to be traced to the original ladle of treated metal and the Surveyor is to be given full facilities for so tracing the castings when required.

1.11.2 Before acceptance, all castings which have been tested and inspected with satisfactory results are to be clearly marked by the manufacturer with the following particulars:-

a) Grade of cast iron;

b) Identification number, or other marking which will enable the full history of the casting to be traced;

c) Manufacturer's name or trade mark;

d) IR and the abbreviated name of the local office of IRS;

e) Personal stamp of the Surveyor responsible for inspection;

f) Where applicable, test pressure;

g) Date of final inspection.

1.11.3 Where small castings are manufactured in large numbers, modified arrangements for identification may be specially agreed with IRS.

1.12 Certification

1.12.1 The manufacturer is to provide the Surveyor with a written statement giving the following particulars for each casting or batch of castings which has been accepted:-

a) Purchaser's name and order no;

b) Description of castings and quality of cast iron;

c) Identification number;

d) Results of mechanical tests;

e) Where applicable, details of heat treatment;

f) Where specially required, the chemical analysis of the ladle sample;

g) Where applicable, test pressure.

Copper Alloys

Contents

Section

1 *General Requirements*

2 *Castings for Valves and Fittings*

3 *Castings for Propellers*

4 *Tubes*

Section 1

General Requirements

1.1 Scope

1.1.1 The Rules in this Chapter apply to copper alloys used in castings for valves and fittings, propeller castings and tubes.

1.1.2 When required by the relevant parts of the Rules, dealing with design and construction, tubes and castings are to be manufactured and tested in accordance with the appropriate requirements of Ch.1 and 2 and the requirements of this Chapter.

1.1.3 Alternatively, tubes and castings which comply with National or proprietary specifications may be accepted provided these specifications give reasonable equivalence to the requirements of this Chapter and provided that survey is carried out in accordance with the requirements of Ch.1.

1.1.4 Where it is proposed to use an alloy which is not specified in this Chapter, details of chemical composition, heat treatment and mechanical properties are to be submitted for approval.

Section 2

Castings for Valves and Fittings

2.1 Scope

2.1.1 Following requirements make provision for copper alloy castings for valves, liner bushes and other fittings intended for use in ship and machinery construction.

2.2 Manufacture

2.2.1 Approval of Works, as required by Ch.1, for the manufacture of castings, covered by this Section, is not required.

2.3 Quality of castings

2.3.1 All castings are to be free from surface or internal defects, which could be prejudicial to their proper application in service.

2.4 Chemical composition

2.4.1 The chemical composition is to comply with the appropriate requirements of Table 2.4.1.

2.4.2 Where a cast is wholly prepared from ingots for which an analysis is already available, and provided that no significant alloy additions are made during melting, the ingot maker's certified analysis may be accepted subject to occasional check tests as requested by the Surveyors.

Table 2.4.1 : Chemical composition

Designation	Chemical composition %								
	Cu	**Sn**	**Zn**	**Pb**	**Ni**	**Mn**	**P**	**Fe**	**Al**
90/10 Cu-Sn Phosphor-bronze	Remainder	9.0-11.0	0.5 max.	0.75 max.	0.5 max.	-	0.50 max.	-	-
85/5/10 Leaded bronze	Remainder	4.0-6.0	2.0 max.	9.0-11.0	2.0 max.	-	0.10 max.	-	-
88/10/2 Gunmetal	Remainder	8.5-11.0	1.0-3.0	1.5 max.	1.0 max.	-	-	-	-
87/7/3/3 Leaded Gunmetal	Remainder	6.0-8.0	1.5-3.0	2.5-3.5	2.0 max.	-	-	-	-
85/5/5/5 Leaded Gunmetal	Remainder	4.0-6.0	4.0-6.0	4.0-6.0	2.0 max.	-	-	-	-
70/30 Cu-Ni-Fe	Remainder	-	-	-	29.0-32.0	0.5-1.50	-	0.4-1.0	-
90/10 Cu-Ni-Fe	Remainder	-	-	-	9.0-11.0	0.5-1.0	-	1.0-1.8	-
Ni-Al-bronze	Remainder	0.10 max.	1.0 max.	0.03 max.	3.0-6.0	0.5-4.0	-	2.0-6.0	7.0-11.0

2.5 Heat treatment

2.5.1 At the option of the manufacturer castings may be supplied in the 'as cast' or heat treated condition.

2.6 Mechanical tests

2.6.1 The test material may be separately cast as a keel block sample in accordance with Fig.3.6.1 or as otherwise agreed with the Surveyor. For liners and bushes, the test material may be cut from the ends of the casting.

2.6.2 Where castings are supplied in a heat treated condition, the test samples are to be similarly heat treated prior to the preparation of the tensile specimens.

2.6.3 The results of all tests are to comply with the appropriate requirements given in Table 2.6.1.

Table 2.6.1 : Mechanical properties for acceptance purposes

Designation	0.2% proof stress [N/mm^2] minimum (see Note)	Tensile Strength [N/mm^2] minimum	Elongation on $5.65\sqrt{S_o}$% minimum
90/10 Cu-Sn Phosphor-bronze	120	250	15
85/5/10 Leaded bronze	100	200	16
88/10/2 Gunmetal	130	270	13
87/7/3/3 Leaded Gunmetal	130	250	16
85/5/5/5 Leaded Gunmetal	100	200	16
70/30 Cu-Ni-Fe	220	420	20
90/10 Cu-Ni-Fe	160	320	20
Ni-Aluminium bronze	240	590	16

Note:

The 0.2% proof stress values are given for information purposes only and, unless otherwise agreed, are not required to be verified by test.

2.7 Visual examination

2.7.1 All castings must be supplied in a clean fettled condition.

2.7.2 Before acceptance, all castings are to be presented for visual examination by the Surveyor. This is to include the examination of internal surfaces where applicable.

2.7.3 The accuracy and verification of dimensions are the responsibility of the manufacturer, unless otherwise agreed.

2.8 Pressure testing

2.8.1 Where required by the relevant construction Rules, castings are to be pressure tested before final acceptance. Unless otherwise agreed, these tests are to be carried out in the presence of the Surveyors and are to be to their satisfaction.

2.9 Rectification of defective castings

2.9.1 Minor surface defects may be removed by grinding provided that the dimensional tolerances are not exceeded.

2.9.2 Proposal to repair a defective casting by welding are to be submitted to the Surveyor for approval before this work is commenced. Such proposals are to include details of the extent and positions of all defects. The Surveyor is to satisfy himself the number and size of the defects are such that castings can be efficiently repaired.

2.9.3 A statement and/or sketch detailing the extent and position of all weld repairs is to be prepared by the manufacturer as permanent record.

2.9.4 Weld repairs to liners in copper alloys containing more than 0.5 per cent lead are not permitted.

2.10 Identification

2.10.1 Before acceptance, all castings which have been tested and inspected with satisfactory results are to be clearly marked with the following details:

a) Identification number, cast number or other markings which will enable the full history of the casting to be traced;

b) IR and the abbreviated name of the IRS local office;

c) Personal stamp of the Surveyor responsible for inspection;

d) Test pressure, where applicable;

e) Date of final inspection.

2.10.2 Where small castings are manufactured in large numbers, modified arrangements for identification may be specially agreed with the Surveyor.

2.11 Certification

2.11.1 The manufacturer is to provide the Surveyor with a written statement giving the following particulars for each casting or batch of castings which has been accepted:-

a) Purchaser's name and order no.;

b) Description of castings and alloy type;

c) Identification number

d) Type of heat treatment, where applicable;

e) Ingot or cast analysis.

2.11.2 In addition to 2.11.1 the manufacturer is to provide a signed statement and/or sketch detailing the extent and position of all weld repairs made to each casting.

Section 3

Castings for Propellers

3.1 Scope

3.1.1 These requirements are applicable to the manufacture, inspection and repair procedures of cast copper alloys propellers, blades and bosses.

3.1.2 These requirements may also be used for the repair of propellers damaged in service, subject to prior agreement with IRS

3.1.3 Where the use of alternative alloys is proposed, particulars of chemical composition, mechanical properties and heat treatment are to be submitted for approval.

3.2 Foundry approval

3.2.1 Approval

3.2.1.1 All propellers and propeller components are to be manufactured by foundries approved in accordance with Ch.1. Also refer Ch.1, Sec.1, Cl.1.3.2. The castings are to be manufactured and tested in accordance with the requirements of these rules.

3.2.2 Application for approval

3.2.2.1 It is the manufacturer's responsibility to assure that effective quality, process and production controls during manufacturing are adhered to within the manufacturing specification. The manufacturing specification is to be submitted to IRS at the time of initial approval, and is to at least include the following particulars:

a) description of the foundry facilities,

b) copper alloy material specification,

c) runner and feeder arrangements,

d) manufacturing procedures,

e) non-destructive testing

f) inspection procedures, and

g) repair procedures.

3.2.3 Scope of the approval test

3.2.3.1 The scope of the approval test is to be agreed upon with IRS. This is to include the presentation of cast test coupons of the propeller materials in question for approval testing in order to verify that the chemical composition and the mechanical properties of these materials comply with these rules.

3.2.4 Inspection facilities

3.2.4.1 The foundry is to have an adequately equipped laboratory, manned by experienced personnel, for the testing of moulding materials chemical analyses, mechanical testing, and microstructural testing of metallic materials and non-destructive testing. Where testing activities are assigned to other companies or other laboratory, additional information required by IRS is to be included.

3.3. Moulding and casting

3.3.1 Pouring

3.3.1.1 The pouring is to be carried out into dried moulds using degassed liquid metal. The pouring is to be controlled as to avoid turbulences of flow. Special devices and/or procedures must prevent slag flowing into the mould.

3.3.2 Stress relieving

3.3.2.1 Subsequent stress relieving heat treatment may be performed to reduce the residual stresses. For this purpose, the manufacturer is to submit a specification containing the details of the heat treatment to IRS for approval. For stress relieving temperatures and holding times see Tables 3.12.3(a) and (b).

3.4 Quality of castings

3.4.1 Freedom from defects

3.4.1.1 All castings must have a workmanlike finish and are to be free from defects which would be prejudicial to their proper application in service. Minor casting defects which may still be visible after machining such as small

sand and slag inclusions, cold shuts and scabs are to be trimmed off by the manufacturer in accordance with 3.11.

3.4.2 Removal of defects

3.4.2.1 Casting defects which may impair the serviceability of the castings, e.g. major non-metallic inclusions, shrinkage cavities, blow holes and cracks, are not permitted. They may be removed by one of the methods described in 3.11 and repaired within the limits and restrictions for the severity zones. Full description and documentation are to be available for the surveyor.

3.5 Dimensions, dimensional and geometrical tolerances

3.5.1 The verification of dimensions, the dimensional and geometrical tolerances is the responsibility of the manufacturer. The report on the relevant examinations is to be submitted to the Surveyor, who may require checks to be made in his presence.

3.5.2 Static balancing is to be carried out on all propellers in accordance with the approved drawing. Dynamic balancing is necessary for propellers running above 500 rpm.

3.6 Chemical composition and metallurgical characteristics

3.6.1 Chemical composition

3.6.1.1. Typical copper propeller alloys are grouped into the four types CU 1, CU 2, CU 3 and CU 4 depending on their chemical composition as given in Table 3.6.1. Copper alloys whose chemical composition deviate from the typical values of Table 3.6.1 are to be specially approved by IRS. The manufacturer is to maintain records of the chemical analyses of the production casts, which are to be made available to the Surveyor.

3.6.2 Metallurgical characteristics

3.6.2.1 The main constituents of the microstructure in the copper-based alloys categories CU 1 and CU 2 are alpha and beta phase. Important properties such as ductility and resistance to corrosion fatigue are strongly influenced by the relative proportion of beta phase (too high a percentage of beta phase having a negative effect on these properties). To ensure adequate cold ductility and corrosion fatigue resistance, the proportion of beta phase is to be kept low. The concept of the zinc equivalent is to be used as control since it summarizes the effect of the tendency of various chemical elements to produce beta phase in the structure.

3.6.2.2 The structure of CU 1 and CU 2 type alloys must contain an alpha phase component of at least 25 % as measured on a test bar by the manufacturer. The zinc equivalent defined by the following formula is not to exceed a value of 45 %:

$$\text{Zinc equivalent} = 100 - \frac{100 \text{ x } \%\text{Cu}}{100 + \text{A}}$$

where A is the algebraic sum of the following:

1 x % Sn

5 x % Al

- 0.5 x % Mn

- 0.1 x % Fe

- 2.3 x % Ni.

The negative sign in front of the elements Mn, Fe and Ni signifies that these elements tend to reduce the proportion of beta phase.

The micro structure of alloy types CU 1 and CU 2 is to be verified by determining the proportion of alpha phase. For this purpose, at least one specimen is to be taken from each heat. The proportion of alpha phase is to be determined as the average value of 5 counts.

Table 3.6.1 : Typical chemical compositions of cast copper alloy for propellers								
Alloy Designation	**Chemical composition of ladle samples %**							
	Cu	**Sn**	**Zn**	**Pb**	**Ni**	**Fe**	**Al**	**Mn**
Grade CU1 Manganese Bronze (high strength brass)	52 - 62	1.5 max.	35 - 40	0.5 max.	1.0 max.	0.5-2.5	0.5-3.0	0.5-4.0
Grade CU2 Ni-Manganese Bronze (high strength brass)	50 - 57	1.5 max.	33 - 38	0.5 max.	3.0-8.0	0.5-2.5	0.5-2.0	1.0-4.0
Grade CU3 Ni-Aluminium Bronze	77 - 82	0.1 max.	1.0 max.	0.03 max.	3.0-6.0	2.0-6.0	7.0-11.0	0.5-4.0
Grade CU4 Mn - Aluminium Bronze	70 - 80	1.0 max.	6.0 max.	0.05 max.	1.5-3.0	2.0-5.0	6.5-9.0	8.0-20.0

3.7 Mechanical properties and tests

3.7.1 The mechanical properties are to comply with the values in Table 3.7.1. These values are applicable to test specimens taken from separately cast samples in accordance with Figure 3.7.1 or with a recognised standard.

Note : These properties are a measure of the mechanical quality of the metal in each heat and they are generally not representative of the mechanical properties of the propeller casting itself which may be upto 30% lower than that of a separately cast test coupon. For integrally cast test specimens the requirements are to be specially agreed with IRS.

3.7.2 Other alloys

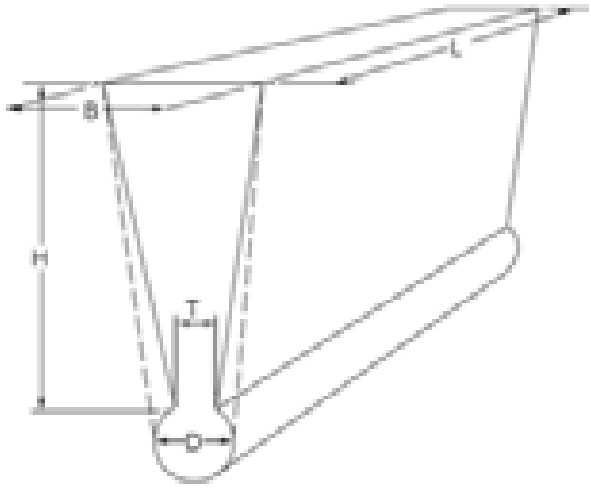
3.7.2.1 The mechanical properties of alloys not meeting the minimum values of Table 3.7.1 are to comply with a specification approved by IRS.

3.7.3 Tensile tests and specimens

3.7.3.1 Tensile tests and specimens are to be in accordance with Ch.2.

3.7.3.2 Generally, the specimens are to be taken from separately cast sample pieces in accordance with 3.7.1. The test samples are to be cast in moulds made of the same material as the mould for the propeller and they are to be cooled down under the same conditions as the propeller. At least one tensile test specimen is to be taken from each ladle. If propellers are subjected to a heat treatment the test samples are to be heat treated together with them.

3.7.3.3 Where test specimens are to be taken from integrally cast test samples, these are to be the subject of special agreement with IRS. Wherever possible, the test samples are to be located on the blades in an area lying between 0.5 to 0.6 R, where R is the radius of the propeller. The test sample material is to be removed from the casting by non thermal procedures.



H= 100 mm, B=50 mm, L>150 mm, T=15 mm and D = 25 mm

Fig.3.7.1 : Test sample casting

Table 3.7.1 : Mechanical properties of cast copper alloys for propellers (separately cast test coupons)			
Alloy Designation	**0.2% proof stress [N/mm^2] minimum**	**Tensile Strength [N/mm^2] minimum**	**Elongation on 5.65$\sqrt{S_o}$% minimum**
Grade CU1 Manganese bronze	175	440	20
Grade CU2 Ni-Manganese bronze	175	440	20
Grade CU3 Ni-Aluminium bronze	245	590	16
Grade CU4 Mn-Aluminium bronze	275	630	18

3.8 Definition of skew, severity zones

3.8.1 Definition of skew

3.8.1.1 The skew of a propeller is defined as follows:

The maximum skew angle of a propeller blade is defined as the angle, in projected view of the blade, between a line drawn through the blade tip and the shaft centreline and a second line through the shaft centreline which acts as a tangent to the locus of the mid-points of the helical blade section. See Fig.3.8.1.

High skew propellers have a skew angle greater than 25°, low skew propellers a skew angle of up to 25°.

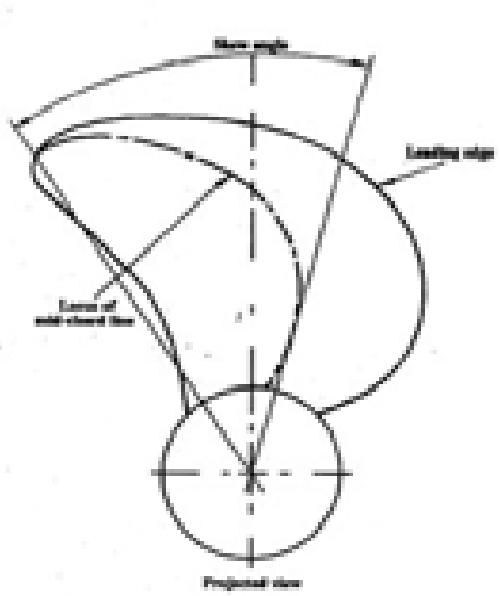


Fig.3.8.1 : Definition of skew angle

3.8.2 Severity zones

In order to relate the degree of inspection to the criticality of defects in propeller blades and to help reduce the risk of failure by fatigue cracking after repair, propeller blades are divided into the three severity zones designated A, B and C.

Zone A is the region carrying the highest operating stresses and which, therefore, requires the highest degree of inspection. Generally, the blade thicknesses are greatest in this area giving the greatest degree of restraint in repair welds and this in turn leads to the highest residual stresses in and around any repair welds. High residual tensile stresses frequently lead to fatigue cracking during subsequent service so that relief of these stresses by heat treatment is essential for any welds made in this zone. Welding is generally not permitted in Zone A and will only be allowed after special consideration. Every effort is to be made to rectify a propeller which is either defective or damaged in this area without recourse to welding even to the extent of reducing the scantlings, if this is acceptable. If a repair using welding is agreed, postweld stress relief heat treatment is mandatory.

Zone B is a region where the operating stresses may be high. Welding is to preferably be avoided but generally is allowed subject to prior approval from IRS. Complete details of the defect / damage and the intended repair procedure are to be submitted for each instance in order to obtain such approval.

Zone C is a region in which the operating stresses are low and where the blade thicknesses are relatively small so that repair welding is safer and, if made in accordance with an approved procedure is freely permitted.

3.8.2.1 Low-skew propellers

Zone A is in the area on the pressure side of the blade, from and including the fillet to 0.4R, and bounded on either side by lines at a distance 0,15 times the chord length Cr from the leading edge and 0.2 times Cr from the trailing edge, respectively (see Fig. 3.8.2).Where the hub radius (Rb) exceeds 0.27R, the other boundary of zone A is to be increased to 1.5Rb.

Zone A also includes the parts of the separate cast propeller hub which lie in the area of the windows as described in Fig. 3.8.4 and the flange and fillet area of controllable pitch and built-up propeller blades as described in Fig. 3.8.5.

Zone B is on the pressure side the remaining area up to 0.7R and on the suction side the area from the fillet to 0.7R (see Fig. 3.8.1).

Zone C is the area outside 0.7R on both sides of the blade. It also includes the surface of the hub of a monoblock propeller and all the surfaces of the hub of a controllable pitch propeller other than those designated Zone A above.

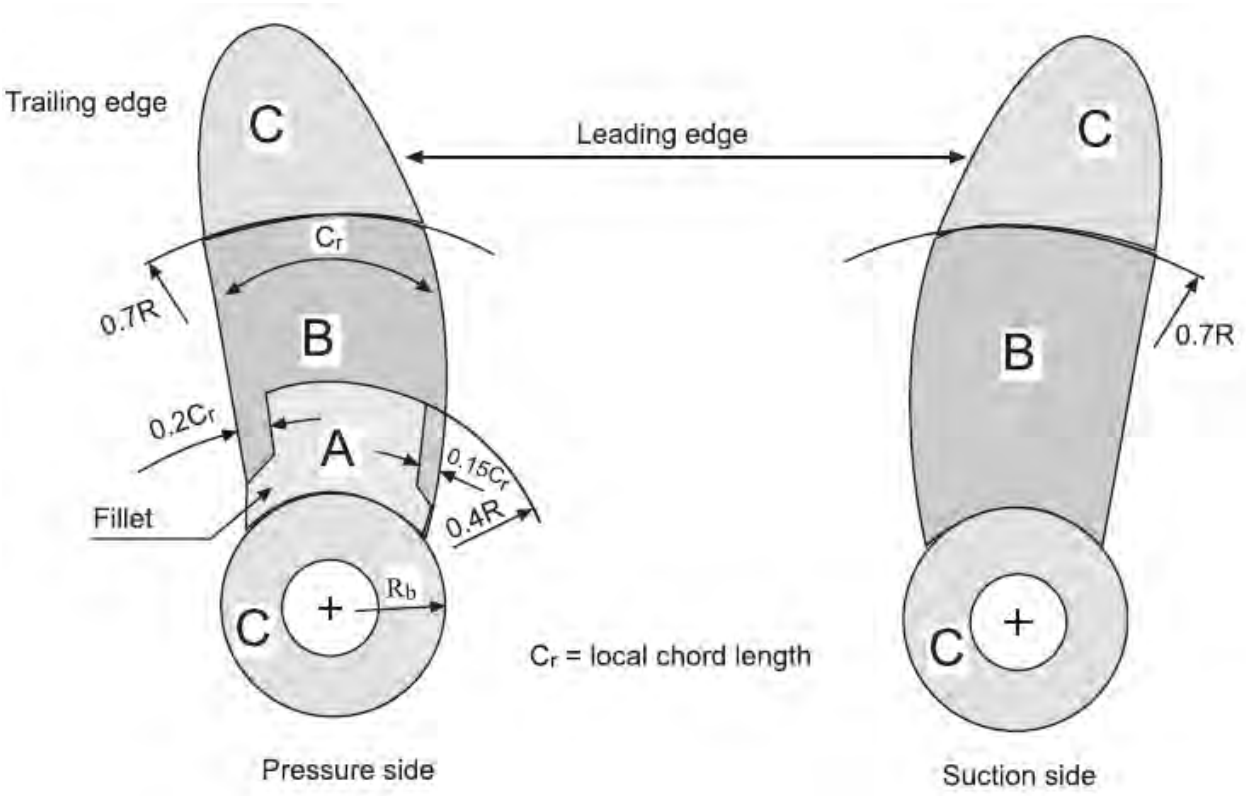

Fig.3.8.2 : Severity zones for integrally cast low skew propellers

3.8.2.2 High-skew propellers

Zone A is the area on the pressure face contained within the blade root-fillet and a line running from the junction of the leading edge with the root fillet to the trailing edge at 0.9 R and at passing through the mid-point of the blade chord at 0.7 R and a point situated at 0.3 of the chord length from the leading edge at 0.4 R. It also includes an area along the trailing edge on the suction side of the blade from the root to 0.9 R and with its inner boundary at 0.15 of the chord lengths from the trailing edge. Zone B constitutes the whole of the remaining blade surfaces. Zone A and B are illustrated in Fig. 3.8.3.

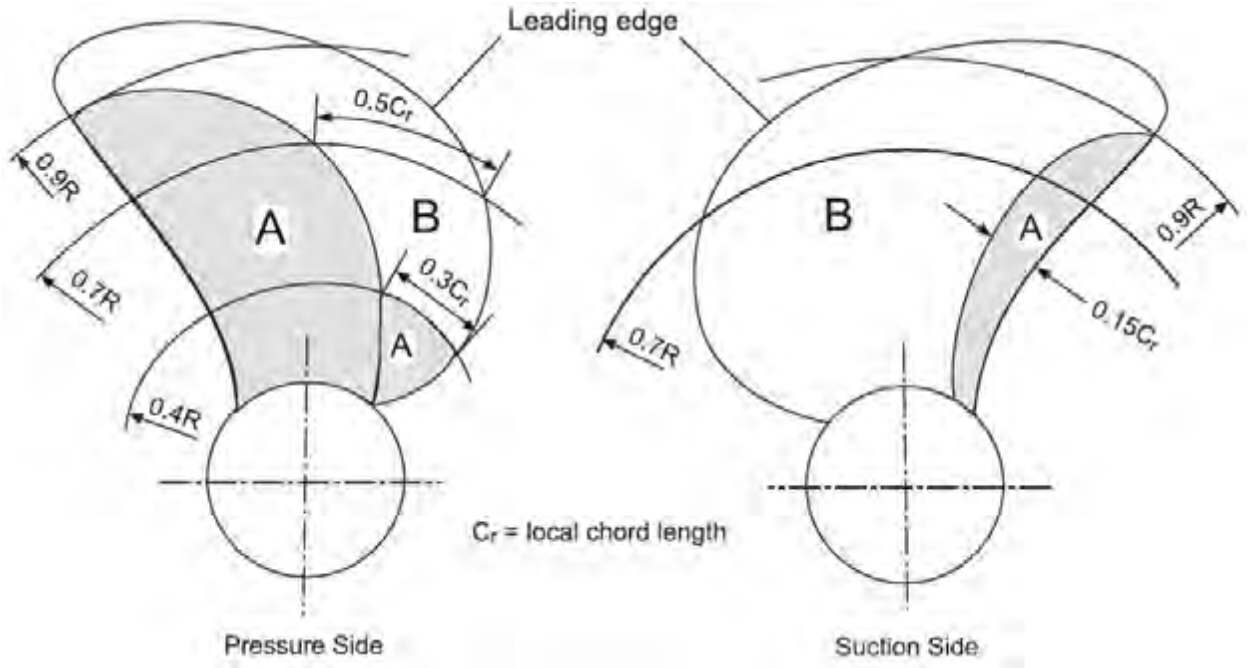

Fig.3.8.3 : Severity zones in blades with skew angles greater than 25º

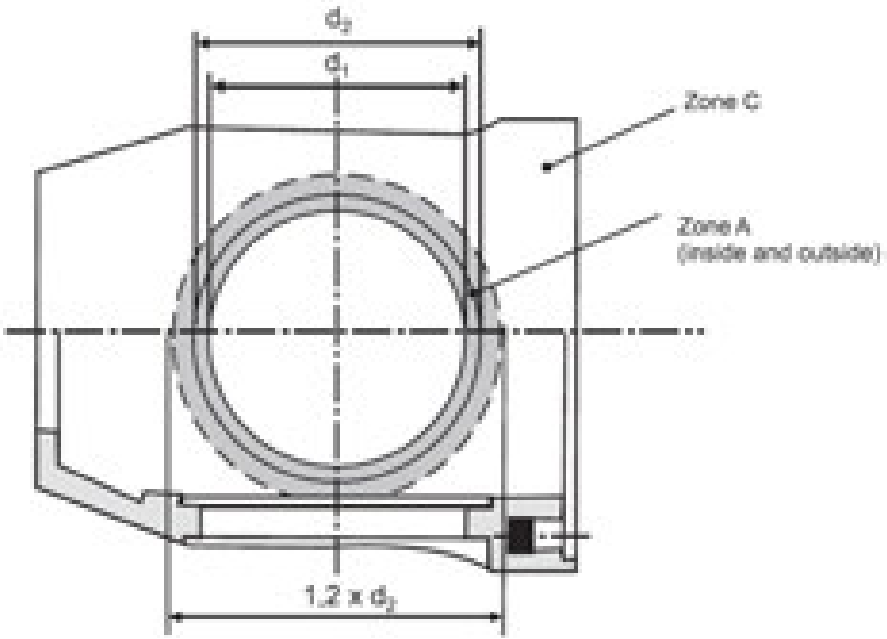

Fig.3.8.4 : Severity zones for controllable pitch propeller boss

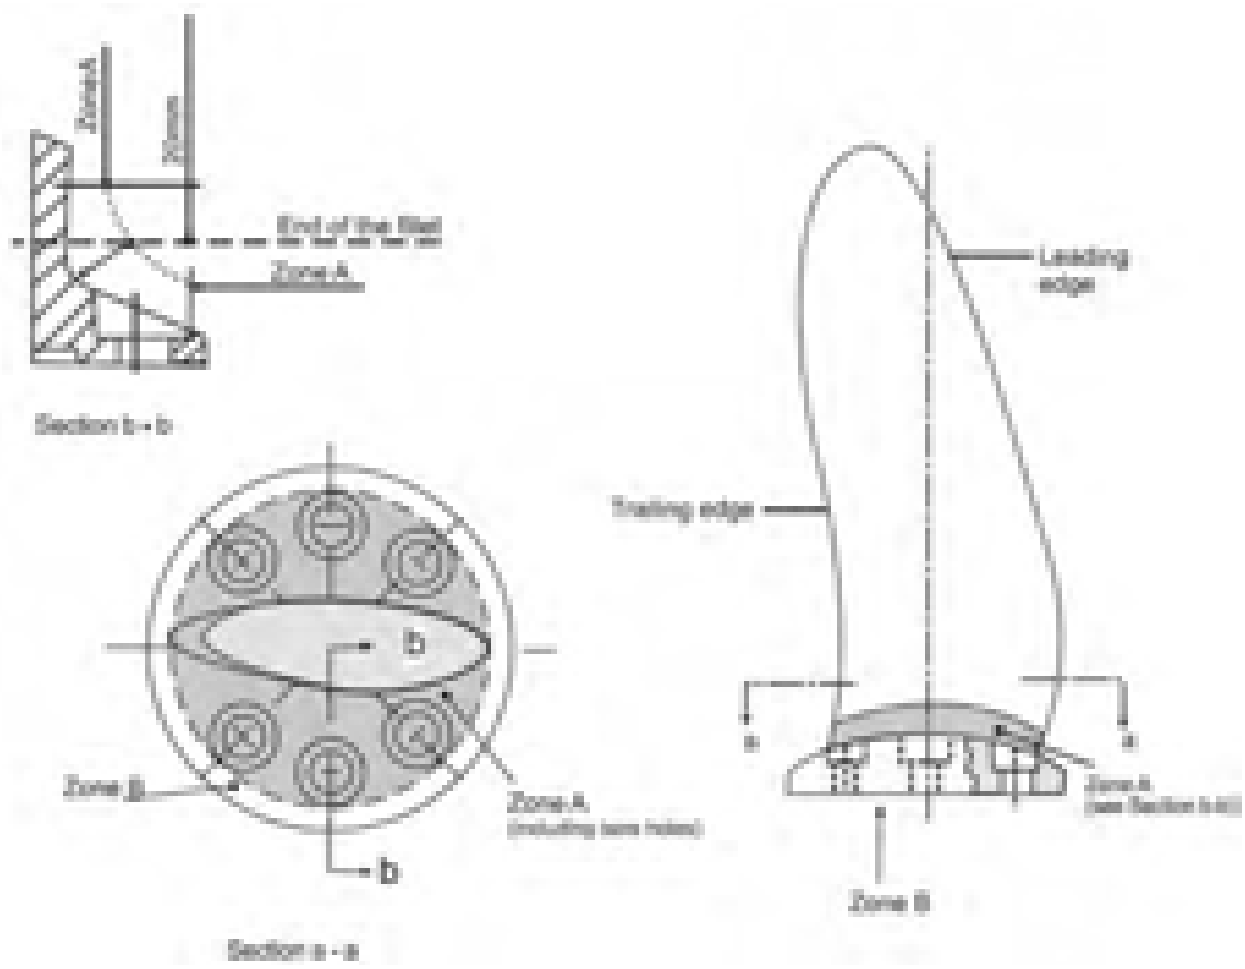

Fig.3.8.5 : Severity zones for controllable pitch and built-up propeller

Note:
The remaining surface of the propeller blades is to be divided into the severity zones as given for solid cast propellers (Fig. 3.8.2 and Fig. 3.8.3)

3.9 Non-destructive testing

3.9.1 Qualification of personnel involved in NDT

3.9.1.1 Refer to IRS Classification Note: "*Requirements for NDT Suppliers*".

3.9.2 Visual testing

3.9.2.1 All finished castings are to be 100% visually inspected by the manufacturer. Castings are to be free from cracks, hot tears or other imperfections which, due to their nature, degree or extent, will interfere with the use of the castings. A general visual examination is to be carried out by the Surveyor.

3.9.3 Liquid penetrant testing

3.9.3.1 Liquid penetrant testing procedure is to be submitted to IRS and is to be in accordance with ISO 3452-1:2013 or a recognized standard. The acceptance criteria are specified in 3.10. The severity zone A is to be subjected to a liquid penetrant testing in the presence of the Surveyor.
In zones B and C the liquid penetrant testing is to be performed by the manufacturer and may be witnessed by the Surveyor upon his request. If repairs have been made either by grinding, straightening or by welding the repaired areas are additionally to be subjected to the liquid penetrant testing independent of their location and/or severity zone.

3.9.4 Radiographic and ultrasonic testing

3.9.4.1 When required by IRS or when deemed necessary by the manufacturer, further non-destructive testing (e.g. radiographic and/or ultrasonic testing) are to be carried out. The acceptance criteria or applied quality levels are to be agreed between the manufacturer and IRS in accordance with a recognized standard.
Note: due to the attenuating effect of ultrasound within cast copper alloys, ultrasonic testing may not be practical in some cases, depending on the shape/type/thickness, and grain-growth direction of the casting.

In such cases, effective ultrasound penetration into the casting is to be practically demonstrated on the item. This would normally be determined by way of back-wall reflection, and/or target features within the casting.

3.10 Acceptance criteria for liquid penetrant testing

3.10.1 Definitions of liquid penetrant indications

Indication: In the liquid dye penetrant inspection testing an indication is the presence of detectable bleed-out of the penetrant liquid from the material discontinuities appearing at least 10 minutes after the developer has been applied.

Relevant indication: Only indications which have any dimension greater than 1.5 mm are to be considered relevant for the categorization of indications.

Non-linear indication: an indication with a largest dimension less than three times its smallest dimension (i.e. $l < 3\ w$).

Linear indication: an indication with a largest dimension three or more times its smallest dimension (i.e. $l \geq 3\ w$).

Aligned indications:

a) Non-linear indications form an alignment when the distance between indications is less than 2 [mm] and at least three indications are aligned. An alignment of indications is considered to be a unique indication and its length is equal to the overall length of the alignment.

b) Linear indications form an alignment when the distance between two indications is smaller than the length of the longest indication.

Illustration of liquid penetrant indication is given in Fig. 3.10.1.

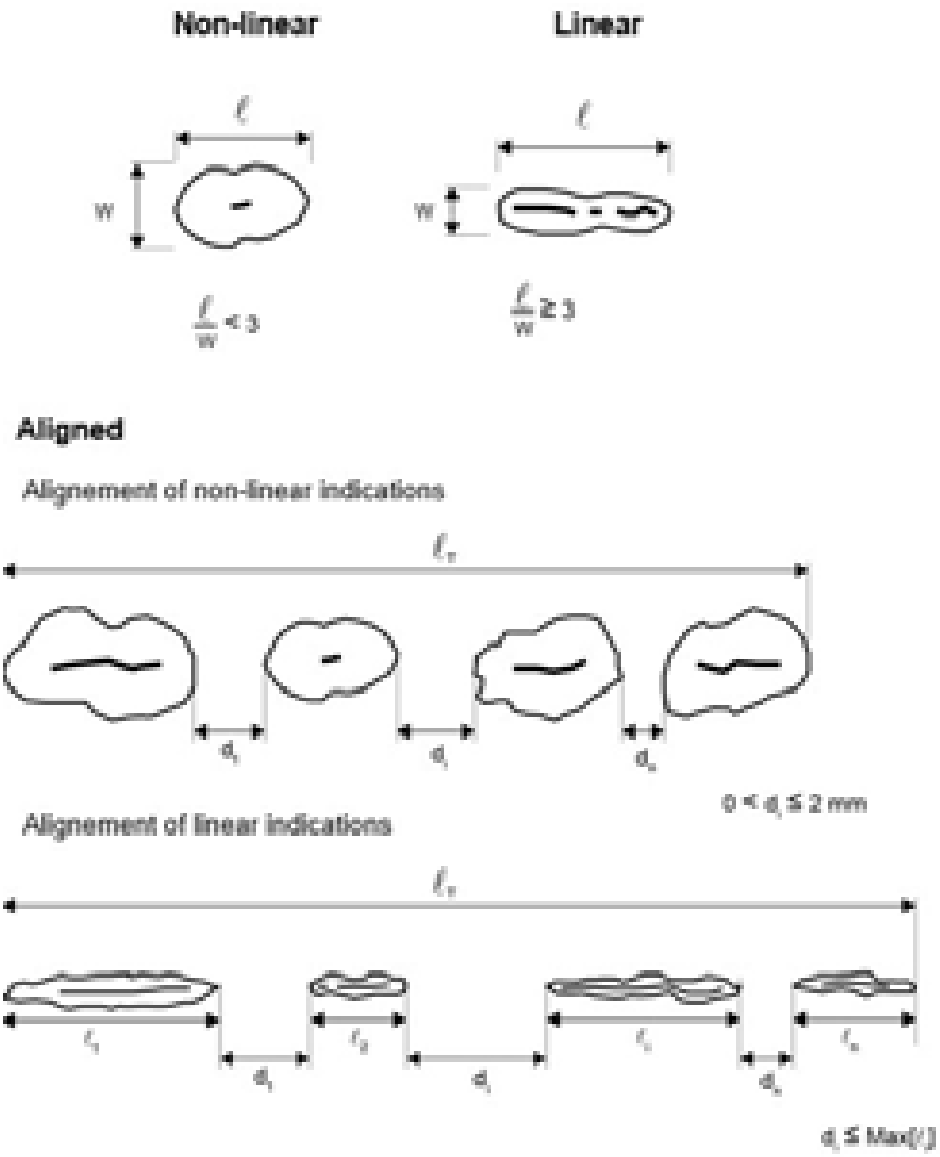

Fig.3.10.1 : Shape of indications

Table 3.10.2 : Allowable number and size of relevant indications in a reference area of 100 [cm^2], depending on severity zones[1)]

Severity zones	Max. total number of indications	Type of indication	Max. number of each type [1)2)]	Max. acceptable value for "a" or "l" of indications [mm]
A	7	Non-Linear Linear Aligned	5 2 2	4 3 3
B	14	Non-Linear Linear Aligned	10 4 4	6 6 6
C	20	Non-Linear Linear Aligned	14 6 6	8 6 6

Notes:

1) Singular non-linear indications less than 2 [mm] for zone A and less than 3 [mm] for the other zones are not considered relevant.

2) The total number of non-linear indications may be increased to the max. total number, or part thereof, represented by the absence of linear or aligned indications.

3.10.2 Acceptance standard

3.10.2.1 The surface to be inspected is to be divided into reference areas of 100 [cm^2] . Each reference area may be square or rectangular with the major dimension not exceeding 250mm.

The area is to be taken in the most unfavourable location relative to the indication being evaluated.

The relevant indications detected, with respect to their size and number, are not to exceed the values given in the Table 3.10.2.

3.10.2.2 Areas which are prepared for welding are, independent of their location, always to be assessed according to Zone A. The same applies to the welded areas after being finished machined and/or ground.

3.11 Repair of defects

3.11.1 Definitions

3.11.1.1 Indications exceeding the acceptance standard of Table 3.10.2, cracks, shrinkage cavities, sand, slag and other non-metallic inclusions, blow holes and other discontinuities which may impair the safe service of the propeller are defined as defects and must be repaired.

3.11.2 Repair procedures

a) In general the repairs are to be carried out by mechanical means, e.g. by grinding, chipping or milling. Welding may be applied subject to the agreement with IRS if requirements of 3.11.3, 3.11.4 and/or 3.11.5 will be complied with.

b) After milling or chipping grinding is to be applied for such defects which are not to be welded. Grinding is to be carried out in such a manner that the contour of the ground depression is as smooth as possible in order to avoid stress concentrations or to minimise cavitation corrosion. Complete elimination of the defective material is to be verified by liquid penetrant testing.

c) Welding of areas less than 5 [cm^2] is to be avoided.

3.11.3 **Repair of defects in zone A**

a) In zone A, repair welding will generally not be allowed unless specially approved by IRS. In some cases the propeller designer

may submit technical documentation to propose a modified zone A based on detailed hydrodynamic load and stress analysis for consideration by IRS.

b) Grinding may be carried out to an extent which maintains the blade thickness of the approved drawing.

c) The possible repair of defects which are deeper than those referred to above will be specially considered by IRS.

3.11.4 **Repair of defects in zone B**

a) Defects that are not deeper than dB = (t/40) [mm] (t = minimum local rule thickness [mm]) or 2 [mm] (whichever is greater) below minimum local rule thickness is to be removed by grinding.

b) Those defects that are deeper than allowable for removal by grinding may be repaired by welding.

3.11.5 **Repair of defects in zone C**

In zone C, repair welds are generally permitted.

3.11.6 **Repair documentation**

3.11.6.1 The foundry is to maintain records of inspections, welding, and any subsequent heat treatment, traceable to each casting. Before welding is started, full details of the extent and location of the repair, the proposed welding procedure, heat treatment and subsequent inspection procedures are to be submitted to IRS for approval.

3.12 Welding repair procedure

3.12.1 General requirements

3.12.1.1 Before welding is started, manufacturer is to submit to IRS a detailed welding procedure specification covering the weld preparation, welding parameters, filler metals, preheating and post weld heat treatment and inspection procedures.

3.12.1.2 All weld repairs are to be carried out in accordance with qualified procedures, and, by welders who are qualified to a recognized standard. Welding Procedure Qualification Tests are to be carried out in accordance with 3.16 and witnessed by the Surveyor.

3.12.2 Defects to be repaired by welding are to be ground to sound material according to 3.11.2.

3.12.2.1 The welding grooves are to be prepared in such a manner which will allow a good fusion of the groove bottom. The resulting ground areas are to be examined in the presence of the Surveyor by liquid penetrant testing in order to verify the complete elimination of defective material.

3.12.3 Welding repair procedure

3.12.3.1 Metal arc welding is recommended to be used for all types of welding repair on cast copper alloy propellers.

Arc welding with coated electrodes and gas-shielded metal arc process (GMAW) are generally to be applied. Argon-shielded tungsten welding (GTAW) is to be used with care due to the higher specific heat input of this process.

Recommended filler metals, pre-heating and stress relieving temperatures are listed in Table 3.12.3(a).

3.12.3.2 All propeller alloys are generally to be welded in down-hand (flat) position. Where this cannot be done, gas-shielded metal arc welding is to be carried out.

The section to be welded is to be clean and dry. Flux-coated electrodes are to be dried before welding according to the maker's instructions.

To minimize distortion and the risk of cracking, interpass temperatures are to be kept low especially in the case of CU3 alloys.

Slag, undercuts and other defects are to be removed before depositing the next run.

Table 3.12.3(a) : Recommended filler metals and heat treatments

Alloy type	Filler metal	Preheat temp.°C [min]	Interpass temp.°C [max]	Stress relief temp.°C	Hot straightening temp.°C
CU1	Al-bronze [1] Mn-bronze	150	300	350 - 500	500 - 800
CU2	Al-bronze Ni-Mn-bronze	150	300	350 - 550	500 - 800
CU3	Al-bronze Ni-Al-bronze [2] Mn-Al-bronze	50	250	450 - 500	700 - 900
CU4	Mn-Al-bronze	100	300	450 - 600	700 - 850

Notes:

1) Ni-Al-bronze and Mn-Al-bronze are acceptable.

2) Stress relieving not required, if filler metal Ni-Al-bronze is used.

Table 3.12.3(b) : Soaking times for stress relief heat treatment of copper alloy propellers

Stress relief temp.°C	Alloy grade CU1 and CU2		Alloy grade CU3 and CU4	
	Hours per 25 [mm] thickness	Max. recommended total time hours	Hours per 25 [mm] thickness	Max. recommended total time hours
350	5	15	-	-
400	1	5	-	-
450	1/2	2	5	15
500	1/4	1	1	5
550	1/4	1.2	1/2 [1]	2 [1]
600	-	-	1/4 [1]	1 [1]

Note 1) 550°C and 600°C only applicable for CU4 alloys

3.12.3.3 All welding work is to be carried out preferably in the shop free from draughts and influence of the weather.

3.12.3.4 With the exception of alloy CU3 (Ni-Al-bronze) all weld repairs are to be stress relief heat treated, in order to avoid stress corrosion cracking. However, stress relief heat treatment of alloy CU3 propeller castings may be required after major repairs in zone B (and specially approved welding in Zone A) or if a welding consumable susceptible to stress corrosion cracking is used. In such cases the propeller is to be either stress relief heat treated in the temperature 450 to 500°C or annealed in the temperature range 650 - 800°C, depending on the extent of repair, see Table 3.12.3(a).

3.12.3.5 The soaking times for stress relief heat treatment of copper alloy propellers is to be in accordance with Table 3.12.3(b). The heating and cooling is to be carried out slowly under controlled conditions. The cooling rate after any stress relieving heat treatment is not to exceed 50°C/hr until the temperature of 200°C is reached.

3.13 Straightening

3.13.1 **Application of load**

For hot and cold straightening purposes, static loading only is to be used.

3.13.2 **Hot straightening**

Weld repaired areas may be subject to hot straightening, provided it can be demonstrated that weld properties are not impaired by the hot straightening operations.

Straightening of a bent propeller blade or a pitch modification is to be carried out after heating the bent region and approximately 500 [mm] wide zones on either side of it to the suggested temperature range given in Table 3.12.3.(a).

The heating is to be slow and uniform and the concentrated flames such as oxy-acetylene and oxy-propane are not to be used. Sufficient time is be allowed for the temperature to become fairly uniform through the full thickness of the blade section. The temperature is to be maintained within the suggested range throughout the straightening operation. A thermocouple instrument or temperature indicating crayons are to be used for measuring the temperature.

3.13.3 **Cold straightening**

Cold straightening is to be used for minor repairs of tips and edges only. Cold straightening on CU1, CU2 and CU4 bronze is always to be followed by a stress relieving heat treatment, See Table 3.12.3(a).

3.14 Identification and marking

3.14.1 Identification

3.14.1.1 The manufacturer is to adopt a system for the identification of all castings, which enable the material to be traced to its original cast. The Surveyor is to be given full facilities for so tracing the castings when required.

3.14.2 Marking

3.14.2.1 Each finished casting propeller is to be marked by the manufacturer at least with the following particulars:

a) Grade of cast material or corresponding abbreviated designation

b) Manufacturer’s mark

c) Heat number, casting number or another mark enabling the manufacturing process to be traced back

d) Date of final inspection

e) IRS certificate number

f) Ice class symbol, where applicable

g) Skew angle for high skew propellers.

3.15 Manufacturer’s Certificates

3.15.1 For each casting propeller the manufacturer is to supply to the Surveyor a certificate containing the following details:

a) Purchaser and order number

b) Shipbuilding project number, if known

c) Description of the casting with drawing number

d) Diameter, number of blades, pitch, direction of turning

e) Grade of alloy and chemical composition of each heat

f) Heat or casting number

g) Final weight

h) Results of non-destructive tests and details of test procedure where applicable

i) Portion of alpha-structure for CU 1 and CU 2 alloys

k) Results of the mechanical tests

l) Casting identification Number.

m) Skew angle for high skew propellers, see 3.8.1.

3.16 Welding procedure qualification tests for repair of cast copper alloy propeller

3.16.1 General

3.16.1.1 This sub-section includes the requirements for qualification tests of welding procedures intended for the repair of cast copper alloy propellers.

3.16.1.2 For the welding procedure approval the welding procedure qualification tests are to be carried out with satisfactory results. The qualification tests are to be carried out with the same welding process, filler metal, preheating and stress-relieving treatment as those intended applied by the actual repair work. Welding procedure specification (WPS) is to refer to the test results achieved during welding procedure qualification testing.

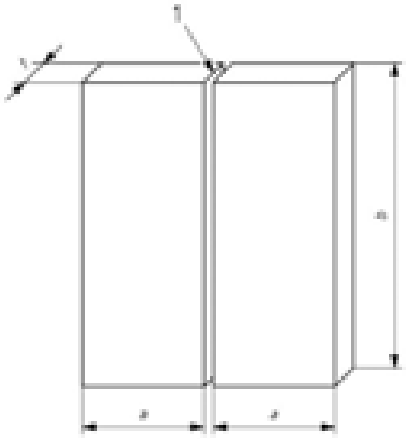
3.16.1.3 Welding procedures qualified at a manufacturer are valid for welding in workshops under the same technical and quality management.

3.16.2 Test piece and welding of sample

3.16.2.1 The test assembly, consisting of cast samples, is to be of a size sufficient to ensure a reasonable heat distribution and according to Fig. 3.16.2.1 with the minimum dimensions. A test sample of minimum 30 mm thickness is to be used.

3.16.2.2 Preparation and welding of test pieces are to be carried out in accordance with the general condition of repair welding work which it represents.

3.16.2.3 Welding of the test assemblies and testing of test specimens are to be witnessed by the Surveyor.



1: Joint preparation and fit-up as detailed in the preliminary welding procedure specification
a: minimum value 150mm
b: minimum value 300mm
t: material thickness.

Fig.3.16.2.1 : Test piece for welding repair procedure

3.16.3 Examination and tests

3.16.3.1 Test assembly is to be examined non-destructively and destructively in accordance with the Table 3.16.3.1 and Fig. 3.16.3.1.

Table 3.16.3.1 : Type of tests and extent of testing

Type of test [1)]	Extent of testing
Visual testing	100% as per 3.16.2
Liquid penetrant testing	100% as per 3.16.2
Transverse tensile test	Two specimens as per 3.16.3
Macro examination	Three specimens as per 3.16.4
Note 1: bend or fracture test are at the discretion of IRS.	

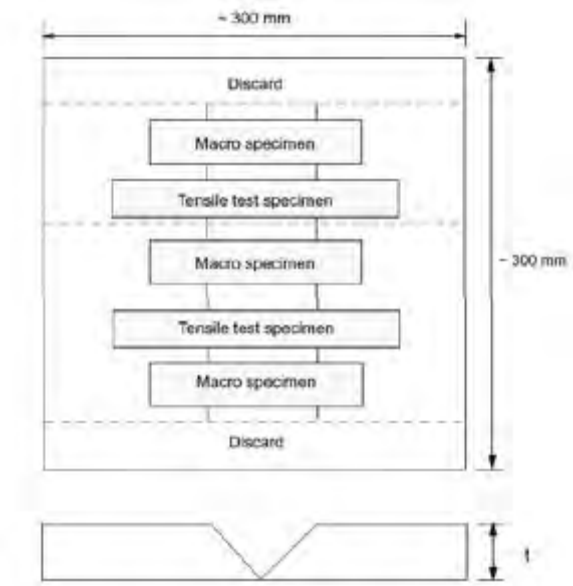


Fig.3.16.3.1 : Test Specimen

3.16.3.2 Non-destructive testing

.1 The test assembly is to be examined by visual and liquid penetrant testing prior to the cutting of test specimen. In case, that any post-weld heat treatment is required or specified, non-destructive testing is to be performed after heat treatment. No cracks are permitted. Imperfections detected by liquid penetrant testing are to be assessed in accordance with 3.10.

3.16.3.3 Tensile test:

.1 Two tensile tests are to be prepared as

shown in Ch.2. Alternatively tensile test specimens according to recognized standards acceptable to IRS may be used. The tensile strength is to meet the values given in Table 3.16.3.3.

3.16.3.4 Macroscopic examination

Three test specimens are to be prepared and etched on one side to clearly reveal the weld metal, the fusion line and the heat affected zone (Figure 3.16.3.1). A suitable etchant for this purpose is:

5 g iron (III) chloride
30 ml hydrochloric acid (cone)
100 ml water.

The test specimens are to be examined for imperfections present in the weld metal and the heat affected zone. Cracks and lack of fusion are not permitted. Imperfections such as pores, or slag inclusions, greater than 3 [mm] are not permitted.

Table 3.16.3.3 : Required tensile strength values

Alloy Type	Tensile strength [N/mm^2] min
CU 1	370
CU 2	410
CU 3	500
CU 4	550

3.16.3.5 Re-testing

.1 If the test piece fails to comply with any of the requirements for visual or non-destructive testing one further test piece is to be welded and subjected to the same examination. If this additional test piece does not comply with the relevant requirements, the pWPS (preliminary welding procedure specification) is to be regarded as not capable of complying with the requirements without modification.

.2 If any test specimens fail to comply with the relevant requirements for destructive testing due to weld imperfections only, two further test specimens are to be obtained for each one that failed. These specimens can be taken from the same test piece if there is sufficient material available or from a new test piece, and are to be subjected to the same test. If either of these additional test specimens does not comply with the relevant requirements, the pWPS is to be regarded as not capable of complying with the requirements without modification.

.3 If a tensile test specimen fails to meet the requirements, the re-testing is to be in accordance with Ch.2.

.4 If there is a single hardness value above the maximum values allowed, additional hardness tests are to be carried out (on the reverse of the specimen or after sufficient grinding of the tested surface). None of the additional hardness values is to exceed the maximum hardness values required.

.5 The re-testing of Charpy impact specimens are to be carried out in accordance with Ch.2.

.6 Where there is insufficient welded assembly remaining to provide additional test specimens, a further assembly is to be welded using the same procedure to provide the additional specimens.

3.16.4 Test record

3.16.4.1 Welding conditions for test assemblies and test results are to be recorded in welding procedure qualification record. Forms of welding procedure qualification records may be in accordance with recognised standards.

3.16.4.2 A statement of the results of assessing each test piece, including repeat tests, is to be made for each welding procedure qualification records. The relevant items listed for the WPS are to be included.

3.16.4.3 The welding procedure qualification record is to be signed by the Surveyor witnessing the test and is to include the IR identification.

3.16.5 Range of approval

3.16.5.1 General

.1 All the conditions of validity stated below are to be met independently of each other. Changes outside of the ranges specified are to require a new welding procedure test. A qualification of a WPS obtained by a manufacturer is valid for welding in workshops or sites under the same technical and quality control of that manufacturer.

3.16.5.2 Base metal

.1 The range of qualification related to base metal is given in Table 3.16.5.2.

Table 3.16.5.2 : Range of qualification for base metal

Copper alloy material grade used for qualification	Range of approval
CU1	CU1
CU2	CU1& CU2
CU3	CU3
CU4	CU4

3.16.5.3 Thickness

.1 The qualification of a WPS carried out on a weld assembly of thickness t is valid for the thickness range given in Table 3.16.5.3.

Table 3.16.5.3 : Range of qualification for thickness

Thickness of the test piece, t (mm)	Range of approval
30≤t	≥3 mm

3.16.5.4 Welding position

.1 Approval for a test made in any position is restricted to that position.

3.16.5.5 Welding process

.1 The approval is only valid for the welding process used in the welding procedure test. Single run is not qualified by multi-run butt weld test used in this section

3.16.5.6 Filler metal

.1 The approval is only valid for the filler metal used in the welding procedure test.

3.16.5.7 Heat input

.1 The upper limit of heat input approved is 25% greater than that used in welding the test piece. The lower limit of heat input approved is 25% lower than that used in welding the test piece.

3.16.5.8 Preheating and interpass temperature

.1 The minimum preheating temperature is not to be less than that used in the qualification test. The maximum interpass temperature is not to be higher than that used in the qualification test.

3.16.5.9 Post-weld heat treatment

The heat treatment used in the qualification test is to be specified in pWPS. Soaking time may be adjusted as a function of thickness.

Section 4

Tubes

4.1 Scope

4.1.1 Following requirements make provision for copper and copper alloy tubes intended for use in heat exchangers, condensers and pressure piping systems.

4.1.2 Except for pipes for Class lll pressure systems (as defined in Pt.4, Ch.2) all pipes and tubes are to be manufactured and tested in accordance with the requirements of Ch.1 and 2 of this Part and the requirements of this Section.

4.1.3 Pipes and tubes which comply with national/international or proprietary specifica-ions may be accepted provided that these specifications give reasonable equivalence to the requirements of this Section or are otherwise specifically approved for a specific application and provided that survey is carried out in accordance with Ch.1 of this Part.

4.1.4 At the discretion of the Surveyor, modified testing procedure may be adopted for small quantities of materials. In such cases, these may be accepted on the manufacturer's declared chemical composition and hardness tests or other evidence of satisfactory properties.

4.1.5 Pipes for Class lll pressure systems are to be manufactured and tested in accordance with the requirements of an acceptable national/ international specification. The manufacturer's test certificate will be acceptable and is to be provided for each consignment of material.

4.2 Manufacture

4.2.1 Approval of Works, as required by Ch.1, for the manufacture of copper and copper alloy tubes is generally not required.

4.2.2 Unless otherwise agreed tubes shall be solid drawn.

4.3 Quality

4.3.1 Tubes are to have a workmanlike finish and are to be clean and free from such surface and internal defects as can be established by the specified tests.

4.3.2 The tubes are to be supplied in straight lengths, and the ends are to be cut clean and square with the axis of the tube.

4.3.3 The tolerance on wall thickness and diameter of pipes and tubes are to be in accordance with an acceptable national/ international standard.

4.4 Chemical composition

4.4.1 The chemical analysis is to comply with the requirements of Table 4.4.1. Residual elements are not to be present in amounts greater than specified in an acceptable national/international standard.

4.5 Heat treatment

4.5.1 All tubes are to be supplied in the annealed condition. Aluminium brass tubes may additionally be required to be given a suitable stress relieving heat treatment when subjected to a cold straightening operation after annealing.

4.6 Mechanical tests

4.6.1 The tubes are to be presented in lots of 600 tubes or 900 [Kg], whichever is greater. Each lot is to contain tubes of the same dimensions, material grade and in the same state of heat treatment. From each lot 2 tubes are to be selected for testing.

4.6.2 Following tests are to be carried out on each tube selected for testing in accordance with the requirements of Ch.2:

a) Tensile test;

b) Flattening test;

c) Drift Expanding test.

4.6.3 Flattening test is to be carried out until the interior surfaces of the tube meet.

4.6.4 For the drift-expanding test, the mandrel is to have an included angle of 45°.

4.6.5 The results of all mechanical tests are to comply with the requirements of Table 4.6.1.

Table 4.4.1 : Chemical composition of tubes [1)]

Designation	Chemical composition %								
	Cu	Fe	Ni	Zn	As	Al	Mn	P	Pb
Phosphorus deoxidised non-arsenical copper	99.90 [2)] min.	-	-	-	-	-	-	0.013-0.050	-
Phosphorus deoxidised arsenical copper	99.20 [2)] min.	-	-	-	0.30-0.50	-	0.013-0.050	-	-
Al-brass	76.0-79.0	-	-	Remainder	0.02-0.06	1.8-2.3	-	-	-
Copper-nickel 90/10	Remainder	1.0-1.8	9.0-11.0	-	-	-	0.5-1.0	-	-
Copper-nickel 70/30	Remainder	0.4-1.0	30.0-32.0	-	-	-	0.5-1.5	-	-

Notes:

1) Table shows essential alloying elements only
2) Includes silver also.

Table 4.6.1 : Mechanical properties for acceptance purposes

Designation	0.2% proof stress [N/mm^2] minimum	Tensile strength [N/mm^2] minimum	$5.65\sqrt{S_o}$% minimum	Drift expansion test % minimum
Phosphorus deoxidised non-arsenical copper	100	220	35	30
Phosphorus deoxidised arsenical copper	100	220	35	30
Al-brass	110	320	35	30
Copper-nickel 90/10	100	270	30	30
Copper-nickel 70/30	120	360	30	30

4.7 Visual examination

4.7.1 All pipes are to be presented for visual examination and verification of dimensions. The manufacturer is to provide adequate lighting conditions to enable an internal and external examination of the tubes to be carried out.

4.8 Stress cracking test

4.8.1 This test is applicable to aluminium brass only. Mercurous Nitrate Test or alternatively at the express agreement between purchaser and manufacturer Ammonia Vapour Cracking Test are to be carried out on test specimen to prove that the tubes are free from internal stresses. The tests are to be carried out in accordance with an acceptable national/international standard.

4.8.2 Should a specimen reveal cracks when tested, the manufacturing batch shall be rejected. The manufacturer shall be free to submit the batch to renewed heat treatment before presenting it for retesting.

4.9 Hydraulic test

4.9.1 All tubes are to be hydraulically tested by the manufacturer to the following pressure:

$$P = \frac{5 \text{ x } t \text{ x } Rm}{D}$$

where,

P = Test pressure;

t = nominal wall thickness;

D = nominal outside diameter;

Rm = Tensile strength in accordance with Table 4.6.1.

Unless otherwise stated the pressure need not be greater than 7.0 [N/mm^2].

4.9.2 The test pressure is to be maintained for sufficient time to permit proof and inspection. Unless otherwise agreed, the manufacturer's certificate of satisfactory hydraulic test will be accepted subject to 10 per cent of the tubes being retested in the presence of the Surveyor. If one of the tubes in a batch does not pass the test, it will be rejected, and all other tubes in the batch are to be retested.

4.10 Identification

4.10.1 Tubes are to be clearly marked by the manufacturer in accordance with the requirements of Ch.1, with at least the following details:

a) IR;

b) Manufacturer's name or trade mark;

c) Grade of material.

4.10.2 Identification is to be by rubber stamp or stencil. Hard stamping is not to be used.

4.11 Certification

4.11.1 The manufacturer is to provide the Surveyor with a written statement giving the following particulars for each lot of material accepted:-

a) Purchaser's name and Order no.;
b) Grade of material;
c) Description and dimensions;
d) Cast number and chemical composition;
e) Mechanical test results and results of stress cracking tests where applicable.

Chapter 9

Aluminium Alloys

Contents

Section

1 *General*

2 *Wrought Aluminium Alloys*

3 *Aluminium Alloy Castings*

4 *Aluminium/Steel Transition Joints*

Section 1

General

1.1 Scope

1.1.1 This Chapter specifies the requirements for wrought aluminium alloys for structural applications, aluminium alloy castings and aluminium/steel transition joints intended for use in ship and machinery construction.

1.1.2 This Chapter is not applicable to aluminium alloys for forgings and to the use of aluminium alloys at low temperature for cryogenic applications. For these products suitable alloys which comply with recognized standards may be used.

1.1.3 These requirements are applicable to wrought aluminium alloy products within a thickness range of 3 [mm] and 50 [mm] inclusive. The application of aluminium alloys products outside this thickness range requires prior agreement of IRS.

1.1.4 The numerical designation (grade) of aluminium alloys and the temper designation are based on those of the Aluminium Association.

Temper conditions (delivery heat treatment) are as defined in EN 515:2017 Or ANSI H35.1:2017.

1.1.5 When required by the relevant Chapters of the Rules dealing with design and construction, structural aluminium alloys, aluminium alloy castings and aluminium/steel transition joints are to be manufactured and tested in accordance with the appropriate requirements of Ch.1 and 2 and those detailed in this Chapter.

1.1.6 Consideration may be given to aluminium alloys not specified in this chapter and to alternative temper conditions, complying with recognized national or international standards with specifications equivalent to the requirements of this chapter.

Section 2

Wrought Aluminium Alloys

2.1 Scope

2.1.1 This Section deals with wrought aluminium alloys for structural applications including plates, sections, tubes, bars and rivet bars and rivets.

2.1.2 Wrought aluminium alloys are to have a satisfactory resistance to corrosion in marine environment. Grades for welded structures are to be weldable, applying one of the welding methods approved by IRS.

2.1.3 The alloy grades 6005A, 6061 of the 6000 series should not be used in direct contact with sea water unless protected by anodes and/or paint system.

2.2 Manufacture

2.2.1 Aluminium alloys are to be manufactured at Works approved by IRS. Also refer Chapter 1, Section 1, Cl. 1.3.2.

2.2.2 The alloys may be cast either in ingot moulds or by an approved continuous casting process. Plates are to be formed by rolling and may be hot or cold finished. Bars and sections may be formed by rolling, extrusion or drawing.

2.3 Quality of materials

2.3.1 Materials are to be free from surface or internal defects of such a nature as would be harmful in service.

2.4 Dimensional tolerances

2.4.1 The dimensional tolerances are to be in accordance with Table 2.4.1, Table 2.4.2 and Table 2.4.3 and are minimum requirements.

2.4.2 Dimensional tolerances other than those given in Table 2.4.1, Table 2.4.2 and Table 2.4.3 are to comply with a recognized national or international standard.

2.5 Chemical composition

2.5.1 Samples for chemical analysis are to be taken representative of each cast, or the equivalent where a continuous melting process is involved.

2.5.2 The chemical composition of these samples is to comply with the requirements of Table 2.5.1.

Table 2.4.1 : Under thicknesses tolerances for rolled products

	Thickness tolerances for nominal width [mm]		
Nominal thickness [t] [mm]	$w \leq 1500$	$1500 < w \leq 2000$	$2000 < w \leq 3500$
$3.0 \leq t < 4.0$	0.10	0.15	0.15
$4.0 \leq t < 8.0$	0.20	0.20	0.25
$8.0 \leq t < 12.0$	0.25	0.25	0.25
$12.0 \leq t < 20.0$	0.35	0.40	0.50
$20.0 \leq t < 50.0$	0.45	0.50	0.65

Table 2.4.2 : Under thicknesses tolerances for extruded open profiles

	Thickness tolerances for nominal thicknesses for a diameter of the circumscribing circle [mm]		
Nominal thickness [mm]	Upto 250	From 250 to 400	Above 400
From 3 to 6	0.25	0.35	0.40
From 6 to 50	0.30	0.40	0.45

Table 2.4.3 : Under thicknesses tolerances for extruded closed profiles

Nominal thickness [mm]	Thickness tolerances [mm]
From 3 to 6	0.25
From 6 to 50	0.30

Table 2.5.1 : Chemical composition

Grade	Al	Si	Fe	Cu	Mn	Mg	Cr	Zn	Ti	Oth-ers (2)	Oth-ers (2)	Misc.
	%	%	%	%	%	%	%	%	%	Each %	Total %

6082	Remain der	0.7-1.3	≤ 0.50	≤ 0.10	0.40-1.0	0.6-1.2	≤ 0.25	≤ 0.20	≤ 0.10	≤ 0.05	≤ 0.15	

Notes:

1. Slight variations in the content of some elements, compared with values indicated in this Table may be accepted with IRS's agreement.
2. Other metallic elements such as Ni, Ga.V are considered as impurities. The regular analysis need not be made for these elements.
3. Zr: maximum 0.20. The total for other elements does not include Zirconium.
4. Zr: 0.05-0.25. The total for other elements does not include Zirconium.

2.5.3 The manufacturer's declared analysis will be accepted subject to occasional checks if required by IRS Surveyor, particularly, product analysis may be required where the final product chemistry is not well represented by the analysis from the cast.

2.5.4 When the aluminium alloys are not cast in the same works in which they are manufactured into semi finished products, the works is to give a certificate detailing the chemical composition and heat number.

2.6 Heat treatment

2.6.1 Temper conditions (delivery heat treatment) are defined in Table 2.8.1.

2.7 Test material

2.7.1 All materials in a lot forwarded for sampling are to be of the same alloy, production batch and product form (plates, sections etc.). The materials in one lot are to be of the same dimensions and in the same delivery condition. Artificially aged grades are to be from the same furnace batch.

2.7.2 Wherever practicable, the tensile test pieces for rolled and extruded sections are to be of full section of material. Otherwise, the pieces are to be taken in the range one third to half the distance from the edge to center of the predominant or thickest part of the section.

2.8 Testing and inspection

2.8.1 Testing procedures

The test specimens and procedures are to be in accordance with Ch.2.

2.8.2 Verification of proper fusion of press welds for closed profiles.

The Manufacturer has to demonstrate by macrosection tests or drift expansion tests of closed profiles performed on each batch of closed profiles that there is no lack of fusion at the press welds.

2.8.3 Drift expansion tests

2.8.3.1 Every fifth profile is to be sampled after final heat treatment.

One sample is to be selected from the batches of five profiles or less.

Every profile is to be selected if the length exceeds 6 [m].

2.8.3.2 Two samples are to be cut from the front and back end of each production profile.

2.8.3.3 The test specimens are to be cut with the ends perpendicular to the axis of the profile. The edges of the end may be rounded by filing.

2.8.3.4 The length of the specimen is to be in accordance with details given in Chapter 2.

2.8.3.5 Testing is to be carried out at ambient temperature and is to consist of expanding the end of the profile by means of a hardened conical steel mandrel having an included angle of at least 60°.

2.8.3.6 The sample is considered to be unacceptable if the sample fails with a clean split along the weld line which confirms lack of fusion.

2.8.4 Requirements of mechanical properties for rolled products in different delivery conditions are given in Table 2.8.1 and are applicable for thickness within the range 3 [mm] to 50 [mm]. For thickness above 10 [mm], however, lower mechanical properties may be accepted.

2.8.5 Requirements of mechanical properties for extruded products in different delivery conditions are given in Table 2.8.2 and are applicable for thickness within the range 3 [mm] to 50 [mm].

2.8.6 Requirements of mechanical properties and delivery conditions for extruded closed profiles are given in Table 2.8.3.

2.8.7 Other delivery conditions with related mechanical properties may be accepted by IRS, in each particular case.

Table 2.8.1 : Mechanical properties for rolled products 3 [mm] ≤ t ≤ 50 [mm]

Grade	Temper [3] condition	Thickness, [t]	0.2% proof stress [N/mm^2]	Tensile strength [N/mm^2]	Elongation % minimum [1]	
					On gauge length of 50 [mm]	On gauge length of 5 x dia
5083	O	3 ≤ t ≤ 50 mm	125	275-350	16	14
	H111	3 ≤ t ≤ 50 mm	125	275-350	16	14
	H112	3 ≤ t ≤ 50 mm	125	275	12	10
	H116	3 ≤ t ≤ 50 mm	215	305	10	10
	H321	3 ≤ t ≤ 50 mm	215-295	305-385	12	10
5383	O	3 ≤ t ≤ 50 mm	145	290	-	17
	H111	3 ≤ t ≤ 50 mm	145	290	-	17
	H116	3 ≤ t ≤ 50 mm	220	305	10	10
	H321	3 ≤ t ≤ 50 mm	220	305	10	10
5059	O	3 ≤ t ≤ 50 mm	160	330	24	24
	H111	3 ≤ t ≤ 50 mm	160	330	24	24
	H116	3 ≤ t ≤ 20 mm	270	370	10	10
		20 < t ≤ 50 mm	260	360	-	10
	H321	3 ≤ t ≤ 20 mm	270	370	10	10
		20 < t ≤ 50 mm	260	360	-	10
5086	O	3 ≤ t ≤ 50 mm	95	240-305	16	14
	H111	3 ≤ t ≤ 50 mm	95	240-305	16	14
	H112	3 ≤ t ≤ 12.5 mm	125	250	8	
		12.5 < t ≤ 50 mm	105	240		9
	H116	3 ≤ t ≤ 50 mm	195	275	10 [2]	9
5754	O	3 ≤ t ≤ 50 mm	80	190-240	18	17
	H111	3 ≤ t ≤ 50 mm	80	190-240	18	17

Table 2.8.1 : (Contd.)

Grade	Temper [3] condition	Thickness, t	0.2% proof stress [N/mm^2]	Tensile strength [N/mm^2]	Elongation % minimum [1]	
					On gauge length of 50 [mm]	On gauge length of 5 x dia
5456	O	3 ≤ t ≤ 6.3 mm	130-205	290-365	16	
		6.3 < t ≤ 50 mm	125-205	285-360	16	14
	H116	3 ≤ t ≤ 30 mm	230	315	10	10
		30 < t ≤ 40 mm	215	305		10
		40 < t ≤ 50 mm	200	285		10
	H321	3 ≤ t ≤ 12.5 mm	230-315	315-405	12	
		12.5 < t ≤ 40 mm	215-305	305-385		10
		40 < t ≤ 50 mm	200-295	285-370		10

Notes:

1) Elongation in 50 mm apply for thicknesses upto and including 12.5 mm and in 5d for thicknesses over 12.5 mm.
2) 8% for thicknesses upto and including 6.3 mm.
3) The mechanical properties for the O and H111 tempers are the same. However, they are separated to discourage dual certification as these tempers represent different processing.

Designation	Condition
F	As fabricated
O	Annealed, soft
H1	Strain hardened only
H2	Strain hardened and partially annealed
H3	Strain hardened and thermally stabilized
H321	Strain hardened and stabilized
H11	Strain hardened to specified strength
H12	Strain hardened to specified strength
H13	Strain hardened to specified strength
H111	Less strain hardened than H11 e.g. by straightening or stretching
H112	No controlled strain hardening, but there are mechanical property limits
H116	Treatment against exfoliation corrosion
T5	Cooled from an elevated temperature shaping process and then artificially aged
T6	Solution heat treated and then artificially aged.

Table 2.8.2 : Mechanical properties for extruded products 3 [mm] ≤ t ≤ 50 mm

Grade	Temper condition	Thickness, t	0.2% proof stress [N/mm^2]	Tensile strength [N/mm^2]	Elongation % minimum 1)	
					On gauge length of 50 [mm]	On gauge length of 5 x dia
5083	O	3 ≤ t ≤ 50 mm	110	270-350	14	12
	H/111	3 ≤ t ≤ 50 mm	165	275	12	10
	H112	3 ≤ t ≤ 50 mm	110	270	12	10
5383	O	3 ≤ t ≤ 50 mm	145	290	17	17
	H111	3 ≤ t ≤ 50 mm	145	290	17	17
	H112	3 ≤ t ≤ 50 mm	190	310		13
5059	H112	3 ≤ t ≤ 50 mm	200	330		10
5086	O	3 ≤ t ≤ 50 mm	95	240-315	14	12
	H111	3 ≤ t ≤ 50 mm	145	250	12	10
	H112	3 ≤ t ≤ 50 mm	95	240	12	10
6005A	T5	3 ≤ t ≤ 50 mm	215	260	9	8
	T6	3 ≤ t ≤ 10 mm	215	260	8	6
		10 ≤ t ≤ 50 mm	200	250	8	6
6061	T6	3 ≤ t ≤ 50 mm	240	260	10	8
6082	T5	3 ≤ t ≤ 50 mm	230	270	8	6
	T6	3 ≤ t ≤ 50 mm	250	290	6	
		3 ≤ t ≤ 50 mm	260	310	10	8

Notes:

1) The values are applicable for longitudinal and transverse tensile test specimens as well.
2) Elongation in 50 mm applies for thicknesses upto and including 12.5 mm and in 5d for thicknesses over 12.5 mm.

Table 2.8.3 : Mechanical properties for extruded closed profiles (testing transverse to extruding direction)

Grade	Temper condition	0.2% proof stress [N/mm^2]	Tensile strength [N/mm^2]	Elongation % min on gauge length of 5 x dia
6061	T5/T6	205	245	4
6005A	T5/T6	215	250	5
6082	T5/T6	240	290	5

2.9 Freedom from defects

2.9.1 The finished material is to have a good finish and is to be free from internal and surface defects prejudicial to the use of the concerned material for the intended application.

2.9.2 Slight surface imperfections may be removed by smooth grinding or machining as long as the thickness of the material remains within the tolerances given in 2.4.

2.10 Corrosion testing

2.10.1 Rolled 5xxx-alloys of type 5083, 5383, 5059, 5086 and 5456 in the H116 and H321 tempers intended for use in marine hull construction or in marine applications where frequent direct contact with seawater is expected, are to be corrosion tested with respect to exfoliation and intergranular corrosion resistance.

2.10.2 The manufacturers are to establish the relationship between microstructure and resistance to corrosion when the above alloys are approved. A reference photomicrograph taken at 500x under the conditions specified in ASTM B928:2015, Section 9.4.1, is to be established for each of the alloy-tempers and relevant thickness ranges. The reference photographs are to be taken from samples which have exhibited no evidence of exfoliation corrosion and a pitting rating of PB or better, when subjected to the test described in ASTM G66:2018 “Standard test method for visual assessment of exfoliation, corrosion susceptability of 5xxx series aluminium alloys” (ASSET Test). The samples are also to have exhibited resistance to intergranular corrosion at a mass loss not greater than 15 [mg/cm^2], when subjected to tests described in ASTM G67:2018 “Standard test method for determining the susceptibility to intergranular corrosion of 5xxx series aluminium alloys by mass loss after exposure to nitric acid” (NAMLT). Upon satisfactory establishment of the relationship between microstructure and resistance to corrosion, the master photomicrographs and the results of the corrosion tests are to be approved by IRS. Production practices are not to be changed after approval of the reference micrographs.

Other test methods may also be accepted at the discretion of IRS.

2.10.3 For batch acceptance of 5xxx-alloys in the H116 and H321 tempers, metallographic examination of one sample selected from mid width at one end of a coil or random sheet or plate is to be carried out. The microstructure of the sample is to be compared to the reference photomicrograph of acceptable material in the presence of the Surveyor. A longitudinal section perpendicular to the rolled surface is to be prepared for metallographic examination under the conditions specified in ASTM B928:2015, Section 9.6.1. If the microstructure shows evidence of continuous grain boundary network of aluminium-magnesium precipitate in excess of the reference photomicrographs of acceptable material, the batch is either to be rejected or tested for exfoliation-corrosion resistance and intergranular corrosion resistance subject to the agreement of the Surveyor. The corrosion tests are to be in accordance with ASTM G66:2018 and G67:2018 or equivalent standards. Acceptance criteria are as noted below:

i) The sample is to exhibit no evidence of exfoliation corrosion
ii) The pitting rating of the sample is to be PB or better when subjected to ASTM G66:2018 ASSET test
iii) The sample is to exhibit resistance to intergranular corrosion at a mass loss no greater than 15 [mg/cm^2] when

subjected to ASTM G67:2018 NAMLT test.

If the results from testing satisfy the acceptance criteria the batch is accepted, else it is to be rejected.
As an alternative to metallographic examination, each batch may be tested for exfoliation-corrosion resistance and intergranular corrosion resistance, in accordance with ASTM G66:2018 and G67:2018 under the conditions specified in ASTM B928:2015 or equivalent standards. If this alternative is used, then the results of the test must satisfy the acceptance criteria stated above.

2.11 Test materials

2.11.1 Definition of batches

Each batch is made up of products:

- of the same alloy grade and from the same cast
- of the same product form and similar dimensions (for plates, the same thickness)
- manufactured by the same process
- having been submitted simultaneously to the same temper condition.

2.11.2 The test samples are to be taken

- at one third of the width from a longitudinal edge of rolled products.
- in the range 1/3 to 1/2 of the distance from the edge to the centre of the thickest part of extruded products.

2.11.3 Test samples are to be taken so that the orientation of test specimens is as follows:

a) Rolled products

Normally, tests in the transverse direction are required. If the width is insufficient to obtain transverse test specimen, or in the case of strain hardening alloys, tests in the longitudinal direction will be permitted.

b) Extruded products

The extruded products are tested in longitudinal direction.

2.11.4 After removal of test samples, each test specimen is to be marked in order that its original identity, location and orientation is maintained.

2.12 Mechanical test specimens

2.12.1 Type and location of tensile test specimens are to be in accordance with details given in Ch.2.

2.13 Number of test specimens

2.13.1 Tensile test

a) Rolled products

- One tensile test specimen is to be taken from each batch of the product. If the weight of one batch exceeds 2000 [kg], one extra tensile test specimen is to be taken from every 2000 [kg] of the product or fraction thereof, in each batch.
- For single plates or for coils weighing more than 2000 [kg] each, only one tensile test specimen per plate or coil shall be taken.

b) Extruded products

- For the products with a nominal weight of less than 1 [kg/m], one tensile test specimen is to be taken from each 1000 [kg], or fraction thereof, in each batch. For nominal weights between 1 and 5 [kg/m], one tensile test specimen is to be taken from each 2000 [kg] or fraction hereof, in each batch. If the nominal weight exceeds 5 [kg/m], one tensile test specimen is to be taken for each 3000 [kg] of the product or fraction thereof, in each batch.

2.13.2 Corrosion tests

For rolled plates of grade 5083, 5383, 5059 and 5086 delivered in the tempers H116 or H321, one sample is to be tested per batch.

2.14 Retest procedures

2.14.1 When the tensile test from the first piece selected in accordance with Sec.11 fails to meet the requirements, two further tensile tests may be made from the same piece. If both of these additional tests are satisfactory,

this piece and the remaining pieces from the same batch may be accepted.

2.14.2 If one or both the additional tests referred to above are unsatisfactory, the piece is to be rejected, but the remaining material from the same batch may be accepted provided that two of the remaining pieces in the batch selected in the same way, are tested with satisfactory results. If unsatisfactory results are obtained from either of these two pieces then the batch of material is to be rejected.

2.14.3 In the event of any material bearing the Classification Society's brand failing to comply with the test requirements, the brand is to be unmistakably defaced by the manufacturer.

2.15 Visual and non-destructive examination

2.15.1 Surface inspection and verification of dimensions are the responsibility of the manufacturer, and acceptance by the Surveyors of material later found to be defective shall not absolve the manufacturer from this responsibility.

2.15.2 In general, the non-destructive examination of materials is not required for acceptance purposes. Manufacturers are expected, however to employ suitable methods of non-destructive examination for the general maintenance of quality standards.

2.15.3 For applications where the non-destructive examination of materials is considered to be necessary, the extent of this examination, together with appropriate acceptance standards, are to be agreed between the purchaser, manufacturer and Surveyor.

2.16 Rectification of defects

2.16.1 Local surface defects may be removed by machining or grinding, provided the thickness of the material remains within the tolerances given in para 2.4. The extent of repairs is to be agreed upon with the Surveyor, and all repairs are to be carried out under Surveyor's supervision, unless otherwise arranged.

2.16.2 Surface defects which cannot be dealt with as in 2.12.1 are not allowed to be repaired, unless it can be ensured that repair by welding does not affect the strength and stability of the piece for the intended purpose. Any case of repair by welding is to be specified in detail for consideration and approval by the Surveyor. Prior to any such repair welding, the defect is to be removed by machining or grinding. After complete removal of the defect and before welding the thickness of the piece at no place is to be reduced by more than 20 per cent. The welding is to be carried out by approved welders. The weld is to be ground flush with the surrounding piece surface. Before repair welding is commenced and after grinding the weld bead, suitable non destructive testing may be required at the discretion of the Surveyor.

2.17 Identification

2.17.1 The manufacturer is to adopt a system of identification which will ensure that all finished material in a batch presented for test is of the same nominal chemical composition.

2.17.2 Products are to be clearly marked by the manufacturer in accordance with the requirements of Ch.1. The following details are to be shown on all materials which have been accepted:

a) Manufacturer's name or trade mark;

b) Grade of alloy;

c) Identification mark which will enable the full history of the item to be traced;

d) Abbreviated designation of temper condition in accordance with para 2.6;

e) Personal stamp of the Surveyor responsible for the final inspection and also IRS’s stamp.

f) Tempered grades that are corrosion tested in accordance with 2.12 are to be marked “M” after the temper condition, e.g. 5083 H321 M.

2.17.3 When extruded products are bundled together or packed in crates for delivery, the marking specified in para 2.17.2 are to be affixed by a securely fastened tag or label.

2.18 Certification

2.18.1 Each test certificate or shipping statement is to include the following particulars:

a) Purchaser's name and order number;

b) Contract number;

c) Address to which material is to be dispatched;

d) Description and dimensions;

e) Specification or grade of alloys;

f) Identification mark which will enable the full history of the item to be traced;

g) Chemical composition;

h) Mechanical test results (Not required on shipping statement);

i) Details of heat treatment, where applicable; and

j) Corrosion test results (if any).

2.18.2 Where the alloy is not produced at the works at which it is wrought, a certificate is to be supplied by the Manufacturer of the alloy stating the cast number and chemical composition. The works at which alloys are produced must be approved by IRS. Also refer Chapter 1, Section 1, Cl. 1.3.2.

Section 3

Aluminium Alloy Castings

3.1 Scope

3.1.1 Provision is made in this section for aluminium alloy castings intended for use in the construction of ships, ships for liquid chemicals and other marine structures, liquefied gas piping systems where the design temperature is not lower than minus 165°C. These materials should not be used for piping outside cargo tanks except for short lengths of pipes attached to cargo tanks in which case fire resisting insulation should be provided.

3.1.2 Castings are to be manufactured and tested in accordance with Ch.1 and Ch.2 and also with the requirements of this Section.

3.1.3 As an alternative to 3.1.2, castings which comply with National/International and proprietary specifications may be accepted provided that these specifications give reasonable equivalence to the requirements of this Section or are approved for a specific application. Generally survey and certification are to be carried out in accordance with the requirements of Ch.1.

3.2 Manufacture

3.2.1 Castings are to be manufactured at foundries approved by IRS.

3.3 Quality of castings

3.3.1 All castings are to be free from surface or internal defects which would be prejudicial to their proper application in service.

3.4 Chemical composition

3.4.1 The chemical composition of a sample from each cast is to comply with the requirements given in Table 3.4.1. Suitable grain refining elements may be used at the discretion of the Manufacturer. The content of such elements is to be reported in ladle analysis.

3.4.2 Where it is proposed to use alloys not specified in Table 3.4.1 details of chemical composition, heat treatment and mechanical properties are to be submitted for approval.

3.4.3 When a cast is wholly prepared from ingots for which an analysis is already available, and provided that no significant alloy additions are made during melting, the ingot maker's certified analysis can be accepted subject to occasional checks as required by the Surveyor.

Table 3.4.1 : Chemical composition for aluminium alloy castings

Alloy Element %	Grade			
	AlMg3	**AlSi12**	**AlSi10Mg**	**AlSi7 High purity**
Copper	0.1 max	0.1 max.	0.1 max.	0.1 max.
Magnesium	2.5 - 4.5	0.1 max.	0.15 - 0.4	0.25 - 0.45
Silicon		0.5 max. 11.0 - 13.5	9.0 - 11.0	6.5 - 7.5
Iron	0.5 max.	0.7 max.	0.6 max.	0.2 max.
Manganese	0.6 max.	0.5 max.	0.6 max.	0.1 max.
Zinc	0.2 max.	0.1 max.	0.1 max.	0.1 max.
Chromium	0.1 max.	-	-	-
Titanium	0.2 max.	0.2 max.	0.2 max.	0.2 max.
Others				
each	0.05 max.	0.05 max.	0.05 max.	0.05 max.
Total	0.15 max.	0.15 max.	0.15 max.	0.15 max.
Aluminium	Remainder	Remainder	Remainder	Remainder

3.5 Heat treatment

3.5.1 Castings are to be supplied in the following conditions:

Grade Al-Mg 3 — As manufactured

Grade Al-Si 12 — As manufactured

Grade Al-Si 10 Mg — As manufactured or solution heat treated and precipitation hardened

Grade Al-Si 7 Mg — Solution heat treated and precipitation (high purity) hardened

3.6 Mechanical tests

3.6.1 At least one tensile specimen is to be tested from each cast, where heat treatment is involved, for each treatment batch from each cast. Where continuous melting is employed 500 [kgs] of fettled castings may be regarded as a cast.

3.6.2 The test samples are to be separately cast in moulds made from the same type of material as used for the castings. These moulds should conform to National Standards.

3.6.3 The methods and procedures for the identification of the test specimens, and the castings they represent, are to be agreed with the Surveyor. The identification marks are to be maintained during the preparation of test specimens.

3.6.4 Where castings are supplied in the heat treated condition, the test samples are to be heat treated together with the castings which they represent prior to testing.

3.6.5 The results of all tensile tests are to comply with the appropriate requirements given in Table 3.6.1 and/or Table 3.6.2.

Table 3.6.1 : Minimum mechanical properties for acceptance purpose of sand cast and investment cast reference test pieces

Alloy	Temper (see Note)	Tensile strength [N/mm^2]	Elongation %
AlMg3	M	150	5
AlSi12	M	150	3
AlSi10Mg	M	150	2
AlSi10Mg	TF	220	1
AlSi7Mg	TF	230	5

Note
M - As cast condition
TF - Solution heat treated and precipitation hardened condition

Table 3.6.2 : Minimum mechanical properties for acceptance purpose of chill cast reference test pieces

Alloy	Temper (see Note)	Tensile strength [N/mm^2]	Elongation %
AlMg3	M	150	5
AlSi12	M	170	3
AlSi10Mg	M	170	3
AlSi10Mg	TF	240	1.5
AlSi7Mg	TF	250	5

Note
M - As cast condition
TF - Solution heat treated and precipitation hardened condition

3.7 Visual examination

3.7.1 All castings are to be cleaned and adequately prepared for inspection.

3.7.2 The accuracy and verification of dimensions are the responsibility of the manufacturer, unless otherwise agreed.

3.7.3 Before acceptance, all castings are to be presented to the Surveyor for visual examination.

3.8 Rectification of defective castings

3.8.1 At the discretion of the Surveyor, small surface blemishes may be removed by local grinding.

3.8.2 Where appropriate, repair by welding may be accepted at the discretion of the Surveyor. Such repair is to be made in accordance with an approved procedure.

3.9 Pressure testing

3.9.1 Where required by the relevant construction rules, castings are to be pressure tested before final acceptance. Unless otherwise agreed, these tests are to be carried out in the presence and to the satisfaction of the Surveyor.

3.10 Identification

3.10.1 The manufacturer is to adopt a system of identification which will enable all finished castings to be traced to the original cast and

the Surveyor is to be given full facilities for tracing the casting when required.

3.10.2 All castings which have been tested and inspected with satisfactory results are to be clearly marked with following details:

a) Identification number, cast number or other numbers which will enable the full history of the casting to be traced;

b) IR and the abbreviated name of local office of IRS;

c) Personal stamp of the surveyor responsible for the inspection;

d) Test pressure where applicable; and

e) Date of final inspection.

3.10.3 Where small castings are manufactured in large numbers, modified arrangements for identification may be specially agreed with the Surveyor.

3.11 Certification

3.11.1 The manufacturer is to provide the Surveyor with a written statement giving the following particulars for each casting or batch of castings which have been accepted :

a) Purchaser name and order number;

b) Description of castings and alloy type;

c) Identification number;

d) Ingot or Cast analysis;

e) General details of heat treatment where applicable;

f) Results of mechanical tests; and

g) Test pressure, where applicable.

Section 4

Aluminium/Steel Transition Joints

4.1 Scope

4.1.1 Provision is made in this section for explosion bonded composite aluminium/steel transition joints used for connecting aluminium structures to steel plating.

4.1.2 Each design is to be separately approved by IRS.

4.2 Manufacture

4.2.1 Transition joints are to be manufactured by an approved producer in accordance with an approved specification which is to include the maximum temperature allowable at the interface during welding.

4.2.2 The aluminium material is to comply with the requirements of Sec.1 and the steel is to be of an appropriate grade complying with the requirements of Ch.3.

4.2.3 Alternative materials which comply with International, National or proprietary specifications may be accepted provided that they give reasonable equivalence to the requirements of 4.2.2 or are approved for a specific application.

4.2.4 Intermediate layers between aluminium and steel may be used, in which case the material of any such layer is to be specified by the manufacturer and will be recorded in the approval certificate. Any such intermediate layer is then to be used in all production joints.

4.3 Visual and non-destructive examination

4.3.1 Each composite plate is to be subjected to 100 per cent visual and ultrasonic examination in accordance with a relevant National/ International standard to determine the extent of any unbounded areas. The unbounded areas are unacceptable and any such area and the surrounding 25 [mm] area is to be discarded.

4.4 Mechanical tests

4.4.1 Two shear test specimens and two tensile test specimens are to be taken from each end of each composite plate for tests to be made on bond strength. One shear and one tensile test specimen from each end are to be tested at ambient temperature after heating to the maximum allowable interface temperature; the other two specimens are to be tested without heat treatment.

4.4.2 Shear tests may be made on a specimen as shown in Fig.4.4.1 or an appropriate equivalent. Tensile tests may be made across the interface by welding extension pieces to each surface or by the ram method shown in Fig.4.4.2 or by an appropriate alternative method.

4.4.3 The shear and tensile strengths of all the test specimens are to comply with the requirements of the manufacturing specification.

4.4.4 If either the shear or tensile test strength of the bond is less than the specified minimum but not less than 70 per cent of the specified minimum, two additional shear and two tensile test specimens from each end of the composite plate are to be tested and, in addition bend tests as described in 4.4.6 and Table 4.4.1 are to be conducted.

4.4.5 If either the shear or the tensile strength of the bond is less than 70 per cent of the specified minimum the case is to be investigated. After evaluation of the results of this investigation IRS will consider the extent of composite plate which is to be rejected.

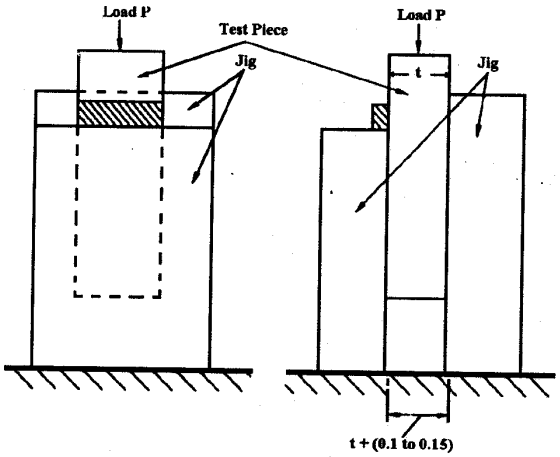

Fig.4.4.1 : Shear tests

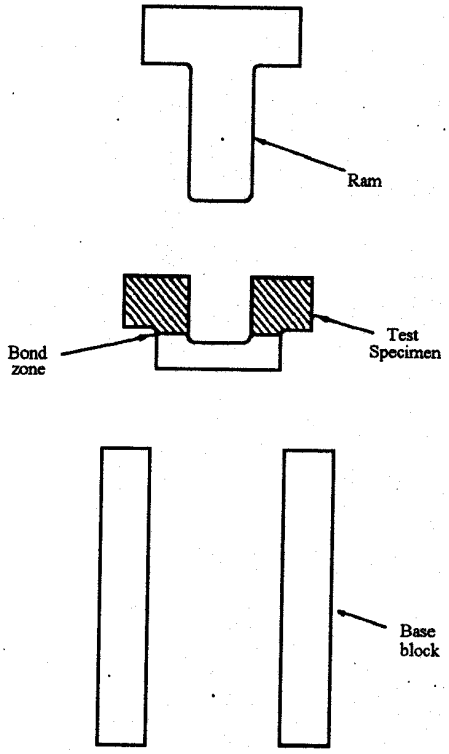

Fig.4.4.2 : Tensile tests

4.4.6 Bend tests, when required, are to be made under the following conditions, as listed in Table 4.4.1 :

a) the aluminium plate is in tension;

b) the steel plate is in tension; and

c) a side bend is applied.

Table 4.4.1 : Bend tests on explosion bonded aluminium / steel transition joints

Type of test	Minimum bend, degrees	Diameter of former
Aluminium in tension	90	3T
Steel in tension	90	3T
Side bend	90	6T

4.5 Identification

4.5.1 Each acceptable transition strip is to be clearly marked with IRS brand IR and the following particulars:

a) Manufacturers name or trade mark;

b) Identification mark for the grade of aluminium; and

c) Identification mark for the grade of steel.

The particulars are to be stamped on the aluminium surface at one end of the strip.

4.6 Certification

4.6.1 Each test certificate or shipping statement is to include the following particulars:

a) Purchaser's name and order number;

b) The contract number for which the material is intended, if known;

c) Address to which the material is dispatched;

d) Description and dimensions of the material;

e) Specification or grades of both the aluminium alloy and the steel and any intermediate layer;

f) Cast numbers of steel and aluminium plates;

g) Identification number of the composite plate; and

h) Mechanical test results (not required on the shipping statement).

5 *Offshore Mooring Chains*

Section 1

Anchors

1.1 Scope

1.1.1 The following paragraphs give requirements for cast, forged or fabricated steel anchor heads, shanks and anchor shackles. The requirements given in this section are applicable to the following types of anchors:

a) Ordinary stockless and stocked anchors
b) High Holding Power (HHP) anchors, and
c) Super High Holding Power (SHHP) anchors not exceeding 1500 [kg] in mass.

1.2 Manufacture

1.2.1 Cast steel anchor heads, shanks and shackles are to be manufactured and tested in accordance with the relevant requirements for castings for welded construction of Ch.4. The steel is to be fine grain treated with aluminium. The toughness of steel castings for SHHP anchors is to be not less than charpy V-notch energy average of 27 J at 0°C.

1.2.2 Forged steel anchor heads, shanks, shackles and anchor crown pins are to be manufactured in accordance with the requirements for forgings of weldable quality of Ch.5.

1.2.3 Plate material and bars used for the manufacture of fabricated parts of steel anchors are to comply with the requirements of Ch.3.

For welded super high holding power (SHHP) anchors, the base steel grades are to be selected with respect to the material grade requirements for Class II in Part 3, Chapter 2 'Materials of Construction' Section 2 'Use of Steel Grades'.

1.2.4 The welding consumables are to meet the toughness for the base steel grades in accordance with Part 2, Chapter 11 'Approval of Welding Consumables for Use in Ship Construction'.

1.2.5 Fabrication is to be carried out by qualified welders using approved welding procedure.

1.2.6 The toughness of the anchor shackles for SHHP anchors is to meet that for Grade CC3 anchor chain given in Section 2. The toughness of steel castings for SHHP anchors is to be not less than charpy V-notch energy average of 27 J at 0°C.

1.2.7 Hardness values of mating parts are to be such that the more easily replaceable part wears faster.

1.3 Dimensions and tolerances

1.3.1 Anchors are to be manufactured as per approved drawings or as per internationally recognised designs meeting the tolerances specified in such documents. In addition the following dimensional tolerances are also to be applied:

- the clearance either side of the shank within the shackle jaws is not to be more than 3 [mm] for anchors upto 3000 [kg] mass, 4 [mm] for anchors upto 5000 [kg] mass, 6 [mm] for anchors upto 7000 [kg] mass and 12 [mm] for larger anchors.

- the shackle pin is to be push fit in the eyes of the shackle, which are to be chamfered on the outside to ensure tightness when the pin is clenched over. The shackle pin to hole clearance is not to be more than 0.5 [mm] for pins upto 57 [mm] and not more than 1 [mm] for pins of larger diameter

- the anchor crown pin is to be snug fit within the chamber and long enough to prevent horizontal movement. The gap is not to be more than 1% of the chamber length.

- The lateral movement of the shank should not exceed 3 degrees.

1.4 Proof test of anchors

1.4.1 Anchors of all sizes are to be proof load tested with the load specified in Table 1.4.1. Anchors inclusive of stock, having a mass of 75 [kgs] or more (56 [kgs] in case of high holding power anchors) are to be tested at a proving establishment recognized by IRS.

1.4.2 The proof test load is to be as given in Table 1.4.1. The mass to be used in the Table is to be as follows:-

a) For stockless anchors - the total mass of the anchor;

b) For stocked anchors - the mass of the anchor excluding the stock;

c) For high holding power anchors - a nominal mass equal to 1.33 times the actual mass of the anchor;

d) For super high holding power anchors - a nominal mass equal to 2.0 times the actual mass of the anchor.

1.4.3 The proof load is to be applied on the arm or on the palm at a spot which, measured from the extremity of the bill, is one-third of the distance between it and the centre of the crown.

In the case of the stockless anchors, both arms are to be tested at the same time, first on one side of the shank, then reversed and tested on the other.

1.4.4 Before application of proof test load the anchors are to be examined to be sure that castings are reasonably free of surface imperfections of harmful nature.

On completion of the proof load tests the anchors are to be examined for cracks and other defects and for anchors made in more than one piece, the anchors are to be examined for free rotation of their heads over the complete angle.

In every test the difference between the gauge lengths (shown in Fig.1.4.4), where one-tenth of the required load was applied first and where the load has been reduced to one-tenth of the required load from the full load, is not to exceed one percent (1%).

1.4.5 In addition to the requirements given in this Chapter attention must be given to any relevant statutory requirements of the National Authority of the country in which the ship is to be registered.

Table 1.4.1 : Proof loads for anchors (Contd.)					
Mass of anchor [kg] (1)	**Proof load* [kN] (2)**	**Mass of anchor [kg] (1)**	**Proof load* [kN] (2)**	**Mass of anchor [kg] (1)**	**Proof load* [kN] (2)**
38000	2330.0	42000	2490.0	46000	2650.0
40000	2410.0	44000	2570.0	48000	2730.0
Proof loads for intermediate masses are to be determined by linear interpolation					

Notes

Where ordinary anchors have a mass exceeding 48 000 [kg], the proof loads are to be taken as 2.059 (mass of anchor in kg)$^{2/3}$ [kN].

Where high holding power anchors have a mass exceeding 38 000 [kg], the proof loads are to be taken as 2.452 (actual mass of anchor in kg)$^{2/3}$ [kN].

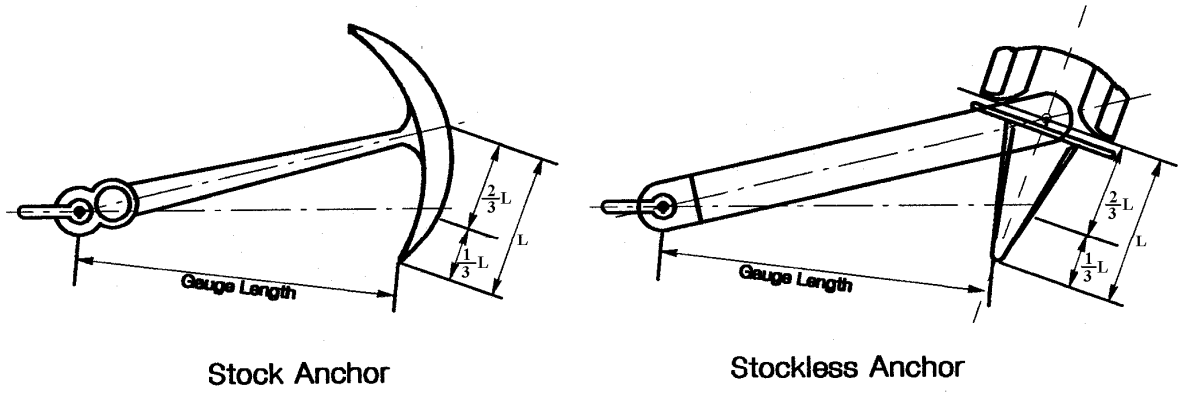

Fig.1.4.4 : Gauge Length

1.5 Inspections and other tests

1.5.1 Inspection and testing of anchor components is to be carried out as per the following:

a) Cast components are to be tested as per

Test Programme A

or

Test Programme B, where the Charpy V notch energy average of the cast material at 0°C is not less than 27J.

b) Forged / fabricated components are to be tested as per Test Programme B.

Test Programme A is to consist of Drop Test, Hammering Test, Visual Inspection and General NDE as described below.

Test Programme B is to consist of Visual Inspection, general NDE and Extended NDE as described in 1.5.5 and 1.5.6 below.

1.5.2 Drop test is to be carried out by dropping each anchor component individually from a height of 4 [m] to an iron or steel slab. The iron or steel slab should be able to resist the impact. The component under test should not fracture.

1.5.3 Hammering test is to be carried on each fluke and shank, after the drop test, by hammering the component, hung clear off the ground using a non-metallic sling, with a hammer of not less than 3 [kg] mass, to check the soundness.

1.5.4 Visual inspection is to be carried out of all accessible surfaces after the proof load test.

1.5.5 General non-destructive examination is to be carried out, after proof load testing, as per Table 1.5.5.

1.5.6 Extended non-destructive examination is to be carried out, after proof load testing, as per Table 1.5.6.

Table 1.5.5 : General NDE for Anchors		
Location	**Method of NDE**	
	SHHP	**Ordinary / HHP**
Feeders of castings	DP or MP and UT	DP or MP
Risers of castings	DP or MP and UT	DP or MP
All surfaces of castings	DP or MP	Not required
Weld repairs	DP or MP	DP or MP
Forged components	Not required	Not required
Fabrication welds	DP or MP	DP or MP
DP : Dye Penetrant Test		
MP : Magnetic Particle Test		
UT : Ultrasonic Testing

DP : Dye Penetrant Test	
MP : Magnetic Particle Test	
UT : Ultrasonic Testing	

1.6 Identification

1.6.1 All identification marks are to be stamped on one side of the anchor, on the shank and the fluke, at locations reserved solely for this purpose.

1.6.2 The following details are to be marked on all the anchors:-

a) IR and abbreviated name of local office of IRS issuing the certificate;

b) Number of the certificate;

c) Month and year of test;

d) Mass (also the letters 'HHP/SHHP', when approved for as high holding power anchor/super high holding power anchor);

e) Mass of stock (in case of stocked anchors);

f) Personal stamp of Surveyor responsible for inspection.

g) Manufacturer’s mark

h) Unique cast identification number of shank and fluke, if applicable.

1.6.3 In addition to the markings detailed in 1.6.2, each important part of the anchor is to be plainly marked with the words 'forged steel' or 'cast steel' as appropriate.

1.7 Painting

1.7.1 Anchors are to be painted only on completion of all inspections and tests.

Section 2

Stud Link Chain Cables

2.1 Scope

2.1.1 The following requirements apply to the materials, design, manufacture and testing of stud link anchor chain cables and accessories used for ships.

2.1.2 Depending upon the nominal tensile strength of the chain cable steel used for manufacture, stud link chain cables are subdivided in to three grades, namely CC1, CC2 and CC3.

2.2 Manufacture

2.2.1 Chain cables and accessories are to be manufactured at Works approved by IRS for the pertinent type of chain cable, size and method of manufacture. Also refer Chapter 1, Section 1, Cl. 1.3.2.

2.2.2 Chain cables are to be preferably manufactured by flash butt welding using material suitable for CC1, CC2 or CC3 grades of chain cables. Chain cables may also be manufactured by drop forging or casting.

Accessories such as shackles, swivels and swivel shackles are to be forged or cast in steel of at least grade CC2 material. The welded construction of these components will be specially considered.

2.2.3 Details of the method of manufacture and the specification of the steel are to be submitted for approval.

2.2.4 All materials used for the manufacture of chain cables and accessories are to be supplied by manufacturer's works approved by IRS. Also refer Chapter 1, Section 1, Cl. 1.3.2. However, for Grade CC1 steel bars, approval of material manufacturer is not required.

For Grade CC3 steel bars, detailed material specifications including manufacturing procedure, deoxidation practice, specified chemical composition, heat treatment and mechanical properties are to be submitted.

2.3 Design and tolerances

2.3.1 The form and proportion of chain cable links and shackles are to be in accordance with ISO 1704:2008 (see Figs.2.3.1 to 2.3.6). All dimensions in the figures are shown in multiples of the nominal diameter d of the common link. The dimensions in brackets may be chosen for studless links in outboard end swivel pieces. Where designs do not comply with this and where accessories are of welded construction, plans giving full details of the design, manufacturing process and heat treatment are to be submitted for approval.

2.3.2 The following tolerances are applicable to links with the provision that the plus tolerance may be up to 5 per cent of the nominal diameter:

a)

Nominal diameter Measured at the Crown (see note)	**Max. minus tolerance**
Upto 40 [mm]	1 [mm]
Over 40 and upto 84 [mm]	2 [mm]
Over 84 and upto 122 [mm]	3 [mm]
Over 122 and upto 152 [mm]	4 [mm]
Over 152 and upto 184 [mm]	6 [mm]
Over 184 and upto 222 [mm]	7.5 [mm]

Note : Two measurements are to be taken at the same location: one in the plane of the link (see d_p in Fig.2.3.7) and one perpendicular to the plane of the link. The cross sectional area at the crown is to be calculated using the average of the diameters with negative and plus tolerance

The cross sectional area at the crown must not have any negative tolerance. For diameters of 20 [mm] or greater, the plus tolerance may be upto 5 per cent of the nominal diameter. For diameters less than 20 [mm] the plus tolerance is to be agreed with IRS at the time of approval;

Diameter measured at locations other than the crown is to have no negative tolerance. Plus tolerance may be up to 5 per cent of the nominal diameter except at the butt weld where it is to be in accordance to manufacturer's specification, which is to be agreed with IRS. For diameters less than 20[mm], the plus tolerance is to be agreed with IRS at the time of approval.

a) The maximum allowable tolerance on assembly measured over a length of 5 links may equal +2.5 per cent but may not be negative (measured with the chain under tension after proof load test);

b) All other dimensions are subject to a manufacturing tolerance of ± 2.5 per cent, provided that all of the final link parts fit together properly;

c) Studs must be located in the links centrally and at right angles to the sides of the link, although the studs at each end of any length may also be located off-centre to facilitate the insertion of the joining shackle. The following tolerances are regarded as being inherent in the method of manufacture and will not be objected to provided the stud fits snugly and its ends lie practically flush against the inside of the link.

Maximum off-centre distance 'X'	10 per cent of the nominal diameter d
Maximum deviation "α" from the 90° position	4°

The tolerances are to be measured in accordance with Fig.2.3.7.

2.3.3 The following tolerances are applicable to accessories :

Nominal diameter : + 5 per cent, - 0 per cent
Other diameter : ± 2.5 per cent.

2.4 Material for welded chain cables and accessories

2.4.1 Bar material intended for the manufacture of welded chain cables is to be in accordance with the appropriate requirements of Ch.3. Rimming steel is not acceptable for this application.

2.4.2 Bars of the same nominal diameter are to be presented for test in batches of 50 tonnes or fraction thereof from the same cast. A suitable length from one bar in each batch is to be selected for test purposes.

2.4.3 In order to evaluate the suitability of the bar material the sample selected from each batch is to be tested in a heat treatment condition equivalent to that of the finished chain cable and accessories. For this purpose only the sample need be heat treated.

2.4.4 For all grades, one tensile test is to be taken from each sample selected. Additionally one set of three Charpy V-notch impact test specimens is to be prepared and tested as required in Table 2.4.1.

2.4.5 Where the dimensions allow, the test specimens are to be taken at approximately one-third of the radius from the outer surface as shown in Fig.2.4.1. For smaller diameters the test specimens are to be taken as close as possible to these positions.

2.4.6 The cross-sectional area of the tensile test specimen is to be not less than 150 [mm^2]. Alternatively, the tensile test specimen may be a suitable length of bar tested in full cross-section.

2.4.7 The impact test specimens are to be notched in the radial direction as shown in Fig.2.4.1.

2.4.8 The results of all the mechanical testing are to comply with the requirements of Table 2.4.1.

2.4.9 The average value obtained from one set of three impact test specimens is to comply with the requirements given in Table 2.4.1. One individual value only may be below the specified average value provided it is not less than 70% of that value.

If the Charpy V-notch impact test requirements are not achieved, a retest of three further specimens selected from the same sample as per 1.10.2 of Chapter 1 shall be permissible. Failure to meet the requirements will result in rejection of the test unit represented unless it can be clearly attributable to improper simulated heat treatment.

If the tensile test requirements are not achieved, a retest of two further specimens selected from the same sample shall be permissible. Failure to meet the specified requirements in either of the additional tests will result in rejection of the test unit represented unless it can be clearly attributable to improper simulated heat treatment.

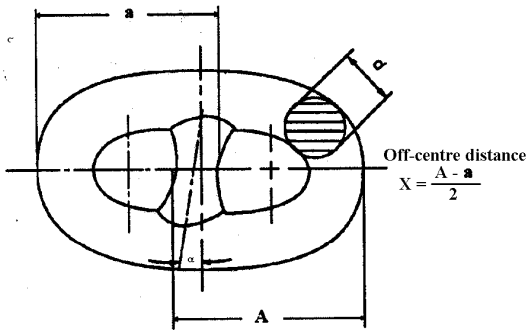

Fig. 2.3.7 : Link-stud tolerance

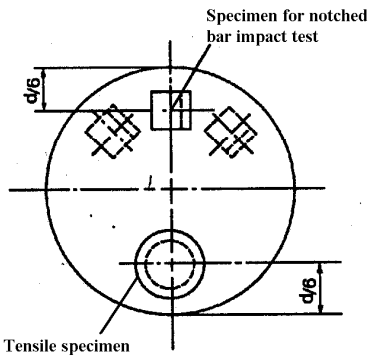

Fig. 2.4.1 : Position of test pieces

Table 2.4.1 : Mechanical properties of rolled steel bars for acceptance purposes

Designation	Tensile strength [N/mm²]	Yield strength [N/mm²] min.	Elongation on 5.65 $\sqrt{S_o}$% min.	Reduction of area % min.	Impact Tests	
					Test temp.°C	Average energy J min.[1]
Grade CC1	370 - 490	-	25	-	-	-
Grade CC2	490 - 690	295	22	-	0	27[1]
Grade CC3	Min. 690	410	17	40	0[2]	60
					-20	35

1 The impact test of grade CC2 material may be waived, if the chain is to be supplied in a heat treated condition as per Table 2.9.1.

2 The impact testing is normally to be carried out at 0°C.

Table 2.4.2 : Chemical composition of rolled steel bars

Designation	Chemical Composition					
	C max.	Si	Mn	P max.	S max.	Al (Total)[1] min.
Grade CC1	0.20	0.15 - 0.35	min. 0.40	0.040	0.040	-
Grade CC2[2]	0.24	0.15 - 0.55	max. 1.60	0.035	0.035	0.020
Grade CC3 [3]	To be specially considered in each case					

1 Aluminium may be replaced partly by other grain refining elements.

2 Subject to special consideration, additional alloying elements may be added.

3 To be killed and of fine grain.

Table 2.4.3 : Dimensional tolerance of rolled steel bars

Nominal diameter [mm]	Tolerance on diameter [mm]	Tolerance on roundness (dmax - dmin) [mm]
Less than 25	-0 + 1.0	0.6
25 – 35	-0 +1.2	0.8
36 – 50	-0 + 1.6	1.1
51 – 80	-0 + 2.0	1.5
81 – 100	-0 +2.6	1.95
101 – 120	-0 + 3.0	2.25
121 – 160	-0 + 4.0	3.0
161 – 210	-0 + 5.0	4.0

2.4.10 If failure to pass the tensile test or the Charpy V-notch impact test is definitely attributable to improper heat treatment of the test sample, a new test sample may be taken from the same piece and re-heat treated. The complete test (both tensile and impact test) is to be repeated and the original results obtained may be disregarded.

2.4.11 The chemical composition of the steel bars is to be generally within the limits given in Table 2.4.2.

2.4.12 The tolerances on diameter and roundness of rolled steel bars are to be within the limits specified in Table 2.4.3 unless otherwise agreed.

2.4.13 The minimum markings required for the steel bars are the manufacturers' brandmark, the steel grade and an abbreviated symbol of the heat. Steel bars having diameters of up to and including 40 mm and combined into bundles, may be marked on permanently affixed labels.

2.4.14 Material certification : Bar material for Grade 2 or Grade 3 is to be certified by IRS. For each consignment, manufacturers shall forward to the Surveyor a certificate containing at least the following data:

- Manufacturer's name and/or purchaser's order no.
- Number and dimensions of bars and weight of consignment
- Steel specification and chain grade
- Heat number
- Manufacturing procedure
- Chemical composition
- Details of heat treatment of the test sample (where applicable)
- Results of mechanical tests (where applicable)
- Number of test specimens (where applicable).

2.5 Material for cast chain cables and accessories

2.5.1 Manufacture of cast steel chain cables is generally to be in accordance with Ch.4, as appropriate.

2.5.2 All castings must be properly heat treated i.e. normalized, normalized and tempered or quenched and tempered, as specified in Table 2.7.1 for the relevant grade of steel.

2.6 Material for forged chain cables and accessories

2.6.1 The procedure for the manufacture of drop forgings for chain cables will be specially considered, but is generally to be in accordance with the appropriate requirements of Ch.5.

2.6.2 The stock material may be supplied in the as rolled condition. Finished forgings are to be properly heat treated, i.e. normalized, normalized and tempered or quenched and tempered, as specified for the relevant grade of steel in Table 2.7.1.

2.7 Heat treatment of completed chain cables

2.7.1 The completed chain cable and accessories are to be heat treated in accordance with Table 2.7.1, for the appropriate grade of cable.

2.7.2 In all cases, heat treatment is to be carried out prior to the proof, load test, breaking load test and all mechanical testing.

Table 2.7.1 : Condition of supply of chain cables and accessories		
Grade	**Chain cables**	**Accessories**
CC1	As welded or normalized	NA
CC2	As welded or normalized [1)]	Normalized
CC3	Normalized, Normalized and tempered or Quenched and tempered	Normalized, normalized and tempered or Quenched and tempered
1) Grade CC2 chain cables made by forging or casting are to be supplied in the normalized condition NA = Not Applicable.		

2.8 Materials and welding of studs

2.8.1 The studs are to be made of steel corresponding to that of the chain cable or from rolled, cast or forged mild steels. The use of other materials, e.g. grey or nodular cast iron is not permitted.

2.8.2 The welding of studs is to be in accordance with an approved procedure subject to following :

a) The studs being of weldable steel;

b) The studs being welded at one end only, i.e. opposite to the weldment of the link. The stud ends must fit inside of the link without appreciable gap;

c) The welds, preferably in the horizontal position, are to be executed by qualified welders using suitable welding consumables;

d) All the welds are to be completed before the final heat treatment of the chain cable; and

e) The welds are to be free from defects liable to impair the proper use of the chain.

2.9 Testing of completed chain cables

2.9.1 Finished chain cables are to be tested in the presence of a Surveyor, at a proving establishment recognized by IRS. For this purpose the chain cables must be free from paint and anti-corrosive media. Special attention would be given to the visual inspection of the flash-butt-weld, if present. In addition to the requirements of this Chapter, attention must be given to any relevant statutory requirements of the National Authority of the country in which the ship is to be registered.

2.9.2 The design and/or standard breaking loads and proof loads of stud link chain cables are given in Table 2.9.1 (a). The test loads rounded off from the loads in 2.9.1 (a) to be used for testing and acceptance of chain cables, are given in Table 2.9.1 (b). Each length of chain is to be subjected to a proof loading test in an approved testing machine and is to withstand the load given in Table 2.9.1 for the appropriate grade and size of cable. On completion of the test, each length of cable is to be examined and is to be free from significant defects.

Should a proof load test fail, the defective link(s) is (are) to be replaced, a local heat treatment to be carried out on the new link(s) and the proof load test is to be repeated. In addition, an investigation is to be made to identify the cause of the failure.

Table 2.9.1(a) : Formulae for proof loads and breaking loads of stud link chain cables			
Test	**Grade CC1**	**Grade CC2**	**Grade CC3**
Proof load (kN)	$0.00686d^2$ (44 – 0.08d)	$0.00981d^2$ (44 – 0.08d)	$0.01373d^2$ (44 – 0.08d)
Breaking load (kN)	$0.00981d^2$ (44 – 0.08d)	$0.01373d^2$ (44 – 0.08d)	$0.01961d^2$ (44 – 0.08d)
Note d = nominal diameter [mm]			

Table 2.9.1(b) : Test load values for stud link chain cables

Table 2.9.2 : Number of mechanical test specimens for finished chain cables and accessories

Grade	Manufacturing method	Condition of supply 1)	Number of test specimens		
			Tensile test for base metal	Charpy V-notch impact test	
				Base metal	Weldment
CC1	Flash-butt welded	AW N	NR	NR	NR
CC2	Flash-butt welded	AW --- N	1 --- NR	3 --- NR	3 --- NR
	Forged or Cast	N	1	3 [2)]	NA
CC3	Flash-butt welded	N NT QT	1	3	3
	Forged or Cast	N NT QT	1	3	NA

1) AW = As Welded, N = Normalized, NT = Normalized and Tempered, QT = Quenched and Tempered

2) For chain cables, Charpy V-notch impact test is not required.

NR = Not required
NA = Not applicable

Table 2.9.3 : Mechanical properties of finished chain cables and accessories

Grade	Yield strength [N/mm^2] min.	Tensile strength [N/mm^2] min.	Elongation on 5.65 √So % min.	Reduction of area % min.	Charpy V-notch impact test		
					Test temperature, in C	Absorbed energy, in Joules min.	
						Base metal	Weldment
CC1	NR	NR	NR	NR	NR	NR	NR
CC2	295	490 – 690	22	NR	0	27	27
CC3	410	690 min.	17	40	0 [1)]	60	50
					-20	35	27

1) Testing is normally to be carried out at 0°C.
NR = Not required.

2.9.3 Sample lengths comprising of at least three links are to be taken from every four lengths or fraction of chain cables and tested at the breaking loads given in Table 2.9.1. The breaking load is to be maintained for a minimum of 30 seconds. The links concerned are to be made in a single manufacturing cycle together with the chain cable and must be welded and heat treated together with it. Only after this these may be separated from the chain cable in the presence of the Surveyor.

2.9.4 Where a breaking load test specimen fails, a further specimen is to be cut from the same length of cable and subjected to test. If this re-test fails, the length of cable from which it was taken is to be rejected. When this test is also representative of other lengths, each of the remaining lengths in the batch is to be individually tested and is to meet the requirements of the breaking load test.

2.9.5 For large diameter cables where the required breaking load is greater than the capacity of the testing machines, special consideration will be given to acceptance of other alternative testing procedure.

2.9.6 Mechanical test specimens required in Table 2.9.2 are to be taken from every four lengths in accordance with 2.9.7. For forged or cast chain cables where the batch size is less than four lengths, the sampling frequency is to be by heat treatment charge. Mechanical tests are to be carried out in the presence of the Surveyor. The test specimens and their location are to be according to 2.4.5 to 2.4.7 and Fig.2.4.1. Testing and re-testing are to be carried out as given in 2.4.9.

2.9.7 An additional link (or where the links are small, several links) for mechanical test specimen removal is to be provided in a length of chain cable not containing the specimen for the breaking test. The specimen link must be manufactured and heat treated together with the length of chain cable.

2.10 Accessories for chain cables

2.10.1 End and joining shackles, attachment links, adapter pieces, swivels and other fittings are to be subjected to the proof and breaking loads appropriate to the grade and size of cable for which they are intended in accordance with the requirements of Table 2.9.1.

2.10.2 The breaking load is to be applied to at least one item out of every 25 (one in 50 for lugless shackles). The items need not necessarily be representative of each heat of steel or individual purchase order. Enlarged links and end links need not be tested provided that they are manufactured and heat treated together with the chain cable. The tested item is to be destroyed and not used as part of an outfit, in general. However, the accessories, which have been successfully tested at the prescribed breaking load appropriate to the chain, may be used in service at the discretion of IRS where the accessories are manufactured with the following:

a) material having higher strength characteristics than those specified for the part in question (e.g. grade 3 material for accessories for grade 2 chain).

b) or alternatively, same grade material as the chain but with increased dimensions and it is verified by procedure tests that such accessories are so designed that the breaking strength is not less than 1.4 times the prescribed breaking load of the chain for which they are intended.

2.10.3 The breaking load test may be waived if –

a) The breaking load has been demonstrated on the occasion of the approval testing of parts of the same design, and

b) The mechanical properties of each manufacturing batch are approved, and

c) The parts are subjected to suitable non-destructive testing.

2.10.4 Unless otherwise specified, the forging or casting must at least comply with the mechanical properties given in Table 2.9.3, when properly heat treated. For test sampling, forgings or castings of similar dimensions originating from the same heat treatment charge and the same heat of steel are to be combined into one test unit. From each test unit, one tensile test specimen and the Charpy V-notch impact test specimens are to be taken in accordance with Table 2.9.2. Mechanical tests are to be carried out in the presence of the Surveyor. Location of test specimens and test procedure are to be as given in 2.4.5 to 2.4.7 and Fig.2.4.1. Testing / re-testing is to be carried out as per 2.4.9. Enlarged links and end links need not be tested provided they are manufactured and heat treated together with the chain cable.

2.11 Identification

2.11.1 All lengths of cables and accessories are to be stamped with the following identification marks:-

a) IR and the abbreviated name of the local office of IRS issuing the certificate;
b) Number of certificate;
c) Date of test;
d) Proof load and grade of chain;
e) Personal stamp of the Surveyor responsible for inspection.

Section 3

Short Link Chain Cables

3.1 General

3.1.1 Details regarding the form and proportions of short link chain cable, materials, method of manufacture and testing are to be submitted for special consideration by IRS.

3.1.2 In general the short link chain cables are to comply with the grades L(3) and M(4) of ISO 1834.

3.2 Testing and inspection of chain cables

3.2.1 All chain cable of 12.5 [mm] diameter and above, and all steering chains irrespective of diameter are to be tested at a proving establishment recognised by IRS. In addition to the requirements stated in this Chapter, attention is to be given to any relevant statutory requirements of the National Authority of the country in which the ship is to be registered.

3.2.2 For chain of diameter less than 12.5 [mm], other than steering chains, the manufacturer's tests will be accepted.

3.2.3 After completion of all manufacturing processes, including heat treatment and galvanising, the whole of the chain is to be subjected to the appropriate proof load specified in Table 3.2.1.

3.2.4 The whole of the chain is to be inspected after the proof load test and is to be free from significant defects.

3.2.5 At least one sample, consisting of seven or more links, is to be selected by the Surveyor from each 200 [m] or less of chain for breaking load tests. Two additional links may be required for engagement in the jaws of the testing machine. These extra links are not to be taken into account in determining the total elongation (See 3.2.7).

3.2.6 The breaking load is to comply with the appropriate requirements of Table 3.2.1.

3.2.7 The total elongation of the breaking load sample at fracture, expressed as a percentage of the original inside length of the sample after proof loading, is to be not less than 20 per cent.

Table 3.2.1 : Mechanical test requirements for short link chain cables

Chain diameter [mm]	Grade L(3)		Grade M(4)	
	Proof load [kN]	Breaking load min. [kN]	Proof load [kN]	Breaking load min. [kN]
5	-	-	7.9	15.8
6	9	18	-	-
6.3	-	-	12.5	25
7.1	-	-	15.9	31.8
8	16	32	20.2	40.4
9	-	-	25.5	51
10	25	50	31.5	63
11.2	-	-	39.5	79
12	35.5	71	-	-
12.5	-	-	49.1	98.2
14	-	-	63	126
16	-	-	81	162
18	-	-	102	204
20	-	-	126	252
22.4	-	-	158	316
25	-	-	197	394
28	-	-	247	494
32	-	-	322	644
36	-	-	408	816
40	-	-	503	1006
45	-	-	637	1274

Section 4

Steel Wire Ropes

4.1 General

4.1.1 Steel wire ropes are to be manufactured at Works approved by IRS. Also refer Chapter 1, Section 1, Cl. 1.3.2.

4.1.2 The wire ropes are to be of six strand type with minimum of 16 wires in each strand. In addition to complying with the requirements of this Chapter, the details regarding form of construction and minimum breaking strength are to be in accordance with IS: 2266-1989. Alternative type of wire ropes will be specially considered on the basis of an equivalent breaking load and the suitability of the construction for the purpose intended.

4.1.3 It is recommended that the wire ropes intended for stream wires, towlines and mooring lines be of fiber core construction and wire ropes for towlines and mooring lines used in association with mooring winches be of wire rope core.

4.2 Materials

4.2.1 The wire used in the manufacture of the rope is to be drawn from steel made in accordance with the requirements of Ch.3.

Table 4.2.1 : Torsion test - Speed of testing	
Diameter of coated wire [mm]	Maximum speed of testing twists per minute
< 1.5	90
≥ 1.5 < 3.0	60
≥ 3.0 < 4.0	30

4.2.2 The tensile strength is generally to be within the ranges 1420 to 1570 [N/mm^2]; 1570 to 1770 [N/mm^2] or 1770 to 1960 [N/mm^2].

4.2.3 The wire is to be galvanized by a hot dip or electrolytic process to give a uniform coating which may be any of the following grades:-

Grade 1 : heavy coating, drawn after galvanizing;

Grade 2 : heavy coating, finally galvanized;

Grade 3 : light coating, drawn after galvanizing.

4.2.4 Torsion and zinc coating tests are to be carried out on wire samples taken from a suitable length of the completed rope. After unstranding and straightening, six wires are to be subjected to both a torsion test and a wrap test for adhesion of coating. Additionally, tests to determine the uniformity of the zinc coating are to be carried out.

4.2.5 As an alternative to test specimens taken as detailed in 4.2.4, tests may be carried out on the wire before the rope is stranded.

4.2.6 For the torsion test, the length of the sample is to be such as to allow a length between the grips of 100 times the wire diameter or 300 [mm], whichever is less. The wire is to be twisted by causing one or both of the vices to be revolved until fracture occurs. The speed of testing is not to exceed, for a length equal to 100 times the diameter, that given in Table 4.2.1 (a tensile load not exceeding 2 per cent of the breaking load of the wire may be applied to keep the wire stretched). The wire is to withstand, without fracture on a length of 100 times the diameter of wire, the number of complete twists given in Table 4.2.2.

Table 4.2.2 : Torsion test - Minimum number of twists				
Diameter of coated wire [mm]	**Minimum number of twists**			
	Grade 2		**Grade 1 or 3**	
	Tested before stranding	**Tested after stranding**	**Tested before stranding**	**Tested after stranding**
< 1.3	15	13	27	24
≥ 1.3 < 2.3	15	13	26	23
≥ 2.3 < 3.0	14	12	23	20
≥ 3.0 < 4.0	12	10	21	18

4.3 Zinc coating tests

4.3.1 The mass per unit area of the zinc coating is to be determined in accordance with a recognised standard and is to comply with the minimum values given in Table 4.3.1.

Table 4.3.1 : Zinc coating		
Diameter of coated wire [mm]	**Zinc coating [grams/m^2]**	
	Grade 1 or 2	**Grade 3**
≥ 0.40 < 0.50	75	40
≥ 0.50 < 0.6	90	50
≥ 0.6 < 0.8	110	60
≥ 0.8 < 1.0	130	70
≥ 1.0 < 1.2	150	80
≥ 1.2 < 1.5	165	90
≥ 1.5 < 1.9	180	100
≥ 1.9 < 2.5	205	110
≥ 2.5 < 3.2	230	125
≥ 3.2 < 4.0	250	135

4.3.2 The uniformity of the zinc coating is to be determined by a dip test carried out in accordance with the requirements of a recognized standard.

4.3.3 The adhesion of the coating is to be tested by wrapping the wire round a cylindrical mandrel for 10 complete turns. The ratio between the diameter of the mandrel and that of the wire is to be as in Table 4.3.2. After wrapping on the appropriate mandrel the zinc coating is to have neither flaked nor cracked to such an extent that any zinc can be removed by rubbing with bare fingers.

Table 4.3.2 : Wrap test for adhesion of zinc coating		
Coating	**Diameter coated wire [mm]**	**Max. ratio of mandrel to wire diameter**
Grade 1 and 2	< 1.5	4
	≥ 1.5	6
Grade 3	< 1.5	2
	≥ 1.5	3

4.4 Test on completed ropes

4.4.1 The breaking load is to be determined by testing to destruction a sample cut from the completed rope. This sample is to be of sufficient length to provide a clear test length of at least 36 times the rope diameter between the grips.

4.4.2 The actual breaking load is not to be less than that given in the appropriate approved standard.

4.5 Identification

4.5.1 All completed ropes are to be identified with attached labels detailing the rope type, diameter and length.

Section 5

Offshore Mooring Chains

5.1 Scope

5.1.1 Following requirements apply to the materials, design, manufacture and testing of offshore mooring chain and accessories intended to be used for application such as: mooring of mobile offshore drilling units, mooring of floating production units, mooring of offshore loading systems and mooring of gravity based structures during fabrication.

5.1.2 Mooring equipment covered by these requirements are common stud and studless links, connecting common links (splice links), enlarged links, end links, detachable connecting links (shackles), end shackles, subsea connectors, swivels and swivel shackles.

5.1.3 Studless link chain is normally to be deployed only once, being intended for long-term permanent mooring systems with pre-determined design life.

5.2 Chain grades

5.2.1 Depending on the nominal tensile strength of the steels used for manufacture, chains are subdivided into five grades, namely R3, R3S, R4, R4S and R5.

5.2.2 Manufacturers propriety specifications for R4S and R5 may vary subject to design conditions and acceptance of IRS.

5.2.3 Each Grade is to be individually approved. Approval for a higher grade does not constitute approval of a lower grade. If it is demonstrated to the satisfaction of the IRS that the higher and lower grades are produced to the same manufacturing procedure using the same chemistry and heat treatment, consideration will be given to qualification of a lower grade by a higher. The parameters applied during qualification are then, not to be modified during production.

5.3 Approval of chain manufacturers

5.3.1 Offshore mooring chain are to be manufactured only by works approved by IRS. Also refer Chapter 1, Section 1, Cl. 1.3.2. For this purpose approval tests are to be carried out, the scope of which is to include proof and breaking load tests, measurements and mechanical tests including fracture mechanics tests.

5.3.2 Manufacturers are to submit for review and approval the sequence of all operations from receiving inspection of raw materials to the shipment of finished products along with details of the following manufacturing processes:

a) bar heating and bending including the method, temperatures, temperature control and recording;

b) flash welding including current, force, time and dimensional variables as well as control and recording of parameters, maintenance procedure and programme for welding machine;

c) flash removal including method and inspection;

d) stud insertion method for stud link chain;

e) heat treatment including furnace types, means of specifying, controlling and recording of temperature and chain speed and allowable limits, quenching bath and agitation, cooling method after exit;

f) proof and break loading including method/machinery, means of horizontal support (if applicable), method of measurement and recording;

g) non-destructive examination procedures;

h) the manufacturer's surface quality requirement of mooring components;

i) the manufacturer's procedure for removing and replacing defective links without heat treatment of the entire chain.

5.3.3 For initial approval CTOD (Crack Tip Opening Displacement) tests are to be carried out on the particular mooring grade of material. CTOD tests are to be conducted in accordance with a recognized standard such as BS 7448 Part 1 and BS EN ISO

15653:2010. The CTOD test piece is to be a standard 2 x 1 single edge notched bend piece, test location as shown in Fig.5.3.1. The notch of the CTOD specimen is to be located as close to the surface as practicable. The minimum cross section of the test piece is to be 50 x 25 [mm] for chain diameter less than 120 [mm] and 80 x 40 [mm] for diameter 120 [mm] and above. CTOD specimens are to be taken from both the side of the link containing the weld and from the opposite side. Three links are to be selected for testing, i.e, a total of six CTOD specimens. The tests are to be taken at minus 20°C and the lowest CTOD of each set of 3 specimens is to meet the minimum values indicated below in Table 5.3.3:

Table 5.3.3 Minimum CTOD test values for chain type

Chain Type	R3 [mm]		R3S [mm]		R4 [mm]		R4S and R5 [mm]	
	BM	WM	BM	WM	BM	WM	BM	WM
Stud link	0.20	0.10	0.22	0.11	0.24	0.12	0.26	0.13
Studless	0.20	0.14	0.22	0.15	0.24	0.16	0.26	0.17

Note : BM : Base metal WM : Welded metal

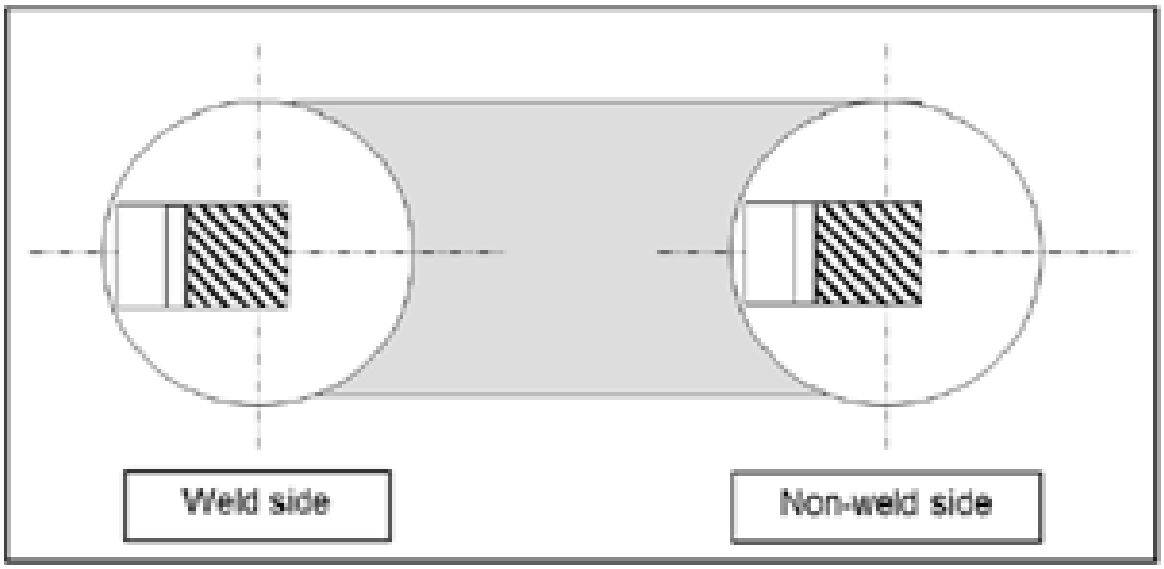

Fig. 5.3.1 : Location of CTOD test specimens for Chain

5.3.4 Calibration of furnaces is to be verified by measurement and recording of a calibration test piece with dimensions equivalent to the maximum size of link manufactured. The manufacturer is to submit a procedure for furnace temperature surveys which is to include the following requirements:

(a) The temperature uniformity of furnaces is to be surveyed whenever approval of manufacturer is requested and at least annually during normal operating conditions.

(b) Furnaces are to be checked by conveying a monitoring link instrumented with two thermocouples through the furnaces at representative travel speed.

(c) One thermocouple is to be attached to the surface of the straight part and one thermocouple is to be imbedded in a drilled hole located at the mid thickness position of the straight part of the calibration block. The time-temperature curves are to show that the temperatures

throughout the cross section and the soaking times are within specified limits as given in the heat treatment procedure.

5.3.5 For R4S and R5 chain and accessories, prior to approval, the manufacturer is to have undertaken experimental tests or have relevant supporting data to develop the chain and accessory material. The tests and data may include: fatigue tests, hot ductility tests (no internal flaws are to develop whilst bending in the link forming temperature range), welding parameter research, heat treatment study, strain age resistance, temper embrittlement study, stress corrosion cracking (SCC) data and hydrogen embrittlement (HE) study, using slow strain test pieces in hydrated environments. Reports indicating the results of experimental tests are to be submitted.

5.4 Approval of quality system at chain and accessory manufacturers

5.4.1 Chain and accessory manufacturers are to have a documented and effective quality system approved by IRS. The provision of such a quality system is required in addition to, and not in lieu of, the witnessing of tests by a Surveyor as specified in 5.7 to 5.14.

5.5 Approval of steel mills - rolled bar

5.5.1 Bar material intended for chain and accessories are to be manufactured only by works approved by IRS. The approval is limited to a nominated supplier of bar material. If a chain manufacturer wishes to use material from a number of suppliers, separate approval tests must be carried out for each supplier. Also refer Chapter 1, Section 1, Cl. 1.3.2.

Approval will be given only after successful testing of the completed chain. Each Grade is to be individually approved. Approval for a higher grade does not constitute approval of a lower grade. If it is demonstrated to the satisfaction of IRS that the higher and lower grades are produced to the same manufacturing procedure using the same chemistry and heat treatment, consideration will be given to qualification of a lower grade by a higher. The parameters applied during qualification are not to be modified during production. The approval will normally be limited upto the maximum diameter equal to that of the chain diameter tested. The rolling reduction ratio is to be recorded and is to be at least 5:1 for R3, R3S, R4, R4S and R5. The rolling reduction ratio used in production can be higher, but should not be lower than that qualified.

5.5.2 The bar manufacturer is to submit a specification of the chemical composition of the bar material, which must be approved by IRS and by the chain manufacturer. The bar maker is to confirm by analysis and testing that the specification is met.

For Grade R4, R4S and R5 chain the steel is to contain a minimum of 0.20 per cent molybdenum.

5.5.3 A heat treatment sensitivity study simulating chain production conditions is to be applied in order to verify mechanical properties and establish limits for temperature and time combinations. All test details and results are to be submitted to IRS.

5.5.4 The bar manufacturer is to provide evidence that the manufacturing process produces material that is resistant to strain ageing, temper embrittlement and for R3S, R4, R4S and R5, hydrogen embrittlement. All test details and results are to be submitted to IRS.

5.6 Approval of forge shops and foundries - accessories

5.6.1 Forge shops and foundries intending to supply finished or semi-finished accessories are to be approved by IRS. A description of manufacturing processes and process controls is to be submitted to IRS. The scope of approval is to be approved by IRS. The approval is to be limited to a nominated supplier of forged or cast material. If an accessory manufacturer wishes to use material from a number of suppliers, a separate approval must be carried out for each supplier.

5.6.2 Approval will be given only after successful testing of the completed accessory. Approval for a higher grade does not constitute approval of a lower grade. If it is demonstrated to the satisfaction of IRS that the higher and lower grades are produced to the same manufacturing procedure using the same steel specification, supplier and heat treatment, consideration will be given to qualification of a lower grade by a higher. The approval will normally be limited to the type of accessory and the designated mooring grade of material upto the maximum diameter or thickness equal to that of the completed accessory used for qualification. unless otherwise agreed by IRS. However, for the

different accessories that have the same geometry, the tests for initial approval are to be carried out on the one having the lowest reduction ratio. Qualification of accessory pins to maximum diameters is also required. Individual accessories of complex geometries will be specially considered.

5.6.3 For forgings – Forgings are to have wrought microstructure and the minimum reduction ratio is to be 3:1. The forging reduction ratio, used in the qualification tests, from cast ingot / slab to forged component is to be recorded. The forging reduction ratio used in production can be higher, but should not be lower than that qualified. The degree of upsetting during qualification is to be recorded and maintained during production. Heat cycling during forging and reheating is to be monitored by the manufacturer and recorded in the forging documentation. The manufacturer is to have a maintenance procedure and schedule for dies and tooling which is to be submitted to IRS.

5.6.4 The forge shop or foundry is to submit a specification of chemical composition of the forged or cast material, which must be approved by IRS. For Grade R4, R4S and R5 chain the steel should contain a minimum of 0.20 per cent molybdenum.

5.6.5 Forges and foundries are to provide evidence that the manufacturing process produces material that is resistant to strain ageing, temper embrittlement and for R4S and R5 grades, hydrogen embrittlement. A heat treatment sensitivity study simulating accessory production conditions shall be applied in order to verify mechanical properties and establish limits for temperature and time combinations. (Cooling after tempering shall be appropriate to avoid temper embrittlement). All test details and results are to be submitted to IRS.

5.6.6 For initial approval CTOD tests are to be carried out on the particular mooring grade of material. Three CTOD tests are to be tested in accordance with a recognized standard such as BS 7448 Part 1 and BS EN ISO 15653:2010. For rectangular accessories, the CTOD test piece is to be a standard 2 x 1 single edge notched bend specimen of thickness equal to full thickness of material to be tested. Subsized specimens may be used, subject to approval by IRS. For circular geometries, the minimum cross section of the test piece is to be 50 x 25 [mm] for accessory diameters less than 120 [mm], and 80 x 40 [mm] for diameters 120 [mm] and above. The notch of the CTOD specimen is to be located as close to the surface as practicable. The tests are to be taken at minus 20°C and the results submitted for review. The minimum values of each set of three specimens are to at least meet the requirements as indicated in Table 5.6.6 (same as that of the studless chain material shown in Table 5.3.3).

Table 5.6.6 : CTOD Test Values for Accessories

Grade of Accessory	R3 [mm]	R3S [mm]	R4 [mm]	R4S & R5 [mm]
CTOD	0.20	0.22	0.24	0.26

The geometry of accessories can vary. Figure 5.6.6 shows the CTOD location for circular and rectangular cross sections such as those of the D-shackle and accessories fabricated from rectangular sections. The orientation of the specimen is to consider the direction of the grain flow. Figure 5.6.6 (b) shows two possible sampling positions for CTOD test specimens with notch orientation for rectangular type accessories.

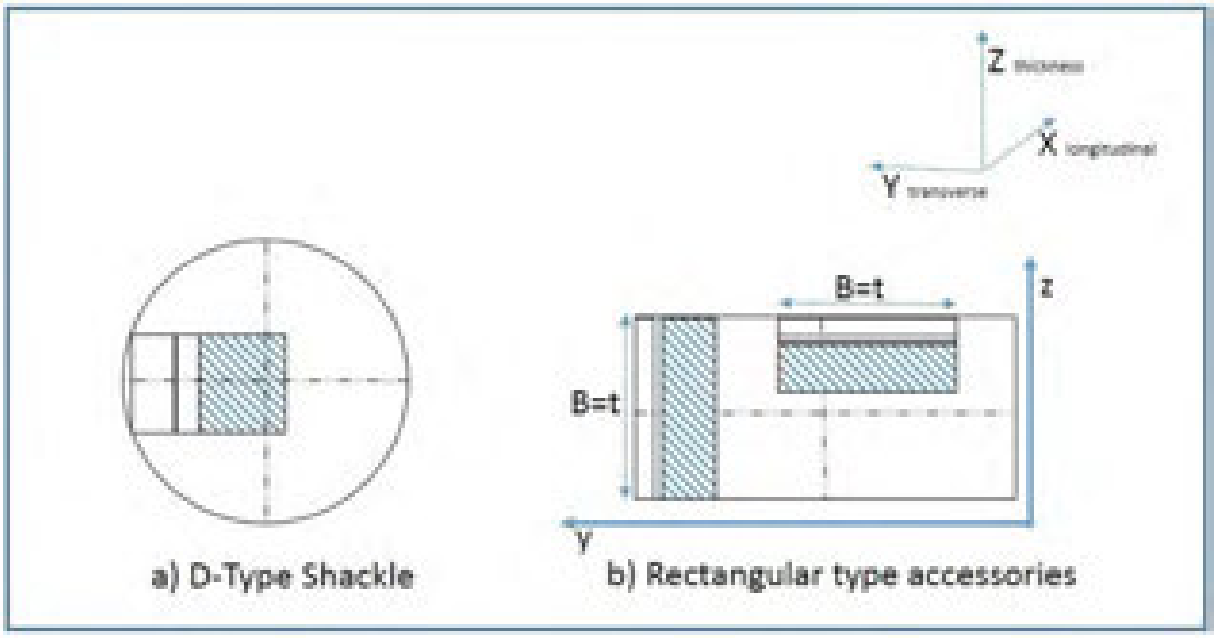

Figure 5.6.6 : Location of CTOD test specimens: a) Circular type accessory and b) rectangular type accessory, B corresponds to the thickness of material, the grain flow is considered in the longitudinal direction X

5.6.7 Calibration of furnaces shall be verified by measurement and recording of a calibration test piece with dimensions equivalent to the maximum size of link manufactured. Thermocouples are to be placed both on the surface and in a drilled hole located to the mid thickness position of the calibration block. The furnace dimensions are to be such as to allow the whole furnace charge to be uniformly heated to the necessary temperature. Temperature uniformity surveys of heat treatment furnaces for forged and cast components are to be carried out according to API Spec 6A/ISO 10423 Annex M or ASTM A991. The initial survey is to be carried out with maximum charge (load) in the furnace. Subsequent surveys are to be carried out annually and may be carried out with no furnace charge.

The quench bath maximum temperature and the maximum heat treatment transfer times from furnace to quench are to be established and documented. During production the established quenching parameters are to be followed and records are to be maintained of bath temperatures and transfer times.

5.6.8 For R4S and R5 refer to additional requirements in 5.3.5.

5.7 Rolled steel bars

5.7.1 Steel manufacture

5.7.1.1 The steels are to be manufactured by basic oxygen, electric furnace or such other process as may be specially approved. All steels are to be killed and fine grain treated. The austenitic grain size for R3, R3S and R4 is to be 6 or finer in accordance with ASTM E112 or equivalent grain size index in accordance to ISO 643. Measurements for circular sections are to be taken at 1/3 radius.

5.7.1.2 Steel for bars intended for R4S and R5 chain is to be vacuum degassed. The austenitic grain size is to be 6 or finer in accordance with ASTM E112 or equivalent grain size index in accordance to ISO 643. Measurements for circular sections are to be taken at 1/3 radius.

5.7.1.3 For R4S and R5 the following information is to be supplied by the bar manufacturer to the mooring chain manufacturer and the results included in the chain documentation:

a) Each heat is to be examined for non-metallic inclusions. The level of micro inclusions is to be quantified and assessed in accordance with national/ international standards; to be sure inclusion levels are acceptable for the final product.

b) A sample from each heat is to be macro etched according to ASTM E381 or equivalent to be sure there is no injurious segregation or porosity.

c) Hardenability data, according to ASTM A255, or equivalent, is to be supplied with each heat.

5.7.2 Chemical composition

For acceptance tests, the chemical composition of ladle samples of each heat is to be determined by the bar manufacturer and is to comply with the approved specification (see 5.5.2).

5.7.3 Mechanical tests

.1 Bars of the same nominal diameter are to be presented for test in batches of 50 tonnes or fraction thereof from the same heat. Test specimens are to be taken from material heat treated in the same manner as intended for the finished chain.

.2 Each heat of Grade R3S, R4, R4S and R5 is to be tested for hydrogen embrittlement. In case of continuous casting, test samples representing both the beginning and the end of the charge are to be taken. In case of ingot casting, test samples representing two different ingots are to be taken.

a) Two tensile test specimens are to be taken from the central region of bar material which has been subjected to the heat treatment cycle intended to be used in production. The specimens are to preferably have a diameter of 20 mm, alternatively 14 mm. One specimen is to be tested within max. 3 hours (1 1/2 hours for 14 mm diameter specimen) after machining. Where this is not possible, the specimen is to be cooled to -60°C immediately after machining and kept at that temperature for a period of maximum 5 days.

   The second specimen is to be tested after baking at 250°C for 4 hours (2 hours for 14 mm diameter specimen).

b) A slow strain rate < 0.0003 per second is to be used during the entire test, until fracture occurs. (This is approx. 10 minutes for a 20 mm diameter specimen).

c) Tensile strength, elongation and reduction of area are to be reported. The requirement for the test is:

$$\frac{Z_1}{Z_2} \geq 0.85$$

where,

Z_1 = Reduction of area without baking

Z_2 = Reduction of area after baking

d) If the requirement of $Z_1/Z_2 \geq 0.85$ is not achieved, the bar material may be subjected to a hydrogen degassing treatment after agreement with the Surveyor(s). New tests are to be performed after degassing.

.3 For all grades, one tensile and three Charpy V-notch specimens are to be taken from each sample selected. The test specimens are to be taken at approximately one-third radius below the surface, as shown in Sec. 2, Fig.2.4.1.
The results of all tests are to be in accordance with the appropriate requirements of Table 5.7.1.

.4 If the tensile test requirements are not achieved, a retest of two further specimens selected from the same sample will be permissible.
Failure to meet the specified requirements of either or both additional tests will result in rejection of the batch represented unless it can be clearly attributable to improper simulation of the heat treatment.

.5 If the impact test requirements are not achieved, a retest of three further specimens selected from the same sample will be permissible. The results are to be added to those previously obtained to form a new average. The new average is to comply with the requirements. No more than two individual results are to be lower than the required average and no more than one result is to be below 70 per cent of the specified average value.

Failure to meet the requirements will result in rejection of the batch represented. Where the failure can be clearly attributable to improper simulation of the heat treatment, new tests may be permitted at the discretion of the Surveyor.

5.7.4 Dimensional tolerances

The diameter and roundness are to be within the tolerances specified in Sec. 2, Table 2.4.3, unless otherwise agreed.

5.7.5 Non-destructive examination and repair

a) Non-destructive examination is to be performed in accordance with recognized standards such as those given below or equivalent:

   i. Magnetic Particle Testing (MT) of Bars – ASTM E1444 and ISO 9934
   ii. Magnetic Leakage Flux Testing (MLFT) – JIS Z2319
   iii. Eddy Current Testing (ET) of bars – ISO 15549

   Non-destructive examination procedures, together with rejection / acceptance criteria are to be submitted to IRS.

b) Manufacturers are to prepare written procedures for NDE. NDE personnel are to be qualified and certified according to ISO 9712, ACCP or equivalent. Personnel qualification to an employer or responsible agency based qualification scheme as SNT-TC-1A may be accepted if the employer's written practice is reviewed and found acceptable and the Level III is ASNT Level III, ISO 9712 Level III or ACCP Professional Level III and certified in the applicable method. NDE operators are to be qualified to at least level II.

c) The manufacturer is to ensure that 100 percent of bar material intended for either chain or fittings is subjected to ultrasonic examination at an appropriate stage of the manufacture to procedures approved by IRS and to the acceptance criteria required.. The bars are to be free of pipe, cracks and flakes. If the end length of the delivered bars is not subjected to UT then it is to be agreed between the bar supplier and the chain manufacturer of what length of bar is to be removed from the ends. The details are to be documented in the approval of each bar supplier. Phased array UT procedures may be applied, subject to approval by IRS.

d) 100 percent of the bar material is to be examined by magnetic particle (MT) or eddy current (ET) or Magnetic Leakage Flux Testing (MLFT) methods. The bars are to be free of injurious surface imperfections such as seams, laps and rolled-in mill scale. Provided that their depth is not greater than 1 per cent of the bar diameter, longitudinal discontinuities may be removed by grinding and blending to a smooth contour.

   All bars supplied in a machined (peeled) condition are to be 100% visually inspected. 10% inspection with magnetic particle testing (MT) or eddy current testing (ET) or Magnetic Leakage Flux Testing (MLFT), for longitudinal imperfections may be undertake at the discretion of the Surveyor. The maximum depth of peeling is to be agreed and documented in the approval of each supplier.

e) The frequency of NDE may be reduced at the discretion of the Surveyor provided it is verified by statistical means that the required quality is consistently achieved.

f) Weld repair of bars is not permitted.

5.7.6 Marking

Each bar is to be stamped with the steel grade designation and the charge number (or a code indicating the charge number) on one of the end surfaces. Other marking methods may be accepted subject to agreement.

Table 5.7.1 : Mechanical properties of offshore mooring chain and accessories

Grade	Yield stress [N/mm^2] min. (Note 1)	Tensile strength [N/mm^2] min. (Note 1)	Elongation % min.	Reduction of area % min. (Note 3)	Charpy V-notch impact test		
					Test temp. °C (Note 2)	Average energy J min.	Average energy flash weld J min.
R3	410	690	17	50	0 -20	60 40	50 30
R3S	490	770	15	50	0 -20	65 45	53 33
R4	580	860	12	50	-20	50	36
R4S (Note 4)	700	960	12	50	-20	56	40
R5 (Note 4)	760	1000	12	50	-20	58	42

Notes:

1 Aim value of yield to tensile ratio: 0.92 max.

2 At the option of IRS the impact test of Grade R3 and R3S may be carried out at either 0°C or minus 20°C.

3 Reduction of area of cast steel is to be for Grades R3 and R3S: min. 40%, for R4, R4S and R5 : min. 35% (see 5.9.4).

4 Aim maximum hardness for R4S is HB330 and R5, HB340.

5.8 Forged steel

5.8.1 Manufacture

5.8.1.1 Forged steels used for the manufacture of accessories are to be in compliance with approved specifications and the submitted test reports approved by IRS. Steel is to be manufactured by basic oxygen, electric furnace or such other process as may be specially approved. All steel is to be killed and fine grain treated. The austenitic grain size for R3, R3S and R4 is to be 6 or finer in accordance with ASTM E112 or equivalent grain size index in accordance to ISO 643. Measurements for circular sections are to be taken at 1/3 radius. Measurements for non-circular sections are to be taken at 1/4t.

5.8.1.2 Steel for forgings intended for R4S and R5 chain is to be vacuum degassed. The austenitic grain size is to be 6 or finer in accordance with ASTM E112 or equivalent grain size index in accordance to ISO 643. Measurements for circular sections are to be taken at 1/3 radius. Measurements for non-circular sections are to be taken at 1/4t.

5.8.1.3 For steel intended for R4S and R5 accessories the following information is to be supplied by the steel manufacturer to the mooring accessory manufacturer and the results included in the accessory documentation:

a) Each heat is to be examined for non-metallic inclusions. The level of micro inclusions is to be quantified and assessed in accordance with the national / international standards; to be sure inclusion levels are acceptable for the final product.

b) A sample from each heat is to be macroetched according to ASTM E381 or

equivalent, to be sure there is no injurious segregation or porosity.

c) Hardenability data, according to ASTM A255 or equivalent, is to be supplied with each heat.

5.8.2 Chemical composition

For acceptance tests, the chemical composition of ladle samples of each heat is to be determined by the bar manufacturer and is to comply with the approved specification (see 5.5.2).

5.8.3 Heat treatment

Finished forgings are to be properly heat treated in compliance with specifications approved by IRS.

5.8.4 Mechanical properties

The forgings are to comply with the mechanical properties given in Table 5.7.1, when properly heat treated.

5.8.5 Mechanical tests

5.8.5.1 For test sampling, forgings of similar dimensions (diameters do not differ by more than 25 mm) originating from the same heat treatment charge and the same heat of steel are to be combined into one test unit. From each test unit one tensile and three impact test specimens are to be taken and tested. For the location of the test specimens see Sec. 2, Fig.2.4.1.

5.8.5.2 Each heat of Grade R3S, R4, R4S and R5 is to be tested for hydrogen embrittlement. In case of continuous casting, test samples representing both the beginning and the end of the charge is to be taken. In case of ingot casting, test samples representing two different ingots are to be taken.

5.8.5.2.1 Two (2) tensile test specimens are to be taken from the central region of forged material which has been subjected to the heat treatment cycle intended to be used in production. A specimen with a diameter of 20 [mm] is preferred (consideration will be given to a diameter of 14 [mm]).

5.8.5.2.2 One of the specimens is to be tested within a maximum of 3 hours after machining (for a 14 [mm] diameter specimen, the time limit is 1½ hours). Where this is not possible, the specimen is to be immediately cooled to -60°C after machining and kept at that temperature for a maximum period of 5 days.

5.8.5.2.3 The second specimen is to be tested after baking at 250°C for 4 hours, alternatively 2 hours for 14 [mm] diameter specimen.

5.8.5.2.4 A slow strain rate < 0,0003 s^{-1} is to be used during the entire test, until fracture occurs (This is approximately 10 minutes for the 20 [mm] diameter specimen). Tensile strength, elongation and reduction of area are to be reported.

5.8.5.2.5 The acceptance requirement for the test is as follows:

$Z_1 / Z_2 \geq 0.85$

Where:

Z_1 = Reduction of area without baking
Z_2 = Reduction of area after baking

If the requirement $Z_1/Z_2 \geq 0.85$ is not achieved, the bar material may be subjected to a hydrogen degassing treatment after agreement with IRS. New tests are to be performed after degassing.

5.8.6 Non-destructive examination and repair

5.8.6.1 Non-destructive examination is to be performed in accordance with recognized standards such as those indicated below, or equivalent. The non-destructive examination procedures, together with rejection / acceptance criteria are to be submitted to IRS.

(a) Magnetic particle testing (MT) of forgings: - EN 10228-1, ASTM A275, using wet continuous magnetization technique

(b) Ultrasonic testing (UT) of forgings: - EN 10228-3, ASTM A388, ISO 13588

5.8.6.2 Manufacturers are to prepare written procedures for NDE. NDE personnel are to be qualified and certified according to ISO 9712, ACCP or equivalent. Personnel qualification to an employer or responsible agency based qualification scheme as SNT-TC-1A may be accepted if the employer's written practice is reviewed and found acceptable and the Level III is ASNT Level III, ISO 9712 Level III or ACCP Professional Level III and certified in the applicable method. NDE operators are to be qualified to at least level II.

5.8.6.3 The forgings are to be subjected to 100 percent ultrasonic examination at an appropriate stage of manufacture and in compliance with the standard approved by IRS.

5.8.6.4 Defects on non-machined surfaces may be removed by grinding to a depth of 5% of the nominal diameter. Grinding is not permitted on machined surfaces, except for slight inspection grinding on plane surfaces to a maximum depth of 0.8 [mm] in order to investigate spurious indications. Welding repairs are not permitted.

5.8.7 Marking

Marking is to be similar to that specified in 5.7.6.

5.9 Cast steel

5.9.1 Manufacture

5.9.1.1 Cast steels used for the manufacture of accessories are to be in compliance with approved specifications and the submitted test reports approved by IRS. Steel is to be manufactured by basic oxygen, electric furnace or such other process as may be specially approved. All steel is to be killed and fine grain treated. The austenitic grain size for R3, R3S and R4 is to be 6 or finer in accordance with ASTM E112 or equivalent grain size index in accordance to ISO 643. Measurements for circular sections are to be taken at 1/3 radius. Measurements for non-circular sections are to be taken at 1/4t.

5.9.1.2 Steel for castings intended for R4S and R5 accessories is to be vacuum degassed. The austenitic grain size is to be 6 or finer in accordance with ASTM E112 or equivalent grain size index in accordance to ISO 643. Measurements for circular sections are to be taken at 1/3 radius. Measurements for non-circular sections are to be taken at 1/4t.

5.9.1.3 For steel intended for R4S and R5 accessories the following information is to be obtained and the results included in the accessory documentation:

a) Each heat is to be examined for non-metallic inclusions. The level of micro inclusions is to be quantified and assessed in accordance with the national/international standards; to be sure inclusion levels are acceptable for the final product.

b) A sample from each heat is to be macro etched according to ASTM E381 or equivalent to be sure there is no injurious segregation or porosity.

c) Hardenability data, according to ASTM A255, or equivalent is to be supplied with each heat.

5.9.2 Chemical composition

For acceptance tests, the chemical composition of ladle samples of each heat is to be determined by the bar manufacturer and is to comply with the approved specification (see 5.5.2).

5.9.3 Heat treatment

All castings are to be properly heat treated in compliance with specifications approved by IRS.

5.9.4 Mechanical properties

The castings are to comply with the mechanical properties given in Table 5.7.1. The requirement for reduction of area is, however, reduced to 40 per cent for grades R3 and R3S and 35 per cent for grade R4, R4S and R5.

5.9.5 Mechanical tests

For test sampling, castings of similar dimensions originating from the same heat treatment charge and the same heat of steel are to be combined into one test unit. From each test unit one tensile and three impact test specimens are to be taken and tested. For the location of the test specimens see Sec. 2, Fig.2.4.1.

5.9.6 Non-destructive Examination and Repair

5.9.6.1 Non-destructive examination is to be performed in accordance with recognized standards, such as those indicated below, or equivalent. The non-destructive examination procedures, together with rejection / acceptance criteria are to be submitted to IRS.

(a) Magnetic particle testing (MT) of castings: - ASTM E709, using wet continuous magnetisation technique

(b) Ultrasonic testing (UT) of castings: - ASTM A609, ISO 13588

5.9.6.2 Manufacturers are to prepare written procedures for NDE. NDE personnel are to be qualified and certified according to ISO 9712, ACCP or equivalent. Personnel qualification to an employer or responsible agency based qualification scheme as SNT-TC-1A may be accepted if the employer's written practice is reviewed and found acceptable and the Level III is ASNT Level III, ISO 9712 Level III or ACCP Professional Level III and certified in the applicable method. NDE operators are to be qualified to at least level II.

5.9.6.3 The castings are to be subjected to 100 percent ultrasonic examination in compliance with the standard approved by IRS.

5.9.6.4 Defects on non-machined surfaces may be removed by grinding to a depth of 5% of the nominal diameter. Grinding is not permitted on machined surfaces, except for slight inspection grinding on plane surfaces to a maximum depth of 0.8 [mm] in order to investigate spurious indications.

5.9.6.5 Where the repair entails removal of more than 5% of the diameter or thickness, the defective area is to be repaired by welding. The excavations are to be suitably shaped to allow good access for welding. The resulting grooves are to be subsequently ground smooth and complete elimination of the defective material is to be verified by NDE.

5.9.6.6 Weld repairs are classified as major or minor. A weld repair is considered major when the depth of the groove prepared for welding exceeds 25% of the diameter/thickness or 25 [mm], whichever is smaller. All other weld repairs are considered minor.

5.9.6.7 Major weld repairs require approval before the repair is commenced. Proposals for major repairs are to be accompanied by sketches or photographs showing the extent and positions of the repairs. A grain refining heat treatment is to be given to the whole casting prior to major repairs. A post weld heat treatment or repeat of original heat treatment of castings is to be carried out.

5.9.6.8 Minor and major weld repairs are to be recorded on sketches or photographs showing the extent and positions of the repairs.

5.9.6.9 All weld repairs are to be done by qualified welders using qualified procedures. Welders are to be qualified according to ISO 9606, ASME IX, ASTM A488 or equivalent. Procedures are to be qualified according to ISO 15614, ASME IX, ASTM A488 or equivalent with the following additional requirements: Charpy V notch impact tests with notch locations in weld metal, fusion line and heat affected zone + 2 [mm] and + 5 [mm] from fusion line, respectively. Test results are to meet the requirements specified for the parent metal.

5.9.7 Marking

Marking is to be similar to that specified in 5.7.6.

5.10 Materials for studs

5.10.1 The studs intended for stud link chain cable are to be made of steel corresponding to that of the chain or in compliance with specifications approved by IRS. In general, the carbon content is not to exceed 0.25 per cent if the studs are to be welded in place.

5.11 Design and Manufacture

5.11.1 Plans with design calculations, giving detailed design of chain and accessories made by or supplied through the chain manufacturer are to be submitted for approval. Typical designs are given in ISO 1704:2008 (see Sec. 2, Fig.2.3.1 to 2.3.6). For studless chain the shape and proportions are to comply with the requirements of this section. Other studless proportions are to be specially approved. It should be considered that new or non-standard designs of chain, shackles or fittings, may require a fatigue analysis and possible performance, fatigue or corrosion fatigue testing.

5.11.2 In addition for stud link chain, plans showing the detailed design of the stud are to be submitted for information. The stud is to give an impression in the chain link which is sufficiently deep to secure the position of the stud, but the combined effect of shape and depth of the impression is to be such as not to cause any harmful notch effect or stress concentration in the chain link.

5.11.3 Machining of Kenter shackles is to result in fillet radius of minimum 3 per cent of nominal diameter.

5.12 Chain cable manufacturing process

5.12.1 General

Offshore mooring chains are to be manufactured in continuous lengths by flash butt welding and are to be heat treated in a continuous furnace; batch heat treatment is not permitted. The use of joining shackles to replace defective links is subject to the written approval of the end purchaser in terms of the number and type permitted, except in special circumstances where short lengths of chain are delivered, such as chafing chain (Ref. 5.15). The use of connecting common links is restricted to 3 links in each 100 m of chain.

5.12.2 Manufacturing process records

Records of bar heating, flash welding and heat treatment are to be made available for inspection by the Surveyor.

5.12.3 Bar heating

a) Bars for links are to be heated by electric resistance, induction or in a furnace.

b) For electric resistance heating or induction heating, the heating phase is to be controlled by an optical heat sensor. The controller is to be checked at least once every 8 hours and the records are to be maintained.

c) For furnace heating, the heat is to be controlled and the temperature continuously recorded using thermocouples in close proximity to the bars. The controls are to be checked at least once every 8 hours and the records are to be maintained.

5.12.4 Flash welding

The following welding parameters are to be controlled during welding of each link:

a) Platen motion;

b) Current as a function of time;

c) Hydraulic pressure.

The controls are to be checked at least every 4 hours and records are to be maintained.

5.12.5 Heat treatment

a) Chain is to be austenitized, above the upper transformation temperature, at a combina-tion of temperature and time within the limits established.

b) When applicable, chain is to be tempered at a combination of temperature and time within the limits established. Cooling after tempering is to be appropriate to avoid temper embrittlement.

c) Temperature and time or temperature and chain speed are to be controlled and continuously recorded.

d) Grain determination is to be made for the final product. The austenitic grain size for R3, R3S, R4, R4S and R5 is to be 6 or finer in accordance with ASTM E112 or equivalent grain size index in accordance to ISO 643. Measurements for circular sections are to be taken at surface, 1/3 radius and centre for the base material, HAZ and weld.

5.12.6 Mechanical properties

The mechanical properties of finished chain and accessories are to be in accordance with Table 5.7.1. For the location of test specimens see Sec. 2, Fig.2.4.1.

5.12.7 Proof and breaking test loads

Chains and accessories are to withstand the proof and break test loads given in Table 5.12.1.

5.12.8 Freedom from defects

All chains are to have a workmanlike finish consistent with the method of manufacture and be free from defects. Each link is to be examined in accordance with 5.15.5 using approved procedures.

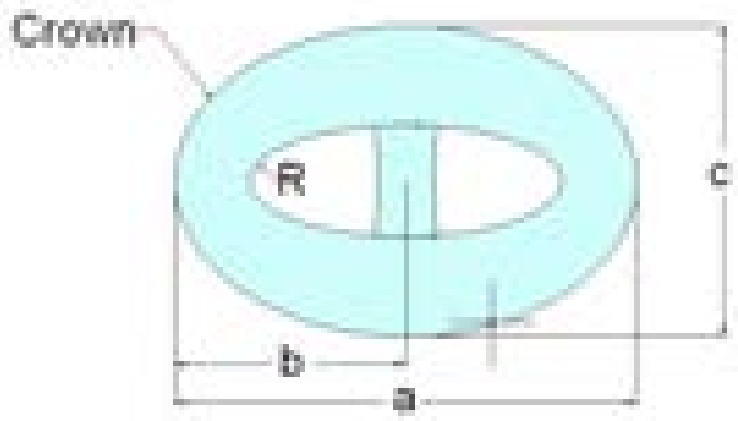
5.12.9 Dimensions and dimensional tolerances

The form and proportion of links and accessories are to be in accordance with the approved design. The tolerances given in Sec. 2, Cl. 2.3 are applicable, in general.

In addition, the tolerances for stud link and studless common links are to be measured in accordance with Fig.5.12.9a) and b).

Table 5.12.1 : Formulae for proof and break test loads, weight and length over 5 links		
Grade Type	**Proof load [kN]**	**Break load [kN]**
Grade R3 Stud Link	0.0148 d^2 (44 – 0.08d)	0.0223 d^2 (44 – 0.08d)
Grade R3S Stud Link	0.0180 d^2 (44 – 0.08d)	0.0249 d^2 (44 – 0.08d)
Grade R4 Stud Link	0.0216 d^2 (44 – 0.08d)	0.0274 d^2 (44 – 0.08d)
Grade R4S Stud Link	0.0240 d^2 (44 – 0.08d)	0.0304 d^2 (44 – 0.08d)
Grade R5 Stud Link	0.0251 d^2 (44 – 0.08d)	0.0320 d^2 (44 – 0.08d)
Grade R3 Studless	0.0148 d^2 (44 – 0.08d)	0.0223 d^2 (44 – 0.08d)
Grade R3S Studless	0.0174 d^2 (44 – 0.08d)	0.0249 d^2 (44 – 0.08d)
Grade R4 Studless	0.0192 d^2 (44 – 0.08d)	0.0274 d^2 (44 – 0.08d)
Grade R4S Studless	0.0213 d^2 (44 – 0.08d)	0.0304 d^2 (44 – 0.08d)
Grade R5 Studless	0.0223 d^2 (44 – 0.08d)	0.0320 d^2 (44 – 0.08d)
Chain Weight [kg/m]	Stud link = 0.0219 d^2	
Chain Weight [kg/m]	Studless chain weight calculations for each design are to be submitted	
Pitch Length :	Five link measure	
Minimum	22d	
Maximum	22.55d	

a) **Stud Link** – The internal link radii (R) and external radii should be uniform

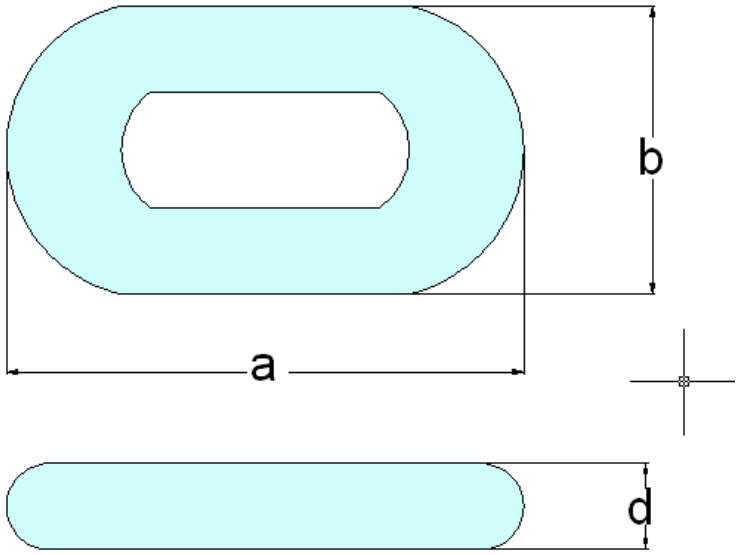


Designation [1)]	Description	Nominal Dimension of the Link	Minus Tolerance	Plus Tolerance
a	Link length	6d	0.15d	0.15d
b	Link half length	a*/2	0.1d	0.1d
c	Link width	3.6d	0.09d	0.09d
e	Stud angular misalignment	0 degrees	4 degrees	4 degrees
R	Inner radius	0.65d	0	----

Notes : 1 Dimension designation is shown in above figure
d = Nominal diameter of chain, (Refer Fig.2.3.1) a* = Actual link length

Fig.5.12.9a) : Stud Link common link, proportions dimensions and tolerances

b) **Studless** – The internal link radii (R) and external radii should be uniform.



Designation [1)]	Description	Nominal Dimension of the Link	Minus Tolerance	Plus Tolerance
a	Link length	6d	0.15d	0.15d
b	Link width	3.35d	0.09d	0.09d
R	Inner radius	0.60d	0	----

Notes : 1 Dimension designation is shown in above figure
d = Nominal diameter of chain
2 Other dimension ratios are subject to special approval.

Fig.5.12.9b) : Stud less common link, proportions dimensions and tolerances

5.12.10 Welding of studs

a) A welded stud may be accepted for grade R3 and R3S chains. Welding of studs in grade R4 chain is not permitted unless specially approved.

b) Where studs are welded into the links, the welding is to be completed before the chain is heat treated.

c) The stud ends must be a good fit inside the link and the weld is to be confined to the stud end opposite to the flash butt weld. The full periphery of the stud end is to be welded unless otherwise approved.

e) Welding of studs at both ends is not permitted unless specially approved.

f) The welds are to be made by qualified welders using an approved procedure and low-hydrogen approved consumables.

g) The size of the fillet weld is, as a minimum, to be as per API Specification 2F.

h) The welds are to be of good quality and free from defects such as cracks, lack of fusion, gross porosity and undercuts exceeding 1 mm.

i) All stud welds are to be visually examined. At least 10 per cent of all stud welds within each length of chain are to be examined by dye penetrant or magnetic particles after proof load testing. If cracks or lack of fusion are found, all stud welds in that length are to be examined.

5.12.11 Connecting common links (splice links)

.1 Single links to substitute for test links or defective links without the necessity for re-heat treatment of the whole length are to be made in accordance with an approved procedure. Separate approvals are required for each grade of chain and the tests are to be made on the maximum size of chain for which approval is sought.

.2 Manufacture and heat treatment of connecting common link is not to affect the properties of the adjoining links. The temperature reached by these links is nowhere to exceed 250°C.

.3 Each link is to be subjected to the appropriate proof load and non-destructive examination as detailed in Table 5.12.1 and 5.13.5 respectively. A second link is to be made identical to the connecting common link; the link is to be tested and inspected as per 5.13.4 and 5.14.5.

.4 Each connecting common link is to be marked either on the stud for stud link chain, or on the outer straight length on the side opposite the flash butt weld for studless chain. This marking is to be in accordance with 5.13.7 plus a unique number for the link. The adjoining links are also to be marked on the studs or straight length as above.

5.13 Testing and inspection of finished chain

5.13.1 General

a) This section applies to but is not limited to finished chain cable such as common stud and studless links, end links, enlarged end links and connecting common links (splice links).

b) All chains are to be subjected to proof load tests, sample break load tests and sample mechanical tests after final heat treatment in the presence of Surveyor. Where the manufacturer has a procedure to record proof loads and the Surveyor is satisfied with the adequacy of the recording system, he may not witness all proof load tests. The Surveyor is to satisfy himself that the testing machines are calibrated and maintained in a satisfactory condition.

c) Prior to inspection chains are to be free from scale, paint or other coating and are to have a suitably prepared surface as per the applied NDE testing standard. The chains are to be sand- or shot blast to meet this requirement.

5.13.2 Proof and break load tests

a) The entire length of chain is to withstand the proof load specified in Table 5.12.1 without fracture and

without crack in the flash weld. The load applied is not to exceed the proof load by more than 10 per cent when stretching the chain. Where plastic straining is used to set studs, the applied load is not to be greater than that qualified in approval tests.

b) A break-test specimen consisting of at least 3 links is to be either taken from the chain or produced at the same time and in the same manner as the chain. The test frequency is to be based on tests at sampling intervals according to Table 5.13.1 provided that every cast is represented. Each specimen is to be capable of withstanding the break load specified without fracture and without crack in the flash weld. It will be considered acceptable if the specimen is loaded to the specified value and maintained at that load for 30 seconds.

c) For chain diameters over 100 [mm], alternative break-test proposals to the above break-test will be considered whereby a one link specimen is used. Alternatives are to be approved by IRS. Every heat is to be represented, the test frequency is to be in accordance with Table 5.13.1 and it is to be demonstrated and proven that the alternative test represents an equivalent load application to the three link test.

d) If the loading capacity of the testing machine is insufficient, an alternative load testing machine is to be used that does have sufficient capacity (e.g. two loading machines in parallel) provided the testing and calibration procedure are agreed with IRS.

Table 5.13.1 : Frequency of break and mechanical tests

Nominal chain diameter (mm)	Maximum sampling interval (m)
Min - 48	91
49 - 60	110
61 - 73	131
74 - 85	152
86 - 98	175
99 - 111	198
112 - 124	222
125 - 137	250
138 - 149	274
150 - 162	297
163 - 175	322
176 – 186	346
187 – 198	370
199 - 210	395
211 – 222	420

5.13.3 Dimensions and dimensional tolerances

After proof load testing, measurements are to be taken on at least 5 per cent of the links in accordance with 5.12.9.

The entire chain is to be checked for the length, five links at a time. By the five link check the first five links are to be measured. In the next set of five links, at least two links from the previous five links set are to be included.

This procedure is to be followed for the entire chain length. The measurements are to be taken preferably while the chain is loaded to 5 - 10 per cent of the minimum proof load. The tolerances for the 5 link measurements are indicated in Table 5.12.1, any deviations from the 5 link tolerances are to be agreed by the client and IRS. The links held in the end blocks may be excluded from this measurement.

Chain dimensions are to be recorded and the information retained on file.

5.13.4 Mechanical tests

a) Links of samples detached from finished, heat treated chain are to be sectioned for determination of mechanical properties. A test unit is to consist of one tensile and nine impact specimens. The tensile specimen is to be taken in the side opposite the flash weld. Three impact specimens are to be taken across the flash weld with the notch centered in the middle. Three impact specimens are to be taken across the unwelded side and three impact specimens are to be taken from the bend region.

b) The test frequency is to be based on tests at sampling intervals according to Table 5.13.1 provided that every cast is represented. Mechanical properties are to be as specified in Table 5.7.1.

c) The frequency of impact testing in the bend may be reduced at the discretion of the Surveyor provided it is verified by statistical means that the required toughness is consistently achieved.

d) Hardness tests are to be carried out on finished chain. The frequency and locations are to be agreed with IRS. The recorded values are for information only and used as an additional check to verify that the heat treatment process has been stable during the chain production.

5.13.5 Non-destructive examination after proof load testing

a) All surfaces of every link are to be visually examined. Burrs, irregularities and rough edges are to be contour ground. Links are to be free from mill defects, surface cracks, dents and cuts, especially in the vicinity where gripped by clamping dies during flash welding. Studs are to be securely fastened. Chain is to be positioned in order to have good access to all surfaces. In order to allow optimal access to the surface area it is recommended that chain be hung in the vertical position, however access to inspect the interlink area may only be possible with the chain in the horizontal position.

b) Testing is to be performed in accordance with a recognized standard and the procedures, together with acceptance / rejection criteria are to be submitted to IRS for review. Manufacturers are to prepare written procedures for NDE. NDE personnel are to be qualified and certified according to ISO 9712, ACCP or equivalent. Personnel qualification to an employer or responsible agency based qualification scheme as SNT-TC-1A may be accepted if the employer's written practice is reviewed and found acceptable and the Level III is ASNT Level III, ISO 9712 Level III or ACCP Professional Level III and certified in the applicable method. NDE operators are to be qualified to at least level II.

c) Magnetic particle testing is to be employed to examine the flash welded area including the area gripped by the clamping dies. Procedures are to be submitted to IRS for approval. Approved procedures and equipment are to be used. Every link is to be examined. Additionally, 10% of links are to be tested on all accessible surfaces.

   Link surface at the flash weld is to be free from cracks, lack of fusion and gross porosity. Testing is to be performed in accordance with ASTM E709 or another recognized standard (e.g. ISO 9934) using wet continuous fluorescent magnetization technique. Non fluorescent techniques can be accepted in special cases where the standard inspection procedures are impractical.

   Links are to be free from:
   - relevant linear indications exceeding 1.6 mm in transverse direction
   - relevant linear indications exceeding 3.2 mm in longitudinal direction
   - relevant non-linear indications exceeding 4.8 mm.

d) Ultrasonic testing is to be employed to examine the flash weld fusion. Procedures are to be submitted to IRS for approval. Approved procedures and

equipment are to be used. On-site calibration standards for chain configurations are to be approved.

Every link is to be examined.

The flash weld is to be free from defects causing ultrasonic back reflections equal to or greater than the calibration standard. The flash butt welds are to be ultrasonic tested (UT) in accordance with ASTM E587 or another recognized standard using single probe, angle-beam shear waves in the range from 45 to 70°.

Single probe technique has limitations as far as testing of the central region is concerned and the flash weld imperfections such as flat spots may have poor reflectivity. Where it is deemed necessary, detectability of imperfections may need to be carried out by using a tandem technique, TOFD or phased array.

e) Stud welds, if used, are to be visually inspected. The toes of the fillets are to have a smooth transition to the link with no undercuts exceeding 1.0 [mm]. Additionally, at least 10% of the stud welds distributed through the length are to be dye penetrant tested according to ASTM E1417 or magnetic particle tested according to ASTM E1444 or equivalent. Cracks, lack of fusion or gross porosity are not acceptable. If defects are found, testing is to be extended to all stud welds in that length.

5.13.6 Retest, rejection and repair criteria

a) If the length over 5 links is short, the chain may be stretched by loading above the proof test load specified provided that the applied load is not greater than that approved and that only random lengths of the chain need stretching. If the length exceeds the specified tolerance, the overlength chain links are to be cut out and the requirements of 5.13.6(b) applied.

b) If single links are found to be defective or do not meet other applicable requirements, defective links may be cut out and a connecting common link inserted in their place. The individual heat treatment and inspection procedure of connecting common links is subject to the approval of the Surveyor. Other methods of repair are subject to approval of the Surveyor and the end purchaser. Weld repair of chain is not permitted.

c) If a crack, cut or defect in the flash weld is found by visual or magnetic particle examination, it is to be ground down no more than 5 per cent of the link diameter in depth and streamlined to avoid any sharp contours. However, the final dimensions are to conform to the agreed standard.

d) If indications of interior flash weld defects in reference to the accepted calibration standards are detected during ultrasonic examination, requirements of 5.13.6(b) are applied.

e) If link diameter, length, width and stud alignment do not conform to the required dimensions, these are to be compared to the dimensions of 40 more links; 20 on each side of the affected link. If a single particular dimension fails to meet the required dimensional tolerance in more than 2 of the sample links, all links are to be examined and requirements of 5.13.6(b) are applied.

f) If a break load test fails, a thorough examination is to be carried out to identify the cause of failure. Two additional break test specimens representing the same sampling length of chain are to be subjected to the break load test. Based upon satisfactory results of the additional tests and the results of the failure investigation, it will be decided what lengths of chain can be accepted. Failure of either or both additional tests will result in rejection of the sampling length of chain represented and requirements of 5.13.6(b) are applied.

g) If a link fails during proof load testing, a thorough examination is to be carried out to identify the probable cause of failure of the proof load test. In the event that two or more links in the proof loaded length fail, that section of proof loaded length is to be rejected.

The above mentioned failure investigation is to especially aim at ascertaining the presence in other lengths of factors or conditions thought to be causal to failure.

In addition, a break test specimen is to be taken from each side of the one

failed link and subjected to the breaking test. Where multiple chains are produced simultaneously it is recognized that the preceding flash butt welded link and subsequent flash butt welded link will be on an alternative chain length or the other end of the chain length. In such cases IRS may require that two additional break tests are to be taken from the lengths of chain that include the preceding and subsequent welded links. Based upon satisfactory results of both break tests and the results of the failure investigation, it will be decided what length of chain can be considered for acceptance. Failure of either or both breaking tests will result in rejection of the same proof loaded length.

Replacement of defective links is to be in accordance with the requirements of 5.13.6(b). If the investigation identifies defects in the flash butt weld or a lower strength flash weld “a glue-weld” is found, additional NDT such as phased array UT is to be carried out to identify if other links are affected. A full assessment of the flash butt welding machine is to be carried out, together with assessment of the condition of the bar ends prior to welding.

h) If the tensile test fails to meet the requirements, a retest of two further specimens selected from the same sample will be permissible. Failure to meet the specified requirements of either or both additional tests will result in rejection of the sampling length of chain represented and requirements of 5.13.6(b) are applied.

i) If the impact test requirements are not achieved, a retest of three further specimens selected from the same sample will be permissible. The results are to be added to those previously obtained to form a new average. The new average is to comply with the requirements. No more than two individual results are to be lower than the required average and no more than one result is to be below 70 per cent of the specified average value.

Failure to meet the requirements will result in rejection of the sampling length represented and requirements of 5.13.6(b) are applied.

5.13.7 Marking

.1 The chain is to be marked at the following places:

- At each end.
- At intervals not exceeding 100 m.
- On connecting common links.
- On links next to shackles or connecting common links.

All marked links are to be stated on the certificate, and the marking is to make it possible to recognize leading and tail end of the chain. In addition to the above required marking, the first and last common link of each individual charge used in the continuous length is to be traceable and adequately marked.

The marking is to be permanent and legible throughout the expected lifetime of the chain.

.2 The chain is to be marked on the studs as follows:

- Chain grade
- Certificate No.
- IRS stamp

The Certificate number may be exchanged against an abbreviation or equivalent, in which case the details are to be stated in the certificate.

The chain certificate will contain information on number and location of connecting common links. The certificate number and replacement link number may be exchanged against an abbreviation or equivalent, in which case, the details are to be stated in the certificate.

5.13.8 Documentation

a) A complete Chain Inspection and Testing Report in booklet form is to be provided by the chain manufacturer for each continuous chain length. This booklet is to include all dimensional checks, test and inspection reports, NDT reports, process records, photographs as well as any nonconformity, corrective action and repair work.

b) Individual certificates are to be issued for each continuous single length of chain.

c) All accompanying documents, appendices and reports are to carry reference to the original certificate number.

d) The manufacturer will be responsible for storing, in a safe and retrievable manner, all documentation produced for a period of at least 10 years.

5.14 Testing and inspection of accessories

5.14.1 General

a) Requirements in 5.14 apply to but is not limited to mooring equipment accessories such as detachable connecting links (shackles), detachable connecting plates (triplates), end shackles, swivels, swivel shackles and subsea connectors.

b) Prior to test and inspection the chain accessories are to be free from scale, paint or other coating.

c) All accessories are to be subjected to proof load tests sample, break load tests and sample mechanical tests after final heat treatment in the presence of a Surveyor. Where the manufacturer has a procedure to record proof loads and the Surveyor is satisfied with the adequacy of the recording system, he may not witness all proof load tests. The Surveyor is to satisfy himself that the testing machines are calibrated and maintained in a satisfactory condition.

d) For accessory production a Manufacturing Procedure Specification (MPS) is to be submitted to IRS that details all critical aspects of accessory production, casting, forging, heat treating (including arrangement and spacing of components in the heat treatment furnaces), quenching, mechanical testing, proof and break loading and NDE.

5.14.2 Proof and break load tests

a) All accessories are to be subjected to the proof load specified for the corresponding stud link chain.

b) Chain accessories are to be tested to the break test loads prescribed for the grade and size of chain for which they are intended. At least one accessory out of every 25 accessories is to be tested.

For individually produced, individually heat treated accessories or accessories produced in small batches (less than 5), alternative testing will be subject to special consideration and the following additional conditions may apply:

(i) Alternative testing is described in a written procedure and manufacturing procedure specification (MPS).

(ii) A finite element analysis is provided at the break load and demonstrates that the accessory has a safety margin over and above the break load of the chain.

(iii) Strain age testing (as per procedure approved by IRS) is carried out on the material grade produced to the same parameters at the time of qualification.

(iv) If an accessory is of a large size that will make heat treating in batches unfeasible or has a unique design, strain gauges are to be applied during the proof and break load tests during initial qualification and during production. The strain gauge results from production are to be comparable with the results from qualification.

A batch is defined as accessories that originate from the same heat treatment charge and the same heat of steel. Accessories which have been subjected to a break test are to be scrapped, in general. However, where the accessories are of increased dimensions or alternatively a material with higher strength characteristics is used, they may be included in the outfit at the discretion of IRS provided that:

v) the accessories are successfully tested at the prescribed breaking load appropriate to the chain for which they are intended, and

vi) it is verified by procedure tests that such accessories are so designed that the breaking strength is not less than 1.4 times the prescribed breaking load of the chain for which they are intended.

vii) strain age properties have been carried out on the material grade produced to the same parameters.

viii) strain gauges are to be applied during the break load test in the high stress locations to monitor that the strains stay within allowable limits.

5.14.3 Dimensions and dimensional tolerances

a) After proof load testing, at least one accessory (of the same type, size and nominal strength) out of 25 is to be checked for dimensions in accordance with 5.12.9. The manufacturer is to provide an adequate evidence indicating compliance with the purchaser's requirements.

b) The following tolerances are applicable to accessories:

- Nominal diameter : +5 percent, -0 percent
- Other dimensions : ± 2 ½ percent.

These tolerances do not apply to machined surfaces.

5.14.4 Mechanical tests

a) Accessories are to be subjected to mechanical testing as described in 5.8 and 5.9. Mechanical tests are to be taken from proof loaded full size accessories that have been heat treated with the production accessories they represent. At least one accessory out of every batch or every 25 accessories, whichever is less, is to be tested. Hardness tests are to be carried out on finished accessories. The frequency and locations are to be agreed with IRS. The recorded values are for information only and used as an additional check to verify that the heat treatment process has been stable during the accessory production. The use of separate representative coupons is not permitted except as indicated in e) below.

b) Test location of forged shackles. Forged shackle bodies and forged Kenter shackles are to have a set of three impact tests and a tensile test taken from the crown of the shackle. Tensile_tests on smaller diameter shackles can be taken from the straight part of the shackle, where the geometry does not permit a tensile specimen from the crown. The tensile properties and impact values are to meet the requirements of Table 5.7.1 in the locations specified in Fig.2.4.1 of Section 2 with the Charpy pieces on the outside radius.

c) The locations of mechanical tests of cast shackles and cast Kenter shackles can be taken from the straight part of the accessory. The tensile properties and impact values are to meet the requirements of Table 5.7.1 in the locations specified in Fig.2.4.1 of Section 2.

d) The locations of mechanical tests of other accessories with complex geometries are to be agreed with IRS.

For non-circular sections, 1/4*t* (thickness) from the surface is considered appropriate.

Rolled plates are to be tested to the Standard to which they are produced.

e) For individually produced (heat treated) accessories or accessories produced in small batches, (less than 5), alternative testing can be proposed to IRS. Each proposal for alternative testing is to be detailed by the manufacturer in a written procedure and submitted to IRS. The following additional conditions may apply:

i) If separately forged or cast coupons are used, they are to have a cross-section and, for forged coupon, a reduction ratio similar to that of the accessories represented, and are to be heat treated in the same furnace and quenched in the same tank at the same time, as the actual forgings or castings. Thermocouples are to be attached to the coupon and to the accessories.

ii) If separately forged or cast coupons are agreed, it is to be verified by procedure test that coupon properties are representative of accessory properties.

f) A batch is defined as accessories that originate from the same heat treatment charge and the same heat of steel.

g) Mechanical tests of pins are to be taken as per Fig.2.4.1 of Section 2 from the mid length of a sacrificial pin of the same diameter as the final pin. For oval pins the diameter taken is to represent the smaller dimension. Mechanical tests may be taken from an extended pin of the same diameter as the final pin that incorporates a test prolongation and a heat treatment buffer prolongation, where equivalence with mid length test values have

been established. The length of the buffer is to be at least equal to 1 pin diameter dimension which is removed after the heat treatment cycle is finished. The test coupon can then be removed from the pin. The buffer and test are to come from the same end of the pin as per Fig.5.14.4 below:

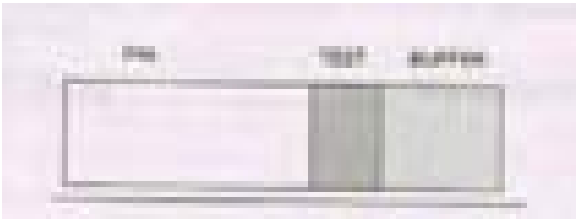


Fig.5.14.4 : Buffer and test piece location

5.14.5 Non-destructive examination after proof load testing

a) All chain accessories are to be subjected to a close visual examination. Special attention is to be paid to machined surfaces and high stress regions. Prior to inspection, chain accessories are to have a suitably prepared surface as per the applied NDE testing standard. All non-machined surfaces, are to be sand or shot blast to permit a thorough examination. Where applicable, accessories shall be dismantled for inspection of internal surfaces. All accessories are to be checked by magnetic particle or dye penetrant testing. UT of accessories may be required by the Surveyor. The acceptance /rejection criteria of UT established for the design is to be met.

b) Testing is to be performed in accordance with a recognized standard, such as those indicated below, or equivalent. The procedures, together with acceptance / rejection criteria are to be submitted to IRS for review.

   Magnetic particle testing (MT) of forgings:
   - EN 10228-1, ASTM A275, using wet continuous magnetization technique or equivalent standards such as ISO 4986, IACS Rec 69

   Ultrasonic testing (UT) of forgings:
   - EN 10228-3, ASTM A388, ISO 13588

   Magnetic particle testing (MT) of castings:
   - ASTM E709, using wet continuous magnetization technique

   Ultrasonic testing (UT) of castings: - ASTM A609, ISO 13588

   All surfaces are to be magnetic particle tested (MT). Testing is to be performed in accordance with standards referenced using the fluorescent technique. As a minimum surfaces are to be free from:

   - relevant linear indications exceeding 1.6 mm in transverse direction

   - relevant linear indications exceeding 3.2 mm in longitudinal direction

   - relevant non-linear indications exceeding 4.8 mm.

   When required by the Surveyor, ultrasonic testing is to be carried out on 100% of cast or forged accessories. The acceptance / rejection criteria established for the design is to be met.

   Manufacturers are to prepare written procedures for NDE. NDE personnel are to be qualified and certified according to ISO 9712, ACCP or equivalent. Personnel qualification to an employer or responsible agency based qualification scheme as SNT-TC-1A may be accepted if the employer's written practice is reviewed and found acceptable and the Level III is ASNT Level III, ISO 9712 Level III or ACCP Professional Level III and certified in the applicable method. NDE operators are to be qualified to at least level II.

c) The manufacturer is to provide adequate evidence that non-destructive examination has been carried out with satisfactory results together with details of technique used and to the operator's qualification.

d) Weld repair of finished accessories is not permitted.

5.14.6 Test failures

In the event of a failure of any test the entire batch represented is to be rejected unless the cause of failure is determined and it is demonstrated to the Surveyor's satisfaction that the condition causing the failure is not present in any of the remaining accessories.

5.14.7 Marking

.1 Each accessory is to be marked as follows:

- Chain grade
- Certificate No.
- IRS stamp

.2 All detachable component parts are to be stamped with a serial number to avoid mixing of components.

.3 The Certificate number may be exchanged against an abbreviation or equivalent, in which case, the details are to be stated in the certificate.

5.14.8 Documentation

.1 A complete Inspection and Testing Report in booklet form is to be provided by the manufacturer for each order. This booklet is to include all dimensional checks, test and inspection reports, NDT reports, process records and example photographs of components positioned in furnaces as well as any nonconformity, corrective action and repair work

.2 Each type of accessory is to be covered by separate certificates.

.3 All accompanying documents, appendices and reports are to carry reference to the original certificate number.

.4 The manufacturer will be responsible for storing, in a safe and retrievable manner, all documentation produced for a period of at least 10 years.

5.15 Chafing chain for single point mooring arrangements

5.15.1 Scope

These requirements apply to short lengths (approximately 8 m) of 76 [mm] diameter chain to be connected to hawsers for the tethering of oil tankers to single point moorings, FPSO's and similar uses.

5.15.2 Approval of manufacturing

The chafing chain is to be manufactured by works approved by IRS according to 5.3 of this chapter. Also refer Chapter 1, Section 1, Cl. 1.3.2.

5.15.3 Materials

The materials used for the manufacture of the chafing chain are to satisfy the requirements of 5.7 to 5.10 of this chapter.

5.15.4 Design, manufacturing, testing and certification

a) The chafing chain is to be designed, manufactured, tested and certified in accordance with 5.11 to 5.14 except that batch heat treatment is permitted.

b) The arrangement of the end connections is to be of an approved type.

c) The common link is to be of the stud link type and of Grade R3 or R4.

d) The chafing chain is to be capable of withstanding the breaking test loads of 4884 [kN] (Grade R3) and 6001 [kN] (Grade R4).

   Documented evidence of satisfactory testing of similar diameter mooring chain in the prior six month period may be used in lieu of break testing subject to agreement with IRS.

e) The chain lengths shall be proof load tested in accordance with 5.13.2. The proof test loads for Grade R3 and Grade R4 are to be 3242 [kN] and 4731 [kN] respectively.

f) The requirements herein are also applicable to other diameter chafing chains, such as 84 [mm] and 96 [mm], subject to compliance with the proof and break load requirements specified for the chain grade and diameters in Table 5.12.1

8	*Consumables for Welding of Aluminium Alloys*

Section 1

General

1.1 Scope

1.1.1 This Chapter gives the requirements for approval and inspection of welding consumables such as electrodes, wires, fluxes etc. intended for welding of the following types of materials used in ship construction:

a) Normal strength steel for ship structures, Grades A, B, D and E (See Ch.3).

b) Higher strength steels for ship structures Grades AH32, DH32, EH32, AH36, DH36 and EH36 (See Ch.3).

c) Higher strength steels for ship structures with minimum yield strength 390 [N/mm^2] : Grades AH40, DH40 and EH40 (See Ch.3).

d) Higher strength steels for ship structures for low temperature application : Grades FH32, FH36 and FH40 (See Ch.3).

e) Higher strength steels for welded structures.

f) Aluminium alloys (See Ch.9).

1.2 Manufacture

1.2.1 The manufacturer's plant and method of production of welding consumables are to be such as to ensure reasonable uniformity in manufacture. IRS is to be notified of any alteration proposed to be made in the process of manufacture subsequent to approval.

1.3 Grading

1.3.1 Welding consumables for steel materials specified in 1.1.1 a) to d) above.

These consumables are divided into 3 strength groups each of which is further graded as per the Charpy V-notch impact test requirements as shown below:

Groups	**Grading**
Normal strength steel	1, 2, 3
Higher strength steel : yield strength upto 355 [N/mm^2]	1Y, 2Y, 3Y, 4Y
Higher strength steels : yield strength upto 390 [N/mm^2]	2Y40, 3Y40, 4Y40, 5Y40
Hydrogen marks Welding consumables of Grades 2 and 3; and of Grades 2Y, 3Y and 4Y and of Grades 2Y40, 3Y40, 4Y40 and 5Y40 for which hydrogen content has been controlled in accordance with Sec.2.5 are identified by the mark H15, H10 or H5	
The following suffixes are added after the Grade mark as applicable: S : Semi-automatic T : Two-run technique M : Multi-run technique TM : Both two-run and multi-run technique V : Vertical	

See Table 1.3.1 for correlation of welding consumables to hull structural steel grades.

1.3.2 For grading of consumables for welding higher strength quenched and tempered steels indicated in 1.1.1e) above, refer to Sec.7.

1.3.3 For grading of consumables for welding aluminium alloys indicated in 1.1.1f) above, refer to Sec.8.

Table 1.3.1 : Correlation of welding consumables to hull structural steel grades

Grades of Welding Consumables (see notes)	**Hull structural steel Grades [1)]**											
	A	**B**	**D**	**E**	**AH32 /36**	**DH32 /36**	**EH32 /36**	**FH32/ 36**	**AH40**	**DH40**	**EH40**	**FH40**
1, 1S, 1T, 1M, 1TM, 1V	X											
1YS, 1YT, 1YM, 1YTM, 1YV	X				X [3)]							
2, 2S, 2T, 2M, 2TM, 2V	X	X	X									
2Y, 2YS, 2YT, 2YM, 2YTM, 2YV	X	X	X	X	X							
2Y40, 2Y40S, 2Y40T, 2Y40M, 2Y40TM, 2Y40V	2)	2)	2)		X	X			X	X		
3, 3S, 3T, 3M, 3TM, 3V	X	X	X	X								
3Y, 3YS, 3YT, 3YM, 3YTM, 3YV	X	X	X	X	X	X	X					
3Y40, 3Y40S, 3Y40T, 3Y40M, 3Y40TM, 3Y40V	2)	2)	2)	2)	X	X	X		X	X	X	
4Y, 4YS, 4YT, 4YM, 4YTM, 4YV	X	X	X	X	X	X	X	X				
4Y40, 4Y40S, 4Y40T, 4Y40M, 4Y40TM, 4Y40V	2)	2)	2)	2)	X	X	X	X	X	X	X	X
5Y40, 5Y40S, 5Y40T, 5Y40M, 5Y40TM, 5Y40V	2)	2)	2)	2)	X	X	X	X	X	X	X	X

1) Requirements for other grades of steels given in ch.3 but not included here will be specially considered.
2) See Note d)
3) See Note e)

a) When joining normal to higher strength structural steel, consumables of the lowest acceptable grade for either material being joined may be used.
b) When joining steels of same strength level but of different toughness grade, consumables of the lowest acceptable grade for either material being joined may be used.
c) It is recommended that controlled low hydrogen type consumables are to be used when joining higher strength structural steels to the same or lower strength level, except that other consumables may be used when the carbon equivalent is below or equal to 0.41%. When other than controlled low hydrogen type electrodes are used appropriate procedure test for hydrogen cracking may be conducted subject to approval of IRS.
d) The welding consumables approved for steel Grades AH40, DH40, EH40 and/or FH40 may also be used for welding of the corresponding grades of normal strength steels subject to the approval of IRS.
e) When joining higher strength steels using Grade 1Y welding consumables, the material thicknesses is not to exceed 25 [mm].

1.4 Approval procedure

1.4.1 Approval of welding consumables will be considered on the basis of the manufacturer's description of the works and detailed description of the method of production control, satisfactory inspection of the works by the Surveyors and compliance with the test requirements detailed in subsequent paragraphs of this Chapter.

1.4.2 When a welding consumable is manufactured in several locations of the same company, the complete series of approval tests would be carried out in one Works only. In other locations, a reduced test programme based upon the requirements of annual testing may be accepted subject to the manufacturer certifying that the materials and the fabrication process used are identical with those of the main unit.

This requirement is also applicable to all manufacturers of welding consumables under license.

Note : In case of wire flux combination for submerged arc welding where a unique powder flux is combined with different wires coming from several factories belonging to the same firm only one test series may be carried out provided the wires conform to the same technical specification.

1.4.3 The test assemblies are to be prepared under the supervision of the Surveyor, and all tests are to be carried out in his presence.

1.4.4 IRS may require, in any particular case, such additional tests or spacing requirements as may be necessary.

1.5 Test assemblies

1.5.1 The test assemblies are to be prepared and tested under the supervision of the Surveyor(s).

1.5.2 When a welded joint is performed, the edges of the plates are to be bevelled either by mechanical machining or by oxygen cutting; in the latter case, a descaling of the edges is necessary.

1.5.3 The welding conditions used such as amperage, voltage, travel speed, etc. are to be within the range recommended by the manufacturer for normal and good welding practice. Where a welding consumable is suitable for both alternating current (AC) and direct current (DC), AC is to be used for the preparation of test assemblies.

1.6 Annual inspection and tests

1.6.1 All establishments, where approved welding consumables are manufactured, and the associated quality control procedures, are to be subjected to annual inspection. On these occasions, samples of the approved consumables are to be selected by the Surveyor and subjected to the tests detailed in the subsequent paragraphs of this Chapter.

1.7 Upgrading and uprating

1.7.1 Upgrading and uprating of welding consumables will be considered only at the manufacturer's request, preferably at the time of annual testing. Generally, for this purpose, tests from butt weld assemblies will be required in addition to the normal annual approval tests.

1.7.2 Upgrading refers to notch toughness of the welding consumable while uprating refers to extension to cover higher strength level steels.

1.7.3 Any alteration to the approved consumable which may result in a change in the chemical composition and the mechanical properties of the deposited metal, must be immediately notified by the manufacturer. Additional tests may be necessary.

1.8 Dimensions of test specimens

1.8.1 Deposited metal tensile test specimens are to be machined to the dimensions shown in Fig.1.8.1. Care is to be taken to ensure that the longitudinal axis of the test piece coincides with the centre of the weld and midthickness of the plates. The test piece may be heated to a temperature not exceeding 250°C for a period not exceeding 16 hours for hydrogen removal, prior to testing.

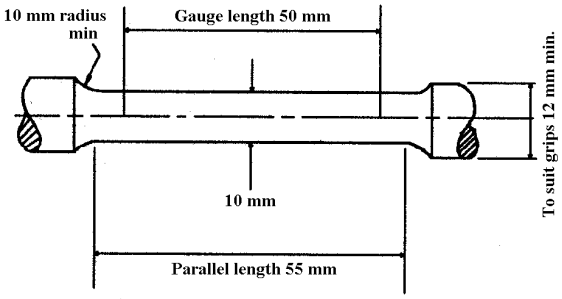

Fig.1.8.1 : Deposited metal tensile test

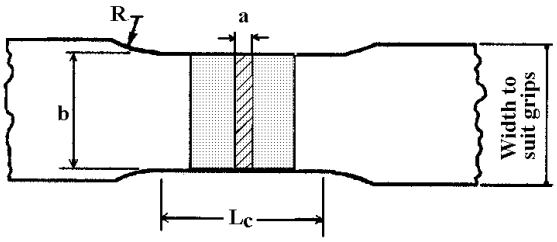

Fig.1.8.2 : Butt weld tensile test specimen

1.8.2 Butt weld tensile test specimens are to be machined to the following dimensions (see Fig.1.8.2).

a = thickness of plate 't'
b = 12 for $t \leq 2$ [mm]
= 25 for $t > 2$ [mm]
L_c = width of weld + 60 [mm]
$R > 25$ [mm].

The upper and lower surfaces of the weld are to be filed, ground or machined flush with the surface of the plates.

1.8.3 Butt weld bend test specimens are to be 30 [mm] in width. Upper and lower surfaces of the weld are to be filed, ground or machined flush with the surfaces of the plates and sharp corners of the specimens are to be rounded to a radius not exceeding 2 [mm].

1.8.4 All impact test specimens are to be of the standard 10 [mm] x 10 [mm] Charpy V-notch type, machined to the dimensions and tolerances detailed in Ch.2.

1.9 Testing procedures

1.9.1 The procedures used for all tensile and impact tests are to comply with the requirements of Ch.2.

1.9.2 Butt weld bend test specimens are to be tested at ambient temperature. The test specimens are to be capable of withstanding, without fracture, being bent through an angle of 120 degrees over a former having a diameter three times the thickness of the specimen. One specimen from each welded assembly is to be tested with the face of the weld in tension and the other with the root of the weld in tension.
The test pieces can be considered as complying with the requirements if, on completion of the test, no crack or defect at the outer surface of the test specimen can be seen.

1.9.3 Tensile Tests : On deposited metal test specimens, the values of tensile strength, yield stress and elongation are to be recorded. On butt weld specimens, the values of tensile strength and the position of fracture are to be recorded.

1.9.4 Charpy V-notch Impact Tests : A set of three test specimens is to prepared and tested. The average absorbed energy value is to comply with the requirements of subsequent sections. One individual value may be less than the required average value provided that it is not less than 70 per cent of this value.

The test temperature for Grades 2, 2Y, 2Y40, 3, 3Y, 3Y40, 4Y, 4Y40 and 5Y40 test pieces is to be controlled within ±2°C of the prescribed temperature.

1.10 Re-test procedures

1.10.1 Where the results of a tensile or bend test do not comply with the requirements, duplicate test specimens of the same type are to be prepared and are to be satisfactorily tested. Where insufficient original welded assembly is available, a new assembly is to be

prepared using welding consumables from the same batch. If the new assembly is made with the same procedure (particularly the number of runs) as the original assembly, only the duplicate re-test specimens need to be tested. Otherwise, all test specimens are to be prepared and re-tested.

1.10.2 Where the results from a set of three impact test specimens do not comply with the requirements, an additional set of three impact test specimens may be taken provided that not more than two individual values are less than the required average value and, of these, not more than one is less than 70 per cent of the average value. The results obtained are to be combined with the original results to form a new average which, for acceptance, is to be not less than the required value. Additionally, for these combined results not more than two individual values are to be less than the required average value, and of these, not more than one is to be less than 70 per cent of the average value. Further retests may be made at the Surveyor's discretion, but these must be made on a new welded assembly and must include all tests required for the original assembly, even those which were previously satisfactory.

1.11 Chemical composition

1.11.1 The chemical analysis of the weld metal made by the electrode is to be supplied by the manufacturer.

Section 2

Electrodes for Normal Penetration Manual Welding

2.1 General

2.1.1 Based on the results of the Charpy V-notch impact tests, electrodes are divided into the following grades:-

For normal strength steel - Grades 1, 2 and 3

For higher strength steel with minimum yield strength upto 355 [N/mm^2] - Grades 2Y, 3Y and 4Y. (Grade 1Y not applicable for manual welding).

For higher strength steels with minimum yield strength upto 390 [N/mm^2] - Grades 2Y40, 3Y40, 4Y40 and 5Y40.

2.1.2 If the electrodes are in compliance with the requirements of the hydrogen test given in 2.5, a suffix H15, H10 or H5 will be added to the grade mark.

2.1.3 For initial approval the tests specified in this Section including hydrogen test, if applicable, are to be carried out.

2.2 Deposited metal tests

2.2.1 Two deposited metal test assemblies are to be prepared in the downhand position as shown in Fig.2.2.1, one using 4 [mm] electrodes and the other using the largest size manufactured. If an electrode is manufactured in one diameter only, one test assembly is sufficient. Any grade of ship structural steel may be used for the preparation of these test assemblies.

2.2.2 The weld metal is to be deposited in single or multi-run layers according to normal practice and the direction of each layer is to alternate from each end of the plate, each run of the weld metal being not less than 2 [mm] and not more than 4 [mm] thick. Between each run the assembly is to be left in still air until it has cooled to 250°C but not less than 100°C, the temperature being taken in the centre of the weld, on the surface of the seam. After being welded the test assemblies are not to be subjected to any heat treatment.

2.2.3 One tensile and three impact test specimens are to be taken from each test assembly as shown in Fig.2.2.1. The impact test specimens are to be cut perpendicular to the weld, with their axes 10 [mm] from the upper surface of the plate. The notch is to be positioned in the centre of the weld and cut in the face of the test specimen perpendicular to the surface of the plate.

2.2.4 The chemical analysis of the deposited weld metal in each test assembly is to be supplied by the manufacturer and is to include the content of all significant alloying elements.

2.2.5 The results of all tests are to comply with the requirements of Table 2.2.1 as appropriate.

Table 2.2.1 : Requirements for deposited metal tests (covered electrodes)

Grade	Yield stress [N/mm^2] min.	Tensile strength [N/mm^2]	Minimum elongation on 50 mm gauge length [%]	Impact Tests	
				Test temp. °C	Average energy J min.
1 2 3	305	400 - 560	22	20 0 -20	47
2Y 3Y 4Y	375	490 - 660	22	0 -20 -40	47
2Y40 3Y40 4Y40 5Y40	400	510 - 690	22	0 -20 -40 -60	47

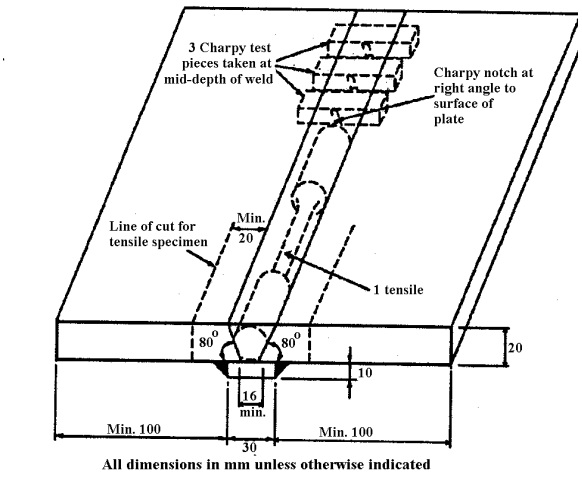

Fig.2.2.1 : Deposited metal test assembly

2.3 Butt weld tests

2.3.1 Butt weld assemblies as shown in Fig.2.3.1 are to be prepared for each welding position (downhand, horizontal-vertical, vertical-upward, vertical-downward and overhead) for which the electrode is recommended by the manufacturer, except that electrodes satisfying the requirements for downhand and vertical-upward positions will be considered as also complying with the requirements for the horizontal-vertical position.

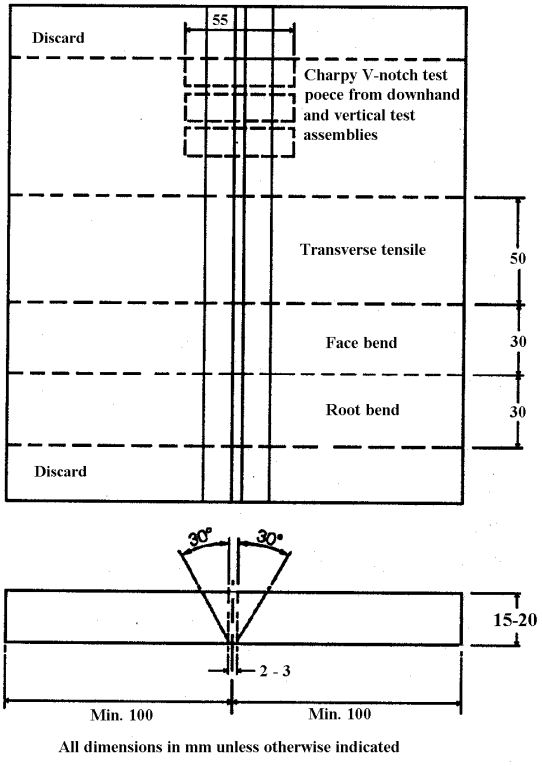

Fig.2.3.1 : Butt weld test assembly

Table 2.3.1 : Requirements for butt weld test (covered electrodes)

Grade	Tensile strength [N/mm^2] min. (transverse test)	Charpy V-notch impact test		
		Test temp. °C	Average energy J min.	
			Down-hand horizon-tal vertical, over-head	Vertical (upward and down-ward)
1 2 3	400	20 0 -20	47	34
2Y 3Y 4Y	490	0 -20 -40	47	34
2Y40 3Y40 4Y40 5Y40	510	0 -20 -40 -60	47	39

2.3.2 Where the electrode is only to be approved in the downhand position an additional test assembly is to be prepared in that position.

2.3.3 The grades of steels used for the preparation of the test assemblies are to be as follows:

Grade 1 electrodes	A
Grade 2 electrodes	A, B, D
Grade 3 electrode	A, B, D, E
Grade 2Y electrode	AH32, AH36, D32, D36
Grade 3Y electrode	AH32, AH36, DH32, DH36, EH32, EH36
Grade 4Y electrodes	AH32, AH36, DH32, DH36, EH32, EH36, FH32, FH36
Grade 2Y40 electrodes	AH40, DH40
Grade 3Y40 electrodes	AH40, DH40, EH40
Grade 4Y40 electrodes	AH40, DH40, EH40, FH40
Grade 5Y40 electrodes	AH40,DH40, EH40, FH40

2.3.4 Where higher strength steel with minimum yield strength 315 [N/mm^2] is used for grade 2Y, 3Y and 4Y electrodes, the actual tensile strength of the steel is to be not less than 490 [N/mm^2]. The chemical composition including the content of grain refining elements is to be reported.

2.3.5 The following welding procedure should be adopted in making the test assemblies:-

DOWNHAND (a)

First run with 4 [mm] diameter electrode. Remaining runs (except last two layers) with 5 [mm] diameter electrodes or above according to the normal welding practice with the electrodes. The runs of the last two layers with the largest size of electrode manufactured.

DOWNHAND (b)

Where a second downhand test is required:-

First run with 4 [mm] diameter electrode. Next run with an intermediate size electrode 5 [mm] or 6 [mm] diameter and the remaining runs with the largest size of electrode manufactured.

HORIZONTAL-VERTICAL

First run with 4 [mm] or 5 [mm] diameter electrode, subsequent runs with 5 [mm] diameter electrodes.

VERTICAL UPWARDS AND OVERHEAD

First run with 3.25 [mm] diameter electrode. Remaining runs with 4 [mm] diameter electrodes or possibly 5 [mm] diameter electrodes if this is recommended by the manufacturer for the positions concerned.

VERTICAL DOWNWARD

The method to be adopted is to be as recommended by the manufacturer.

2.3.6 In all cases the back sealing runs are to be made with 4 [mm] diameter electrodes in the welding position appropriate to each test sample after cutting out the root run to clean metal. For electrodes suitable for downhand welding only, the test assemblies may be turned over to carry out the back sealing run.

2.3.7 The butts are to be welded using normal welding practice and between each run the assembly is to be left in still air until it has cooled to 250°C but not below 100°C, the temperature being taken in the centre of the weld, on the surface of the seam.

2.3.8 After being welded, the test assemblies are not to be subjected to any heat treatment.

2.3.9 It is recommended that the welded assemblies be subjected to a radiographic examination to ascertain any defects in the weld prior to testing.

2.3.10 From each test assembly one tensile, one face and one root bend and a set of three Charpy V-notch test specimens are to be prepared, except that the impact test specimens need not be prepared for test assemblies welded in the overhead position.

2.3.11 The results of all mechanical testing are to comply with the requirements of Table 2.3.1. The position of the fracture in the transverse tensile test is to be reported. The bend test specimens can be considered as complying with the requirements if, after bending, no crack or defect having dimensions exceeding 3 [mm] can be seen on the outer surface of the test specimen.

2.4 Fillet weld tests

2.4.1 When an electrode is submitted for approval for fillet welding only and to which butt weld tests, as per 2.3, are not considered applicable, the initial approval tests are to consist of the fillet weld test, described herein, and the deposited metal test as per 2.2. When the electrode is submitted for approval for both butt and fillet welding, the initial approval is to include one fillet weld test as detailed hereunder and welded in the horizontal-vertical position in addition to the tests required by 2.2 and 2.3.

2.4.2 Fillet weld assemblies as shown in Fig.2.4.1 are to be prepared for each welding position (horizontal-vertical, vertical-upwards, vertical- downwards or overhead) for which the electrode is recommended by the manufacturer. The grade of steel used is to be in accordance with 2.3.3 as appropriate. The test assemblies are to be welded using an electrode of a diameter recommended by the manufacturer. The length of the test assembly, L, is to be sufficient to allow at least the deposition of the entire length of the electrode being tested.

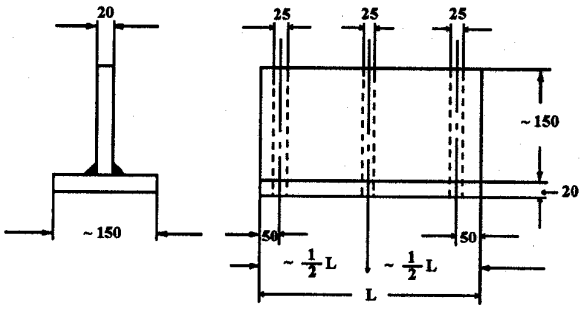

Fig.2.4.1 : Fillet weld test assembly

The first side is to be welded using the maximum size of electrode manufactured and the second side is to be welded using the minimum size of electrode manufactured and recommended for fillet welding. The fillet size will in general be determined by the electrode size and the welding current employed during testing.

2.4.3 The assembly is to be sectioned to form three macro sections each about 25 [mm] thick and the hardness readings are to be made in each section as indicated in Fig.2.4.2. The hardness of the weld is to be determined and is to meet the following listed equivalent values:-

a) Diamond Pyramid Hardness (98 N load) = 150 minimum

b) Rockwell (980 N load) B = 80 minimum

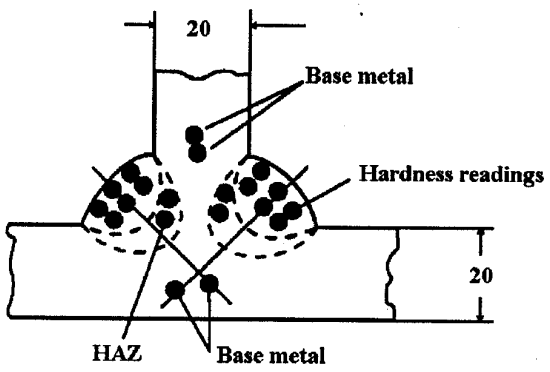

Fig.2.4.2 : Hardness tests for fillet weld test

2.4.4 The hardness of both heat affected zone and base metal is also to be determined and is to be reported for information.

2.4.5 One of the remaining sections of the assembly is to have the weld on the first side gouged or machined to facilitate breaking the fillet weld on the second side by closing the two plates together, subjecting the root of the weld to tension. On the other remaining section the weld on the second side is to be gouged or machined and the section fractured using the same procedure. The fractured surfaces are to be examined and there should be no evidence of incomplete penetrations, nor internal cracking and they should be reasonably free from porosity.

2.5 Hydrogen test

2.5.1 At the request of the manufacturer, electrodes may be submitted to a hydrogen test. A suffix H15, H10 or H5 will be added to

the grade number to indicate compliance with the requirements of this test.

2.5.2 The mercury method or thermal conductivity detector method according to standard ISO 3690:2018 is to be used. Four weld assemblies are to be prepared. The temperature of the specimens and minimum holding time are to be complied with following, according to the measuring method respectively:

Measuring Method		**Test Temp (° C)**	**Minimum Holding Time**
Thermal Conductivity Detector Method [1]	Gas Chromatography	45	72
		150	6
Note 1 - The use of hot carrier gas extraction method may be considered subject to verification of the testing procedure to confirm that collection and measurement of the hydrogen occurs continuously until all of the diffusible hydrogen is quantified.			

Alternatively, the glycerine method as described below is to be used.

2.5.3 Glycerine method

a) Four test specimens are to be prepared measuring 12 x 25 [mm] in cross- section by about 125 [mm] in length. The parent metal may be any grade of ship building steel and, before welding, the specimens are to be weighed to the nearest 0.1 gram. On the 25 [mm] surface of each test specimen a single bead of welding is to be deposited about 100 [mm] in length by a 4 [mm] electrode using about 150 [mm] of the electrode. The welding is to be carried out with as short an arc as possible and with a current of about 150 amperes. The electrode prior to welding, can be submitted to the normal drying process recommended by the manufacturer.

b) Within thirty seconds of the completion of welding of each specimen the slag is to be removed and the specimen quenched in water at approximately 20°C. After a further thirty seconds the specimens are to be cleaned and placed in an apparatus suitable for the collection of hydrogen by displacement of glycerine. The glycerine is to be kept at a temperature of 45°C during the test. All the four specimens are to be welded and placed in the hydrogen collecting apparatus within 30 minutes.

c) The specimens are to be kept immersed in the glycerine for a period of 48 hours and, after removal, are to be cleaned in water and spirit, dried and weighed to the nearest 0.1 gram to determine the amount of weld deposited. The amount of gas evolved is to be measured to the nearest 0.05 [cm^3] and corrected for temperature and pressure to 20C and 760 [mm] Hg.

2.5.4 The individual and average diffusible hydrogen contents of the four specimens are to be reported, and the average value in [cm^3] per 100 grams is not to exceed the following:

Mark	**Diffusible Hydrogen Contents**	**Measuring Method**
H15	15[1]	Mercury Method Thermal Conductivity Detector Method Glycerine Method
H10	10[2]	
H5	5	Mercury Method Thermal Conductivity Detector Method
1 – 10 cm^3 per 100 gms where the glycerine method is used		
2 – 5 cm^3 per 100 gms where the glycerine method is used		
Note :- The glycerine method is not to be used for welding consumables with H5 mark.		

2.6 Covered electrodes for gravity or contact welding

2.6.1 Where an electrode is submitted solely for approval for use in contact welding using automatic gravity or similar welding devices, deposited metal tests (see 2.2), fillet weld tests (see 2.4) and, where appropriate, butt weld tests (see 2.3) similar to those for normal manual electrodes are to be carried out using the process for which the electrode is recommended by the manufacturer.

2.6.2 Where an electrode is submitted for approval for use in contact welding using automatic gravity or similar welding devices in addition to normal manual welding, fillet weld tests (see 2.4) and, where appropriate, butt weld tests (see 2.3) similar to those for normal manual electrodes are to be carried out using the process for which the electrode is recommended by the manufacturer and these

tests are to be in addition to the normal approval tests.

2.6.3 In the case of approval of a fillet welding electrode using automatic gravity or similar contact welding devices, the fillet welding is to be carried out using the welding process recommended by the manufacturer, with the longest size of electrode manufactured. The manufacturer's recommended current range is to be reported for each electrode.

2.6.4 Where approval is requested for the welding of both normal strength and higher tensile steels, the assemblies are to be prepared using higher tensile steel.

2.7 Annual tests

2.7.1 For normal penetration electrodes, the annual tests are to consist of two deposited metal test assemblies. These are to be prepared and tested in accordance with 2.2. If an electrode is available in one diameter only, one test assembly is sufficient.

2.7.2 Where an electrode is approved solely for gravity or contact welding, the annual test is to consist of one deposited metal test assembly using the gravity or other contact device as recommended by the manufacturer.

2.8 Upgrading and uprating

2.8.1 Upgrading and uprating will be considered only at the manufacturer's request and preferably at the time of annual testing. Tests on butt weld assemblies, in addition to the requirements of annual testing, are to be carried out.

2.9 Certification

2.9.1 Each carton or package of approved electrode is to contain a certificate from the manufacturer generally in accordance with the following:-

"The ..... company certifies that composition and quality of these electrodes conform with those of the electrodes used in making the test pieces submitted to and approved by Indian Register of Shipping."

Section 3

Deep Penetration Electrodes for Manual Welding

3.1 General

3.1.1 Where an electrode is designed solely for the deep penetration welding of downhand butt joints and horizontal-vertical fillets, only the test detailed in 3.2 and 3.3 are required for initial approval purposes.

3.1.2 Deep penetration electrodes will only be approved as complying with Grade 1 requirements. The suffix D.P. will be added.

3.1.3 Where a manufacturer recommends that an electrode having deep penetrating properties can also be used for downhand butt welding of thicker plates with prepared edges, the electrode will be treated as normal penetration electrode, and the full series of tests in the downhand position is to be carried out as per normal penetration electrode, together with deep penetration tests given in 3.2 and 3.3.

3.1.4 Where a manufacturer desires to demonstrate that an electrode in addition to its use as normal penetration electrode also has deep penetrating properties when used for downhand butt welding and horizontal - vertical fillet welding, the additional tests given in 3.2 and 3.3 are to be carried out.

3.1.5 Where the manufacturer prescribes a different welding current and procedure for the electrode when used as a deep penetration electrode and a normal penetration electrode, the recommended current and procedure are to be used when making the test specimens in each case.

3.2 Deep penetration butt weld tests

3.2.1 Two plates of thickness equal to twice the diameter of the core of the electrode plus 2 [mm] are to be butt welded together with one downhand run of welding from each side. The

plates are to be not less than 100 [mm] wide and of sufficient length to allow the cutting out of the test specimens of the correct number and size as shown in Fig.3.2.1. Grade A steel is to be used for these test assemblies. The joint edges are to be prepared square and smooth and, after tacking, the gap is not to exceed 0.25 [mm].

3.2.2 The test assembly is to be welded using a 8 [mm] diameter electrode or the largest diameter size manufactured if this is less than 8 [mm].

3.2.3 After welding the test assembly is to be cut to form two transverse tensile test pieces, two bend test pieces and three Charpy V-notch test pieces as shown in Fig.3.2.1. The results of tensile and impact testing are to comply with the requirements of Table 2.3.1 for Grade 1 electrodes.

3.2.4 The discards at the end of the welded assemblies are to be not more than 35 [mm] wide. The joints of these discards are to be polished and etched and must show complete fusion and interpenetration of the welds. At each cut in the test assembly the joints are also to be examined to ensure that complete fusion has taken place.

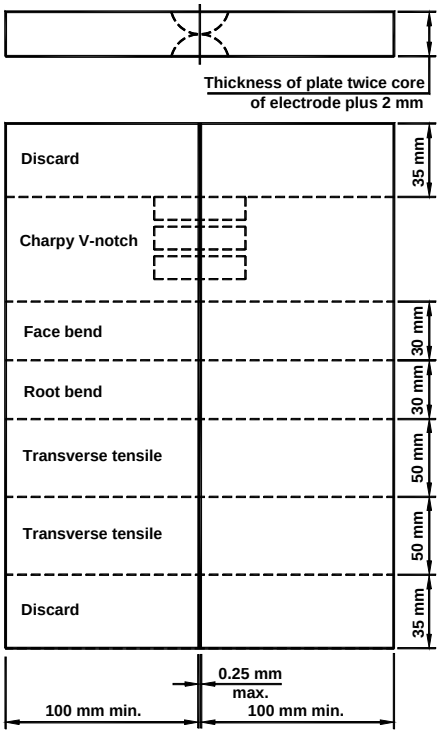

Fig. 3.2.1 : Deep penetration butt weld test assembly

3.3 Deep penetration fillet weld test

3.3.1 A fillet weld assembly is to be prepared as shown in Fig.3.3.1 with plates about 12.5 [mm] in thickness. The welding is to be carried out with one run for each fillet with plate A in the horizontal plane during the welding operations. The length of the fillet is to be 160 [mm] and the gap between the plates is to be not more than 0.25 [mm]. Grade A steel is to be used for these test assemblies.

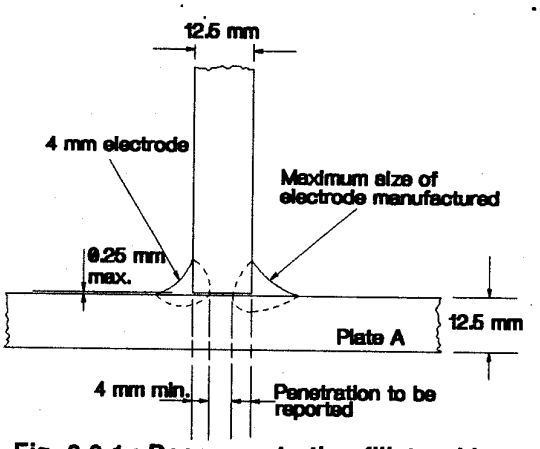

Fig. 3.3.1 : Deep penetration fillet weld test assembly

3.3.2 The fillet weld on one side of the assembly is to be carried out with 4 [mm] electrode and that on the other side with the maximum size of the electrode manufactured. The welding current used is to be within the range recommended by the manufacturer and the welding is to be carried out using normal welding practice.

3.3.3 The welded assembly is to be cut by sawing or machining within 35 [mm] of the ends of the fillet welds and the joints are to be polished and etched. The welding of the fillet made with a 4 [mm] electrode is to show a penetration of 4 [mm] (See Fig.3.3.1) and the corresponding penetration of the fillet made with the maximum size of electrode manufactured is to be reported.

3.4 Electrodes designed for gravity or contact welding

3.4.1 This type of approval is available for welding only normal strength and higher tensile steels with minimum specified yield strengths up to 345 [N/mm^2].

3.4.2 Where an electrode is submitted solely for approval for use in contact welding using automatic gravity or similar welding devices, deposited metal tests, and where appropriate, fillet weld tests similar to those for normal manual electrodes are to be carried out using the process for which the electrode is recommended by the manufacturer.

3.4.3 Where an electrode is submitted for approval for use in contact welding using automatic gravity or similar welding devices in addition to normal manual welding, butt weld and, where appropriate, fillet weld tests, using gravity or other contact device as recommended by the manufacturer, are to be carried out in addition to the normal approval tests.

3.5 Annual tests

3.5.1 Where an electrode is approved only for deep penetration welding, the annual test is to consist of one butt welded test assembly in accordance with 3.2.

3.5.2 Where an electrode is approved for both normal and deep penetration welding, annual tests are to consist of following:-

a) Two deposited metal test assemblies in accordance with 2.2; and

b) One butt welded test assembly in accordance with 3.2.

3.5.3 Where an electrode is approved solely for gravity or contact welding, the annual test is to consist of one deposited metal test assembly using the gravity or other contact device as recommended by the manufacturer.

3.6 Certification

3.6.1 Each carton or package of approved electrodes is to contain a certificate from the manufacturer generally in accordance with 2.9.

Section 4

Wire-flux Combinations for Submerged Arc Automatic Welding

4.1 General

4.1.1 Wire-flux combinations for single electrode submerged-arc automatic or semi-automatic welding are divided into following two categories:-

a) For use with multi-run technique;

b) For use with two-run technique.

Where wire-flux combinations are suitable for welding with both the techniques, tests are to be carried out for each technique.

Wire-flux combinations for multiple electrode submerged arc welding will be subject to separate approval tests. They are to be carried out generally in accordance with the requirements of this section.

4.1.2 Dependent on the results of impact tests, wire-flux combinations are divided into the following grades:-

For normal strength steel - Grades 1, 2 or 3;

For higher strength steel with minimum yield strength upto 355 [N/mm^2] - Grades 1Y, 2Y, 3Y or 4Y.

For higher strength steels with minimum yield strength upto 390 [N/mm^2] - Grades 2Y40, 3Y40, 4Y40 or 5Y40.

4.1.3 The suffixes T, M or TM will be added to the grade mark to indicate two-run technique, multi-run technique or both techniques respectively.

4.1.4 The welding current may be either a.c. or d.c. (electrode positive or negative) according to the recommendation of the manufacturer. If both a.c. and d.c. are recommended, a.c. is to be used for the tests.

4.2 Multi-run technique

4.2.1 When approval for use with multi-run technique is required, deposited metal and butt weld tests are to be carried out in accordance with 4.3 and 4.4 respectively.

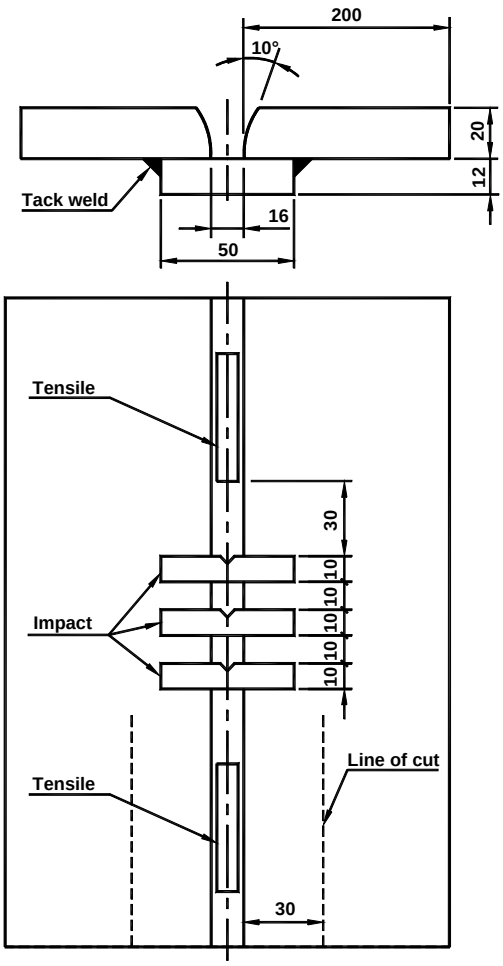
4.3 Deposited metal tests

4.3.1 An all weld metal test assembly is to be prepared in the downhand position as shown in Fig.4.3.1, using any grade of hull structural steel.

4.3.2 The bevelling of the plate edges is to be carried out by machining or mechanized gas cutting. In the latter case any remaining scale is to be removed from the bevelled edges.

4.3.3 The direction of deposition of each run is to alternate from each end of the plate and after completion of each run the flux and welding slag is to be removed. Between each run the assembly is to be left in still air until it has cooled to 250°C but not below 100°C, the temperature being taken in the centre of the weld, on the surface of the seam. The thickness of the layer is to be not less than the diameter of the wire but not less than 4 [mm].

4.3.4 The welding conditions (amperage, voltage and rate of travel) are to be in accordance with the recommendations of the manufacturer and are to conform with normal good welding practice for multi-run welding.



All dimensions in mm unless otherwise indicated

Fig. 4.3.1 : Deposited metal test assembly

4.3.5 The welded assembly is to be cut longitudinally at a distance of 30 [mm] from the edges of the weld and then cut transversely.

4.3.6 Two longitudinal tensile and three impact test specimens are to be taken from each test assembly as shown in Fig.4.3.1. Care is to be taken that the axes of the tensile test specimens coincide with the centre of the weld and the midthickness of the plates. The impact test specimens are to be cut perpendicular to the weld with their axes 10 [mm] from the upper surface. The notch is to be positioned in the centre of the weld and cut in the face of the test specimen perpendicular to the surface of the plate.

4.3.7 The results of all tests are to comply with requirements of Table 4.3.1 as appropriate. The chemical analysis of the deposited weld metal including the content of the significant alloying elements is to be submitted by the manufacturer.

Table 4.3.1 : Requirements for deposited metal tests (wire-flux combinations)

Grade	Yield stress [N/mm^2]	Tensile strength [N/mm^2]	Elongation on 50 mm gauge length % min.	Charpy V-notch impact	
				Test temp. °C	Avg. energy - J min.
1 2 3	305	400 - 560	22	20 0 -20	34
1Y 2Y 3Y 4Y	375	490 - 660	22	20 0 -20 -40	34
2Y40 3Y40 4Y40 5Y40	400	510 - 690	22	0 -20 -40 -60	39

4.4 Butt weld test (two-run technique)

4.4.1 Two welded assemblies for each grade of wire-flux combination are to be prepared in accordance with Fig.4.4.1, using the following plate thicknesses:-

For Grades 1 and 1Y	12 to 15 [mm] and 20 to 25 [mm]
For Grades 2, 2Y, 3, 3Y and 4Y	20 to 25 [mm] and 30 to 35 [mm]
For Grades 2Y40, 3Y40, 4Y40 and 5Y40	20 to 25 [mm] and 30 to 35 [mm]

A limitation of the approval to the medium range (upto the maximum welded plate thickness) may be agreed in which case the test assemblies are to be welded using plates of 12 to 15 [mm] and 20 to 25 [mm] irrespective of the grade for which the approval is requested.

Where approval is requested for welding of both normal strength and higher tensile steel, two assemblies are to be prepared using higher tensile steel.

4.4.2 The maximum diameter of wire, grades of steel plate and edge preparation to be used are to be in accordance with Table 4.4.2. Small deviations in the edge preparation may be allowed if requested by the manufacturer. The bevelling of the plate edges is to be performed by machining or mechanized gas cutting. In the latter case any remaining scale is to be removed from the bevelled edges. The root gap should not exceed 1.0 [mm].

Table 4.4.2 : Butt weld test assemblies (two-run technique)

Plate thick-ness [mm]	Recommended preparation [mm]	Max. diameter of wire [mm]	Grade of wire-flux combi-nation	Grade of normal strength steel	Grade of higher strength steel
About 12 -15		5	1	A	-
			1Y	-	AH32 AH36
About 20 - 25		6	1	A	-
			1Y	-	AH32, AH36
			2	A,B or D	-
			2Y	-	AH32, AH36, DH32, DH36
			2Y40	-	AH40, DH40
			3	A,B,D or E	-
			3Y	-	AH32, AH36, DH32 DH36, EH32, EH36
			3Y40	-	AH40, DH40, EH40
			4Y	-	AH32, AH36, DH32, DH36 EH32, EH36, FH32, FH36
			4Y40	-	AH40, DH40, EH40, FH40
			5Y40	-	AH40, DH40, EH40, FH40
About 30 - 35		7	2	A, B or D	-
			2Y	-	AH32, AH36, DH32, DH36
			2Y40	-	AH40, DH40
			3	A, B, D or E	-
			3Y	-	H32, AH36, DH32, DH36, EH32, EH36
			3Y40	-	AH40, DH40, EH40
			4Y	-	AH32, AH36, DH32, DH36, EH32, EH36, FH32, FH36
			4Y40	-	AH40, DH40, EH40, FH40
			5Y40	-	AH40, DH40, EH40, FH40

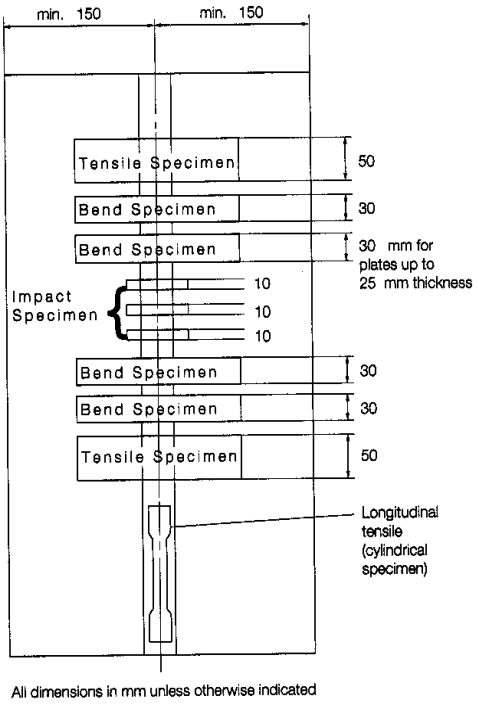


Fig.4.4.1 : Butt weld test assembly (two-run technique)

4.4.3 The welding current may be either a.c. or d.c. (electrode positive or negative) according to the recommendation of the manufacturer. If both a.c. and d.c. are recommended a.c. is to be used for test pieces.

4.4.4 Each butt weld is to be welded in two runs, one from each side, using amperages, voltages and travel speeds in accordance with the recommendations of the manufacturer and normal good welding practice.

4.4.5 After completion of the first run, the flux and welding slag are to be removed and the assembly is to be left in still air until it has cooled to 100°C, the temperature being taken in the centre of the weld, on the surface of the seam. After being welded the test assemblies are not to be subjected to any heat treatment.

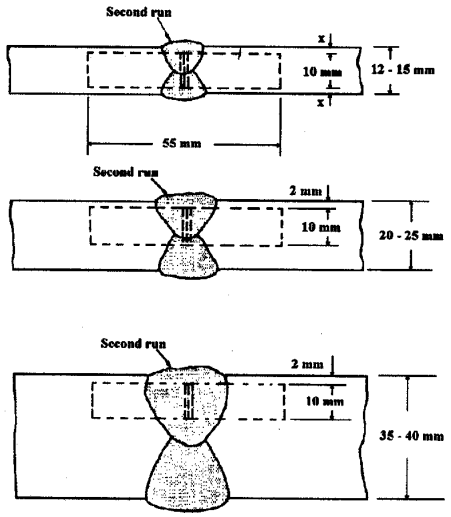

Fig. 4.4.3 : Butt weld test assemblies - two-run technique : position of impact test specimens

4.4.6 It is recommended that welded assemblies be subjected to radiographic examination to ascertain any defects in the weld prior to testing.

4.4.7 The assemblies are to be cut transversely, to form two tensile test pieces and two bend test pieces as shown in Fig.4.4.1, three impact test pieces as shown in Fig.4.4.1 and Fig.4.4.3. The edges of all test pieces and also the discards are to be examined to ensure complete fusion and interpenetration of welds.

4.4.8 Where the wire-flux combination is to be used for two-run technique only, a longitudinal test is also to be made in accordance with Fig.4.5.1 on the thicker plate tested.

4.4.9 The results of the transverse tensile and impact tests are to comply with the requirements of Table 4.5.1 as appropriate. The results of longitudinal tensile test are to comply with the requirements of Table 4.3.1 as appropriate except that for Grades 1Y, 2Y and 3Y the tensile strength is not to be less than 490 [N/mm^2].

4.5 Butt weld test (multi-run technique)

4.5.1 A butt weld assembly, as shown in Fig.4.5.1, is to be prepared in the downhand position by welding together two 20 [mm] thick plates of not less than 150 [mm] in width and of sufficient length to allow the cutting out of test specimens of the prescribed number and size.

4.5.2 The grade of steel used for the preparation of the test assembly is to be as follows:-

Grade 1 wire-flux combination	Grade A
Grade 2 wire-flux combinations	Grade A, B, D
Grade 3 wire-flux combinations	Grade A, B, D, E
Grade 1Y wire-flux combinations	Grade AH32, AH36
Grade 2Y wire-flux combinations	AH32, AH36, DH32, DH36
Grade 3Y wire-flux combinations	AH32, AH36, DH32, DH36, EH32, EH36
Grade 4Y wire-flux combinations	AH32, AH36, DH32, DH36, EH32, EH36, FH32, FH36
Grade 2Y40 wire-flux combinations	AH40, DH40
Grade 3Y40 wire-flux combinations	AH40, DH40, EH40
Grade 4Y40 wire-flux combinations	AH40, DH40, EH40, FH40
Grade 5Y40 wire-flux combinations	AH40, DH40, EH40, FH40

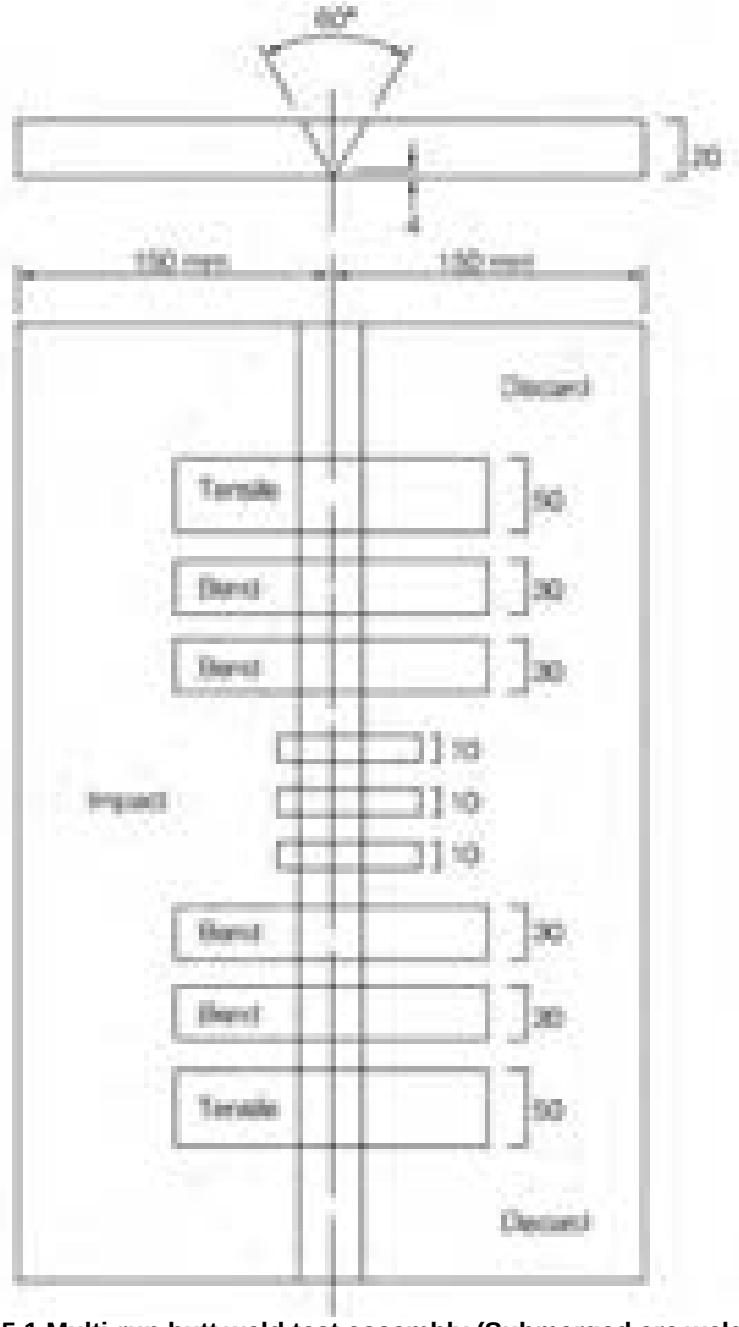

Fig 4.5.1 Multi-run butt weld test assembly (Submerged arc welding)

4.5.3 Welding is to be carried out in the downhand position, and the direction of deposition of each run is to alternate from each end of the plate. After completion of each run, the flux and welding slag is to be removed. Between each run the assembly is to be left in still air until it has cooled to less than 250°C but not below 100°C, the temperature being taken in the centre of the weld, on the surface of the seam. The thickness of the layer is to be not less than the diameter of the wire nor less than 4 [mm].

4.5.4 The plate edges are to be prepared to form a single vee joint, the included angle between the fusion faces being 60 degrees and the root face being 4 [mm]. The bevelling of the plate edges is to be carried out by machining or mechanized gas cutting. In the latter case, any remaining scale is to be removed from the bevelled edges.

4.5.5 The welding is to be carried out by the multi-run technique and the welding conditions are to be the same as those adopted for the deposited metal test assembly.

4.5.6 The back sealing run is to be applied in the downhand position after cutting out the root run to clean metal. After being welded the test assembly is not to be subjected to any heat treatment.

4.5.7 It is recommended that the welded assembly be subjected to radiographic examination to ascertain any defects in the weld prior to testing.

4.5.8 The test assembly is to be cut to form two tensile; two face bend; two root bend; three impact test pieces as shown in Fig.4.5.1.

4.5.9 The results of all tensile and impact test specimens are to comply with the requirements of Table 4.5.1 as appropriate. The position of the fracture of the transverse tensile test is to be reported.

Table 4.5.1 : Requirements for butt weld tests (wire flux-combination)

Grade	Tensile strength (transverse test) [N/mm^2] min.	Charpy V-notch impact test	
		Test temp. °C	Avg. energy J min. (See note)
1 2 3	400	20 0 -20	34
1Y 2Y 3Y 4Y	490	20 0 -20 -40	34
2Y40 3Y40 4Y40 5Y40	510	0 -20 -40 -60	39
Note : No individual impact test value is to be less than 23J			

4.6 Annual tests

4.6.1 Following tests on wire-flux combinations are to be carried out at the time of annual inspection:-

a) For two-run technique:- On butt weld assembly with 20 [mm] minimum plate thickness : One transverse tensile, two transverse bends and three impact tests. One longitudinal tensile test specimen is also to be prepared where the wire-flux combination is approved solely for the two-run technique.

b) For multi-run technique :- Deposited metal Tests - One tensile and three impact tests in accordance with 4.3.

4.6.2 The specimens are to be prepared and tested in accordance with, and on grades of steel specified for initial approval tests and the results are to comply with the results of the approved grade.

4.7 Upgrading and uprating

4.7.1 Requests for upgrading and uprating will generally be considered at the time of annual testing and additional tests in accordance with the requirements of 2.8 would be required.

Section 5

Wires and Wire-gas Combinations for Semi-automatic and Automatic Welding

5.1 General

5.1.1 Wire-gas combinations and flux-cored or flux-coated wires (for use with or without a shielding gas) are divided into following categories for the purposes of approval testing:-

a) For use in semi-automatic multi-run welding;

b) For use in single electrode multi-run automatic welding; and

c) For use in single electrode two-run automatic welding.

5.1.2 The term 'semi-automatic' is used to describe processes in which the weld is made manually by a welder holding a gun through which the wire is continuously fed. A suffix S will be added after the grade mark to indicate approval for semi-automatic multi-run welding.

5.1.3 Dependent on the results of impact tests, wires and wire-gas combinations are divided into the following grades:-

For normal strength steel	Grades 1, 2 and 3
For higher strength steel with minimum yield strength upto 355 [N/mm^2]	Grades 1Y, 2Y, 3Y and 4Y.
For higher strength steels with minimum yield strength upto 390 [N/mm^2]	Grades 2Y40, 3Y40, 4Y40 and 5Y40

5.1.4 For wires intended for automatic welding, the suffixes T, M or TM will be added after the grade mark to indicate approval for two-run, multi- run or both welding techniques, respectively.

5.1.5 For wires intended for both semi-automatic and automatic welding, the suffixes will be added in combination.

5.1.6 Where applicable, the composition of the shielding gas is to be reported. Unless otherwise agreed, additional approval tests are required when the shielding gas is different from that used for the original approval tests.

Where a wire in combination with any particular gas has been approved, usage of the same wire with another gas in the same group as defined in Table 5.1.6 may be considered.

5.1.7 Flux-cored or flux-coated wires which have satisfied the requirements for Grades 2, 2Y, 2Y40, 3, 3Y, 3Y40, 4Y, 4Y40 and 5Y40 may, at the option of the manufacturer, be submitted to the hydrogen test as detailed in 2.5 using the manufacturer's recommended welding condi-tions and adjusting the deposition rate to give a weight of weld deposit per sample similar to that deposited when using manual electrodes. A suffix H15, H10 or H5 will be added to the grade mark, in the same conditions as for manual arc welding electrodes to indicate compliance with the requirements of the test.

Table 5.1.6 : Compositional limits of designated groups of gas types and mixtures

Group		Gas Composition (Vol. %)			
		CO_2	O_2	H_2	Ar
M1	1	> 0 to 5	-	> 0 to 5	Rest 1) 2)
	2	> 0 to 5	-	-	
	3	-	> 0 to 3	-	
	4	> 0 to 5	> 0 to 3	-	
M1	1	> 5 to 25	-	-	Rest 1) 2)
	2	-	3 to 10	-	
	3	> 5 to 25	> 0 to 3	-	
M1	1	> 25 to 50	-	-	Rest 1) 2)
	2	-	> 10 to 15	-	
	3	> 5 to 50	> 8 to 15	-	
C	1	100	-	-	Rest 1) 2)
	2	Rest	> 0 to 30	-	

1) Argon may be substituted by Helium upto 95% of the Argon content.

2) Approval covers gas mixtures with equal or higher Helium contents only.

5.2 Approval tests for two-run automatic welding

5.2.1 Approval tests for two-run automatic welding are to be carried out generally in accordance with the requirements of Sec.4 using the two-run automatic welding technique for the preparation of all test assemblies.

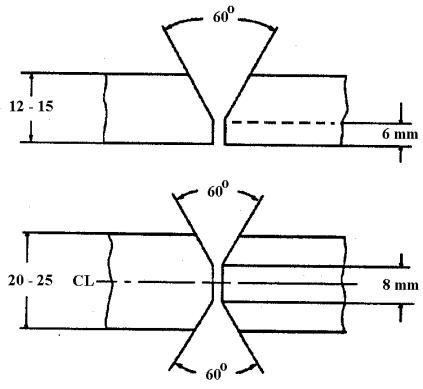

Fig.5.2.1 : Recommended edge preparation for two-run butt weld test assemblies

5.2.2 Two butt weld test assemblies are to be prepared generally as detailed in 4.4.1 and 4.4.2 using plates 12-15 [mm] and 20-25 [mm] in thickness.

5.2.3 If approval is requested for welding plates thicker than 25 [mm], one assembly is to be prepared using plates approximately 20 [mm] in thickness and the other using plates of maximum thickness for which approval is requested.

5.2.4 The edge preparation of test assemblies is to be as shown in Fig.5.2.1. Small deviations in the edge preparation may be allowed, if requested by the manufacturer. For assemblies using plates over 25 [mm] in thickness, the edge preparation is to be reported for information.

5.3 Approval tests for semi-automatic multi-run welding

5.3.1 Approval tests for semi-automatic multi-run welding are to be carried out generally in accordance with the requirements of Sec.2, using the semi-automatic multi-run technique for the preparation of all test assemblies.

5.3.2 Two deposited metal test assemblies are to be prepared in the downhand position as shown in Fig.2.2.1, one using the smallest diameter, and the other using the largest diameter of the wire intended for the welding of ship structures. The weld metal is to be deposited according to the practice recommended by the manufacturer, and the thickness of each layer of weld metal is to be between 2 [mm] and 6 [mm]. Where only one diameter is manufactured, only one deposited metal assembly is to be prepared.

5.3.3 Butt weld assemblies as shown in Fig.2.3.1 are to be prepared for each welding position (downhand, horizontal-vertical, vertical-upwards, vertical-downwards and overhead) for which the wire is recommended by the manufacturer.

5.3.4 The downhand assembly is to be welded using, for the first run, wire of 1.2 [mm] diameter or of the smallest diameter manufactured and, for the remaining runs, wire of 2.4 [mm] diameter or the largest diameter manufactured.

5.3.5 Where approval is requested only in the downhand position, an additional butt weld assembly is to be prepared in that position using wires of different diameter from those required by 5.3.4.

5.3.6 The butt weld assemblies, in positions other than downhand, are to be welded using for the first run, wire of 1.2 [mm] diameter or of the smallest diameter manufactured, and for the remaining runs, the largest diameter of wire recommended by the manufacturer for the position concerned.

5.3.7 Fillet weld test in accordance with Sec.2 is to be carried out.

5.4 Approval tests for multi-run automatic welding

5.4.1 Approval tests for multi-run automatic welding are to be carried out generally in accordance with the requirements of Sec.4 using the multi-run automatic welding technique for the preparation of all test assemblies.

5.4.2 One deposited metal test assembly is to be prepared as shown in Fig.4.3.1. Welding is to be as detailed in Sec.4 except that thickness of each layer is to be not less than 3 [mm].

5.4.3 A butt weld assembly is to be prepared, as shown in Fig.4.5.1.

5.5 Annual tests

5.5.1 The annual tests are to consist of at least the following:-

a) Wires approved for semi-automatic or for both semi-automatic and automatic multi-run welding: One deposited metal test assembly prepared in accordance with 5.3 using a wire of diameter within the range intended for the welding of the ship structures;

b) Wires approved for automatic multi-run welding: One deposited metal test assembly prepared in accordance with 5.4 using a wire of diameter within the range intended for the welding of the ship structure;

c) Wires approved for two-run automatic welding: One butt weld test assembly prepared in accordance with 5.2 using plates 20 to 25 [mm] in thickness. The diameter of the wire used is to be reported.

5.5.2 From the test assemblies prepared in accordance with 5.5.1, only the following tests are to be carried out:-

a) For deposited metal assemblies: One tensile and three impact tests;

b) For butt weld assemblies: One transverse tensile, two bend and three impact tests. One longitudinal tensile test is also required where the wire is approved solely for two-run automatic welding.

5.6 Upgrading and uprating

5.6.1 Requests for upgrading and uprating will generally be considered at the time of annual testing and additional tests in accordance with the requirements of 2.8 would be required.

Section 6

Consumables for use in Electro-slag and Electro-gas Vertical Welding

6.1 General

6.1.1 The requirements for the two-run technique as detailed in Sec.4 are applicable for the approval of special consumable used in electro-slag and electro-gas vertical welding with or without consumable nozzles except as otherwise required by the following requirements especially as regards the number and kind of the test-pieces used for the mechanical tests and taken from the butt welded assemblies.

6.1.2 For Grades 1Y, 2Y, 3Y, 4Y, 2Y40, 3Y40, 4Y40 and 5Y40 approval of the consumables may be restricted for use only with specific types of higher tensile steel. This is in respect of the content of grain refining elements, and if general approval is required, a niobium treated steel is to be used for the approval tests.

6.1.3 For these special welding consumables, the requirements of 1.3 may not be entirely applicable for technical reasons.

Where approval is requested for welding of both normal strength and higher tensile steel two assemblies are to be prepared using higher tensile steel. Two assemblies prepared using normal strength steel may also be required at the discretion of IRS.

6.2 Butt weld tests

6.2.1 Preparation of test assemblies

- Two butt weld test assemblies are to be prepared, one of them with plates 20/25 [mm] thick, the other with plates 35/40 [mm] thick or more. The grade of the steel to be used for each one of these assemblies must be selected according to the requirements given in the Table 4.4.2.

- The chemical composition of the plate, including the content of grain refining elements is to be reported.

- The welding conditions and the edges preparation are to be those recommended by the welding consumable manufacturer and are to be reported.

6.2.2 Radiographic examination

It is recommended that the welded assemblies be subjected to a radiographic examination to ascertain if there are any defects in the weld prior to the preparation of test specimens.

6.2.3 Test series

- Each assembly shall be cut to give test specimens according to Fig.6.2.1.

The length of the assembly should be sufficient to allow the selection of all the following test specimens :

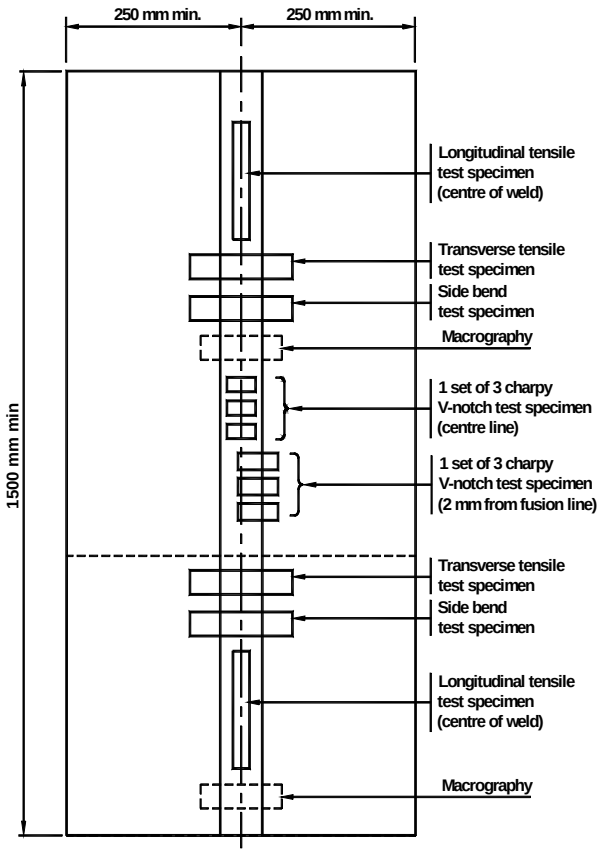

Fig. 6.2.1 : Butt weld test assembly

- 2 longitudinal tensile test specimens with their axis at the centre of the weld;

- 2 transverse tensile test specimens;
- 2 side bend test specimens;
- 2 sets of 3 Charpy-V notch impact test specimens in accordance with Fig.6.2.1 comprising of :
- 1 set with the notch in the axes of the weld;
- 1 set with the notch at 2 [mm] from the fusion line in the deposited metal; and
- 2 macro-sections of the weld (towards the middle of the weld and towards one end).

6.2.4 Results to be obtained

The results of the tensile, bend and impact tests are to comply with the requirements of 4.4 (two-run welding) for the class of filler product in question.

6.3 Annual tests

6.3.1 One test assembly must be prepared from plates 20/25 [mm] thick, and tested as indicated in 6.2.

The following specimens are to be selected :

- 1 longitudinal tensile specimen from the axis of the weld:
- 1 transverse tensile specimen;
- 2 side bend specimens;
- 3 Charpy-V specimens notched at the centre of the weld (position 1 Fig.6.3.1);
- 3 Charpy-V specimens cut out transverse to the weld with their notches at 2 [mm] from the fusion line, in the weld; and
- macro section.

6.3.2 The results to be obtained should meet the requirements given in 4.4 (two-run welding) for the class of the consumables in question.

6.4 Upgrading and uprating

6.4.1 Upgrading and uprating will be considered only at the manufacturers request, preferably at the time of annual testing. Generally, for this purpose, full tests from butt weld assemblies as indicated in 6.2 will be required, irrespective of the other tests requested if the concerned consumable is also approved (and possibly upgraded or uprated) according to Sec.4 or Sec.5.

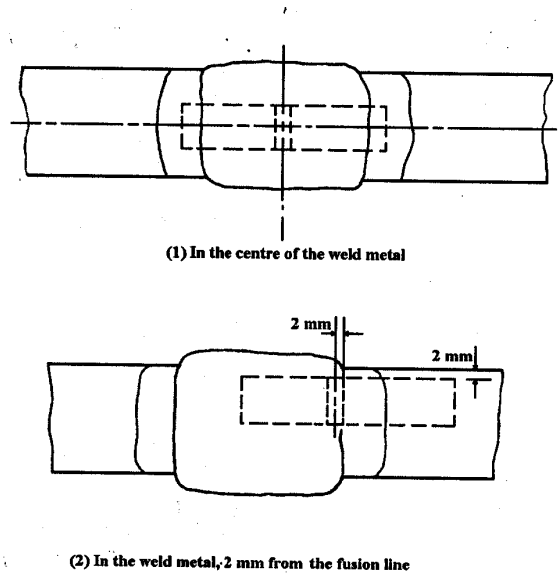

Fig.6.3.1 : Position of Charpy V-notch impact test specimens

Section 7

Welding Consumables for High Strength Steels for Welded Structures

7.1 General

7.1.1 Scope

7.1.1.1 These requirements supplement the requirements of Sections 1 to 6 and give the conditions of approval and inspection of welding consumables used for high strength steels for welded structures according to Ch.3, Sec.4 with yield strength levels from 420 [N/mm^2] upto 960 [N/mm^2] and impact grades AH, DH, EH and FH, except impact grade FH is not applicable for 890 [N/mm^2] and 960 [N/mm^2] yield strength levels.

Where no special requirements are given, those of Sections 1 to 6 apply in analogous manner.

7.1.1.2 The welding consumables preferably to be used for the steels concerned are divided into several categories as follows:

- covered electrodes for manual welding,
- wire-flux combinations for multirun sub-merged arc welding,
- solid wire-gas combinations for arc welding (including rods for gas tungsten arc welding),
- flux cored wire with or without gas for arc welding.

7.1.2 Grading, Designation

7.1.2.1 Based on the yield strength of the weld metal, the welding consumables concerned are divided into eight (yield) strength groups:

Y42 for welding steels with minimum yield strength 420 [N/mm^2]

Y46 for welding steels with minimum yield strength 460 [N/mm^2]

Y50 for welding steels with minimum yield strength 500 [N/mm^2]

Y55 for welding steels with minimum yield strength 550 [N/mm^2]

Y62 for welding steels with minimum yield strength 620 [N/mm^2]

Y69 for welding steels with minimum yield strength 690 [N/mm^2]

Y89 for welding steels with minimum yield strength 890 [N/mm^2]

Y96 for welding steels with minimum yield strength 960 [N/mm^2].

Wire-flux combinations for single or two-run technique are subject to special consideration of IRS.

7.1.2.2 Each of the eight (yield) strength groups is further divided into three main grades in respect of charpy V-notch impact test requirements (test temperatures):

Grade	Test temperature
3	- 20°C
4	- 40°C
5	- 60°C

7.1.2.3 Analogously to the designation scheme used in Section 1 to 6 the welding consumables for high strength steels are subject to additional designation and approval as follows:

- According to 7.1.2.2 with the quality grades 3, 4 or 5.
- With the added symbol Y and an appended code number designating the minimum yield strength of the weld metal corresponding to 7.1.2.1 : Y42, Y46, Y50, Y55, Y62, Y69, Y89 and Y96.
- With the added symbol H10 or H5 for controlled hydrogen content of the weld metal.
- With the added symbol S (= semi-automatic) for semi-mechanised welding.
- With the added symbol M designating multirun technique and is applicable only

to welding consumables for fully mechanised welding).

7.1.2.4 Each higher quality grade includes the one (or those) below, AH, DH steels according to Ch.3, Sec.4 are to be welded using welding consumables of at least quality grade, 3, grade EH steels using at least quality grade 4 and grade FH steels using at least quality grade 5, as per the following table:

Consumables Grade	Steel Grades covered
3Y..	DH..
4Y..	EH..and FH..
5Y..	FH.., EH.. and DH..

7.1.2.5 Welding consumables approved with grades.Y42, ..Y46 and ..Y50 are also considered suitable for welding steels in the two strength levels below that for which they have been approved. Welding consumables approved with grades ..Y55, ..Y62 and ..Y69 are also considered suitable for welding steels in the one strength level below that for which they have been approved. Welding consumables with grade Y89 are considered suitable for welding steels in the same strength level only. Welding consumables with grade Y96 are also considered suitable for welding steels in the one strength level below that for which they have been approved. For grade Y89 and Y96, where the design requirements permit undermatching weld joint, then welding consumables within the scope of this section can be considered subject to IRS's discretion and Manufacturer's recommendations.

7.1.2.6 IRS may, in individual cases, restrict the range of application in (up to) such a way, that approval for any one strength level does not justify approval for any other strength level.

7.1.3 Manufacture, testing and approval procedure

7.1.3.1 Manufacturer's plant, production methods and quality control measures shall be such as to ensure reasonable uniformity in manufacture, see also Sec.1.

7.1.3.2 Testing and approval procedure shall be in accordance with Sec.1 and as required in Section 1 to 6 for the individual categories (types) of welding consumables mentioned in 7.1.1.2 above.

7.2 Testing of the weld metal

7.2.1 For testing the deposited weld metal, test pieces analogous to those called for in Sections 1 to 6 respectively shall be prepared, depending on the type of the welding consumables (and according to the welding process). The base metal used shall be a fine-gained structural steel compatible with the properties of the weld metal, or the side walls of the weld shall be buttered with a weld metal of the same composition.

7.2.2 The chemical composition of the deposited weld metal shall be determined and certified in a manner analogous to that prescribed in Sec.2, Cl.2.2.4. The results of the analysis shall not exceed the limit values specified in the standards or by the manufacturer, the narrower tolerances being applicable in each case.

7.2.3 Depending on the type of the welding consumables (and according to the welding process), the test specimens prescribed in Sections 1 to 6 respectively shall be taken from the weld metal test pieces in a similar manner.

7.2.4 The mechanical properties must meet the requirements stated in Table 7.2.1 and Table 7.2.2. The provisions of Sections 1 to 6 apply in analogous manner to the performance of the tests, including in particular the maintenance of the test temperature in the notched bar impact test and the carrying out of results.

7.2.5 Specifications of welding consumables used for welding high strength extremely thick steel plates of thickness more than 50 [mm] but not exceeding 100[mm] of EH47 grade used in container carriers are to be in accordance with Table 7.2.3

7.2.6 Welding consumables for brittle crack arrest steels are to be in accordance with the relevant requirements for each steel grade excluding suffix “BCA1” or “BCA2” specified in Table 10.1.3 of Chapter 3, Section 10.

7.3 Testing on welded joints

7.3.1 Depending on the type of the welding consumables (and according to the welding process), the testing on the welded joints shall be performed on butt-weld test pieces in a manner analogous to that called for in Sections 1 to 6.

7.3.2 Depending on the type of the welding consumables (and according to the welding process), the butt-weld test pieces called for in para 7.3.1 shall be welded in a manner analogous to that prescribed in Sections 1 to 6. The base metal used shall be a high-strength fine-grained structural steel with a minimum yield strength and tensile strength matching the consumable grade being approved and compatible with the added symbol for which application is made.

7.3.3 Depending on the type of the welding consumables (and according to the welding process), the test specimens described in Sections 1 to 6 shall be taken from the butt-weld test pieces.

7.3.4 The mechanical properties must meet the requirements stated in Table 7.3.1. The provisions of Sections 1 to 6 apply in analogous manner to the performance of the tests, including in particular the maintenance of the test temperatures in the notched bar impact test and the requirements regarding the retest specimens.

Table 7.2.1 : Required toughness properties of the weld metal

Quality Grade	Test temp.°C	Min. notch impact energy [J][1)]
3	- 20	Y42: ≥ 47 Y46: ≥ 47 Y50: ≥ 50 Y55: ≥ 55 Y62: ≥ 62 Y69: ≥ 69 Y89: ≥ 69[2)] Y96: ≥ 69[2)]
4	- 40	
5	- 60	

1) Charpy V-notch impact test specimen, mean value of three specimens; for requirements regarding minimum individual values and retests, See Section 1, 1.10
2) Quality grade 5 is not applicable for Y89 and Y96 grade consumables.

Table 7.2.2 : Required strength properties of the weld metal

Symbols added to quality grade	Min. yield strength or 0.2% proof stress [N/mm^2]	Tensile Strength [N/mm^2]	Minimum elongation [%]
Y42	420	520 - 680	20
Y46	460	540 - 720	20
Y50	500	590 - 770	18
Y55	550	640 – 820	18
Y62	620	700 - 890	18
Y69	690	770 - 940	17
Y89	890	940 - 1100	14
Y96	960	980 - 1150	13

Table 7.2.3 : Required strength properties for deposited metal used to weld high strength extremely thick steel plates of thickness more than 50[mm] but not exceeding 100[mm], of EH47 grade used in container carriers,				
Mechanical Properties			Impact Test	
Yield Strength [N/mm^2] min.	Tensile Strength [N/mm^2]	Elongation (%) min	Test Temp. [^{o}C]	Average Impact Energy [J] min.
460	570 - 720	19	-20	64

7.3.5 Where the bending angle required in Table 7.3.1 is not achieved, the specimen may be considered as fulfilling the requirements, if the bending elongation on a gauge length Lo fulfills the minimum elongation requirements stated in Table 7.2.2. The gauge length Lo = Ls + t (Ls = width of weld, t = specimen thickness), see Fig.7.3.1.

7.3.6 Mechanical Properties for Butt weld tests for high strength extremely thick steel plates of thickness more than 50[mm] but not exceeding 100[mm], of EH47 grade used in container carriers are to be as per Table 7.3.2

Table 7.3.1 : Required properties of welded joints					
Quality Grade	**Added symbol**	**Min. tensile strength [N/mm^2]**	**Min. notch impact energy, test temperature**	**Minimum bending angle 1)**	**Bend ratio D/t 2)**
3 to 5 in accordance with Table 7.2.1	Y42 Y46 Y50 Y55 Y62 Y69 Y89 Y96	520 540 590 640 700 770 940 980	Depending on the quality grade and yield strength in accordance with Table 7.2.1	120°	4 4 4 5 5 5 6 7

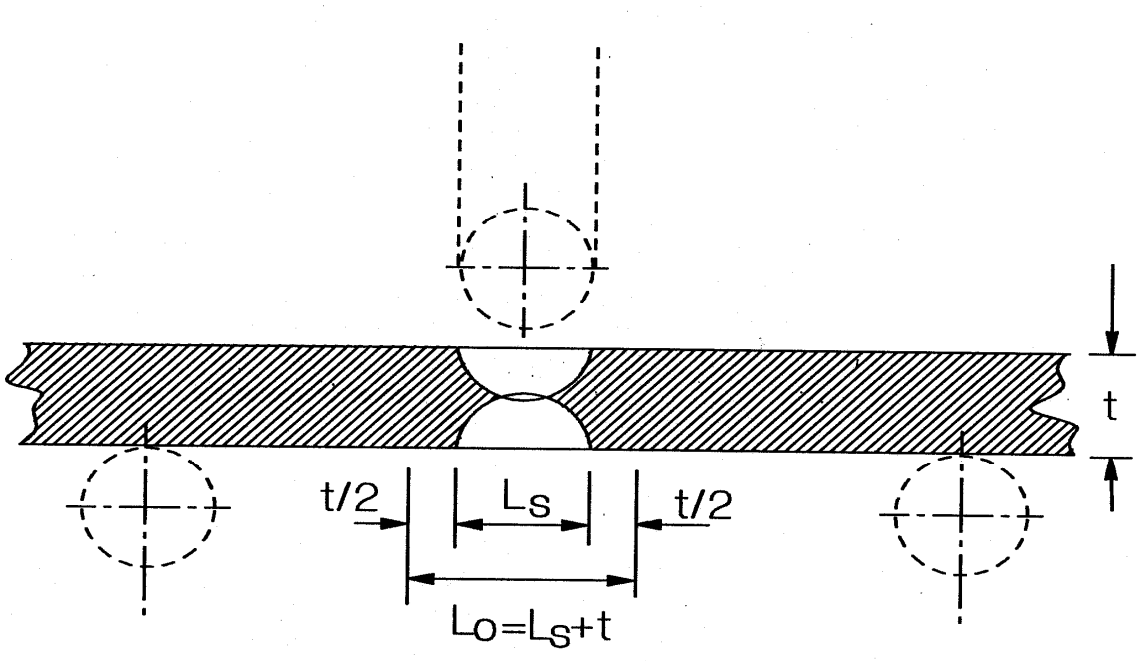

Fig.7.3.1 : Required proportion of welded joints

1) Bending angle attained before the first incipient crack, minor pore exposures upto a maximum length of 3 mm allowed.

2) D = Mandrel diameter, t = specimen thickness

Table 7.3.2 : Mechanical Properties for Butt weld tests for high strength extremely thick steel plates of thickness more than 50[mm] but not exceeding 100[mm], of EH47 grade used in container carriers

Tensile Strength [N/mm^2]	Bend Test Ratio: D/t	Charpy V-notch Impact Tests	
		Test Temperature (^oC)	Average Energy (J) min.
570-720	4	-20	64

7.4 Hydrogen test

7.4.1 The welding consumables, other than solid wire-gas combinations, shall be subjected to a hydrogen test in accordance with the mercury method to ISO 3690:2018, or any other method such as the gas chromatographic method which correlates with that method, in respect of cooling rate and delay times during preparation of the weld samples, and the hydrogen volume determinations.

7.4.2 The diffusible hydrogen content of the weld metal determined in accordance with the provisions of Sec.2, Para 2.5 shall not exceed the limits given in Table 7.4.1.

Table 7.4.1 : Allowable diffusible hydrogen content

Yield strength group	**Hydrogen symbol**	**Max. hydrogen content [cm^3/100 g deposited weld metal]**
Y42 Y46 Y50	H 10	10
Y55 Y62 Y69	H 5	5
Y89 Y96	H 5	5

7.5 Annual tests

7.5.1 The annual repeat tests specified in Sections 1 to 6 shall entail the preparation and testing of weld metal test pieces as prescribed under 7.2. For grades Y69 to Y96 annual hydrogen test is required. In special cases, IRS may require more extensive tests.

Section 8

Consumables for Welding of Aluminium Alloys

8.1 General

8.1.1 Tests for the approval of consumables intended for welding the aluminium alloys detailed in Ch.9 are to be carried out generally in accordance with the requirements of Secs.1,2 and 5, except as otherwise detailed in this Section.

8.1.2 The welding consumables are divided into two categories as follows:

W = wire electrode, wire - gas combinations for metal arc inert gas welding (MIG, 131 according to ISO 4063:2009), tungsten inert gas welding (TIG, 141) or plasma arc welding (15)

R = rod - gas combinations for tungsten inert gas arc welding (TIG, 141) or plasma arc welding (15)

8.1.3 Approval will be indicated by the grade as shown in Table 8.1.3.

Table 8.1.3 : Consumables grades and base materials for the approval test

Consumable quality grade (Symbol)	Base material for the tests	
	Alloy Designation	
	Numerical	Chem-Symbol
RA/WA	5754	AlMg3
RB/WB	5086	AlMg4
RC/WC	5083	AlMg4.5 Mn0.7
	5383	AlMg4.5 Mn0.9
	5456	AlMg5
	5059	-
RD/WD	6082	AlSi1MgMn
	6005A	AlSiMg(A)
	6061	AlMg1SiCu
Note: Approval on higher strength AlMg base materials covers also the lower strength AlMg grades and their combination with AlSi grades		

8.1.4 The welding technique will be indicated in the approval grading by a letter as under:

m - manual multi-run welding (GTAW);
S - semi-automatic multi-run welding (GMAW);
M - automatic multi-run welding (GTAW or GMAW);
T - automatic two-run welding (GMAW).

8.1.5 The compositions, of the shielding gas and the filler/electrode wire are to be reported.

8.1.6 Approval of a wire or a rod will be granted in conjunction with a specific shielding gas according to Table 8.1.6 or defined in terms of composition and purity of "special" gas to be designated with group sign "S". The composition of the shielding gas is to be reported. Where a wire in combination with any particular gas has been approved, usage of the same wire with another gas in the same group as defined in Table 8.1.6 may be considered.

Table 8.1.6 : Compositional limits of shielding gases and mixtures to be used

Group	Gas composition (Vol.%)[1])	
	Argon	**Helium**
I - 1	100	-
I - 2	-	100
I - 3	Rest	> 0 to 33
I - 4	Rest	> 33 to 66
I - 5	Rest	> 66 to 95
S	Special gas, composition to be specified, See 8.1.6	

1) Gases of other chemical composition (mixed gases) may be considered as "special gases" and covered by a separate test.

8.1.7 On completion of welding, assemblies must be allowed to cool naturally to ambient temperature. Welded test assemblies and test specimens must not be subjected to any heat treatment after welding except for the alloy Grades 6005A, 6061 and 6082. These are to be allowed to naturally age at ambient temperature for a period of 72 hours from the completion of welding, before the testing is carried out. A second solution heat treatment is not permitted. The time and temperature of any ageing treatment is to be reported in detail.

8.2 Initial approval tests for manual, semi-automatic and automatic multi-run techniques

8.2.1 Plate of the corresponding type of aluminium alloy and of appropriate thickness is to be used for the preparation of the weld test assemblies.

8.2.2 The welding current and power requirements are to be within the range recommended by the manufacturer and are to be reported.

8.2.3 Welded assemblies are to be prepared and tested in accordance with 8.3, 8.4 and 8.5.

8.3 Deposited metal test assemblies

8.3.1 One assembly is to be prepared in the downhand position as shown in Fig.8.3.1.

8.3.2 The chemical composition of the plate used for the assembly is to be compatible with the weld metal.

8.3.3 The thickness of the plate used and the length of the assembly are to be appropriate to the welding process. The plate thickness is to be not less than 12 [mm].

8.3.4 For the approval of filler wire/gas and electrode wire/gas combinations for manual or semi-automatic welding by GTAW or GMAW, one test assembly is to be welded using any size of wire within the range for which approval is sought.

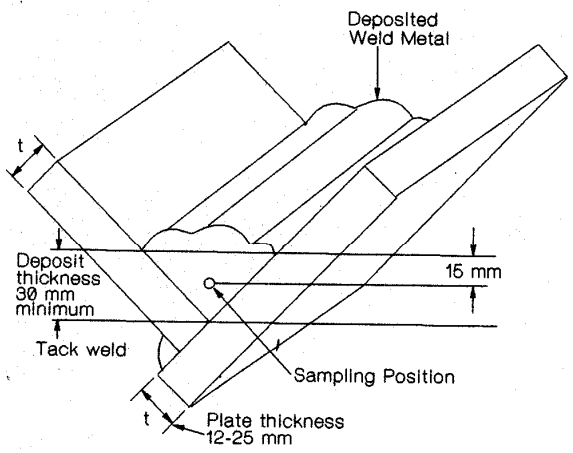

Fig.8.3.1 : Deposited metal test assembly

8.3.5 For automatic multi-run approval, one test assembly is to be welded by the respective process using the recommended diameter of wire.

8.3.6 The weld metal is to be deposited in multi-run layers in accordance with normal practice. The direction of deposition of each layer is to alternate from each end of the plate.

8.3.7 The deposited weld metal in each test assembly is to be analysed and reported including the contents of all significant elements. The elements reported will be dependent on the type of aluminium alloy for which approval of the consumables is requested. The results of the analysis are to be within the tolerances specified in the standards and by the manufacturer.

8.4 Butt weld test assemblies

8.4.1 Plate of the corresponding type of aluminium alloy and of an appropriate thickness is to be used for the preparation of the test assemblies.

Table 8.4.1 : Requirements for the transverse tensile and bend tests

Grade	Base material used for the test	Tensile strength R_m [N/mm^2] min.	Former diameter	Bending angle [1] [°] min.
RA/WA	5754	190	3t	180
RB/WB	5086	240	6t	
RC/WC	5083	275	6t	
	5383 or 5456	290		
	5059	330		
RD/WD	6061, 6005A or 6082	170	6t	

1) During testing, the test specimen shall not reveal any one single flaw greater than 3 [mm] in any direction. Flaws appearing at the corners of a test specimen shall be ignored in the evaluation, unless there is evidence that they result from lack fusion.

8.4.2 In order to ensure sound and representative welds, it is essential that test assemblies are cleaned and degreased prior to welding. Assemblies as shown in Fig.8.4.2 are to be prepared for each welding position (downhand, horizontal-vertical, vertical-upward, vertical-downward and overhead) for which the consumable is recommended by the manufacturer; except that consumables satisfying the requirements for downhand and vertical-upward positions will be considered as also complying with the requirements for the horizontal-vertical position.

Back sealing runs are allowed in single V weld assemblies. In case of double V assembly both sides shall be welded with the same welding position.

8.4.3 One additional assembly, as shown in Fig.8.4.3, is to be prepared for welding in the downhand position. The assembly is to be welded using, for the first run, wire of the smallest diameter recommended by the manufacturer and for the remaining runs, wire of the largest diameter to be approved.

8.4.4 The manufacturer's recommended procedures are to be used in making the welds and are to be reported.

8.4.5 The welded assemblies should be subjected to both radiographic and visual examination, aided where necessary by dye penetrant testing, to ensure that the welds are free from cracks and porosity.

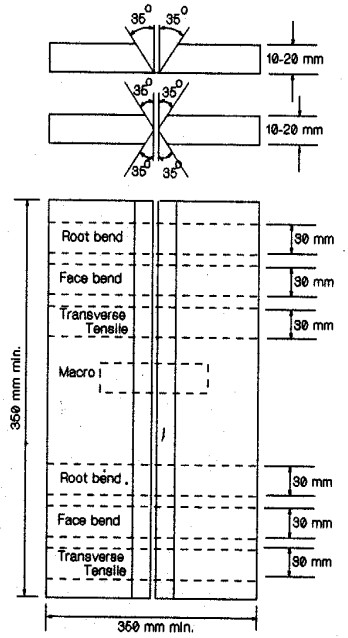

Fig.8.4.2 : Butt weld test assembly (positional welding)

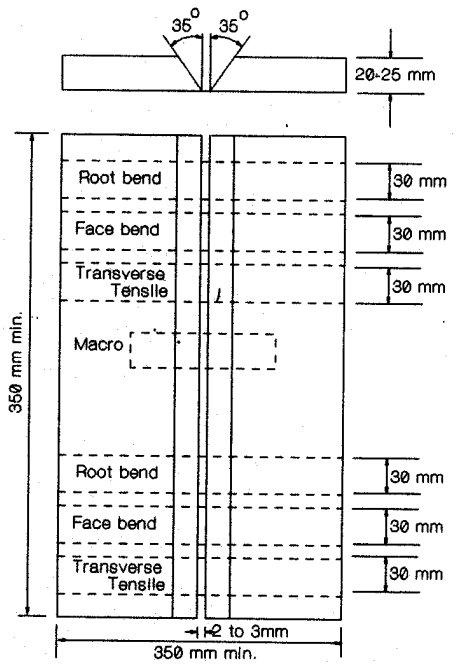

Fig.8.4.3 : Additional butt weld assembly (downhand)

8.4.6 The test specimens are to be taken from the welded assemblies as shown in Fig.8.4.2 and Fig.8.4.3. For each assembly they are to comprise:

2 transverse tensile specimens;
1 macro specimen;
2 face bend specimens; and
2 root bend specimens.

8.4.7 All tensile test specimens should have a tensile strength not less than the respective value shown in Table 8.4.1. The position of each fracture is to be reported.

8.4.8 The bend test specimens are to be bent around a former having a diameter not more than the number of times the thickness (t) of the test specimen as shown in Table 8.4.1.

8.5 Fillet weld test assemblies

8.5.1 Assemblies are to be prepared and tested in accordance with the appropriate requirements of 2.4 except that the plates are to be of the aluminium alloy for which approval is required, that no hardness tests are required and that for automatic multi-run approval only one fillet weld bead is to be made using the recommended wire diameter. In this case, the bead size should be as large as the maximum single bead size recommended by the manufacturer for fillet welding.

8.5.2 The results of examination of the macro specimens and the fractured fillet welds are to be reported in accordance with 2.4.3 and 2.4.5. Particular attention is to be given to the presence of any porosity.

8.6 Initial approval tests for two-run technique

8.6.1 Two butt weld test assemblies are to be prepared using the following plate thicknesses as shown in Fig.8.7.1:

a) one with the maximum thickness for which approval is requested;

b) one with a thickness approximately one half to two thirds that of the maximum thickness.

8.7 Annual tests

8.7.1 Annual repeat tests are to consist of preparation and testing of the deposited weld metal test assembly as prescribed in 8.3 (Fig.8.3.1) and of the downhand buttweld assembly according to 8.4 (Fig.8.4.2).

Section 1

General

1.1 Scope of application

1.1.1 In general, the Rules in this part apply to all-welded, single hull sea going steel ships of normal form, proportions and speed of Length equal to or greater than 24[m].

1.1.2 For additional class notations relating to various ship types, requirements as per Part 5 are to be complied with.

1.1.3 Ships of unconventional forms and proportions or intended for carriage of cargoes not covered by the Rules or to be engaged in special service will receive individual consideration based on the general principles of the Rules. In these cases, however, additional calculations and/or model testing may be required to be carried out and submitted for approval.

1.1.4 Proposals for use of alternative materials e.g. aluminum, wood, etc. for some parts of the ship will receive special consideration.

1.1.5 In general, these Rules are not applicable for vessels required to comply with IACS Common Structural Rules for Oil Tankers and Bulk Carriers. For ships with CSR notation, *IRS Rules for Bulk Carriers and Oil Tankers,* are applicable.

1.2 Equivalence

1.2.1 Alternative arrangements, scantlings and equipment may be accepted provided they can be shown to be equivalent to the overall safety and strength standard of the Rules. Direct calculations for the derivation of the scantlings as an alternative to those derived by the Rule formulae, may be accepted on special consideration. The calculation procedure and the assumptions made are to be submitted for approval.

1.3 National and international regulations

1.3.1 While the Rules cover requirements for the classification of ships, the attention of all concerned is drawn to requirements of various local, national or international Regulations, Codes and Recommendations which the vessel may also have to comply with.

1.4 Application

1.4.1 Rules for hull structure are provided in Part 3 and Part 5.

1.4.2 Part 3 contains the general hull requirements and includes application related to hull shape, arrangement, main dimensions, materials, etc.

1.4.3 Part 5 (Vol. I and II) covers the application and additional requirements related to special ship types and systems.

1.5 Design Basis

1.5.1 General assumptions:

This sub-section specifies the assumptions and the design parameters that are used as the basis of the design principles of the Rules:

1.5.1.1 Ships are to be designed to withstand, in the intact condition, the environmental loads anticipated during the design life, for the appropriate loading conditions. Structural strength is to be checked against buckling, yielding, fatigue and hull girder ultimate strength. Ships are to be designed to have sufficient strength to withstand the loads due to flooded conditions, as applicable.

1.5.1.2 Fatigue strength is to be assessed for being adequate for the specified fatigue life and design environments.

1.5.1.3 Vibrations in the hull structural elements are not considered in relation to the requirements for scantlings given in the rules. However, it is to be ensured by designer/shipyard that significant dynamic excitation of major orders from propellers and machinery items do not fall close to any natural frequency of the hull and that special considerations are made to avoid resonance, causing structural failures.

1.5.1.4 It is assumed that the ships will be competently handled and loaded as per the approved loading manuals.

1.5.1.5 For ships over 350[m] in length, special consideration would be made for the wave loads by IRS.

1.5.2 Transverse strength

1.5.2.1 Additional calculations are required for vessels, when total number of effective transverse bulkheads is less than that is given in Chapter 3.

1.5.3 Design life

1.5.3.1 The design life is the period that the ship is assumed to be exposed to operating and/or environmental conditions and minimum design life is taken as 25 years, unless specified otherwise.

1.5.4 Environmental conditions

1.5.4.1 The requirements are based on wave-induced loads covering the worst anticipated wave environment and related long-term sea state spectrum. The minimum environmental conditions to be used in the rules for unrestricted service are the North Atlantic wave environment according to IACS Rec.34 standard wave data.

1.5.4.2 The effects of ice are covered by Part 5, Chapter 21 (Ice Class Requirements) and Part 5, Chapter 32 (Polar Class).

1.5.5 Design temperatures

1.5.5.1 The rules assume that the structural assessment of hull strength members is valid for the following design temperatures:

- Lowest mean daily average temperature in air is above –10[°C]

- Lowest mean daily average temperature in sea water is 0[°C].

1.5.5.2 Ships intended to operate in areas with lower mean daily average temperature (below and including –10[°C]), e.g. regular service during winter season to Arctic or Antarctic waters is subject to the requirements in Chapter 2, Section 2.3.

1.5.6 Operating draughts

1.5.6.1 The design operating draughts are to be specified by the designer and to be used to derive the appropriate structural scantlings. All operational loading conditions in the loading manual are to comply with the specified design operating draughts. Following draughts are to be considered:

- Scantling draught for assessment of structure

- Maximum and minimum draughts amidships specified by the designer;

- Normal and heavy ballast draught, if applicable, for assessment of some particular structure.

1.5.7 Maximum service speed

1.5.7.1 Maximum service speed, is the speed with which the vessel is running ahead at maximum continuous rated shaft rpm and at the summer load waterline. Special consideration will be given to ships designed to operate at higher speed at a lower draft, and with full immersion of rudder. For ships with high speed and large flare (in particular L>120[m] and speed V>17[knots]), special consideration for the wave loads may be required based on the distribution of still water and vertical wave bending moments.

1.6 Design principles

1.6.1 Overall rule principles

1.6.1.1 In general, the Rules are based on the basic principles, as follows:

(a) The safety of the structure can be assessed by Limit State approach with respect to possible structural failure mode(s) when the ship is subjected to operational and environmental loads/ conditions.

(b) The design complies with the design basis, given in 1.5.

(c) Structural assessments are carried out based on consistent design load scenarios.

1.6.2 Ship structure design principles

1.6.2.1 In general, the ship's structure is to be designed such that:

(a) Ship structure has inherent redundancy. The ship's structure works in a hierarchical manner and the failure of structural elements lower down in the hierarchy do not result in immediate consequential failure of elements higher up in the hierarchy such as failure of plating will not lead to immediate consequent failure of stiffened panels.

(b) Permanent deformations are minimized. Permanent deformations of local plate panels or individual stiffened plate panels is acceptable provided that this does not affect the structural integrity, containment integrity and the performance of structural or other systems.

(c) Occurrence of in-service cracking is minimized, particularly in locations which affect the structural integrity, containment integrity and the performance of structural or other systems.

(d) Adequate structural redundancy to survive in the accidental damage in the event of flooding of any compartment.

(e) Good access conditions during construction to assure satisfactory quality of welding, coating and safe survey/ inspection.

(f) Good access conditions during the operational phase to allow adequate maintenance and safe periodical survey/ inspection to identify inspect and repair cracks by crew, IRS and relevant authorities.

1.6.3 Limit State Design Principles

1.6.3.1 Limit state design, on which the Rules are based, is a systematic approach wherein possible failure modes related to the design scenarios for each structural element is identified and evaluated. There may be one or more relevant limit states for each failure mode. The limit load for the structural element is found as the minimum limit load resulting from all the relevant limit states. The limit states are divided into four categories: serviceability limit state (SLS), ultimate limit state (ULS), fatigue limit state (FLS) and accidental limit state (ALS). The Rules include requirements for relevant limit states for the various modes of failure in ship structures and the same are indicated in Table 1.6.3.

Table 1.6.3: Failure modes in relation to the limit states to be considered				
Failure modes	**Limit States**			
	ULS	**SLS**	**ALS**	**FLS**
Yielding	Yes	Yes	Yes	-
Plastic collapse	Yes		Yes	-
Buckling	Yes	Yes	Yes	-
Rupture	Yes		Yes	-
Brittle fracture	Yes	Yes	Yes	-
Fatigue crack	-	-	-	Yes

1.7 Design load scenarios

1.7.1 The design and assessment of the ship structures is to be based on the design load scenarios encountered by the ship in its life time. A realistic set of design load scenarios corresponds to either normal operations (at sea or harbor) or accidental operations. The design load scenarios are based on operational loads and accidental loads as given below.

1.7.2 Operational Loads

1.7.2.1 The operational load scenarios include static and dynamic load components and are further subdivided into two distinct load groups

(a) Static or still water design loads scenario (S)

(i) Loads caused by the ship's loading condition, self-weight due to gravity, equipment loads, weight of cargo, buoyancy loads and mass, thermal loads etc.

(ii) Covers application of relevant static loads and typically covers load scenarios in harbour and sheltered water or tank testing.

(b) Environmental (dynamic or time varying) loads in seagoing conditions

(i) Static plus dynamic design load (S+D) covers application of relevant static loads and simultaneously occurring dynamic load components and typically cover load scenarios for seagoing operations

(ii) Fatigue or cyclic loads (F) caused by wave action, including pressure loading on side shell, inertial loads due to ship motions, and the induced shear forces and bending moments.

(iii) Impact loads (I) caused by wave impact, bottom slamming, stern slamming and liquid impact in tanks encountered during seagoing operations

(iv) Sloshing loads (SL) due to liquid sloshing in partially filled tanks encountered during seagoing operations

1.7.3 Accidental Load Scenario (A)

1.7.3.1 Accidental load scenarios include loads that do not occur during normal operations but as a result of an accident, such as flooding of compartments.

1.8 Structural capacity assessment

1.8.1 The capacity assessment method is capable of analyzing the failure mode in question to the required degree of accuracy. The possible failure modes are controlled by appropriate capacity assessment methods using relevant capacity models. The method may be different for each of the limit states even for the same failure mode, as the degree of the ultimate capacity utilization is different. The capacity models are based on a net thickness approach with corresponding scantling requirements given as net thickness values.

1.8.2 Failure modes to be assessed

1.8.2.1 The main failure modes in ship structures considered for the assessment of ship structural safety with the relation to the limit states (SLS, ULS, ALS, and FLS) are as follows:

(a) Yielding: The yielding failure mode is the mode in which plastic strain occurs locally in the structural member under combined in-plane and normal stresses. Local plastic strain is controlled in SLS, ULS and ALS models by checking the stress levels in the structural member being below the permissible value.

(b) Plastic collapse: The plastic collapse failure mode usually appears in the local structural members under large lateral impact pressure. In this failure mode, permanent lateral deflection in the local structural members will occur, but does not influence the global strength. This mode is controlled in ULS and ALS by using conventional plastic design method.

(c) Buckling: The buckling failure mode is the instability phenomena of structural members under compressive loads. Elastic (reversible) buckling occurs, when the structural members reach its elastic buckling stress. This buckling failure mode is controlled in SLS model. If the compressive load is increased, stress redistribution occurs due to buckling of the weakest structural member and the stress reaches the yield value. This buckling failure mode with large elastic deflection is controlled in ULS or ALS models. When compression is unloaded, no consequence of failure due to buckling is seen.
Plastic (irreversible) buckling occurs when the stress in structural members exceeds the yield stress. As a result, permanent deflections due to plastic buckling will occur. This irreversible buckling failure mode is controlled only in ULS or ALS models for global hull girder strength.

(d) Rupture: The rupture failure mode is the mode in which breaking occurs in the structural members under large tensile stress beyond the yield stress of the material. This failure mode is controlled in ULS or ALS models, but the assessment of this failure mode will be covered by controlling the yielding failure.

(e) Brittle Fracture: Brittle fracture occurs with very little plastic deformation under tensile stresses less than the yield stress of the material when small cracks are contained in the structural members due to undesirable material properties. Brittle fracture depends on the material tensile strength, temperature and thickness. Therefore, this mode is controlled by the material rule requirement of steel grade based on the impact test and addresses all limit states except FLS. The consequence of this failure mode is directed to the overall collapse of the ship hull.

(f) Fatigue cracking: This failure mode is different from the failure modes mentioned above and is controlled in FLS alone.
Failure modes in ship structures with relation to the limit states are shown in Table 1.6.3.

1.8.3 Capacity models for ULS, SLS and ALS

1.8.3.1 The structural capacity assessment methods are either prescriptive or require the use of more advanced calculations such as finite element analysis methods.

1.8.4 Capacity models for FLS

1.8.4.1 The fatigue assessment method provides requirements for assessing structural details against fatigue failure. The fatigue capacity model is based on a linear cumulative damage summation (Palmgren-Miner's rule) in combination with a design S-N curve, a reference stress range and an assumed long-term stress distribution curve.

1.8.4.2 The fatigue capacity assessment models are either prescriptive or require the use of more advanced calculations, such as finite element analysis methods. These methods account for the combined effects of global and local dynamic loads. The procedure for fatigue assessment of ship structures is indicated in Chapter 10.

1.8.5 Net Scantling Approach

The application of the net thickness approach to assess the structural capacity is specified in Chapter 2, Section 4.

1.8.6 Intact Structure

All strength calculations for ULS, SLS and FLS are based on the assumption that the structure is intact. But in ALS, the residual strength of the ship in a structurally damaged condition is assessed.

1.9 Rule design methods

1.9.1 General

1.9.1.1 The requirements associated with the assessment of the scantlings are based on the Working Stress Design (WSD) or Partial Safety Factor (PSF) design method. For both WSD and PSF, the design assessment conditions and corresponding acceptance criteria are given. These conditions are associated with the probability level of the combined 'expected' and 'extreme' loads covered by static and dynamic load combinations.

(i) Working Stress Design (WSD), also known as the permissible or allowable stress method

(ii) Partial Safety Factor (PSF), also known as Load and Resistance Factor Design (LRFD).

The safety factors for both WSD and PSF method are calibrated for the various rule requirements such that consistent and acceptable safety level for all combinations of static and dynamic load effects are achieved.

(a) The WSD method has the following composition:

$$W_{stat} + W_{dyn} \leq \eta R$$

where:

W_{stat} = simultaneously occurring static loads or load effects in terms of stresses.

W_{dyn} = simultaneously occurring dynamic loads or load effects. The dynamic loads are typically a combination of local and global load components.

R = characteristic capacity or material strength (e.g. yield stress or buckling capacity)

η = permissible utilization factor (resistance factor). The utilization factor includes consideration of uncertainties in loads, structural capacity and the consequence of failure

(b) The PSF method has the following composition:

$$\gamma_{stat} W_{stat} + \gamma_{dyn} W_{dyn} \leq \frac{R}{\gamma_R}$$

where:

W_{stat} = simultaneously occurring static loads or load effects in terms of stresses.

γ_{stat} = partial safety factor associated with the uncertainties related to static loads

W_{dyn} = simultaneously occurring dynamic loads or load effects. The dynamic loads are typically a combination of local and global load components.

γ_{dyn} = partial safety factor associated with the uncertainties related to dynamic loads

R = characteristic capacity or material strength (e.g. yield stress or buckling capacity)

γ_R = the partial factor associated with the capacity (resistance), or the resistance factors

1.9.1.2 In general, the working stress design (WSD) method is applied in these Rules, except for the hull girder ultimate strength criteria where the partial safety factor (PSF) method is applied. The partial safety factor format is applied for this highly critical failure mode to better account for uncertainties related to static loads, dynamic loads and capacity formulations.

1.9.1.3 The identified load scenarios are addressed in terms of design loads, design format and acceptance criteria set, as given in Table 1.10.1.2. The table is indicative and only intended to give an overview.

1.9.1.4 Load based prescriptive requirements provide scantling requirements for all plating, local supporting members, most primary supporting members and the hull girder and cover all structural elements including deckhouses, foundations for deck equipment.

1.9.1.5 In general, these requirements explicitly control one particular failure mode and hence several requirements may need to be applied to assess one particular structural member.

1.9.1.6 Minimum requirements indicate the minimum scantlings which are to be applied irrespective of all other requirements, hence thickness below the minimum is not allowed. The minimum requirements are usually in one of the following forms:

(i) Minimum thickness, which is independent of the specified minimum yield stress.

(ii) Minimum stiffness and proportion, which are based on buckling failure modes.

1.9.2 Design loads for SLS, ULS and ALS

1.9.2.1 The structural assessment of compartment boundaries, e.g. bulkheads, is based on loading condition relevant for the type of ship and the operation the ship is intended for.

1.9.2.2 To provide consistency of approach, standardized rule values for parameters, such as GM, R_{roll}, T_{SC} and C_b are to be applied to calculate the rule load values.

1.9.2.3 The probability level of the dynamic global, local and impact loads (Refer Table 1.10.1.1) is 10^{-8} and is derived using the long-term statistical approach.

1.9.2.4 The probability level of the sloshing loads (Refer Table 1.10.1.1) is 10^{-4}. These loads are considered to be frequent loads.

1.9.2.5 The design load scenarios for structural verification apply the applicable simultaneously acting local and global load components. The relevant design load scenarios are given in Chapter 5, Section 6.

1.9.2.6 The simultaneously occurring dynamic loads are specified by applying a dynamic load combination factor to the dynamic load values given in Chapter 5. The dynamic load combination factors that define the dynamic load cases are given in Chapter 5, Section 2.

1.9.2.7 Design load conditions for hull girder ultimate strength are indicated in Chapter 6, Section 4.

1.9.3 Design loads for FLS

1.9.3.1 The fatigue requirements are given in Chapter 10.

1.9.3.2 The expected load history for the design life is characterized at a probability level of 10^{-2} of the dynamic load value, the load history for each structural member is represented by Weibull probability distributions of the corresponding stresses.

1.9.3.3 The considered wave induced loads include:

(i) Hull girder loads (i.e. vertical and horizontal bending moments and torsional moments).

(ii) Dynamic wave pressures.

(iii)Dynamic pressure and forces from cargo, ballast etc.

1.9.4 Structural response analysis

1.9.4.1 In general, the following approaches are to be followed for determination of the structural response to the applied design load combinations:

(a) Beam theory: Used for prescriptive requirements

(b) FE analysis:

(i) Coarse mesh for cargo hold model
(ii) Fine mesh for local models
(iii) Very fine mesh for fatigue assessment.

1.10 Acceptance criteria

1.10.1 General

1.10.1.1 The acceptance criteria are categorized into four acceptance criteria sets. These are indicated in Table 1.10.1.1 to Table 1.10.1.3. The specific acceptance criteria set that is applied in the rule requirements is dependent on the probability level of the characteristic combined load.

1.10.1.2 The acceptance criteria set AC-1 is applied for operational static and sloshing design loads. The allowable stress for such loads is lower than that for an extreme load to take into account effects of:

- Repeated yield
- Allowance for some dynamics
- Margins for some selected limited operational mistakes.

1.10.1.3 The acceptance criteria set AC-II is applied for the static + dynamic design load combinations where considered loads are extreme loads with a low probability of occurrence.

1.10.1.4 The acceptance criteria set AC-III is typically applied for impact loads such as bottom slamming, bow impact and liquid impact in tanks.

1.10.1.5 The acceptance criteria set AC-IV is to be applied for accidental loads like flooding.

Table 1.10.1.1: Load scenarios and corresponding rule requirements			
Operation	**Load type**	**Design load scenario**	**Acceptance criteria**
Load Scenario 1: Seagoing operations			
Transit	Static and dynamic loads in heavy weather	S + D	AC-II
	Impact loads in heavy weather	Impact (I)	AC-III
	Internal sloshing loads	Sloshing (SL)	AC-I
	Cyclic wave loads	Fatigue (F)	**----**
Load Scenario 2: Harbour and sheltered operations			
Loading, unloading and ballasting	Typical maximum loads during loading, unloading and ballasting operations	S	AC-I
Tank testing	Typical maximum loads during tank testing operations	S	AC-I
Special conditions in harbour	Typical maximum loads during special operations in harbour, e.g. propeller inspection afloat or dry-docking loading conditions	S	AC-I
Load Scenario 3: Flow through ballast water exchange			
BWE by flow through	Static and dynamic loads in heavy weather	S + D	AC-II
Load Scenario 4: Sequential ballast water exchange			
BWE by sequential methods	Static and dynamic loads in heavy weather	S + D	AC-II
Load Scenario 5: Accidental condition			
Flooded conditions	Typically, maximum loads on internal watertight subdivision structure in accidental flooded conditions	A	AC-I for collision bulkheads AC-IV for other watertight boundaries.

Table 1.10.1.2: Acceptance criteria - prescriptive requirements						
Acceptance criteria	**Plate panels and local support members**		**Primary supporting members**		**Hull girder members**	
	Yield	Buckling	Yield	Buckling	Yield	Buckling
AC-I AC-II AC-IV	Permissible stress: Chapter 7 Chapter 11	Control of stiffness and proportions: Chapter 9	Permissible stress: Chapter 7 Chapter 11	Control of stiffness and proportions: Chapter 9	Permissible stress: Chapter 6	Allowable buckling utilization factor: Chapter 9
AC-III	Plastic criteria: Chapter 11	Control of stiffness and proportions: Chapter 9	Plastic criteria: Chapter 11	Control of stiffness and proportions: Chapter 9	N/A	N/A

Table 1.10.1.3: Acceptance criteria – Finite Element analysis			
Acceptance criteria	**Direct /Cargo hold analysis**		**Fine mesh analysis**
	Yield	Buckling	Yield
AC-I AC-II	Permissible stress: Chapter 8	Allowable buckling Utilization factor: Chapter 9	Permissible von Mises stress: Chapter 8

1.10.2 Acceptance criteria

1.10.2.1 Table 1.10.1.1 to Table 1.10.1.3 gives a general overview of the acceptance criteria for the different design load scenarios covered by these rules for the yield and buckling failure modes.

1.10.2.2 For the yield criteria the permissible stress is proportional to the specified minimum yield stress of the material.

1.10.2.3 For the buckling failure mode, the acceptance criteria are based on the control of stiffness and proportions as well as on the buckling utilization factor.

Section 2

Definitions

2.1 Principal particulars

2.1.1 Length

2.1.1.1 The forward perpendicular, F.P., [m], is the perpendicular drawn at the intersection of the water line at the scantling draught with the fore side of the stem, Refer Figure 2.1.1.1. In ships with unusual bow arrangement the position of the F.P. will be specially considered.

2.1.1.2 The after perpendicular, A.P., [m], is the perpendicular drawn at the intersection of the water line at the scantling draught with the after side of the rudder post or the centerline of the rudder stock if there is no rudder post, Refer Figure 2.1.1.1. In ships with unusual stern arrangement the position of the A.P. will be specially considered.

2.1.1.3 Rule length, L, is the distance, [m], between the forward and after perpendiculars. However, L is to be not less than 96%, and need not be greater than 97% of the extreme length on the waterline at the scantling draught. In ships with unusual bow and/or stern arrangement the Rule length, L, will be specially considered.

In ships without rudder stock, (e.g. ships fitted with azimuth thrusters), the rule length L is to be taken equal to 97% of the extreme length on the waterline at the scantling draught.

2.1.1.4 "Amidship" is at 0.5L aft of the F.P.

The midship part of a ship is the part extending 0.4L amidships, unless otherwise specified. Refer Figure 2.1.1.1.

2.1.1.5 Load line length, L_L, is to be taken as 96% of the total length [m], on a waterline at 85% of the least moulded depth measured from the top of the keel, or as the length from the fore side of the stem to the axis of the rudder stock on that waterline, if that is greater.

For ships without a rudder stock, the length L_L shall be taken as 96% of the waterline at 85% of the least moulded depth.

In ships designed with a rake of keel the waterline on which this length is measured is parallel to the designed waterline at 85% of the least moulded depth D_{min}, found by drawing a line parallel to the keel line of the ship (including skeg) tangent to the moulded sheer line of the freeboard deck.

The least moulded depth is the vertical distance measured from the top of the keel to the top of the freeboard deck beam at side at the point of tangency. Refer Figure 2.1.1.2.

2.1.1.6 Where the stem contour is concave above the waterline at 85% of the least moulded depth, and where the aftermost point of the stem is above the waterline, forward end of the length, L_L is to be taken at the aftermost point of the stem above that waterline, Refer Figure 2.1.1.3.

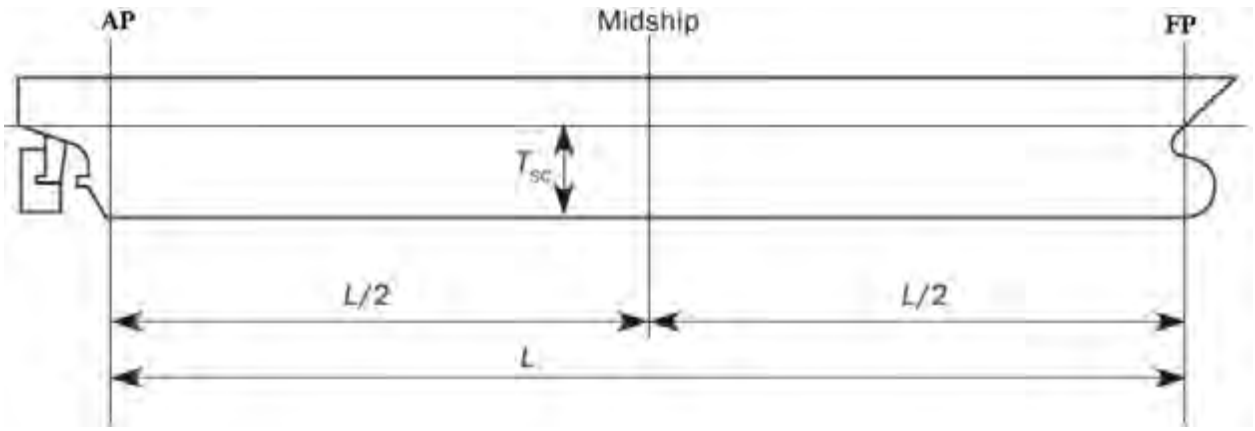

Figure 2.1.1.1: Ends and Midship

Figure 2.1.1.2: Ship with rake of keel

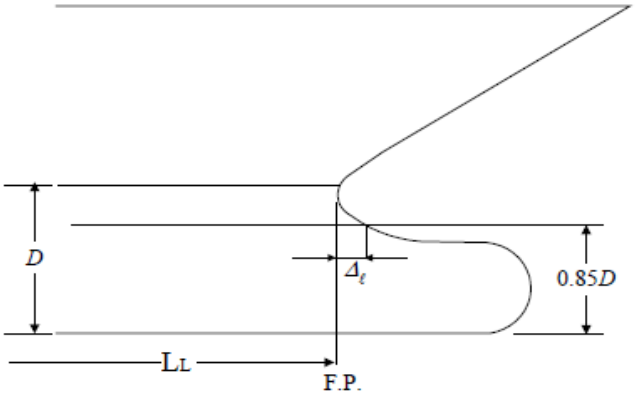

Figure 2.1.1.3: Concave stem contour

2.1.2 Breadth, B, [m], is the greatest moulded breadth measured amidship at the scantling draught, T_{SC}.

2.1.3 Depth, D, is the moulded depth [m], measured amidships from top of the keel to the moulded deck line of the uppermost continuous deck at side. When a rounded gunwale is arranged the depth is to be measured to the continuation of the moulded deck line as shown in Figure 2.1.3.

Where the freeboard deck is stepped and the raised part of the deck extends over the point at which the moulded depth is to be determined, the moulded depth is to be measured to a line of reference extending from the lower part of the deck along a line parallel with the raised part.

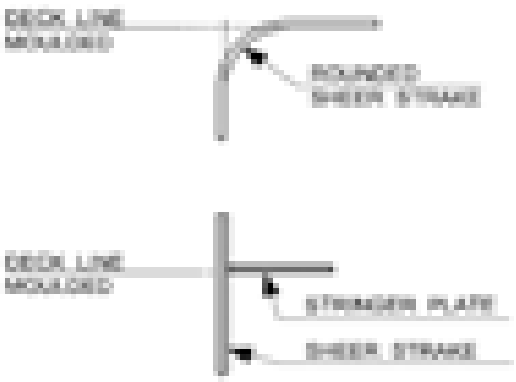

Figure 2.1.3: Deck corners

2.1.4 Load line Draught, T_L, [m], is the moulded draught amidships corresponding to the summer load waterline. Note this may be less than the maximum permissible scantling draught.

The scantling draught T_{SC} [m] is the draft at which the strength requirements for the scantlings of the ship are met and represents the full load condition. The scantling draught T_{SC} is not to be less than that corresponding to the assigned freeboard. (i.e. T_{SC} is not to be less than T_L)

The lowest design ballast draft, T_B is the minimum draught amidships in ballast conditions, including ballast water exchange operation, if any, for any ballast conditions in the loading manual including both departure and arrival conditions.

If the lowest design ballast draught amidships is not available in the initial design stage, T_B is taken from the Table 2.1.4. When T_B taken from the below table is used for strength assessment, it is to be confirmed that all ballast conditions in the final loading manual are covered.

T_{BH} is the minimum design heavy ballast draught, in [m], at which the strength requirements for the scantlings of the ship are met. This heavy ballast draught is to be considered for ships having heavy ballast condition.

Table 2.1.4: Minimum design ballast draught

Ship Type	T_B
Ship carrying dry cargo	$0.35T_{SC}$
Ship carrying liquid cargoes (Tankers)	2+0.02L
Ro-Ro ships	$0.5T_{SC}$
Passenger ships	$0.75T_{SC}$

2.1.5 Moulded displacement, [t], corresponds to the underwater volume of the ship, at a draught, in sea water having a density of 1.025[t/m^3].

2.1.6 Block coefficient, C_b, is the moulded block co-efficient corresponding to the waterline at the scantling draught, T_{SC} based on rule length, L and moulded breadth, B and calculated as follows: -

$$C_b = \frac{\text{Moulded displacement } (m^3) \text{ at } T_{SC}}{L\ B\ T_{SC}}$$

2.1.7 Design speed, V, [knots] means the speed with which the vessel is running ahead at the maximum continuous rated shaft rpm and at the summer load waterline.

2.1.8 Deadweight, [t], is the difference between the displacement at the summer draught in sea water having a density of 1.025[t/m^3] and the lightweight of the ship.

2.1.9 Lightweight, [t], is the displacement of a ship without cargo, fuel, lubricating oil, ballast water, fresh water and feed water in tanks, consumable, stores, and passengers and crew and their effects but including liquids in piping and machinery and mediums required for the fixed fire-fighting systems (e.g. fresh water, CO_2, dry chemical powder, foam concentrate, etc.).

2.2 Structural terms

2.2.1 The general terms used in the Rules for various structural parts of the ships are defined as under:

2.2.1.1 Strength Deck: The strength deck is, in general, the uppermost continuous deck. In the case of a superstructure or deckhouses of length greater than 0.15L, extending within the 0.4L amidships, the strength deck is the deck of the superstructure or the deck of the uppermost deckhouse.

2.2.1.2 Freeboard Deck: The freeboard deck is normally the uppermost complete deck exposed to weather and sea, which has permanent means of closing all openings in the weather part and below which all openings on the sides of the ship are fitted with means for watertight closing.

2.2.1.3 Bulkhead Deck: In a passenger ship, the uppermost deck at any point in the subdivision length (L_S), of the ship to which the main bulkheads and the ship's shell are carried watertight and the lowermost deck from which passenger and crew evacuation will not be impeded by water in any stage of flooding for

damage cases defined in SOLAS Ch II-1 Regulation 8 and in SOLAS Ch II-1 Part B-2. The bulkhead deck may be a stepped deck. In a cargo ship the freeboard deck may be taken as the bulkhead deck.

2.2.1.4 Superstructure: A decked structure on freeboard deck extending from side to side of the ship or with the side plating not inboard of shell plating by more than 4 per cent of the breadth B.

2.2.1.5 Deckhouse: A decked structure above the freeboard deck with the side plating being inboard of the shell plating by more than 4% of the breadth B.

2.2.1.6 Bottom Structure: Shell plating with stiffeners and girders below the upper turn of bilge and all other elements below and including the inner bottom plating in case of the double bottom. Sloping hopper tank top is to be regarded as a bulkhead.

2.2.1.7 Side Structure: Shell plating with stiffeners and girders between the upper turn of bilge and the uppermost continuous deck at side. A rounded gunwale is included in the side structure.

2.2.1.8 Deck Structure: Deck plating with stiffeners, girders, and supporting pillars.

(i) Girder: A collective term for the primary supporting members, other terms include:

- Transverses - transverse girders under the deck.

- Web frames - side vertical girders.

- Hatch end beams - transverse deck girders at the ends of the hatch.

- Stringers - horizontal girders.

- Cross-ties - girders connecting two vertical girders in a deep tank.

- Floor - bottom transverse girders.

(ii) Stiffener: A collective term for secondary supporting members; other terms being:

- Frames.

- Bottom, inner bottom, side or deck longitudinals.

- Reverse frame - transverse stiffener on the inner bottom.

- Horizontal or vertical bulkhead stiffeners.

2.2.2 Weathertight

A closing appliance is considered weathertight if it is designed to prevent the passage of water into the ship in any sea conditions. Generally, all openings on the freeboard deck and in enclosed superstructures are to be provided with weathertight closing appliances.

2.2.3 Watertight

A closing appliance is considered watertight if it is designed to prevent the passage of water in either direction under a head of water for which the surrounding structure is designed. Generally, all openings below the freeboard deck in the outer hull or main watertight bulkheads are to be fitted with permanent means of watertight closing appliances.

2.2.4 Position 1 and position 2 (Refer Figure 2.2.4)

2.2.4.1 Position 1includes:

- exposed freeboard and raised quarter decks for their entire length- exposed superstructure decks situated forward of $0.25L_L$ from FP_{LL}.

2.2.4.2 Position 2 includes:

- exposed superstructure decks situated aft of $0.25L_L$ from FP_{LL} and located atleast one standard height of superstructure above the freeboard deck.

- exposed superstructure decks situated forward of $0.25L_L$ from FP_{LL} and located at least two standard heights of superstructure above the freeboard deck.

Note: The upper limit of the vertical extent of Position 2 need not be considered to exceed two standard superstructure heights at locations abaft the $0.25L_L$ from the FP_{LL} and three standard superstructure heights forward of $0.25L_L$ from the FP_{LL}.

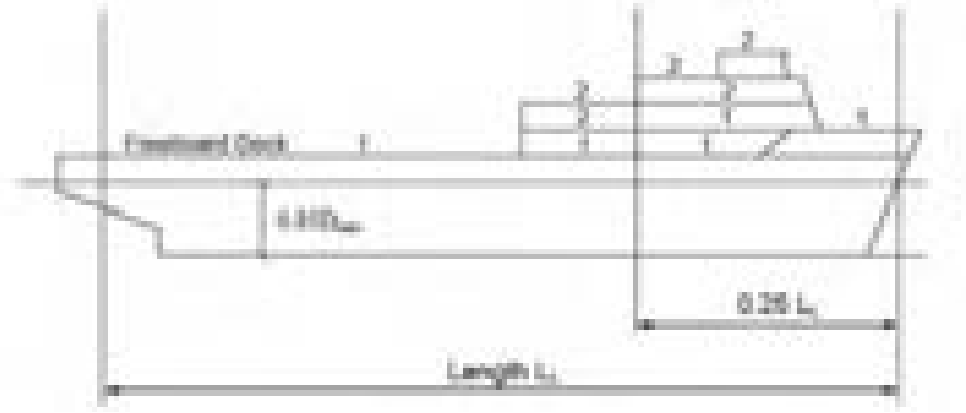

Figure 2.2.4: Position 1 and 2 for general ships

2.2.5 Standard height of superstructure

2.2.5.1 The height of a superstructure is the least vertical height measured at side from the top of the superstructure deck beams to the top of the freeboard deck beams. The standard height of superstructure is defined in Table 2.2.5.

Table 2.2.5: Standard height of superstructure		
Freeboard length L_L[m]	**Standard height h_s, [m]**	
	Raised quarter deck	**All other superstructures**
$L_L \leq 30$	0.9	1.8
75	1.2	1.8
$L_L > 125$	1.8	2.3
The standard heights at intermediate lengths of ships are obtained by linear interpolation.		

2.2.5.2 A tier is defined as a measure of the extent of a deckhouse. A deckhouse tier consists of a deck and external bulkheads. In general, the first tier is the tier situated on the freeboard deck.

2.3 Type A and Type B freeboard ships

2.3.1 Type 'A' ship

Type 'A' ship is one which:

(a) Is designed to carry only liquid cargoes in bulk.

(b) Has a high integrity of the exposed deck with only small access openings to cargo compartments, closed by watertight gasketed covers of steel or equivalent material.

(c) Has low permeability of loaded cargo compartments.

Type 'A' ship is to be assigned a freeboard in accordance with the requirements specified in the *International Convention on Load Lines* (ICLL).

2.3.2 Type 'B' ship

All ships which are not Type 'A' ships stated in 2.3.1 are to be considered as Type 'B' ships. Type 'B' ship is to be assigned a freeboard following the requirements specified in the ICLL.

2.3.3 Type 'B-60' ship

Type 'B-60' ship is any Type 'B' ship of over 100[m] in length which, according to applicable requirements of ICLL is assigned with a value of tabular freeboard which can be reduced up to 60% of the difference between the 'B' and 'A' tabular values for the appropriate ship lengths.

2.3.4 Type B-100 ship

Type ‘B-100’ ship is any Type ‘B’ ship of over 100[m] in length which, according to applicable requirements of ICLL is assigned with a value of tabular freeboard which can be reduced up to 100% of the difference between the ‘B’ and ‘A’ tabular values for the appropriate ship lengths.

2.3.5 Type 'B+' ship

Cargo ships with increased freeboard on account of hatch cover arrangement.

2.4 Material factor

2.4.1 Material factor ‘k’, a factor depending on material strength is defined in Chapter 2.

2.5 Reference coordinate system

2.5.1 The ship’s geometry, motions, accelerations and loads are defined with respect to the following right-hand coordinate system, (Refer Figure 2.5.1):

Origin = at the intersection among the longitudinal plane of symmetry of ship, the aft end (AP) of L and the baseline.

X axis = longitudinal axis, positive forward

Y axis = transverse axis, positive towards port side

Z axis = vertical axis, positive upwards.

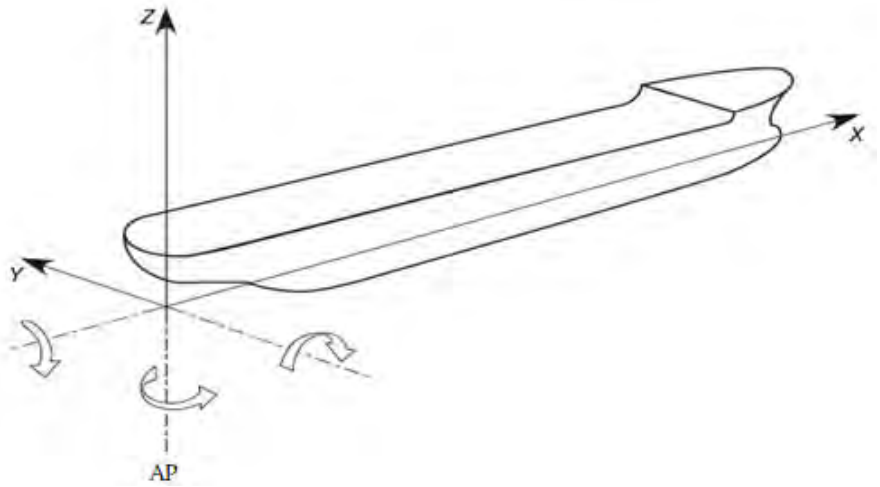

Figure 2.5.1: Reference coordinate system

2.6 Primary symbols and units

2.6.1 General

2.6.1.1 Unless otherwise specified, the general symbols and their units used in these rules are those defined in Table 2.6.1.

Table 2.6.1: Primary symbols and Units		
Symbol	**Definition**	**Units**
C	Correction factors	
F	Force and Concentrated loads	N
M	Bending moment	$\mathrm{kN-m}$
m	Mass	t
P	Pressure	$\mathrm{N/mm^2}$
$Q/F_s/F_w$	Shear force	kN
a	Acceleration	$\mathrm{m/s^2}$
g	Acceleration due to gravity, taken equal to $9.81[\mathrm{m/s^2}]$	$\mathrm{m/s^2}$
n	Number of items	
x	X coordinate along longitudinal axis, [Refer 2.5]	m
y	Y coordinate along transverse axis, [Refer 2.5]	m
z	Z coordinate along vertical axis, [Refer 2.5]	m
δ	Angle of repose of cargo	deg
∇	Moulded volume	$\mathrm{m^3}$
α	Angle	deg
ρ	Density of seawater, taken equal to $1.025[\mathrm{t/m^3}]$	$\mathrm{t/m^3}$
σ	Normal stress	$\mathrm{N/mm^2}$
τ	Shear stress	$\mathrm{N/mm^2}$
σ_b	Hull girder bending stress	$\mathrm{N/mm^2}$
Z	Section modulus	$\mathrm{cm^3}$
σ_c	Compressive stress	$\mathrm{N/mm^2}$
σ_e	Ideal elastic buckling stress	$\mathrm{N/mm^2}$
σ_{crb}	Critical buckling stress	$\mathrm{N/mm^2}$
r	Radius of curvature	mm
R_s	Service limitations [Refer Part 1, Chapter 1]	
t_D	Design temperature	$^{\circ}\mathrm{C}$

2.6.2 Ship's main data

2.6.2.1 Unless otherwise specified, symbols regarding ship's main data and their units used in these rules are those defined in Table 2.6.2.

Table 2.6.2: Ship's main data

Symbol	Definition	Units
L	Rule length	m
L_L	Freeboard length or Load line length	m
FP	Forward perpendicular	m
AP	Aft perpendicular	m
B	Moulded breadth of ship	m
D	Moulded depth of ship	m
T	Moulded draught amidships	m
T_{SC}	Scantling draught	m
T_B	Lowest design ballast draught amidships	m
T_{DAM}	Deepest equilibrium waterline in damage condition. For passenger vessels, deepest intermediate or final equilibrium damage waterline	m
T_{BH}	Heavy ballast draught	m
C_b	Block coefficient at draught, T_{SC}	
V	Maximum ahead service speed	knot
X, Y, Z	x, y, z coordinates of the calculation point with respect to the reference coordinate system	m

2.6.3 Materials

2.6.3.1 Unless otherwise specified, symbols regarding materials and their units used in these rules are those defined in Table 2.6.3.

Table 2.6.3: Materials

Symbol	Definition	Units
E	Modulus of Elasticity [Refer Part 3, Chapter 2, Sec.1]	N/mm^2
μ	Poisson's ratio [Refer Part 3, Chapter 2, Sec.1]	
k	Material factor [Refer Part 3, Chapter 2, Sec.1]	
R_{eH}	Specified minimum yield stress of material	N/mm^2
R_m	Specified tensile stress of material	N/mm^2
τ_{eH}	Specified shear yield stress, $\tau_{eH} = \frac{R_{eH}}{\sqrt{3}}$	N/mm^2
R_y	Nominal yield stress, taken equal to 235/k	N/mm^2
λ	Slenderness ratio	

2.6.4 Loads

2.6.4.1 Unless otherwise specified, symbols regarding loads and their units used in these rules are those defined in Table 2.6.4.

Table 2.6.4: Loads

Symbol	Definition	Units
C_w	Wave coefficient	
$\emptyset$	Roll angle	deg
θ	Pitch angle	deg
T_r	Roll period	s
T_p	Pitch period	s
k_r	Roll radius of gyration	m
GM	Metacentric height	m
a_o	Common acceleration parameter	
C_v	Wave parameter	
a_{surge}	Surge acceleration	m/s^2
a_{sway}	Sway acceleration	m/s^2
a_{heave}	Heave acceleration	m/s^2
M_{sw}	Permissible still water bending moment	kNm
Q_{sw}	Permissible still water shear force	kN
Q_{wv}	Vertical wave shear force	kN
M_{wv}	Vertical wave bending moment	kNm
M_{wh}	Horizontal wave bending moment	kNm
M_u	Hull girder ultimate bending moment capacity	kNm
P_{Bow}	Bow impact pressure	kN/m^2
P_{SL}	Design bottom slamming pressure	kN/m^2

2.6.5 Scantlings

2.6.5.1 Unless otherwise specified, symbols regarding scantlings and their units used in these rules are those defined in Table 2.6.5.

Table 2.6.5: Scantlings		
Symbol	**Definition**	**Units**
s	Stiffener spacing [Refer Part 3, Chapter 3, section 7]	mm
S	Primary supporting member spacing [PSM] [Refer Part 3, Chapter 3, section 7]	m
ℓ	Span of stiffeners or PSM	m
b_f	Face plate width of stiffener or PSM	mm
h_{stf}	Height of stiffener or PSM	mm
h_w	Web height of stiffeners or PSM	mm
t_w	Web thickness of stiffener or PSM	mm
t_f	Face plate thickness of stiffener or PSM	mm
t_p	Thickness of the plating attached to a stiffener or to a PSM	mm
t_c	Corrosion addition	mm
t_{off}	Net offered thickness	mm
t_{net}	Net required thickness	mm
$t_{as-built}$	As-built thickness taken as the actual thickness provided at the new building stage	mm
t_{gr-off}	Gross offered thickness	mm
t_{gr}	Gross required thickness	mm
$t_{vol-add}$	Thickness for voluntary addition taken as the thickness voluntarily added as the owner's extra margin or builder's extra margin for corrosion wastage in addition to tc	mm
t_{res}	Reserve thickness, taken equal to 0.5[mm]	mm
t_{c1}, t_{c2}	Corrosion addition on one side of the considered structural member as defined in [Refer Part 3, Chapter 2, Section 5,]	mm
ℓ_{bdg}	Effective bending span [Refer Part 3, Chapter 3, Section 7]	m

Section 3

Documentation

3.1 General

3.1.1 Documentation is to be submitted as per the following paragraphs. In case of certain ship types additional documentation may be required as per Part 5.

3.2 Plans for information

3.2.1 The following supporting plans and calculations are to be submitted for **information**:

- General arrangement.- Tank plan.- Capacity plan indicating the volume and position of the centre of gravity of all compartments and tanks.

- Lines plan and Hydrostatic curves or tables.

- Docking plan.

- Disposition of anodes (Refer Chapter 2, Section 3.5).

- Engine room arrangement

3.3 Plans for Approval

3.3.1 Plans as relevant are to be submitted to IRS for approval are listed in Table 3.3.1. These should as far as practicable be complete in all necessary details.

Table 3.3.1: Plans/Documents to be submitted for Approval

Plan Category	Drawing/Document	Including Information On
Hull structure drawings	Midship section drawing	- Main particulars (L, B, D, T, C_b, V) - Complete class notation applied for; - Stiffener and web frame spacing - Density of cargo - Deck loads, if other than those specified in the Rules - Openings on the deck - Minimum ballast draught(s) - Extent of flat part of bottom forward - Openings on the shell - Flat of bottom, flat of side - Material grades
	Shell expansion drawing	
	Transverse and Longitudinal sections drawing	
	Decks and inner bottom	
	Framing plans	
	Other transverse section drawings	
	Pillar arrangements	
	Watertight bulkheads / weather tight	
	Aft peak construction drawing	
	Fore peak construction drawing	
	Wash bulkheads	
	Double bottom	- Indication of access - Height and location of overflows - Loading on inner bottom
	Bilge keel, sea chest details	- Material grade - Details of connection to hull structure
	Standard construction details	

Loading Manual [1)]	Preliminary/Final loading manual	- Details of loading in all contemplated loading conditions - Resulting Still Water Bending Moment, Shear Force and Torsional Moments (TM) - Design values of SWBM, SWSF & TM
	Longitudinal strength calculation, if any	
	Freeboard calculation, if any	
Super structure, Deckhouses and Machinery casings	Structure drawings: a) Decks and profile plan b) Section drawings including Transverse, side and end bulkhead	- Height of sills from deck and closing appliances for companionways - Extension and mechanical properties of the aluminium alloy used (where applicable)
Welding	Welding tables and details	
Engine room area	Foundation and structural drawings for Main engine, DG sets etc.	- Type, power and R.P.M of propulsion machinery - Weight of machinery, boilers, etc. - Unbalance moments and forces if any
	Engine and thrust block seatings	
Aft end construction	Structural drawings	- Aft-end structure - Aft peak tank - Stern frame or sternpost - Steering gear arrangement
Fore end construction	Structural drawings, General arrangement of transverse thruster, tunnel structure, if any	- Fore-end structure - Fore peak tank details - Openings on non-watertight bulkheads and diaphragm plates - Height and location of overflows - Connections of bow thruster with tunnel and hull structures.
Propeller Details	Structural drawings for propeller shaft brackets, propeller nozzles, propeller bearings, struct palms, A-Bracket & P-Bracket details	- Type, R.P.M, no of blades, diameter of propeller - propeller outline - propeller thrust, torque - height and location of overflow
Rudder Details	Rudder, stock and tiller Steering gear arrangement	- speed of the ship (ahead & astern) - material of bearings, coupling bolts, stock and the locking device - rudder carrier

Anchoring arrangement	Arrangement Plan, Equipment list and Equipment number calculation	- It includes main dimensions and design loads. - List of equipment covering windlasses, anchors, anchor chain etc. - Geometric elements for calculation; grade of anchor chain, type and breaking load of chain - Construction and breaking load of steel wires - Material, construction, breaking load and relevant elongation of synthetic ropes
Anchor windlass supporting structure	Supporting structure and foundations for windlasses and chain stoppers.	- Design loads and directions of load actions - Reaction forces - Details of connection of the foundations to the deck, including specifications for holding down bolts for windlasses - Supporting structure below deck - Material specifications and welding
Mooring and towing arrangement	Mooring and towing arrangement plan	- Location on the ship - Fitting types - Dimensions - Safe working load - Maximum breaking strength of the towing and mooring lines the purpose (mooring / harbour towing etc.) - Manner of applying the lines including limiting fleet angles.
	Supporting structure and foundations for ship board fitting associated with mooring and towing operations.	- Design loads and directions of load actions - Rated pull and holding load for mooring winches - Reaction forces - Details of connection of the foundations to the deck, including specifications for holding down bolts for mooring winches - Supporting structure below deck - Material specifications and welding
	Emergency Towing Procedure	Covering SOLAS II-1/3-4.

Any Deck equipment/machinery supporting structure	Structural drawing	Foundation details above and below deck supporting structure and fixation (bolts, chocks and shear stoppers)
Masts and Derrick posts	Arrangement plan	- Safe working load - Information about the operation of derrick booms - Derrick length and loading - dimensions and positions of stays and shrouds - Material quality
	Structural drawing for masts, derrick posts and support structure	
Cranes	Arrangement and Structural drawing and support structure	- Safe working load and dynamic coefficients - Design loads and reaction forces during operation and in stowed position - Maximum sea state in offshore operation, if any connections to hull structure
Lifesaving appliances	Arrangement and Structural drawing of supporting structure	- Design loads, - Safe working load and self-weight, - Connections to hull structure.
Internal watertight doors/ ramps	Testing plan of tanks & bulkheads	- Test procedure for various compartments - Height of pipes for testing
	Watertight subdivision bulkheads & watertight tunnels	- Openings and their closing appliances
	Oil tight/water tight and partition bulkheads in cargo tanks, ballast tanks and deep tanks	- Electrical diagram of power control and position indication circuits. - Intended tank contents & their densities - Height and location of overflow/air pipes - Tanks intended to be partially filled - Corrosion protection; if any
Miscellaneous structural/arrangement plans	Weathertight/outer doors	- Position and type where it is located - Closing, opening, sealing, securing and locking arrangement - Spacing of bolts or wedges - Locations of hatch covers from summer load waterline and from fore end - Design pressure/load if different from those specified in the rules
	Hatchways	
	Hatches and Hatch covers	
	Shell doors (bow, side, stern as applicable)	
	Side ports	
	Windows and side scuttles	
	Manholes arrangement plan	
	Plan showing access to and escape from spaces	

	Bulwarks and freeing ports	- Arrangements and dimensions of bulwarks and freeing ports on the freeboard deck and the superstructure deck.
Air conditioning and Ventilation	Ventilation plan including ventilators and tank vents	- Height and location of air vents outlets of various compartments. - Use of spaces intended
Note: 1) Refer Chapter 1, Section 4. 2) One drawing may contain more than one of the items from each group. 3) Where other steering or propulsion systems are adopted (e.g. Steering nozzles or azimuth propulsion systems), the plans showing the relevant arrangement and structural scantlings are to be submitted. 4) The information is to be included as indicated in the 3rd column is required for approval of plans given in the 2nd column of the Table. However, approval of plans mentioned in the 2nd column does not necessarily mean that all the information given in 3rd column is also approved or need approval.		

3.4 Plans to be kept on board

3.4.1 A set of as built construction drawings and other plans showing any subsequent structural alterations are to be kept on board. The set of plans are to include the following:

(a) Main plan includes:

(i) General arrangement
(ii) Capacity plan
(iii) Hydrostatic curves
(iv) Loading manual, where required

(b) Structural plans include:

(i) Midship section
(ii) Scantling profile
(iii) Decks
(iv) Shell expansion
(v) Transverse bulkheads
(vi) Rudder and rudder stock
(vii) Cargo hatch covers, when applicable

(c) Bilge ballast and cargo piping diagrams.

An additional set of such drawings are to be kept ashore by the company responsible for the operation of the ship.

3.4.2 To facilitate the ordering of materials for repairs, the above plans are to show the disposition and extent of high strength steel and steel of grades other than Grade A, along with the information relating to their physical and mechanical properties, recommended working, treatment and welding procedures etc.

3.4.3 A ship construction file is required to be maintained on board the ship to facilitate inspection (survey) and repair and maintenance in future. The ship construction file to contain:

(a) Plans as mentioned in Cl.3.4.1;

(b) Essential certificates and records;

(c) Manuals required for classification and statutory requirements;

(d) Details of equipment forming part of the watertight and weathertight integrity of the ship;

(e) Tank testing plan including details of the test requirements;

(f) Corrosion protection specifications;

(g) Details for the in-water survey, if applicable, information for divers, clearances measurements instructions etc. tank and compartment boundaries;

(h) Docking plan and details of all penetrations normally examined at dry docking;

(i) Coating technical file, for ships subject to compliance with the IMO Coating Performance Standard (PSPC). (Refer Chapter 2, Section 3.6).

(j) Watertight cable transit seal systems register (See Part 4, Chapter 8, Section 3.21)

Section 4

Loading Guidance Information

4.1 General Requirements

4.1.1 Application

4.1.1.1 The requirements in this section apply to all ships of 65[m] in length and above.

4.1.1.2 All ships covered by Regulation 10 of the International Convention on Load Lines are to be provided with an approved loading manual except those belonging to Category II with length less than 90[m] for which the maximum deadweight does not exceed 30% of the displacement at the summer load line draft.

4.1.1.3 In addition to the Loading Manual, all ships of Category I of 100[m] in length and above are to be provided with an approved loading instrument for calculation and control of hull strength.

4.1.1.4 The requirements concerning the loading manual and the loading instruments are indicated in 4.3 and 4.4 respectively.

4.1.1.5 Additional requirements for bulk carriers, ore carriers and combination carriers of L ≥ 150[m] are indicated in Part.5, Chapter 1.

4.1.1.6 For chemical carriers and gas carriers existing analog computer may be retained.

4.2 Definitions

4.2.1 Loading Manual is a document which describes:

- The loading conditions on which the design of the ship has been based for seagoing and harbour/ sheltered waters, including permissible limits of still water bending moment and shear force. Additionally, where applicable, shear force correction values and permissible limits for still water torsional moment and lateral loads.

- The conditions specified in the ballast water management procedure and dry-docking procedure.

- The results of the calculations of still water bending moments, shear forces and where applicable, limitations due to torsional and lateral loads.

- The allowable local loading for the structure (hatch covers, decks, double bottom, etc.)

An operation manual is always to be provided with the loading instrument.

4.2.2 Loading Instrument is an instrument, which unless otherwise stated is digital, by means of which it can be easily and quickly ascertained that, at specified read-out points, the still water bending moments, shear forces, and the still water torsional and lateral loads, where applicable, in any loaded or ballast condition will not exceed the specified permissible values.

The loading instrument is a ship specific onboard equipment and the results of the calculations are only applicable to the ship for which it has been approved.

An approved loading instrument cannot replace an approved loading manual.

4.2.3 Category I Ships:

- Ships with large deck openings where combined stresses due to vertical and horizontal hull girder bending, torsional and lateral loads have to be considered; e.g. container ships.

- Ships liable to carry non-homogeneous loadings, where the cargo and/or ballast may be unevenly distributed; e.g. bulk carriers, tankers.

- Chemical tankers and gas carriers.

4.2.4 Category II Ships:

- Ships with arrangement giving small possibilities for variation in the distribution of cargo and ballast,

- Ships on regular and fixed trading pattern where the Loading Manual gives sufficient guidance,

- Ships of less than 120[m] in length, when their design takes into account uneven distribution of cargo or ballast, belong to Category II.

- In addition, those exceptions given under Category I.

4.3 Loading Manuals

4.3.1 Conditions of Approval of Loading Manuals

4.3.1.1 The approved Loading Manual is to be based on the final data of the ship. The Manual is to include the design loading and ballast conditions; sub divided into departure and arrival conditions, upon which the approval of the hull scantlings is based.

4.3.1.2 In case of modifications implying changes in the main data of the ship (e.g. lightship weight, buoyancy distribution, tank volumes or usage, etc.) a new Loading Manual is to be issued duly approved.

4.3.1.3 The Loading Manual is to be prepared in a language understood by the users. If this language is not English, a translation into English is to be included.

4.3.2 Loading conditions

4.3.2.1 The loading manual is to contain the design (cargo and ballast) loading conditions, subdivided into departure and arrival conditions, and ballast exchange at sea conditions, where applicable, upon which the approval of the hull scantlings is based, as defined in Chapter 5, Section 7.

4.3.2.2 Loading conditions for ship specific types are indicated in Part 5 of the Rules.

4.3.2.3 In general, the loading conditions, based on amount of bunkers, fresh water and stores at departure and arrival, should be included in the Loading Manual.

4.3.3 Operational limitations

4.3.3.1 The loading manual is to indicate relevant operational limitations, as follows:

- Scantling draught

- Load specifications for cargo decks

- Design minimum ballast draught at midships

- Minimum slamming draught forward with forward double bottom ballast tanks filled

- Minimum slamming draught forward with any of the forward double bottom ballast tanks empty

- Maximum allowable cargo density

- Maximum cargo density and filling heights in any loading condition in loading manual

- Restrictions in cargo mass- and angle of repose

- Maximum service speed

- Envelope results and permissible limits of still water bending moments and shear forces, and still water torsional moments, if applicable

- Restrictions to GM-value

- Restrictions to filling of tanks in seagoing conditions

- Restrictions to ballast holds which may not be partially filled in seagoing conditions

- Restrictions to double bottom ballast tanks which may be filled in alternate loaded seagoing conditions.

4.4 Loading Instruments

4.4.1 Conditions of Approval of Loading Instruments

4.4.1.1 The loading instrument and its operation manual are subject to approval. The approval includes the following:

- Verification of type approval, if any

- Verification that the final data of the ship has been used

- Acceptance of number and position of read-out points

- Acceptance of relevant limits for all read-out points

- Checking of proper installation and operation of the instrument on board in accordance with the agreed test conditions; and that a copy of the approved operation manual is available.

4.4.2 In case of modifications implying changes in the main data of the ship, the loading instrument is to be modified accordingly and approved.

4.4.3 The operation manual and the instrument output must be prepared in a language understood by the users. If this language is not English, a translation into English is to be included.

Materials of Construction and Corrosion Additions

Contents

Section	
1	*General*
2	*Use of Steel Grades*
3	*Corrosion Protection*
4	*Net Scantling Approach*
5	*Corrosion Addition*

Section 1

General

1.1 Scope

1.1.1 The Rules relate, in general, to the construction of steel ships. Consideration will however be given to the use of other materials also.

1.1.2 The materials used in the construction of the ship are to be manufactured and tested in accordance with the requirements of Part 2. Materials for which provision is not made in Part 2 may be accepted, provided that they comply with an approved specification and such tests as may be considered necessary.

1.2 Steel

1.2.1 Ordinary hull structural steel is a hull structural steel with a minimum yield stress of 235[N/mm^2] and a tensile strength generally in the range of 400-520[N/mm^2]. Steels having a higher specified minimum yield stress are regarded as higher strength steels.

For ordinary hull structural steel, the **material factor `k'** is to be taken as 1.0.

1.2.2 Where higher tensile steel is used, the hull girder section modulus and the local scantlings may be reduced in accordance with the relevant requirement of the Rules.

1.2.3 For this purpose, a material factor 'k', is to be taken from Table 1.2.3.

1.2.4 Where steel castings or forgings are used for stern frames, rudder frames, rudder stocks, propeller shaft brackets and other major structural items, they are to comply with Part 2 as appropriate.

1.2.5 Following material grades of hull structural steels are commonly used in the ship construction.

1.2.5.1 A, B, D, E and F denote normal strength steel grades.

1.2.5.2 AH, DH, EH and FH denote high strength steel grades, where ‘H’ indicates the material strength. Strength levels are supplied in four levels, 32, 36, 40 and 47, intended for use in hull construction. Table 1.2.5 gives specified yield stress and tensile strength for rolled steels generally used in construction of ships.

Table 1.2.3: Material factor (k)	
Specified minimum yield stress R_{eH}, in [N/mm^2]	**k**
235	1.00
315	0.78
355	0.72
390	0.66/0.68*
460	0.62 (#)
(*) The material factor k may be taken equal to 0.66 for steels with yield stress equal to 390[N/mm^2], provided that a fatigue assessment of the structure is performed to the satisfaction of IRS. (#) The application of high strength steel with yield stress equal to 460[N/mm^2] is limited to ships with the notation **Container Ship** as defined in Part 5, Chapter 5. The application of high strength steel with R_{eH} > 390[N/mm^2] for other ship types is specially considered.	
For intermediate values of yield stress, k is obtained by linear interpolation.	

Table 1.2.5: Mechanical properties of hull structural steels		
Steel Grades	**Specified minimum yield stress R_{eH} [N/mm^2]**	**Specified tensile stress R_m [N/mm^2]**
A-B-D-E	235	400/520
AH32, DH32, EH32 & FH32	315	440/570
AH36, DH36, EH36 & FH36	355	490/ 630
AH40, DH40, EH40 & FH40	390	510/660
EH47#	460	570/720
(#) For note, Refer Table 1.2.3, Material factor (k)		

1.3 Aluminium

1.3.1 Where seawater resisting aluminium alloys manufactured and tested in accordance with the requirements of Part 2 are used for super-structures, deckhouses, hatch covers, helicopter decks or other structural components, scantlings equivalent to steel are to be derived as follows:

plating thickness, $t_a = t_s \cdot \sqrt{k_a}$

section modulus of stiffeners, $z_a = z_s \cdot k_a$

Web area of stiffeners, $A_a = A_s \cdot k_a$

where,

k_a = Material factor for Aluminium alloy

t_a, t_s= plating thickness of aluminium and mild steel respectively.

z_a, z_s = section modulus of aluminium and mild steel stiffeners respectively.

A_a, A_s = Web area of stiffeners of aluminium and mild steel stiffeners respectively.

1.3.2 The material factor, k_a for aluminium alloys is to be obtained from the following formula:

$$k_a = \frac{235}{\sigma'_{lim}}$$

Where,

σ'_{lim} = Minimum guaranteed yield stress of the parent metal in welded condition $\sigma'_{p0.2}$, in [N/mm^2], but not to be taken greater than 70% of the minimum guaranteed tensile strength of

the parent metal in welded condition σ'_m, in [N/mm^2].

$\sigma'_{p0.2}$ = Minimum guaranteed yield stress, in [N/mm^2], of material in welded condition.

$$\sigma'_{p0.2} = \eta_1 \sigma_{p0.2}$$

σ'_m = Minimum guaranteed tensile strength, in [N/mm^2], of material in welded condition.

$$\sigma'_m = \eta_2 \sigma_m$$

$\sigma_{p0.2}$ = Minimum guaranteed yield stress, in [N/mm^2], of material in delivery condition.

σ_m = Minimum guaranteed tensile strength, in [N/mm^2], of material in delivery condition.

η_1, η_2 = Coefficients for welded construction for Aluminium alloys specified in Table 1.3.2.1.

Table 1.3.2.1: Coefficients for welded construction for Aluminium alloys

Aluminium alloy	η_1	η_2
Alloys without work-hardening treatment (series 5000 in annealed condition O or annealed flattened condition H111)	1	1
Alloys hardened by work hardening (series 5000 other than condition O or H111)	$\sigma'_{p0.2}/\sigma_{p0.2}$	σ'_m/σ_m
Alloys hardened by heat treatment (series 6000) (1)	$\sigma'_{p0.2}/\sigma_{p0.2}$	0.6

(1) When no information is available, coefficient η_1 is to be taken equal to the metallurgical efficiency coefficient β defined in Table 1.3.2.2.
Note: For $\sigma_{p0.2}$ and σ_m values, Refer Part 2, Chapter 9, Section 2.8, Table 2.8.1 and 2.8.2.

Table 1.3.2.2: Metallurgical efficiency coefficient β for Aluminium alloys

Aluminium alloy	Temper condition	Gross thickness [mm]	β
6005 A (Open sections)	T5 or T6	t ≤ 6	0.45
		t > 6	0.40
6005 A (Closed sections)	T5 or T6	all	0.50
6061 (Sections)	T6	all	0.53
6082 (Sections)	T6	all	0.45

1.3.3 The smaller modulus of elasticity of aluminium is to be taken into account, when determining the buckling strength of structural elements subjected to compression and the deflections, where relevant.

1.3.4 In the case of welding of two different aluminium alloys, the material factor, k_a to be considered for the scantlings is to be the greater material factor of the aluminium alloys of the assembly.

1.3.5 Welding heat input lowers locally the mechanical strength of aluminium alloys hardened by work hardening (series 5000 other than condition O or H111) or by heat treatment (series 6000).

1.3.6 For welded constructions in hardened aluminium alloys (series 5000 other than condition O or H111 and series 6000), greater characteristics than those in welded condition may be considered, provided that welded connections are located in areas where stress levels are acceptable for the alloy considered in annealed or welded condition.

1.3.7 The as-welded properties of aluminium alloys of series 5000 are in general those of condition O or H111. Higher mechanical characteristics may be considered, provided they are duly justified.

1.3.8 Extruded plating

1.3.8.1 Extrusions with built-in plating and stiffeners, referred to as extruded plating, may be used.

1.3.8.2 In general, the application of extruded plating is limited to decks, bulkheads, superstructures and deckhouses. Other uses may be permitted by IRS on a case-by-case basis.

1.3.8.3 Extruded plating to be oriented so that the stiffeners are parallel to the direction of main stresses.

1.3.8.4 Connections between extruded plating and primary members are to be given special attention.

1.4 Connections between steel and aluminium

1.4.1 Details of the proposed method of joining any aluminium and steel structures are to be submitted for approval.

1.4.2 To prevent galvanic corrosion a non-hygroscopic insulation material is to be applied between steel and aluminium when a bolted connection is used.

1.4.3 An aluminium-steel transition joint in accordance with the rules Part 2, Chapter 9, Section 4 may be used in a welded connection.

1.4.4 Any direct contact between steel and aluminium alloy is to be avoided (e.g. by means of zinc or cadmium plating of the steel parts and application of a suitable coating on the corresponding light alloy parts).

1.4.5 Bolts with nuts and washers are either to be of stainless steel or cadmium plated or hot galvanized steel. The bolts are to be fitted with sleeves of insulating material. The spacing is normally not to exceed 4 times the bolt diameter.

1.5 Young's modulus and Poisson's ratio

1.5.1 The Young's modulus and the Poisson's ratio to be used in the strength assessment are:

1.5.1.1 For carbon manganese steel materials

$E = 206\ 000[N/mm^2]$

$v = 0.3$

1.5.1.2 For aluminium alloys

$E = 70\ 000[N/mm^2]$

$v = 0.33$

Section 2

Use of Steel Grades

2.1 Grades of steel

2.1.1 The resistance to fracture is controlled, in part, by the notch toughness of the steel used in the structure. Steels with different levels of notch toughness are specified in Part 2. The grade of steel to be used is, in general, related to the air temperature in the area of operation, thickness of the material and the stress pattern associated with its location.

2.1.2 The grades of steel to be used for structures of ships in normal worldwide service and those exposed to low air temperatures (≤ -10°C), are given in Section 2.2 and 2.3 respectively. The grades of steel to be used for certain hull members in refrigerated spaces are given in Section 2.4.

2.1.3 Where tee or cruciform connections employ full penetration welds, and the plate material is subject to significant strains in a direction perpendicular to the rolled surfaces, it is recommended that consideration be given to the use of special plate material with specified through thickness properties, as detailed in Part 2.

2.2 Ships in normal worldwide service

2.2.1 Materials in the various strength members are not to be of lower grade than those corresponding to material classes and grades specified in Tables 2.2.1(a) to 2.2.1(f) and Table 2.2.2.

General requirements are given in Table 2.2.1(a), while additional minimum requirements are given in the following:

- Table 2.2.1(b): For ships, excluding liquefied gas carriers covered in Table 2.2.1(c), with length exceeding 150[m] and single strength deck,
- Table 2.2.1(c): For membrane type liquefied gas carriers with length exceeding 150[m].
- Table 2.2.1(d): For ships with length exceeding 250[m],
- Table 2.2.1(e): For single side bulk carriers subject to SOLAS regulation XII/6.4.3.
- Table 2.2.1(f): For ships with ice strengthening.

2.2.2 The material grade requirements for hull members of each class depending on thickness are defined in Table 2.2.2.

2.2.3 For strength members not mentioned in Tables 2.2.1(a) to 2.2.1(f), refer Table 2.2.3.

2.2.4 The steel grade is to correspond to the as-built plate thickness and material class.

2.2.5 Plating materials for stern-frames supporting the rudder and propeller boss, rudders, rudder horns and shaft brackets are in general not to be of lower grades than corresponding to Class II. For rudder and rudder body plates subjected to stress concentrations (e.g. in way of lower support of semi-spade rudders or at upper part of spade rudders) Class III is to be applied.

Table 2.2.1(a): Material classes and grades for ships in general	
Structural member category	**Material class/grade**
SECONDARY:	
Longitudinal bulkhead strakes, other than that belonging to the primary category	- Class I within 0.4L amidships - Grade A/AH outside 0.4L amidships
Deck plating exposed to weather, other than that belonging to the primary or special category	
Side plating	
PRIMARY:	
Bottom plating, including keel plate	- Class II within 0.4L amidships - Grade A/AH outside 0.4L amidships
Strength deck plating, excluding that belong to the special category	
Continuous longitudinal plating of strength members above strength deck, excluding hatch coamings	
Uppermost strake in longitudinal bulkhead	
Vertical strake (hatch side girder) and uppermost sloped strake in top wing tank	
SPECIAL:	
Sheer strake at strength deck (1)	- Class III within 0.4L amidships - Class II outside 0.4L amidships - Class I outside 0.6L amidships
Stringer plate in strength deck (1)	
Deck strake at longitudinal bulkhead, excluding deck plating in way of inner skin bulkhead of double hull ships (1)	
Strength deck plating at outboard corners of cargo hatch openings in container carriers and other ships with similar hatch opening configurations	- Class III within 0.4L amidships - Class II outside 0.4L amidships - Class I outside 0.6L amidships - Min. class III within cargo region
Strength deck plating at corners of cargo hatch openings in bulk carriers, ore carriers combination carriers and other ships with similar hatch opening configurations Trunk deck and inner deck plating at corners of openings for liquid and gas domes in membrane type liquefied gas carriers	- Class III within 0.6L amidships - Class II within rest of cargo region
Bilge strake in ships with double bottom over the full breadth and length less than 150[m] (1)	- Class II within 0.6L amidships - Class I outside 0.6L amidships
Bilge strake in other ships (1)	- Class III within 0.4L amidships - Class II outside 0.4L amidships - Class I outside 0.6L amidships
Longitudinal hatch coamings of length greater than 0.15L including coaming top plate and flange (Refer Figure 2.2.1).	- Class III within 0.4L amidships - Class II outside 0.4L amidships - Class I outside 0.6L amidships - Not to be less than Grade D/DH
End brackets and deck house transition of longitudinal cargo hatch coamings	
(1) Single strakes required to be of Class III within 0.4L amidships are to have breadths not less than 800+5L[mm], need not be greater than 1800[mm], unless limited by the geometry of the ship's design.	

Table 2.2.1(b): Minimum material grades for ships with length exceeding 150[m] and single strength deck	
Structural member category	**Material grade**
Longitudinal plating of strength deck where contributing to the longitudinal strength	Grade B/AH within 0.4L amidships
Continuous longitudinal plating of strength members above strength deck	Grade B/AH within 0.4L amidships
Single side strakes for ships without inner continuous longitudinal bulkhead(s) between bottom and the strength deck	Grade B/AH within cargo region

Table 2.2.1(c): Minimum material grades for membrane type liquefied gas carriers with length exceeding 150[m]		
Structural member category		**Material grade**
Longitudinal plating of strength deck where contributing to the longitudinal strength		Grade B/AH within 0.4L amidships
Continuous longitudinal plating of strength members above strength deck	Trunk deck plating	Class II within 0.4L amidships
	• Inner deck plating • Longitudinal strength member plating between the trunk deck and inner deck	Grade B/AH within 0.4L amidships
Note: Table 2.2.1(c) is applicable to membrane type liquefied gas carriers with deck arrangements as shown in Figure 2.2.2. Table 2.2.1(c) may also apply to similar ship types with a “double deck” arrangement above the strength deck.		

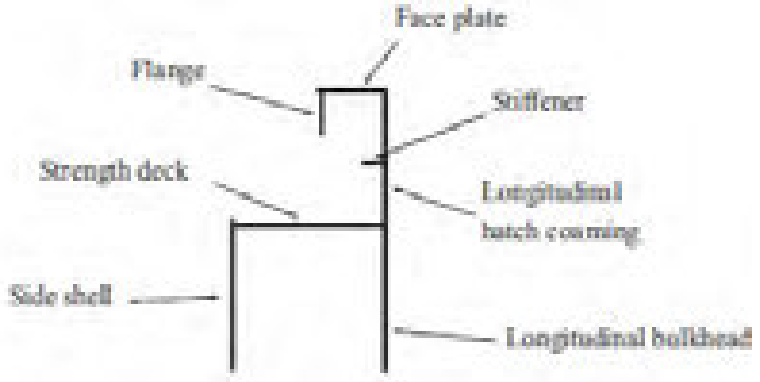

Figure 2.2.1: Typical cross section in longitudinal hatch coaming area

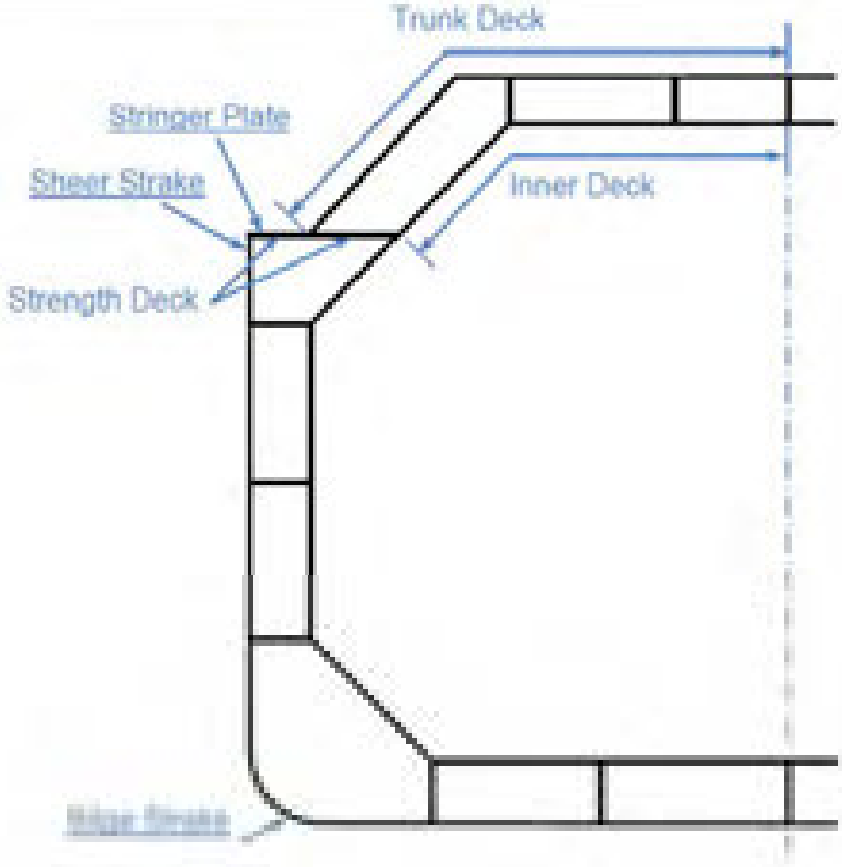

Figure 2.2.2: Typical deck arrangement for membrane type Liquefied Natural Gas Carriers

Table 2.2.1(d): Minimum material grades for ships with length exceeding 250[m]	
Structural member category	**Material grade**
Sheer strake at strength deck (1)	Grade E/EH within 0.4L amidships
Stringer plate at strength deck (1)	Grade E/EH within 0.4L amidships
Bilge strake (1)	Grade D/DH within 0.4L amidships
(1) Single strakes required to be of Grade D/DH or Grade E/EH as shown in the above table and within 0.4L amidships are to have breadths not less than 800+5L[mm], need not be greater than 1800[mm], unless limited by the geometry of the ship's design.	

Table 2.2.1(e): Minimum material grades for single-side skin bulk carriers subjected to SOLAS Regulation XII/6.4 (3)	
Structural member category	**Material grade**
Lower bracket of ordinary side frame (1), (2)	Grade D/DH
Side shell strakes included totally or partially between the two points located to 0.125*l* above and below the intersection of side shell and bilge hopper sloping plate or inner bottom plate (3)	Grade D/DH
(1) The term "lower bracket" means webs of lower brackets and webs of the lower part of side frames upto the point of 0.125*l* above the intersection of side shell and bilge hopper sloping plate or inner bottom plate. (2) The span of the side frame, *l*, is defined as the distance between the supporting structures. Refer Figure 2.5.5 of Part 5, Chapter 1, Section 2. (3) SOLAS Regulation XII/6.4 applies to bulk carriers of $L_L \geq 150$[m], carrying solid bulk cargoes having a density of 1000[kg/m^3] and above constructed on or after 1 July 2006.	

Table 2.2.1(f): Minimum material grades for ships with ice strengthening	
Structural member category	**Material grade**
Shell strakes in way of ice strengthening area for plates (Refer Part 5, Chapter 21)	Grade B/AH

Table 2.2.2: Material grade requirements for classes, I, II and III						
Class	**I**		**II**		**III**	
Thickness [mm]	**MS**	**HT**	**MS**	**HT**	**MS**	**HT**
$t \leq 15$	A	AH	A	AH	A	AH
$15 < t \leq 20$	A	AH	A	AH	B	AH
$20 < t \leq 25$	A	AH	B	AH	D	DH
$25 < t \leq 30$	A	AH	D	DH	D	DH
$30 < t \leq 35$	B	AH	D	DH	E	EH
$35 < t \leq 40$	B	AH	D	DH	E	EH
$40 < t \leq 50$	D	DH	E	EH	E	EH

Table 2.2.3: Minimum material grade requirements for strength members other than mentioned in Table 2.2.1(a) to (f)		
As built thickness [mm]	**Minimum**	
	MS	**HT**
$t \leq 40$	A	AH
$40 < t \leq 50$	B[1)]	AH
$50 < t \leq 150$	D[1)]	DH[1)]
(1) For heavy foundation plates in engine room: — Outside 0.6L amidship, grade A/AH is acceptable. — Within 0.6L amidship, grade B/AH to be used for plate thickness more than 30[mm].		

2.3 Ships exposed to low air temperatures

2.3.1 For ships intended to operate in areas with low air temperatures (below and including -10[°C]), e.g. regular service during winter seasons to Arctic or Antarctic waters, the materials in exposed structures are to be selected based on the design temperature t_D as defined in Cl.2.3.2.

2.3.2 The design temperature t_D is to be taken as the lowest mean daily average air temperature in the area of operation as illustrated in Figure 2.3.2.

Mean: Statistical mean over observation period (at least 20 years)

Average: Average during one day and night.

Lowest: Lowest during year.

MDHT = Mean Daily High (or maximum) Temperature

MDAT = Mean Daily Average Temperature

MDLT = Mean Daily Low (or minimum) Temperature.

For seasonally restricted service the lowest value within the period of operation would be applicable.

For the purpose of issuing a Polar Ship Certificate in accordance with the Polar Code, the design temperature t_D is to be no more than

13[°C] higher than the Polar Service Temperature (PST) of the ship.

In the Polar Regions, the statistical mean over observation period is to be determined for a period of at least 10 years.

2.3.3 Materials in the various strength members above the lowest ballast water line (BWL) exposed to air (including the structural members covered by the Note 5 of Table 2.3.3 and materials of cargo tank boundary plating for which 2.5 is applicable are not to be of lower grades than those corresponding to classes I, II and III as given in Table 2.3.3, depending on the categories of structural members (SECONDARY, PRIMARY and SPECIAL). For non-exposed structures (except as indicated in Note [5] of Table 2.3.3) and structures below the lowest ballast water line, 2.2 applies.

2.3.4 The material grade requirements for hull members of each class depending on thickness and design temperature are defined in Table 2.3.4. For design temperatures t_D<-55[°C], materials will be specially considered.

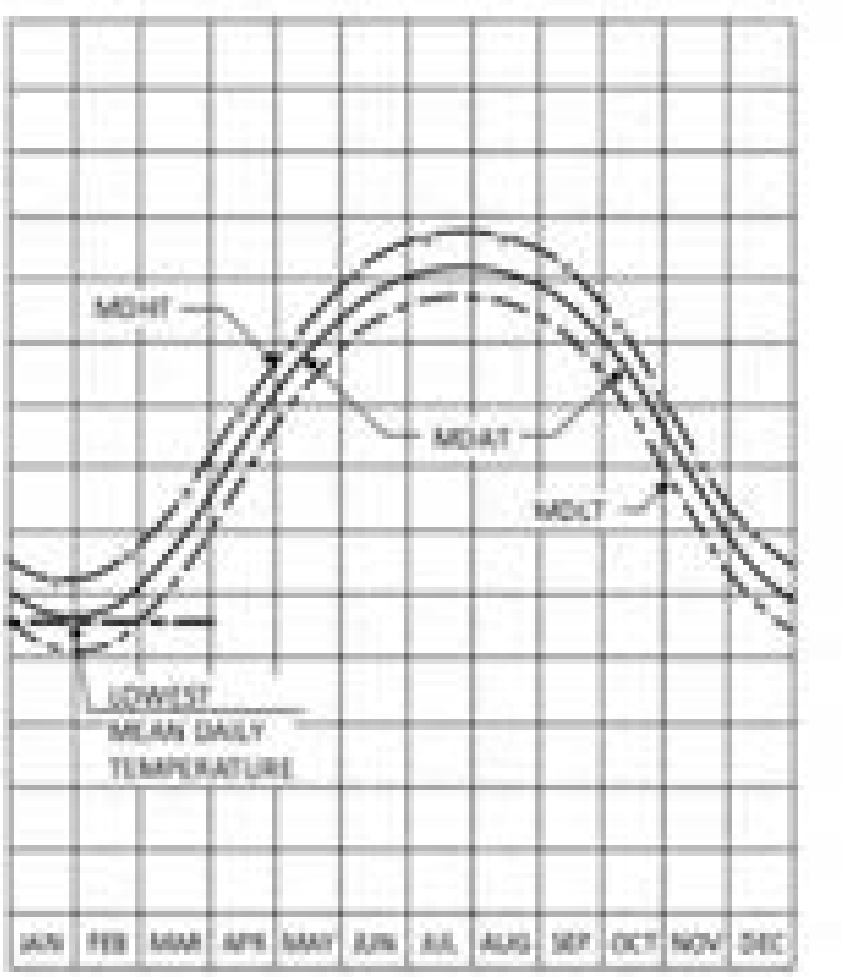

Fig 2.3.2: Commonly used definitions of temperatures

MDHT: Mean Daily High (or maximum) Temperature
MDAT: Mean Daily Average Temperature
MDLT: Mean Daily Low (or minimum) Temperature.

Table 2.3.3: Application of material classes and grades - Structures exposed to low temperatures		
	Material class/grade	
Structural member category	**Within 0.4L amidships**	**Outside 0.4L amidships**
SECONDARY: • Deck plating exposed to weather, in general • Side plating above BWL Transverse bulkheads above BWL (Refer Note 5) • Cargo tank boundary plating exposed to cold cargo (Refer Note 6)	I	I
SECONDARY: • Deck plating exposed to weather, in general • Side plating above BWL • Transverse bulkheads above BWL (Refer Note 5)	I	I
PRIMARY: • Strength deck plating (see Note 1) • Continuous longitudinal members above strength deck, excluding longitudinal hatch coamings • Longitudinal bulkhead above BWL (Refer Note 5) • Top wing tank bulkhead above BWL (Refer Note 5)	II	I
SPECIAL: • Sheer strake at strength deck (Refer Note 2) • Stringer plate in strength deck (Refer Note 2) • Deck strake at longitudinal bulkhead (Refer Note 3) • Continuous longitudinal hatch coamings (Refer Note 4)	III	II
Notes: 1. Plating at corners of large hatch openings to be specially considered. Class III or grade E/EH to be applied in positions where high local stresses may occur. 2. Not to be less than grade E/EH within 0.4L amidships in ships with length exceeding 250[m]. 3. In ships with breadth exceeding 70[m] at least three deck strakes to be class III. 4. Not to be less than grade D/DH. 5. Applicable to plating attached to hull envelope plating exposed to low air temperature. At least one strake is to be considered in the same way as exposed plating and the strake width is to be at least 600[mm]. 6. For cargo tank boundary plating exposed to cold cargo for ships other than liquefied gas carriers, Refer 2.5.		

Table 2.3.4: Material grade requirements for classes I, II and III at low temperatures

Class I

Plate thickness [mm]	-11/-15°C		-16/-25°C		-26/-35°C		-36/-45°C		-46/-55°C	
	MS	HT	MS	HT	MS	HT	MS	HT	MS	HT
t ≤ 10	A	AH	A	AH	B	AH	D	DH	D	DH
10 < t ≤ 15	A	AH	B	AH	D	DH	D	DH	D	DH
15 < t ≤ 20	A	AH	B	AH	D	DH	D	DH	E	EH
20 < t ≤ 25	B	AH	D	DH	D	DH	D	DH	E	EH
25 < t ≤ 30	B	AH	D	DH	D	DH	E	EH	E	EH
30 < t ≤ 35	D	DH	D	DH	D	DH	E	EH	E	EH
35 < t ≤ 45	D	DH	D	DH	E	EH	E	EH	X	FH
45 < t ≤ 50	D	DH	E	EH	E	EH	X	EH	X	FH

Class II

Plate thickness [mm]	-11/-15°C		-16/-25°C		-26/-35°C		-36/-45°C		-46/-55°C	
	MS	HT	MS	HT	MS	HT	MS	HT	MS	HT
t ≤ 10	A	AH	B	AH	D	DH	D	DH	E	EH
10 < t ≤ 20	B	AH	D	DH	D	DH	E	EH	E	EH
20 < t ≤ 30	D	DH	D	DH	E	EH	E	EH	X	FH
30 < t ≤ 40	D	DH	E	EH	E	EH	X	FH	X	FH
40 < t ≤ 45	E	EH	E	EH	X	FH	X	FH	X	X
45 < t ≤ 50	E	EH	E	EH	X	FH	X	FH	X	X

Class III

Plate thickness [mm]	-11/-15°C		-16/-25°C		-26/-35°C		-36/-45°C		-46/-55°C	
	MS	HT	MS	HT	MS	HT	MS	HT	MS	HT
t ≤ 10	B	AH	D	DH	D	DH	E	EH	E	EH
10 < t ≤ 20	D	DH	D	DH	E	EH	E	EH	X	FH
20 < t ≤ 25	D	DH	E	EH	E	EH	X	FH	X	FH
25 < t ≤ 30	D	DH	E	EH	E	EH	X	FH	X	FH
30 < t ≤ 35	E	EH	E	EH	X	FH	X	FH	X	X
35 < t ≤ 40	E	EH	E	EH	X	FH	X	FH	X	X
40 < t ≤ 50	E	EH	X	FH	X	FH	X	X	X	X

Notes:

1. X = Not applicable.
2. Single strakes required to be of class III or of grade E/EH of FH are to have breadths not less than 800 + 5.L[mm] maximum 1800[mm].
3. Plating materials for stern frames rudder horns, rudders and shaft brackets are not to be of lower grades than those corresponding to the material classes given in Section 2.2.

2.4 Refrigerated spaces

2.4.1 Where the minimum design temperature of the steel falls below 0[°C] in refrigerated spaces, in addition to the requirements of Cl.2.2.1, the grade of steel for the following items is to comply, in general, with the requirements of Table 2.4.1:

- Deck plating

- Webs of deck girders.

- Longitudinal bulkhead strakes attached to deck.

- Shelf plates and their face bars supporting hatch covers.

2.4.2 Unless a temperature gradient calculation is carried out to assess the design temperature in the items defined in Cl.2.4.1, the temperature to which the steel deck may be subjected is to be assessed as shown in Table 2.4.2.

Table 2.4.1: Grades of steel for minimum design temperatures below 0[°C]		
Min. design temp. in [°C]	**Thickness, in [mm]**	**Grades of steel**
0 to -10	t ≤ 12.5 12.5 ≤ t ≤ 25.5 t > 25.5	B/AH D/DH E/EH
-10 to -25	t ≤ 12.5 t > 12.5	D/DH E/EH
-25 to -40	t ≤ 12.5 t > 12.5	E/EH C-Mn LT 60 or 1/2 Ni steels

Table 2.4.2: Assessment of deck temperature		
Arrangement		**Deck temperature**
1)	Deck not covered with insulation in the refrigerated space	Temperature of the refrigerated space
2)	Deck covered with insulation in the refrigerated space and not insulated on the other side	Temperature of the space on the un-insulated side
3)	Deck covered with insulation on both sides	
	a) Temperature difference less than or equal to 11[°C] b) Temperature difference greater than 11[°C] but not greater than 33[°C] c) Temperature difference greater than 33[°C]	Mean of the temperatures of the spaces above and below the deck Mean of the temperatures of the spaces above and below the deck less 3[°C] Deck temperature will be specially assessed
Note: Where one of the internal spaces concerned is not refrigerated, the temperature of the space is to be taken as 5[°C].		

2.5 Cold cargo for ships other than liquefied gas carriers

2.5.1 For ships other than liquefied gas carriers, intended to be loaded with liquid cargo having a temperature below -10[°C], e.g. loading from cold onshore storage tanks during winter conditions, the material grade of cargo tank boundary plating is defined in Table 2.3.4 based on the following:

- t_c design minimum cargo temperature in [°C].

- steel grade corresponding to Class I as given in Table 2.3.3.

2.5.2 The design minimum cargo temperature, $t_{cargo,}$ is to be specified in the loading manual.

Section 3

Corrosion Protection

3.1 General

3.1.1 All steelwork, except inside tanks intended for the carriage of oil or bitumen, is to be protected against corrosion by application of suitable coating.

For protection required in salt water ballast spaces, Refer 3.6. For protection of cargo oil tanks of crude oil tankers, Refer 3.7. For protection required in holds of dry bulk cargo carriers, Refer Part 5, Chapter 1, Section 2, 2.11.

For the protection required in tanks carrying chemicals or other special cargoes, Refer Part 5, Chapter 3.

3.1.2 Where bimetallic connections are made, measures are to be incorporated to preclude galvanic corrosion.

3.1.3 Narrow spaces are generally to be protected by an efficient protective product, particularly at the ends of the ship where inspections and maintenance are not easily practicable due to their inaccessibility.

3.2 Surface preparation, prefabrication primers and paints or coatings

3.2.1 Steelwork is to be cleared of millscale and suitably cleaned before the application of surface paints and coatings. It is recommended that blast cleaning or other equally effective means be employed for this purpose.

3.2.2 Where a primer is used to coat steel after surface preparation and prior to fabrication, the composition of the coating is to be such that it will have no significant deleterious effect on subsequent welding work and that it is compatible with the paints or other coatings subsequently applied.

3.2.3 To determine the influence of the primer coating on the characteristics of welds, tests are to be made as detailed in Cl.3.2.4 to Cl.3.2.6.

3.2.4 Three butt weld assemblies are to be tested using plate material 20 to 25[mm] thick. A 'V' preparation is to be used and, prior to welding, the surfaces and edges are to be treated as follows:-

(a) Assembly 1 - Coated in accordance with the manufacturer's instructions.

(b) Assembly 2 - Coated to a thickness approximately twice the manufacturer's instructions.

(c) Assembly 3 - Uncoated.

3.2.5 Tests as follows are to be taken from each test assembly:-

(a) Radiographs - These are to have a sensitivity of better than 2 per cent of the plate thickness under examination, as shown by an image quality indicator.

(b) Photo-macrographs - These may be of actual size and are to be taken from near each end and from the centre of the weld.

(c) Face and reverse bend test - The test specimens are to be bent by pressure or hammer blows round a former of diameter equal to 3 times the plate thickness.

(d) Impact tests - These are to be carried out at ambient temperature, on three Charpy V-notch test specimens prepared in accordance with Part 2. The specimens are to be notched at the centreline of the weld, perpendicular to the plate surface.

3.2.6 The tests are to be carried out in the presence of a Surveyor of IRS or by an independent laboratory specializing in such work. A copy of the test report is to be submitted, together with radiographs and macrographs.

3.2.7 Paints or other coatings are to be suitable for the intended purpose in the locations where they are to be used. Unless previously agreed, at least two coats are to be applied.

3.2.8 The paint or coating is to be compatible with any previously applied primer, Refer Cl.3.2.2.

3.2.9 Paints, varnishes and similar preparations having a nitrocellulose or other highly flammable base, are not to be used in accommodation or machinery spaces.

3.2.10 In ships intended for the carriage of oil cargoes having a flash point below 60[°C] (closed cup test), paint containing aluminium should not in general be used in cargo tanks, adjacent ballast tanks, cofferdams, pump rooms as well as on deck above the mentioned spaces, nor in any other areas where cargo vapours may accumulate, unless it has been shown by appropriate tests that the paint to be used does not increase the incentive sparking hazard.

3.3 Internal cathodic protection

3.3.1 Impressed current cathodic protection systems are not permitted in any tank.

When a cathodic protection system is to be fitted in tanks for the carriage of liquid cargo with flash point not exceeding 60[°C], a plan showing details of the locations and attachment of anodes is to be submitted. The arrangements will be considered for safety against fire and explosion aspects only.

3.3.2 Particular attention is to be given to the locations of anodes in relation to the structural arrangements and openings of the tank.

3.3.3 Anodes are to be of approved design and sufficiently rigid to avoid resonance in the anode support. Weldable steel cores are to be fitted, and these are to be so designed as to retain the anode even when the anode is wasted.

3.3.4 Anodes are to be attached to the structure in such a way that they remain secure both initially and during service. The following methods of attachment would be acceptable:

(a) Steel core connected to the structure by continuous welding of adequate section.

(b) Steel core bolted to separate supports, provided that a minimum of two bolts with lock nuts are used at each support. The separate supports are to be connected to the structure by continuous welding of adequate section.

(c) Approved means of mechanical clamping.

3.3.5 Anodes are to be attached to stiffeners, or may be aligned in way of stiffeners on plane bulkhead plating, but they are not to be attached to the shell. The two ends are not to be attached to separate members which are capable of relative movement.

3.3.6 Where cores or supports are welded to the main structure, they are to be kept clear of the toes of brackets and similar stress raisers. Where they are welded to asymmetrical stiffeners, they are to be connected to the web with the welding kept at least 25[mm] away from the edge of the web. In the case of stiffeners or girders with symmetrical face plates, the connection may be made to the web or to the centreline of the face plate but well clear of the free edges. However, it is recommended that anodes are not fitted to face plates of high strength steel longitudinals.

3.4 Aluminium and magnesium anodes

3.4.1 Aluminium and aluminium alloy anodes are permitted in oil cargo tanks and also in tanks adjacent to oil cargo tanks only at locations where the potential energy does not exceed 275[J] (i.e. 28[kgf m]). The weight of the anode is to be taken as the weight at the time of fitting, including any inserts and fitting devices.

3.4.2 The height of the anode is, in general, to be measured from the bottom of the tank to the centre of the anode. Where the anode is located on or closely above a horizontal surface (such as a bulkhead girder) not less than 1[m] wide, provided with an upstanding flange or face plate projecting not less than 75[mm] above the horizontal surface, the height of the anode may be measured above that surface.

3.4.3 Aluminium anodes are not to be located under tank hatches or tank cleaning openings unless protected by adjacent structure.

3.4.4 Magnesium or magnesium alloy anodes are not permitted in oil cargo tanks and in tanks adjacent to oil cargo tanks.

3.5 External hull protection

3.5.1 Suitable protection for the underwater portion of the hull is to be provided.

3.5.2 Where an impressed current cathodic protection system is fitted, plans showing the proposed layout of anodes, reference cells, wiring diagram and the means of bonding-in of the rudder and propeller, are to be submitted.

3.5.3 The arrangements for glands, where cables pass through the shell, are to include a small cofferdam. Cables to anodes are not to be led through tanks intended for the carriage of low flash point oils. Where cables are led through cofferdams or clean ballast tanks of tankers, they are to be enclosed in a substantial steel tube of about 10[mm] thickness.

3.5.4 When Impressed Current Cathodic Protection (ICCP) systems or Sacrificial anodes are fitted, the system is to be capable of polarizing the underwater steel surface to a potential of about -750[Mv] versus the Ag/AgCl/seawater reference electrode, and to maintain the potential in this interval throughout

3.6 Corrosion protection coatings for salt water ballast spaces and double side skin spaces

3.6.1 The following spaces are to be coated during construction in accordance with the Performance Standards for Protective Coatings (PSPC) adopted by the IMO by Resolution MSC.215(82), as per applicability indicated in Cl.3.6.2.

(a) Dedicated salt water ballast tanks in all ships of 500GT and above.

(b) Double side skin spaces in bulk carriers of $L_L \geq 150$[m].

The following tanks are not considered to be dedicated salt water ballast tanks and therefore need not comply with the requirement of the Performance standard for protective coatings for dedicated salt water ballast tanks in all types of ships and double-side skin spaces of bulk carriers (MSC.215(82)), provided the coatings applied in the tanks described in ii) and iii) below are confirmed by the coating manufacturer to be resistant to the media stored in these tanks and provided such coatings are applied and maintained according to the coating manufacturer's procedures.

i) Salt water ballast tanks identified as "Spaces included in Net Tonnage" in the 1969 International Tonnage Convention Certificate;

ii) Salt water ballast tanks in passenger vessels also designated for the carriage of grey water;

iii) Salt water ballast tanks in livestock carriers also designated for the carriage of the livestock dung.

3.6.2 The IMO Performance Standards for Protective Coatings (PSPC) are to be applied to ships as follows:

i) In case of bulk carriers and tankers that are subject to the IACS common structural rules:

- which are contracted for construction on or after 8 December, 2006.

ii) In case of all ships other than those mentioned in i) above:

- Which are contracted for construction on or after 1 July 2008, or

- In the absence of a building contract, the keels of which are laid or which are at a similar stage of construction on or after 1 January 2009, or

- The delivery of which is on or after 1 July 2012.

3.6.3 For oil tankers and bulk carriers constructed on or after 1 July 1998 and for which Cl.3.6.1 and Cl.3.6.2 are not applicable, the following are to be complied with:

(a) All salt water ballast spaces are to have an efficient corrosion protection hard coating, epoxy or equivalent, applied in accordance with the manufacturer's requirements. The durability of the coatings could affect the frequency of survey of the spaces and light coloured coatings would assist in improving the effectiveness of subsequent surveys. It is therefore recommended that these aspects be taken into account by those agreeing to the specifications for the coatings and their application.

(b) The scheme for the selection, application and maintenance of the coating system to follow the requirements of IMO Resolution A.798(19) and contain, as a minimum the following documentation:

- Owner's, coating manufacturer's and shipyard's explicit agreement to the scheme for coating selection, application and maintenance.

- List of seawater ballast tanks identifying the coating system for each tank, including coating color and whether coating system is a hard coating.

- Details of anodes, if used.

- Manufacturer's technical product data sheet for each product.

- Manufacturer's evidence of product quality and ability to meet owner's requirements.

- Evidence of shipyard's and/or its subcontractor's experience in coating application.

- Surface preparation procedures and standards, including inspection points and methods.

- Application procedures and standards, including inspection points and methods.

- Format for inspection reports on surface preparation and coating application.

- Manufacturer's product safety data sheets for each product and owner's, coating manufacturer's and shipyard's explicit agreement to take all precautions to reduce health and other safety risks which are required by the authorities.

- Maintenance requirements for the coating system.

3.7 Corrosion protection for Cargo Oil tanks of Crude Oil Tankers

3.7.1 Cargo oil tanks of crude oil tankers are to be:

(i) Coated during construction in accordance with the Performance Standards for Protective Coating (PSPC-COT) adopted by the IMO by Resolution MSC. 288(87); or

(ii) Protected by alternative means of corrosion protection or utilization of corrosion resistance material to maintain required structural integrity for 25 years in accordance with the performance standard for alternative means of corrosion protection for cargo oil tanks of crude oil tankers, adopted by the IMO by Resolution MSC. 289(87).

3.7.2 The requirements given in Cl.3.7.1 are to be applied for crude oil tanker greater than 5000 tonnes deadweight where:

(i) Building contract is placed on or after 1st January 2013;

(ii) In absence of building contract, the keels of which are laid or which are at a similar stage of construction on or after 1st July 2013;

(iii) Or the delivery of which is on or after 1st January 2016.

3.7.3 The Administration may exempt a crude oil tanker from the requirements of Cl.3.7.1 to allow the use of prototype alternatives to the coating system specified in Cl.3.7.1 (i), for testing, provided they are subject to suitable controls, regular assessment and acknowledgement of the need of immediate remedial action if the system fails or is shown to be failing. Such exemption is to be recorded on an exemption certificate.

3.7.4 The Administration may exempt a crude oil tanker from the requirement of Cl.3.7.1 if the ship is built to be engaged solely in the carriage of cargoes and cargo handling operations not causing corrosion. Such exemption and conditions for which it is granted is to be recorded on an exemption certificate. (See MSC.1/Circ.1421 "Guidelines on exemption for crude oil tankers solely engaged in the carriage of cargoes and cargo handling operations not causing corrosion").

3.8 Protection against galvanic corrosion in tanks

3.8.1 Non-stainless steel is to be electrically insulated from stainless steel or from aluminium alloys.

3.8.2 Where stainless steel or aluminium alloys are fitted in the same tank as non-stainless steel, a protective coating is to cover both materials.

3.9 Protection of bottom by ceiling

3.9.1 Where ceilings are fitted it is to be laid over the inner bottom and lateral bilges.

3.9.2 Planks forming ceiling over the bilges and on the inner bottom are to be easily removable to permit access for maintenance.

3.9.3 Where the double bottom is intended to carry fuel oil, ceiling on the inner bottom is to be separated from the plating by means of battens, in order to facilitate the efficient drainage of oil leakages to the bilges.

3.9.4 Where the double bottom is intended to carry water, ceiling on the inner bottom may lie next to the plating, provided a suitable protective composition is applied prior to fitting of ceiling.

3.9.5 The attachment of ceiling is not to affect the tightness of the inner bottom.

3.10 Protection of decks by wood sheathing

3.10.1 Where plated decks are sheathed with wood or an approved composition, reductions in plate thickness may be allowed.

3.10.2 The steel deck is to be coated with a suitable material in order to prevent corrosive action, and the sheathing or composition is to be effectively secured to the deck.

3.10.3 Deck coverings in the following positions are to be of a type which will not readily ignite or give rise to smoke or toxic or explosive hazards at elevated temperatures in accordance with the requirements of the International Code for the Application of Fire Test Procedures:

(a)forming the crown of machinery or cargo spaces within accommodation spaces of cargo ships

(b)within accommodation spaces, control stations, stairways and corridors of passenger ships.

3.10.4 Before fitting the wood sheathing, deck plates are to be provided with suitable protective coating.

Section 4

Net Scantling Approach

Symbols

For symbols not defined in this section, Refer to Chapter 1, Section 2.

t_c = Corrosion addition, in [mm].

4.1 Application

4.1.1 The net scantling approach is the method of obtaining the required thickness in accordance with the rules before adding corrosion margin. The scantlings obtained by applying these criteria are net scantlings which provide the structural strength required to sustain the design loads, giving certain allowance for corrosion that is likely to occur during the operation phase of the ship.

4.1.2 No credit is given in the assessment of structural capability for the presence of coatings or similar corrosion protection systems.

4.1.3 Any additional thicknesses specified by the owner, as Owner's extras, are not included in the assessment of the required new building thickness.

4.1.4 The strength is to be assessed using the net thickness approach on all scantlings which is the minimum scantling that must be kept throughout the service life of the ship.

4.2 Local and global corrosion

4.2.1 The net scantling approach distinguishes between local and global corrosion.

4.2.2 Local corrosion is defined as uniform corrosion of local structural elements, such as a single plate or stiffener.

4.2.3 Global corrosion is defined as the average corrosion of larger areas, such as primary supporting members and the hull girder. As the hull girder cross section does not corrode evenly, the reduction of the hull girder sectional properties will be less than the sum of the allowable local wastage allowance for members contributing to the longitudinal strength.

4.3 Exceptions in gross scantling

4.3.1 The scantlings of the below structures are directly determined in terms of gross scantlings and do not follow the net scantling approach. They already include additions for corrosion but without any owner's extra margin. They are:

- Bow doors and inner doors
- Deck equipment
- Massive pieces made of steel forgings, steel castings or iron castings

- Rudder structures and hull appendages

- Side doors and stern doors

- Scantlings of superstructures and deckhouses as given in Chapter 7, Section 8.

Note: The side plating of superstructure is based on net scantling approach as given in Chapter 7, Cl.8.3.1.2, similar to side shell plating. For aft and front plating of superstructures and all plating of deckhouses, gross scantling approach is followed. In cases where the deckhouses are effective in contributing to hull girder strength, the corrosion margins given in Chapter 2, Table 5.1.1 are to be used to determine the reduction in thickness due to corrosion. Half the stipulated corrosion margin is to be deducted from the gross scantlings to arrive at the net-50 scantlings for calculation of hull girder section modulus. For fatigue calculations, 50% corrosion margin is deducted whereas for buckling calculations, 100% corrosion margin is deducted.

4.4 Gross and net scantling definitions

4.4.1 Gross required thickness: The gross required thicknesses (t_{gr} in [mm]) are obtained by adding the corrosion addition t_c, as defined in Part 3, Chapter 2, Section 5 to the net required thickness (t_{net}), as follows:

$$t_{gr} = t_{net} + t_c$$

4.4.2 Gross offered thickness: The gross offered thickness (t_{gr_off} in [mm]) is the gross thickness at the new building stage, which is obtained by deducting any thickness for voluntary addition from the as-built thickness, as follows:

$$t_{gr_off} = t_{as_built} - t_{vol_add}$$

4.4.3 Net offered thickness: The net offered thickness (t_{off} in [mm]) is obtained by subtracting the corrosion addition (t_c) from the gross offered thickness (t_{gr_off}), as follows:

$$t_{off} = t_{gr_off} - t_c$$

4.5 Rounding off of scantlings

4.5.1 The rounding off of the gross required plate thickness, t_{gr}, calculated in accordance with the rule requirements is obtained by rounding to the nearest half millimeter.

For example:

- for $10.75 \leq t_{gr} < 11.25$[mm], the rule required gross thickness is 11.0[mm].

- for $11.25 \leq t_{gr} < 11.75$[mm], the rule required gross thickness is 11.5[mm].

4.6 Strength and scantling compliance

4.6.1 The required strength characteristics are:

4.6.1.1 Thickness, for plating including that which constitutes primary supporting members.

4.6.1.2 Section modulus, shear area, moments of inertia and local thickness, for ordinary stiffeners as well as primary supporting members

4.6.1.3 Section modulus, moments of inertia and first moment for the hull girder.

4.6.1.4 Grillage analysis, Buckling capacity of primary supporting members

4.6.1.5 Buckling/collapse capacity of hull girder

4.6.2 The required scantling characteristics are:

4.6.2.1 The net offered thickness of plating to be equal to or greater than the net required thickness of plating.

4.6.2.2 The required net section modulus, moment of inertia and shear area properties of local supporting members are to be calculated using the net thickness of the attached plate, web and flange. The net sectional dimensions of local supporting members are defined in Figure 4.6.2.

4.6.2.3 The offered net sectional properties of primary supporting members and the hull girder are to be equal to or greater than the required net sectional properties which are to be based on the gross offered scantling with a reduction of the applicable corrosion addition, as specified in Table 4.6.2, applied to all component structural members.

4.6.2.4 The strength assessment methods prescribed are to be assessed by applying the corrosion addition specified in Table 4.6.2 to the offered gross scantlings. Half of the applied corrosion addition specified in Table 4.6.2 is to be deducted from both sides of the structural members being considered.

4.6.2.5 Corrosion additions are not to be taken less than those given in Section 5, Table 5.1.1.

4.7 Minimum requirements

4.7.1 Minimum requirements specify the minimum scantling requirements which is to be applied irrespective of all other requirements. The minimum requirements are usually in one of the following forms:

— Minimum thickness

— Minimum stiffness and proportions.

4.8 Considered net scantling

4.8.1 Yielding check of the hull girder: The net thickness of structural members to be considered for the yielding check of the hull girder, according to Chapter 6, Section 3, is to be obtained by deducting $0.5t_c$ from the gross thickness offered.

4.8.2 Buckling check of the hull girder: The net thickness of structural members to be considered for the buckling check, according to Chapter 9, Section 2, is to be obtained by deducting t_c from the gross thickness offered.

4.8.3 Ultimate strength check of the hull girder: The net thickness of structural members to be considered for the ultimate strength check of the hull girder, according to Chapter 6, Section 4, is to be obtained by deducting $0.5t_c$ from the gross thickness offered.

4.8.4 All buckling capacity assessments are to be based on corrosion addition, as defined in Table 4.6.2.

4.8.5 FE models for vibration analysis to be based on gross offered thickness.

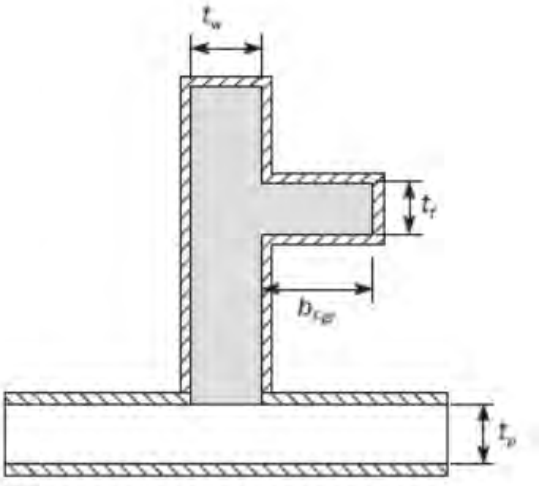
L3 - Profile



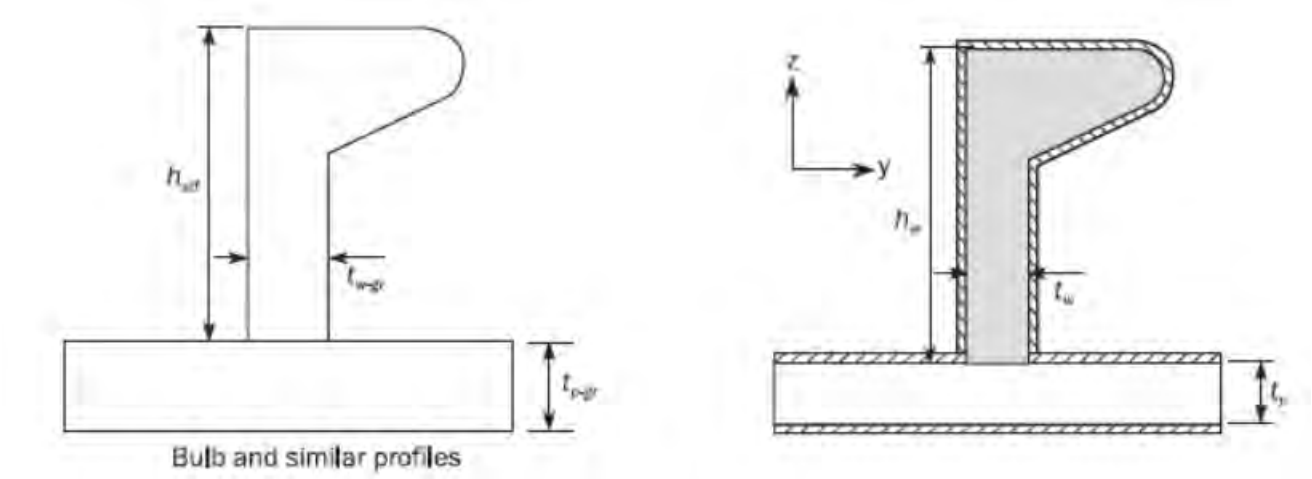


Figure 4.6.2: Net sectional properties of local supporting members

Table 4.6.2: Applied corrosion addition for structural assessment		
Structural requirement	**Property/analysis type**	**Applied corrosion addition for structural assessment**
Minimum thickness all members including primary supporting members (PSM)	Thickness	t_c
Local strength member check (Plates, stiffeners, and hold frames)	Thickness / Sectional properties	t_c
	Proportions / Buckling capacity	t_c
Primary supporting members (Prescriptive check)	Grillage analysis	$0.5t_c$
	Sectional properties	$0.5t_c$
	Proportions of web and flange Buckling capacity	t_c
Strength assessment by Finite Element Method (FEM)	Global FE Model	$0.5t_c$
	Local fine mesh finite element model	$0.5t_c$
	Cargo tank/cargo hold finite element model	$0.5t_c$
	Buckling capacity	t_c
Hull girder strength (Prescriptive check)	Sectional properties/Hull girder yield check	$0.5t_c$ [1)]
	Buckling capacity	t_c
Hull girder ultimate strength	Sectional properties	$0.5t_c$
	Buckling /collapse capacity	$0.5t_c$
Fatigue assessment (simplified stress analysis)	Hull girder section properties Local supporting member	$0.5t_c$
Fatigue assessment (Finite Element Stress analysis)	Very fine mesh Finite Element model	$0.5t_c$
1) For vertical hull girder bending and hull girder shear strength check, as per Chapter 6, Section 2, Cl.2.1.2, Cl.2.1.3 and Cl.2.2.2, gross offered thickness to be applied.		

Section 5

Corrosion Additions

Symbols

For symbols not defined in this section, Refer to Chapter 1, Section 2.

t_{c1}, t_{c2} = Corrosion addition, in [mm], on each of the two sides of the considered structural member, as defined in Table 5.1.1.

t_{res} = Reserve thickness, taken as 0.5[mm], also to be applied in non-corrosive environment and for stainless steel and aluminium to account for possible thickness reductions, e.g. wear and tear, grinding or under tolerance thickness.

5.1 Application

5.1.1 The corrosion additions given in these Rules are applicable to carbon-manganese steels, stainless steels, stainless clad steels and aluminium alloys. Corrosion addition for the exposed carbon steel side of stainless clad structure to be taken from Table 5.1.1 for the corresponding compartment.

5.2 Corrosion addition determination

5.2.1 The corrosion addition for each of the two sides of a structural member, t_{c1} or t_{c2}, is specified in Table 5.1.1.

5.2.2 The total corrosion addition, t_c [mm], for both sides of the structural member is obtained by the following formula:

$$t_c = \text{Roundup}_{0.5}\,(t_{c1} + t_{c2}) + t_{res}$$

$\text{Roundup}_{0.5}$ (t) means that "t" is rounded to the upper half millimeter.

For L<90[m], $\text{Roundup}_{0.5}$ (t) need not be considered in the total corrosion addition.

5.2.3 For an internal member within a given compartment, the total corrosion addition, t_c [mm], is obtained from the following formula:

$$t_c = \text{Roundup}_{0.5}\,(2t_{c1}) + t_{res}$$

where t_{c1} is the value specified in Table 5.1.1 for one side exposure to that compartment.

For L<90[m], $\text{Roundup}_{0.5}$ (t) need not be considered in the total corrosion addition.

5.2.4 The total corrosion addition, t_c [mm], for compartment boundaries and internal members made from stainless steel, or aluminium is to be taken as:

$$\mathbf{t_c = t_{res} = 0.5}$$

5.2.5 In case of stainless clad steel, the corrosion additions, t_{c1}, for the carbon steel side and t_{c2}, for the stainless-steel side are respectively to be taken as:

$\mathbf{t_{c1}}$ as specified for the corresponding compartment in Table 5.1.1

$\mathbf{t_{c2}}$ = 0

5.3 Stiffener

5.3.1 The corrosion addition of a stiffener is determined according to the location of its connection to the attached plating.

5.3.2 When an elementary plate panel or a stiffener is affected by more than one value of corrosion addition, the largest value is to be applied.

5.3.3 The net strength characteristics are to be calculated for the net transverse section and are to be obtained by deducting the corrosion addition $\mathbf{t_c}$ from the gross thickness of the elements which constitute the stiffener profile.

Table 5.1.1: Corrosion addition for one side of a structural member				
Sl.No.	**Compartment Type**	**Structural Member**	**Corrosion Addition (t_{c1} or t_{c2}) [mm]**	
			General	Special case
1	Tanks for Ballast water[1)] /Sea water	All members[6)]	1.00	1.25[2)]
2	Tanks for Cargo Oil[1)] and Slop Tank	All members	1.00	1.25[2)]
3	Tanks for Liquid Chemical	All members	1.00	
4	Tanks for fuel oil, lube oil	All members	0.50	1.00[2)]
5	Tanks for Brine, Urea, Bilge Tank, Drain Storage, Chain Locker	Face plates of PSM's	1.00	
		Other members	1.00	
6	Tanks for fresh water	All members	0.50	
7	Other tanks - cargo tanks only intended to carry fresh water, fuel oil, lube oil, RSW or mud.	All members	0.50	
8	Dry Bulk Cargo[3), 7)]	General	1.00	
		Inner bottom plating	1.50	
		Sloping stool plate of hopper tanks and lower stool		
		Transverse bulkhead plating		
		Brackets, Frames, ordinary stiffeners and primary supporting members	1.00	1.5[4)]
9	Containers and General cargo hold	All members in hold	1.00	
10	Accommodation spaces	All members	0.00	
11	Void, dry spaces and other category spaces not mentioned above[5)].	Bottom plate of the compartment / Upper surface of horizontal stringers in double hull spaces	0.5	
		Elsewhere	0.0	
12	Stainless steel and aluminium (independent of compartment type)	All members	0.00	
13	External Surfaces (exposed to air/water)	All members	0.50	

(1) Ballast tank: also includes combined ballast and cargo oil tanks but does not include cargo oil tanks which may carry ballast according to Regulation 18 of MARPOL 73/78 as amended.
(2) This minimum corrosion addition is applied in the area within 1.5[m] below the top of the tank. This is applied to ballast or liquid cargo tanks with exposed weather deck as the tank top.
(3) Dry bulk cargo hold includes holds intended for the carriage of dry bulk cargoes, which may carry oil or water ballast.
(4) This minimum corrosion addition is applied in the area within 1.5[m] above the bottom of hold, e.g. inner bottom. The bottom of hold is defined as the lowest horizontal boundaries of the hold.
(5) Applicable for the spaces containing membrane or independent cargo tanks of gas carriers. Also applicable for semi-enclosed compartments, e.g. open ro-ro spaces.
(6) 0.5[mm] is to be added to the plate surface exposed to ballast for the plate boundary between water ballast and heated cargo oil tanks or heated fuel/lube oil tanks/slop tanks. 0.3[mm] is to be added to each surface of the web and face plate of a stiffener in a ballast tank and attached to the boundary between water ballast and heated cargo oil tanks or heated fuel/lube oil tanks/slop tanks. Heated oil tanks are defined as tanks/slop tanks arranged with any form of heating capability (the most common type is heating coils). For L<90[m], these additional requirements need not be considered.
(7) For cargo holds carrying cement, corrosion additions need not to be considered.

Section 1

General

1.1 Application

1.1.1 This chapter covers the arrangement design and structural design principles.

Section 2

Subdivision Arrangement

2.1 Watertight bulkhead arrangement

2.1.1 Number and disposition of watertight bulkheads

2.1.1.1 The following transverse watertight bulkheads are to be fitted in all ships:

- A collision bulkhead;

- An after peak bulkhead;

- One bulkhead forward of the machinery space, and one bulkhead at the aft end of the machinery space which may be the aft peak bulkhead.

2.1.1.2 In the case of ships with an electrical propulsion plant, both the generator room and the engine room are to be enclosed by watertight bulkheads.

2.1.1.3 In addition to the requirements of Cl.2.1.1.1 and Cl.2.1.1.2, the number and disposition of bulkheads are to be arranged to meet the requirements for subdivision, floodability and damage stability in accordance with the requirements of the National Authority of the country in which the ship is registered.

2.1.1.4 For ships without longitudinal bulkheads in the cargo region, additional transverse watertight bulkheads are to be fitted so that the total number of bulkheads is not less than that given in Table 2.1.1.1.

2.1.1.5 The ordinary transverse watertight bulkheads in the holds should be spaced at reasonably uniform intervals. Where non uniform spacing is unavoidable and the length of a hold is unusually large, the transverse strength of the ship is to be maintained by

providing additional web frames, increased framing etc. and details are to be submitted.

2.1.1.6 Proposals to dispense with one or more of these bulkheads will be considered, subject to suitable structural compensation, in case they interfere with the requirements of a special trade.

2.1.1.7 The watertight bulkheads are to extend to the bulkhead deck. In exceptional cases at the request of the Owner, IRS may allow transverse watertight bulkheads to terminate at a deck below that from which freeboard is measured, provided that this deck is at an adequate distance above the full load waterline.

2.1.1.8 Where it is not practicable to arrange a watertight bulkhead in one plane, a stepped bulkhead may be fitted. In this case, the part of the deck which forms the step is to be watertight and equivalent in strength to the bulkhead.

2.1.1.9 In ships with a raised quarter deck, the watertight bulkheads within the quarter deck region are to extend to this deck.

2.1.1.10 Bulkhead requirements for specific ships types, Refer to Part 5.

Table 2.1.1.1: Total number of bulkheads

Ship Length [m]	Engine Room Location	
	Aft*	Elsewhere
L ≤ 65	3	4
65 < L ≤ 85	4	4
85 < L ≤ 105	4	5
105 < L ≤ 125	5	6
125 < L ≤ 145	6	7
145 < L ≤ 165	7	8
165 < L ≤ 190	8	9
L > 190	Specially considered	

(*) With Aft peak bulkhead forming after boundary of machinery space.

2.2 Collision bulkhead

2.2.1 Arrangement of collision bulkhead

2.2.1.1 A collision bulkhead is to be fitted which is to be watertight up to the bulkhead deck of passenger ships and the freeboard deck of cargo ships. It is to extend, preferably in one plane, to the freeboard deck.

2.2.1.2 In the case of vessels having long superstructures at the fore end, it is to be extended weathertight to the deck next above the bulkhead deck of passenger ships and the freeboard deck of cargo ships. The extension need not be fitted directly over the bulkhead below, provided that the location of the extension meets the following requirements in Cl.2.2.2 and the part of the deck which forms the step is made effectively weathertight. Any recesses or steps in collision bulkheads are to fall within the freeboard deck, the extension need only be to weathertight standards. If a step occurs at that deck, the deck also need be to only weathertight standards in way of the step unless the step forms the crown of a tank.

2.2.1.3 In ships fitted with visor or bow doors, in which a sloping loading ramp forms part of the collision bulkhead above the bulkhead deck of passenger ships and the freeboard deck of cargo ships, that part of the ramp which is more than 2.3[m] above the freeboard deck may extend forward of the minimum limit specified below in Cl.2.2.2. Such a ramp is to be weathertight over its complete length. Refer Figure 2.2.1.1.

Ramps not meeting the requirements in Cl.2.2.2 is not considered as an extension of the collision bulkhead.

2.2.1.4 Doors, manholes, permanent access openings or ventilation ducts are not to be cut in the collision bulkhead below the bulkhead deck of passenger ships and the freeboard deck of cargo ships. Where the collision bulkhead is extended above the freeboard deck, the number of openings in the extension is to be kept to a minimum compatible with the design and proper working of the ship.

2.2.2 Position of collision bulkhead

2.2.2.1 The distance $[X_c]$, in [m] from perpendicular FP_{LL} to the collision bulkhead is to be between the following limits. Refer Figure 2.2.2.1 and Figure 2.2.2.2 for $X_{c,min}$ and $X_{c,max}$.

$$X_{c,min} \begin{cases} = 0.05L_L - X_R & \text{for } L_L < 200 \\ = 10 - X_R & \text{for } L_L \geq 200 \end{cases}$$

$$X_{c,max} \begin{cases} = 0.05L_L - X_R + 3 & \text{for } L_L < 100 \\ = 0.08L_L - X_R & \text{for } L_L \geq 100 \end{cases}$$

2.2.2.2 For ships having any part of the underwater body extending for'd of the forward perpendicular (ships with bulbous bows), the reference point, (RP) is to be measured from the forward end of L_L a distance X_R forward; where X_R is to be taken as the least of the following:

- 0.5G;
- $0.015L_L$;
- 3.0[m], where

G = the distance in [m] from forward perpendicular to the forward end of the protruded part

L_L = the load line length of the vessel in [m], as per International Load Line Convention (Refer Chapter 1, Section 2).

T_L = the draught in [m] at 85% of the least moulded freeboard depth, D_L. Refer Figure 2.2.2.1.

2.2.2.3 For ships without bulbous bows the reference point is to be taken where the forward end of L_L coincides with the forward side of stem, on the waterline which L_L is measured that is $X_R = 0$, Refer Figure 2.2.2.1.

2.2.2.4 Consideration will however be given to proposals for the collision bulkhead positioned aft of the limits given in Cl.2.2.2.1, provided that the application is accompanied by calculations showing that with the ship fully loaded to summer draught on even keel, flooding of space forward of the collision bulkhead will not result in any part of the bulkhead deck / freeboard deck becoming submerged, nor result in any unacceptable loss of stability.

Definition:

Forward load line perpendicular: The forward load line perpendicular, FP_{LL}, is to be taken at the forward end of the length L_L and is to coincide with the foreside of the stem on the waterline on which the length L_L is measured.

After load line perpendicular: The after load line perpendicular, AP_{LL}, is to be taken at the aft end of the length L_L.

Moulded freeboard depth: The moulded freeboard depth D_L is the least moulded depth taken as the vertical distance, in [m], from the top of the keel to the top of the freeboard deck beam at the side. Where the freeboard deck is stepped and the raised part of the deck extends over the point at which the moulded depth is to be determined, the moulded depth is to be measured to a line of reference extending from the lower part of the deck along a line parallel with the raised part.

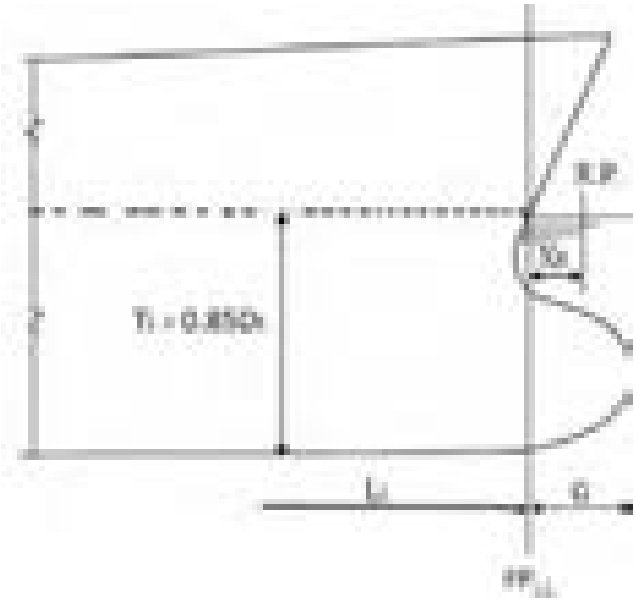

Figure 2.2.2.1: Reference Point for Vessels with Bulbous Bow

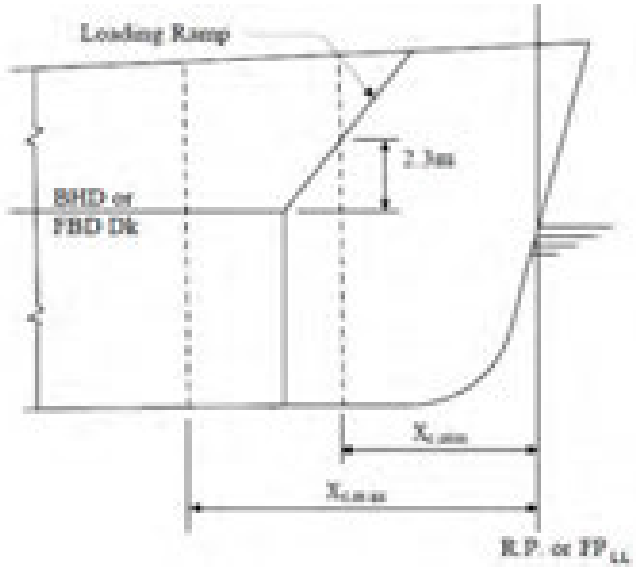

Figure 2.2.1.1: Collision Bulkhead in Vessels with Bow Door

2.3 After peak, Machinery space bulkheads and shaft tunnel

2.3.1 All ships are to have an after peak bulkhead generally enclosing the stern tube and rudder trunk in a watertight compartment. In twin screw ships where the bossing ends forward of the after peak bulkhead, the stern tubes are to be enclosed in suitable watertight spaces inside or aft of the shaft tunnels.

2.3.2 In passenger ships, the stern gland is to be situated in a watertight shaft tunnel or other watertight space separate from the stern tube compartment and of such volume that if flooded by leakage through the stern gland, the bulkhead deck will not be immersed.

2.3.3 In cargo ships, where the inboard end of the stern tube extends into the engine room, provision of an approved watertight/ oil tight gland system for sealing of the inboard end of the stern tube at the aft peak/engine room watertight bulkhead is considered sufficient to minimize danger of water penetrating into the ship in case of damage to stern tube arrangements. (Refer also Part 4, Chapter 4, Section 6, 6.16).

2.3.4 For ships less than 65[m], where the after peak bulkhead in way of the stern tube stuffing box is not provided, stern tubes are to be enclosed in watertight spaces of moderate volume.

2.3.5 In ships with engines situated amidships, a watertight shaft tunnel is to be arranged. Openings in the forward end of shaft tunnels are to be fitted with watertight sliding doors capable of being operated from a position above the load water line.

2.3.6 An afterpeak bulkhead also to be fitted and made watertight up to the bulkhead deck or the freeboard deck. The after peak bulkhead may be stepped below the bulkhead deck or the freeboard deck, provided the degree of safety of the ship as regards subdivision is not thereby diminished.

2.3.7 Bulkheads are to be fitted separating the machinery space from cargo and accommodation spaces forward and aft and made watertight up to the bulkhead deck of passenger ships and the freeboard deck of cargo ships.

2.4 Height of bulkheads

2.4.1 The watertight bulkheads are in general to extend to the bulkhead deck/freeboard deck. The afterpeak bulkhead however, may terminate at the first deck above the load waterline, provided that this deck is made watertight to the stern or to a watertight transom floor provided the degree of safety of the ship as regards the subdivision is not thereby diminished.

2.4.2 The collision bulkhead is normally to extend to the to the bulkhead deck of passenger ships and the freeboard deck of cargo ships or, in the case of ships with combined bridge and forecastle or a long superstructure that includes a forecastle, to the superstructure deck. However, if a ship is fitted with more than one complete superstructure deck, the collision bulkhead may be terminated at the deck next above the bulkhead deck / freeboard deck. Where the collision bulkhead extends above the bulkhead deck / freeboard deck, the extension need only be to weathertight standard.

2.4.3 In passenger ships of restricted draught and all ships of unusual design, the height of bulkheads will be specially considered.

2.5 Openings in watertight bulkheads and closing appliances – General

2.5.1 Openings may be accepted in watertight bulkheads except in that part of collision bulkhead which is situated below the bulkhead deck / freeboard deck. The number of openings in watertight subdivisions is to be kept to a minimum compatible with the design and proper working of the ship. Where penetrations of watertight bulkheads are necessary for access, piping, ventilation, electrical cables, etc., arrangements are to be made to maintain the watertight integrity. Relaxation in the water tightness of openings above the bulkhead deck / freeboard deck may be considered provided it is demonstrated that any progressive flooding can be easily controlled and that the safety of the ship is not impaired.

Ventilation penetrations through watertight subdivision bulkheads are to be avoided. Where penetrations are unavoidable, the ventilation ducting is to satisfy watertight bulkhead requirements or watertight closing appliances are to be installed at the bulkhead penetrations. For ventilation penetrations below the bulkhead deck or below damage equilibrium waterlines, the closing appliances are to be operable from the bridge. Where the penetration is located above the bulkhead deck and damage waterline, local manual controls may be provided at the closing appliances, on one or both sides of the bulkhead, so that the controls will be accessible in the prescribed flooded conditions.

2.5.2 Openings in the collision bulkhead above the bulkhead deck / freeboard deck are to have weathertight doors or an equivalent arrangement.

2.5.3 Doors, manholes, permanent access openings or ventilation ducts are not to be cut in the collision bulkhead below the bulkhead deck of passenger ships and the freeboard deck of cargo ships.

2.5.4 Where watertight bulkhead stiffeners are cut in way of watertight doors in the lower part of the bulkhead, the opening is to be suitably framed and reinforced. Where stiffeners are not cut but the spacing between the stiffeners is increased on account of watertight doors, the stiffeners at the sides of the doorways are to be increased in depth and strength so that the efficiency is at least equal to that of the unpierced bulkhead, without taking the stiffeners of the door-frame into consideration.

2.5.5 Lead or other heat sensitive materials may not be used in systems which penetrate watertight subdivision bulkheads, where

deterioration of such systems in the event of fire would impair the watertight integrity of the bulkheads.

2.5.6 Valves not forming part of a piping system are not permitted in watertight subdivision bulkheads.

2.6 Watertight ventilators and trunks

2.6.1 Watertight ventilators and trunks are to be carried at least up to the bulkhead deck in passenger ships and up to the freeboard deck in ships other than passenger ships.

2.6.2 In passenger ships, where a ventilation trunk passing through a structure penetrates a watertight area of the bulkhead deck, the trunk is to be capable of withstanding the water pressure that may be present within the trunk, after having taken into account the maximum heel angle during flooding, in accordance with regulation SOLAS Chapter II-1, Regulation 7-2.

2.6.3 In ro-ro passenger ships, where all or part of the penetration of the bulkhead deck is on the main ro-ro deck, the trunk is to be capable of withstanding impact pressure due to internal water motions (sloshing) of water trapped on the ro-ro deck.

2.7 Doors in watertight bulkheads for ships where subdivision / damage stability requirements are applicable

2.7.1 General

The requirements in Cl.2.7.1 to Cl.2.7.15 apply to doors located in way of the internal watertight subdivision boundaries and the external watertight boundaries necessary to ensure compliance with the relevant subdivision and damage stability regulations. These requirements do not apply to doors located in external boundaries above equilibrium or intermediate waterplanes.

2.7.2 Definitions

For the purpose of the requirements in this subsection 2.7 the following definitions apply:

2.7.2.1 *Watertight*: Capable of preventing the passage of water in any direction under a design head. The design head for any part of a structure is to be determined by reference to its location relative to the bulkhead deck or freeboard deck, as applicable, or to the most unfavorable equilibrium / intermediate waterplane, in accordance with the applicable subdivision and damage stability regulations, whichever is the greater. A watertight door is thus one that will maintain the watertight integrity of the subdivision bulkhead in which it is located.

2.7.2.2 *Equilibrium Waterplane*: The waterplane in still water when, taking account of flooding due to an assumed damage, the weight and buoyancy forces acting on a vessel are in balance. This relates to the final condition when no further flooding takes place or after cross flooding is completed.

2.7.2.3 *Intermediate Waterplane*: The waterplane in still water, which represents the instantaneous floating position of a vessel at some intermediate stage between commencement and completion of flooding when, taking account of the assumed instantaneous state of flooding, the weight and buoyancy forces acting on a vessel are in balance.

2.7.2.4 *Sliding Door or Rolling Door*: A door having a horizontal or vertical motion generally parallel to the plane of the door.

2.7.2.5 *Hinged Door*: A door having a pivoting motion about one vertical or horizontal edge.

2.7.3 Structural design

Doors are to be of approved design and are to be of a strength equivalent to that of the subdivision bulkheads in which they are fitted.

2.7.4 Operation mode, location and outfitting

Doors are to be fitted in accordance with all requirements regarding their operation mode, location and outfitting, i.e. provision of controls, means of indication etc. as shown in Table 2.7.4.

For passenger ships, in addition to the requirements given in the Table 2.7.4 the watertight doors and their controls are to be located in compliance with the following:

(a) The door is to be located inboard of the damage zone B/5 on P&S as per SOLAS II- 1 Regulation.13.7.

(b) The door controls including hydraulic piping and electric cables are to be kept as close as practicable to the bulkhead in which the doors

are fitted in order to minimize the likelihood of them being involved in any damage to the ship. The positioning of doors and controls is to be such that if the ship sustains damage within damage zone B/5 as mentioned above, the operation of the doors clear of the damaged portion of the ship is not impaired.

Table 2.7.4: Doors in Internal Watertight bulkheads and External Watertight Boundaries in Passenger ships and Cargo ships

A. Door in Internal Watertight Bulkheads

Position relative to bulkhead or freeboard deck	1. Regulation	2. Frequency of use while at sea	3. Type	4. Remote Closure	5. Remote Indication	6. Audible or Visual Alarm	7. Notice	8. Comments

	SOLAS II-1/10, 13-1.4, 13-1.5, 16.2, 24.3 and 24.4	Perm. Closed	S, H	No	No	No	Yes	See Notes 3 & 4

Notes:
1. If hinged, this door is to be of quick acting or single action type.
2. Under ICLL66, doors separating a main machinery space from a steering gear compartment may be hinged quick acting type provided the lower sill of such doors is above the Summer Load Line and the doors remain closed at sea whilst not in use.
3. The time of opening such doors in port and closing them before the ship leaves port is to be entered in the logbook, in case of doors in watertight bulkheads subdividing cargo spaces.
4. Doors are to be fitted with a device which prevents unauthorized opening.
5. Under MARPOL, hinged watertight doors may be acceptable in watertight bulkhead in the superstructure.
6. Passenger ships which have to comply with SOLAS II-1/14.2 require an indicator on the navigation bridge to show automatically when each door is closed and all door fastenings are secured.
7. Refer to the Explanatory Note to Regulation 17.1 of Res.MSC.429 (98) regarding sliding watertight doors with a reduced pressure head and sliding semi-watertight doors.

	SOLAS II-1/15-1.2 and 15-1.4	Perm. Closed	S, H	No	Yes	No	Yes	See Notes 2 & 3

Notes:
1. If hinged, this door is to be of quick acting or single action type.
2. The time of opening such doors in port and closing them before the ship leaves port is to be entered in the logbook.
3. Doors are to be fitted with a device which prevents unauthorized opening.

2.7.4.1 Frequency of use whilst at sea

a) Normally closed
Kept closed at sea but may be used if authorised. To be closed again after use.

b) Permanently closed
The time of opening such doors in port and of closing them before the ship leaves port shall be entered in the log-book. Should such doors be accessible during the voyage, they shall be fitted with a device to prevent unauthorised opening.

c) Used
Kept closed, but may be opened during navigation to permit the passage of passengers or crew, or when work in the immediate vicinity of the door necessitates it being opened. The door is to be immediately closed after use. This is subject to prior approval by the Administration.

2.7.4.2 Types of doors in Table 2.7.4

- Power operated, sliding or rolling — POS
- Power operated, hinged — POH
- Sliding or rolling — S
- Hinged — H

2.7.4.3 Control

(a) Local

All doors, except those which are to be permanently closed at sea, are to be capable of being opened and closed by hand, (and by power, where applicable) locally, from both sides of the doors, with the ship listed to either side. In the case of passenger ships, it is to be possible to close the door from a position above the bulkhead deck with an all round crank motion or some other movement providing the same degree of safety.

For passenger ships, the angle of list at which operation by hand is to be possible is 15 degrees .

For cargo ships, the angle of list at which operation by hand is to be possible is 30 degrees.

(* Arrangements for passenger ships is to be in accordance with SOLAS II-I/Reg.13.7.1.4 and 13.7.1.5 and II-1/Reg.13-1.2 for cargo ships)

(b) Remote

Where indicated in Table 2.7.4, doors are to be capable of being remotely closed by power from the bridge* for all ships, and by hand also from a position above the bulkhead deck for passenger ships as required by SOLAS II-1/Regulation 13 7.1.4. Where it is necessary to start the power unit for operation of the watertight door, means to start the power unit is also to be provided at remote control stations. The operation of such remote control is to be in accordance with Part 4, Chapter 8, Cl.10.1.9 to Cl.10.1.12. For tankers, where there is a permanent access from a pipe tunnel to the main pump room, in accordance with SOLAS II-2/Reg.4.5.2.4 the watertight door is to be capable of being manually closed from outside the main pump room entrance in addition to the requirements above.

(* - Arrangements are to be in accordance with SOLAS II-1/ Regulation 13.7.1.5 for passenger ships and 13-1.2 for cargo ships.)

2.7.4.4 Indication*

(a) Where shown in Table 2.7.4, position indicators are to be provided at all remote operating positions for all ships and provided locally on both sides of the internal doors for cargo ships, to show whether the doors are open or closed and if applicable, with all dogs/cleats fully and properly engaged.

(b) The door position indicating system is to be of self-monitoring type and means for testing of the indicating system is to be provided at the position where the indicators are fitted.

(c) A diagram showing the location of the door and an indication to show its position is to be provided at the central operating console located at the navigating bridge. A red light is to indicate the door is in the open position and a green light is to indicate the door is in the closed position. When the door is closed from this remote position, the red light is to flash when the door is in an intermediate position.

This applies to passenger ships and cargo ships.

(d) Signboard/instructions should be placed in way of the door advising how to act when the door is in "doors closed" mode.

(* - Refer to SOLAS II-I/Regulation 13, 13-1, 15-1 and 17-1, IEC 60092-504, IMO International Code on Alarms and Indicators 2009)

2.7.4.5 Alarms*

a) For passenger ships, failure of the normal power supply of the required alarms is to be indicated by an audible and visual alarm at the central operating console at the navigation bridge. For cargo ships, failure of the normal power supply of the required alarms is to be indicated by an audible and visual alarm at the navigation bridge.

b) All door types including power-operated sliding watertight doors which are to be capable of being remotely closed are to be provided with an audible alarm, distinct from any other alarm in the area, which will sound whenever such a door is remotely closed. For passenger ships the alarm is to sound for at least 5[sec] but not more than 10[sec] before the door begins to move and is to continue sounding until the door is completely closed. In the case of remote closure by hand operation, an alarm is required to sound only while the door is actually moving.

In passenger areas and areas of high ambient noise, the audible alarms are to be supplemented by visual signals at both sides of the doors.

c) All watertight doors, including sliding doors, operated by hydraulic door actuators, either a central hydraulic unit or an independent hydraulic unit for each door is to be provided with a low fluid level alarm or low gas pressure alarm, as applicable or some other means of monitoring loss of stored energy in the hydraulic accumulators. For passenger ships this alarm is to be both audible and visible and is to be located on the central operating console at the navigation bridge. For cargo ships, this alarm is to be both audible and visible and should be located at the navigation bridge.

(***** - Refer to SOLAS II-1/ Reg.13, 13-1, 15-1 and 17-1, IEC 60092-504, IMO International Code on Alarms and Indicators 2009)

2.7.4.6 Notices

As shown in Table 2.7.4, doors which are normally closed at sea but not provided with means of remote closure, are to have notices fixed to both sides of the doors stating, 'To be kept closed at sea'. Doors which are to be permanently closed at sea are to have notices fixed to both sides stating, 'Not to be opened at sea'.

2.7.4.7 Location

For passenger ships the watertight doors and their controls are to be located in compliance with SOLAS II-1/Reg.13.5.3 and II-1/Reg.13.7.1.2.2.

2.7.5 Fire doors

Watertight doors may also serve as fire doors but need not be fire-tested notwithstanding the fire resistance of the division in which the watertight doors are fitted. However, such doors fitted above the bulkhead deck on passenger ships are to be tested to the FTP Code in accordance with the division they are fitted. If it is not practicable to ensure self-closing, means of indication on the bridge showing whether these doors are open or closed and a notice stating ‘To be kept closed at sea’ can be alternative of the self-closing.

Where a watertight door is located adjacent to a fire door, both doors are to be capable of independent operation, remotely if required by SOLAS ll-1/ Regulation 13.8.1 to 13.8.3 and from both sides of each door.

2.7.6 Testing

(a) Doors which become immersed by an equilibrium or intermediate waterplane are to be subjected to a hydrostatic pressure test. (Refer also Chapter 17, Table 3.3.1).

(b) For large doors intended for use in the watertight subdivision boundaries of cargo spaces, structural analysis may be accepted in lieu of pressure testing. Where such doors utilize gasket seals, a prototype pressure test

to confirm that the compression of the gasket material is capable of accommodating any deflection, revealed by the structural analysis, is to be carried out.

(c) Doors above freeboard or bulkhead deck, which are not immersed by an equilibrium or intermediate waterplane but become intermittently immersed at angles of heel in the required range of positive stability beyond the equilibrium position are to be hose tested.

2.7.6.1 Pressure testing

(a) The head of water used for the pressure test corresponds to at least the head measured from the lower edge of the door opening, at the location in which the door is to be fitted in the vessel, to the bulkhead deck or freeboard deck, as applicable, or to the most unfavorable damage waterplane, if that be greater. Testing may be carried out at the factory or other shore-based testing facility prior to installation in the ship.

(b) For doors on passenger ships which are normally open and used at sea or which become submerged by the equilibrium or intermediate waterplane, a prototype test is to be conducted, on each side of the door, to check the satisfactory closing of the door against a force equivalent to a water head of at least 1[m] above the sill on the centre line of the door *.

(* - Arrangements for passenger ships are to be in accordance with SOLAS Regulation II-1/13.5.2.)

2.7.6.2 Hose testing

After installation in a ship if pressure test is not carried out, all watertight doors are to be subject to a hose test in accordance with Part 3, Chapter 17. Hose testing is to be carried out from each side of the door unless, for a specific application, exposure to floodwater is anticipated only from one side. Where a hose test is not practicable because of possible damage to machinery, electrical equipment, insulation or outfitting items, it may be replaced by means such as an ultrasonic leak test or an equivalent test.

2.8 Minimum bow height

Attention is drawn to minimum bow height requirement of ships, in ICLL Regulation 39, as applicable.

Section 3

Compartment Arrangement

3.1 Cofferdams

3.1.1 Definition

A cofferdam means an empty space arranged so that compartments on each side have no common boundary; a cofferdam may be located vertically or horizontally. As a rule, a cofferdam is to be kept gastight and is to be properly ventilated, provided with drainage arrangement and of sufficient size to allow proper inspection, maintenance and safe evacuation.

3.1.2 Arrangement of cofferdams

3.1.2.1 Cofferdams are to be provided between compartments intended for liquid hydrocarbons (including fuel oil, lubricating oil) and those intended for feed water (water for propelling machinery and boilers) as well as tanks intended for the carriage of liquid foam for fire extinguishing and tanks for edible oil. Cofferdams are also to be provided between compartments intended for carrying fuel oil, lubricating oil and those intended for aviation fuel.

3.1.2.2 Furthermore, tanks carrying fresh water for human consumption are to be separated from other tanks containing substances hazardous to human health by cofferdams or other means as approved by IRS. Normally, tanks for fresh water and water ballast are considered non-hazardous.

3.1.2.3 Where a corner-to-corner situation occurs, tanks are not considered to be adjacent.

3.1.2.4 The cofferdams specified in Cl.3.1.2.1 may not be required when deemed impracticable or unreasonable by IRS in relation to the characteristics and dimensions of the spaces containing such tanks, provided that:

- the thickness of common boundary plates of adjacent tanks is increased, with respect to the thickness obtained according to Chapter 7, Section 3, Cl.3.1.1 by 2[mm] in the case of tanks carrying fresh water or boiler feed water, and by 1[mm] in all other cases,

- the sum of the throats of the weld fillets at the edges of these plates is not less than the thickness of the plates themselves,

- the structural test is carried out with a test pressure increased by 1[m] with respect to Chapter 17, Section 3, 3.4.

3.1.2.5 Tanks for lubricating oil are also to be separated by cofferdams from those carrying fuel oil. However, these cofferdams need not be fitted provided that the common boundaries have full penetration welds and the head of lubricating oil is not less than that in the adjacent fuel oil tanks. In this case, a permanent notice is to be displayed near the lubricating oil tank that the oil level is not to be less than that in the adjacent fuel oil tank at any time.

3.1.2.6 Vented cofferdam may be required to separate heated oil fuel tanks from enclosed spaces located directly above (Refer Part 4, Chapter 3, Section 4, Cl.4.5.3).

3.1.2.7 Cofferdam arrangements and requirements for specific ships types, refer to Part 5.

3.2 Double bottom

3.2.1 General

3.2.1.1 Except as specified in Cl.3.2.1.6, passenger ships and cargo ships other than tankers, are to be fitted with a double bottom extending from the collision bulkhead to the after peak bulkhead as far as this is practical and compatible with the design and proper working of the ship.

Note: For the purpose of this requirement, a “tanker” is a cargo ship constructed or adapted for the carriage in bulk of liquid cargoes of an inflammable nature.

3.2.1.2 For oil tankers, chemical carriers and liquefied gas carriers, the requirements indicated in Part 5, Chapter 2, Chapter 3 and Chapter 4 respectively regarding double bottom and location of wells above bottom shell are to be complied with.

3.2.1.3 A double bottom need not be fitted in way of watertight tanks, including dry tanks of moderate size provided the safety of the ship is not impaired in the event of bottom or side damage as regulated in SOLAS II-1, Regulation 9.

3.2.1.4 A double bottom need not be fitted in way of watertight compartments used exclusively for the carriage of liquids, provided the safety of the ship is not impaired in the event of bottom damage.

3.2.1.5 Any part of a passenger ship or a cargo ship other than tanker that is not fitted with a double bottom in accordance with Cl.3.2.1.1 or Cl.3.2.1.4 is to be capable of withstanding bottom damages as specified in SOLAS II-1, Paragraph 8 of Regulation 9.

3.2.1.6 A double bottom need not be fitted on the following ships:

- Cargo ships of less than 500 tons gross tonnage.

- Ships not propelled by mechanical means.
- Fishing vessels.

3.2.1.7 The engine room of all ships having L>80[m] is to have a double bottom.

3.2.1.8 For ships of L>90[m], single bottoms within the cargo region, where permitted, are normally to be longitudinally stiffened.

3.2.1.9 For ships of L>150[m] and for ships strengthened for heavy cargoes, double bottoms within the cargo region are normally to be longitudinally stiffened.

3.2.1.10 The continuity of the bottom, bilge and inner bottom longitudinal is to be maintained in accordance with Chapter 3, Section 5.

3.2.1.11 The weld connections are to comply with the requirements of Chapter 16.

3.2.1.12 For double bottom requirements for specific ships types, Refer to Part 5.

3.2.2 Height of double bottom

Where double bottom is required to be fitted, the inner bottom is to be continued out to the ship side in such a manner as to protect the bottom to the turn of the bilge. Such protection is to be deemed satisfactory if the inner bottom is not lower at any part than a plane parallel with the keel line and which is located not less than a vertical distance ‘d’ in [mm] measured from the keel line, as calculated by the formula:

$$d = 50B$$

However, in no case the value of d is to be less than 760[mm], and need not to be taken more than 2000[mm]. This is applicable for passenger ships and cargo ships other than tankers.

And also, the depth ’d’ of the centre girder is not to be less than:

$d = 250 + 20B + 50T$ with a minimum of 760[mm].

For ships with large rise of floor, the minimum height may have to be increased after special consideration.

3.2.3 Small wells in double bottom tank

Bilge / Small wells constructed in the double bottom, in connection with the drainage arrangement of holds, are not to extend in depth more than necessary. A well extending to the outer bottom, may be permitted at the after end of the shaft tunnel of the ship. In no case, the vertical distance from the bottom of such a well to the plane coinciding with the keel is not to be less than 500[mm] or half the required double bottom height whichever is greater, for passenger ships and cargo ships other than tankers unless compliance for that part of the ship with SOLAS II-1, Paragraph 8 of Regulation 9- Double bottoms in passenger ships and cargo ships other than tankers is demonstrated.

Other wells e.g. for lubricating oil under main engines may be considered provided the arrangements give protection equivalent to that offered by a double bottom. For a cargo ship of 80 [m] in length and upwards or for a passenger ship, proof of equivalent protection is to be shown by demonstrating that the ship is capable of withstanding bottom damages as specified in SOLAS II-1, Paragraph 8 of Regulation 9.

Alternatively, wells for lubricating oil below main engines can protrude into the double bottom below the boundary line defined by the distance ‘d’ provided that the vertical distance between the well bottom and a plane coinciding with the keel line is not less than

500[mm] or half the required double bottom height, whichever is greater.

For cargo ships of less than 80[m] in length, the arrangements provided are to be to the satisfaction of IRS.

3.3 Compartments forward of the collision bulkhead

In ships of 400GT and above, compartments forward of the collision bulkhead are not to be arranged for carriage of oil and other inflammable liquids.

3.4 Aft end compartments

3.4.1 Stern tube entry

Stern tubes are to be enclosed in a watertight space (or spaces) of moderate volume. In case the stern tube terminates at an aft peak bulkhead also being a machinery space bulkhead, a pressurized stern tube sealing system may be accepted as an alternative to the watertight enclosure. Other measures to minimize the danger of water penetrating into the ship in case of damage to the stern tube arrangement may be taken at the discretion of IRS.

3.4.2 Steering gear compartment

The steering gear compartment is to be readily accessible and separated from machinery spaces. Refer Part 4, Chapter 6 (Steering Gear), for additional requirements for the steering gear compartment.

3.5 Fuel oil tanks

3.5.1 Arrangement of fuel oil tanks

Fuel oil tanks are to be arranged in accordance with the requirements in SOLAS Chapter II-2, Regulation 4.2.

3.5.2 Protective location of fuel oil tanks

3.5.2.1 All ships with an aggregate oil fuel capacity of 600[m^3] and above are to satisfy the requirements for oil fuel tank protection as given in MARPOL Regulation I/12A. For this purpose, the distances of the oil fuel tanks above the bottom shell and inboard of the side shell are to be not less than the values specified in the above MARPOL Regulation. Alternatively, such ships may comply with the accidental oil outflow performance standard specified in paragraph 11 of MARPOL Regulation I/12A.

3.5.2.2 Small oil fuel tanks of capacity not greater than 30[m^3] are exempted from the requirements for protective location of the above MARPOL Regulation provided the aggregate capacity of such exempted tanks is not greater than 600[m^3].

Section 4

Access Arrangements

4.1 Access to tanks and compartments

4.1. General

4.1.1 All vessels are to be provided with means of access giving safe and practical access to the internal structure during operational phase.

4.1.2 All tanks are to be accessible for easy inspection and close-up survey (as relevant).

4.1.3 All closed spaces are to be accessible for easy inspection. Special measures for inspection and maintenance are to be put in place for small closed spaces for which the design causes impracticality for the access.

4.1.4 Access arrangements for specific ships types, Refer to Part 5.

4.2 Access to double bottom compartments

4.2.1 Inner bottom manholes

4.2.1.1 The number, opening size and location of inner bottom manholes are to be so arranged as to provide convenient access to any part of the double bottom.

4.2.1.2 Inner bottom manholes are to be closed by watertight plate covers. Doubling plates are to be fitted on the covers, where secured by bolts. Where no ceiling is fitted, covers are to be adequately protected from damage by the cargo.

4.2.2 Floor and girder manholes for access, air and drain holes for ventilation and drainage

4.2.2.1 Adequate access is to be provided to all parts of the double bottom. The vertical dimension of lightening holes is generally not to exceed 50% of the girder height. The diameter of lightening holes in the bracket floors is not to exceed 1/3 of the breadth of the brackets. Lightening holes or manholes are normally not to be cut in floors or girders towards their ends and under large pillars or supporting structures. Manholes in inner bottom are to have reinforcement rings, and the man hole covers in the inner bottom plating in cargo holds are to be effectively protected. The edges of all holes are to be smooth.

4.2.2.2 To ensure the free passage of air and water from all parts of the tanks to air pipes and suctions, air and drain holes are to be provided in all non-watertight members. The air holes are to be placed as near to the inner bottom as possible and their total area is to be greater than the area of the filling pipes. The drain holes are to be placed as near to the bottom as possible.

4.2.2.3 The access opening to pipe tunnel is to be visible above the floor plates and is to be fitted with a rigid watertight closing device. A notice board stating that the access opening to the pipe tunnel is to be kept closed, is to be fitted near the opening. The opening is to be regarded as an opening in watertight bulkhead.

4.3 Dimensions of access hatchways

4.3.1 The dimensions of access, through horizontal openings, hatches or manholes, are to be sufficient to allow a person wearing a self-contained air-breathing apparatus to ascend or descend the ladder without obstruction and also to provide a clear opening to facilitate the hoisting of an injured person from the bottom of the tank. In no case is the clear opening to be less than 600[mm] x 600[mm] which may have corner radii of not more than 100[mm].

4.3.2 The dimensions of any access, through vertical openings or manholes in swash bulkheads floors, girders and web frames providing passage through the length and breadth of the space, the minimum dimensions of 600[mm] x 800[mm] are to be arranged in the floors at a height of not more than 600[mm] from the bottom shell plating unless gratings or other foot holds are provided.

4.4 Access to shaft tunnel

4.4.1 Tunnels are to be large enough to ensure easy access to shafting.

4.4.2 Access to the tunnel is to be provided by a watertight door fitted on the aft bulkhead of

the engine room in compliance with Chapter 3, Section 2.6

4.4.3 Where two or more shafts are fitted, the tunnels are to be connected by an interconnecting passage. If two shafts are fitted, there is to be only one door between the machinery space and the tunnel spaces and only two doors where there are more than two shafts.

4.4.4 Where fore and aft under deck passageways are arranged at the ship's side, the after access thereto is to be by a watertight trunk led to the upper deck. Alternative arrangements to prevent the engine room being flooded, in the event of a collision or if the passageway doors are left open, will be considered.

4.4.5 When access to any machinery space of category A is provided at a lower level from an adjacent shaft tunnel, there must be provided in the shaft tunnel, near the watertight door, a light steel fire-screen door operable from both sides.

4.5 Access to steering gear compartment

4.5.1 The steering gear compartment are to be readily accessible and separated from machinery spaces.

4.5.2 The steering gear compartment are to be provided with suitable arrangements to ensure working access to steering gear machinery and controls. These arrangements are to include handrails and gratings or other non-slip surfaces to ensure suitable working conditions in the event of hydraulic fluid leakage

Section 5

Structural Arrangements

Symbols

For symbols not defined in this section, Refer to Chapter 1, Section 2.

5.1 General

5.1.1 Frame spacing

5.1.1.1The standard frame spacing between aft peak and 0.2L from F.P. may be taken as:

- For transverse framing: 450 + 2L [mm]

- For longitudinal framing: 550 + 2L [mm]

However, it is generally not to exceed 1000[mm].

5.1.1.2 Elsewhere, the frame spacing is generally not to exceed the following:

- In peaks and cruiser sterns: 600[mm] or as in Cl.5.1.1.1, whichever is lesser.

- Between collision bulkhead and 0.2L from F.P.: 700[mm] or as in Cl.5.1.1.1, whichever is lesser.

5.1.1.3 Where the actual frame spacing is higher than that mentioned above, the minimum thicknesses of various structural members as given in the Rules may require to be increased.

5.2 Structural continuity

5.2.1 General

5.2.1.1 Attention is to be paid to the structural continuity, in particular in the following areas:

- In way of changes in the framing system

- At end connections of primary supporting members or ordinary stiffeners.

- In way of the transition zones between midship area and fore part, aft part and machinery space

- In way of side and end bulkheads of superstructures.

5.2.1.2 At the termination of a structural member, structural continuity is to be maintained by the fitting of suitable supporting

structure. Abrupt changes in transverse section properties of longitudinal members, sharp corners and points of stress concentration are to be avoided.

5.2.1.3 The variation of thickness of bottom, side and strength deck between the midship region and the fore and aft parts are to be gradual.

5.2.1.4 Where members abut on both sides of a bulkhead or similar structure, care is to be taken to ensure good alignment.

5.2.1.5 Continuity is to be maintained where primary members intersect and where the members are of the same depth, a suitable gusset plate is to be fitted.

5.2.1.6 End connections of structural members are to provide adequate end fixity and effective distribution of the load into the supporting structure.

5.2.1.7 The toes of brackets, etc. should not land on unstiffened plate panels. Special care should be taken to avoid notch effects at the toes of brackets, by making the toe concave or otherwise tapering it off.

5.2.1.8 Where stress concentrations may occur in way of structural discontinuities, adequate compensation and reinforcements are to be provided.

5.2.1.9 Openings are to be avoided, as far as practicable, in way of highly stressed areas. Where necessary, the shape of openings is to be specially designed to reduce the stress concentration factors. Openings are to be generally well rounded with smooth edges.

5.2.2 Primary supporting members

Primary supporting members are to be arranged in such a way that they ensure adequate continuity of strength. Abrupt changes in height or in cross-section are to be avoided.

5.2.3 Longitudinal members

5.2.3.1 Longitudinal members are to be arranged in such a way that continuity of strength is maintained in 0.4L amidship.

5.2.3.2 Longitudinal members contributing to the hull girder longitudinal strength are to extend continuously as far as practicable towards the ends of the ship.

5.2.3.3 For longitudinal bulkheads or deep girders, large transition brackets (e.g. scarfing brackets) fitted in line with the longitudinal member are a possible means to achieve such structural continuity.

5.2.4 Longitudinal stiffeners

5.2.4.1 Stiffeners are to be arranged in such a way that continuity of strength is maintained.

5.2.4.2 Ordinary stiffeners contributing to the hull girder longitudinal strength are to be continuous when crossing primary supporting members within the 0.4L amidships and as far as practicable outside 0.4L amidships. Proposals of longitudinals abutting at transverse members may be accepted outside 0.4L amidships region and in ships less than 150[m] in length, provided the brackets connecting the ends of the longitudinals are continuous and of adequate size.

5.2.4.3 Where stiffeners are terminated in way of large openings, foundations and partial girders, compensation is to be arranged to provide structural continuity in way of the end connection.

5.2.4.4 When the deck, bottom or inner bottom is longitudinally stiffened, the longitudinal is to be continuous through transverse members.

5.2.5 Transverse stiffeners

Transverse and vertical stiffeners are to be continuous through stringers/girders, if provided, or fitted with bracket end connections.

5.3 Bottom structure

5.3.1 Variation in height of double bottom

Any variation in the height of the double bottom is generally to be made gradually and over an adequate length; the knuckles of inner bottom plating are to be located in way of plate floors or girders. Where such arrangement is not possible, suitable longitudinal structures such as partial girders, longitudinal brackets or carlings, fitted across the knuckle are to be arranged.

5.3.2 Connection between inner hull and inner bottom plating

Connection between the inner hull plating and the inner bottom plating is to be designed such that stress concentration is minimized. The connection of inner hull plating or hopper plating with inner bottom is to be effectively supported, e.g. by a longitudinal girder or gusset plates.

5.3.3 Drainage of tank top

For ships designed to carry solid cargoes, effective arrangements are to be provided for draining water from the tank top. Where wells are provided for the drainage, Refer section 3, Cl.3.2.3, for bilge/small well requirements.

5.3.4 Framing system

For ships greater than 120[m] in length, the bottom shell, the inner bottom and the sloped bulkheads of hopper tanks, in general, are to be longitudinally framed.

5.3.5 Striking plate

Striking plates of adequate thickness or other equivalent arrangements are to be provided under sounding pipes to prevent the sounding rod from damaging the plating.

5.3.6 Duct keel

5.3.6.1 Where a duct keel is arranged, the centre girder may be replaced by two girders spaced no more than 3[m] apart. Otherwise, for a spacing wider than 3[m], the two girders are to be provided with support of adjacent structure and subject to IRS's approval.

5.3.6.2 The inner bottom and bottom shell within the duct keel are to be suitably stiffened. The primary stiffening in the transverse direction is to be suitably aligned with the floors in the adjacent double bottom tanks.

5.3.7 Keel plating

Keel plating is to extend over the bottom for the full length of the ship. The width of the keel plate in [mm] is not be less than 800+5L, and need not to be greater than 1800[mm]. The thickness is to be 2[mm] greater than that required for the adjacent bottom plating Refer to Chapter 7, Section 3, Cl.3.1.1.

5.3.8 Girders in single bottom

5.3.8.1 Transverse framing

- On all ships one centre girder is to be fitted and in addition side girders are to be fitted such that the spacing of girders does not exceed 2.5[m]. The girders are to extend as far forward and aft as practicable and where they are cut at transverse bulkheads the longitudinal strength is to be maintained.

- Where the single bottom structure changes into a double bottom structure, the bottom girders are to extend at least 3 frame spaces into double bottom structures. Structural continuity of the girders is to be maintained within the full length of the ship.

5.3.8.2 Longitudinal framing

The spacing of bottom transverses is normally not to exceed the greater of 0.02L [m] or 3.6[m]. The bottom transverses are to be supported by primary girders or longitudinal bulkheads. Where the design does not incorporate a centreline bulkhead, at least a docking girder is to be provided. The scantlings of a complex girder system are to be based on Finite element analysis.

5.3.9 Girders in double bottom

5.3.9.1 General

- Double bottom girders are to be arranged in line with longitudinal bulkheads.

- For longitudinal or transverse framing, the side bottom girders are to be extended as far forward and aft as practicable.

5.3.9.2 Transverse framing

- In double bottoms with transverse framing the longitudinal girders are to be stiffened at every transverse frame.

- The side girders are normally to be fitted at a spacing not exceeding 4.0[m] and are to be extended as far forward and aft as practicable. The girders are to be stiffened at every bracket floor by a vertical stiffener of depth same as that of reverse frame and thickness that of the girder.

- The bottom frames and reverse frames are to be attached to the centre girder and margin plate by means of brackets of same thickness as that of the plate floors. The breadth of the brackets is not to be less than 0.75 times the

depth of the centre girder and the brackets are to be flanged 75[mm] at their free edges.

5.3.9.3 Longitudinal framing

Other than peak and machinery spaces, the side girders are normally to be fitted at a spacing not exceeding 5.0[m] and are to be extended as far forward and aft as practicable.

5.3.10 Floors

5.3.10.1 General

- Plate floors are to be fitted under bulkheads, pillars, thrust seating, boiler bearers and in way of change of depth of double bottom.

- Floors are to be provided with web stiffeners in way of longitudinal stiffeners. Where the web stiffeners are not welded to the longitudinal stiffeners, design standard as given in in Chapter 10 (Fatigue), Appendix A may be applied.

5.3.10.2 Transversely framed single bottom other than peak spaces and engine room

Plate floors are to be fitted at every frame and the top of floors, in general, is to be level from side to side.

5.3.10.3 Transversely framed double bottom other than peak spaces and engine room

The spacing of plate floors other than peak spaces and engine room is not to exceed that given by Table 5.3.10.

Table 5.3.10: Spacing of plate floors (Transverse framing)

Draught T[m]	Under deep tanks (See Note 1)	Clear of deep tanks (maximum 3.0[m])
$T \leq 2$	Every 4th frame	Every 6th frame
$2 < T \leq 5.4$	Every 3rd frame	Every 5th frame
$5.4 < T \leq 8.1$	Every 3rd frame	Every 4th frame
$T > 8.1$	Every 2nd frame	Every 3rd frame
Note 1: Under tanks with height greater than 0.7 times the distance between inner bottom and main deck		

5.3.10.4 Longitudinally framed double bottom other than peak spaces and engine room.

- The spacing of floors is normally not to exceed 2.5[m] under deep tanks with height greater than 0.7 times the distance between inner bottom and main deck. Elsewhere, the spacing is normally not to exceed 3.6[m].

- The plate floors are to be stiffened at every longitudinal by a vertical stiffener having a depth not less than 150[mm] and thickness as that of the floor. For ships of length, L< 90[m], the depth is not to be less than 1.65L[mm], with a minimum of 50[mm].

- In general, intermediate brackets are to be fitted connecting either the margin plate or the centre girder to the nearest bottom and inner bottom ordinary stiffeners. Such brackets are to be stiffened at the edge with a flange having a width not less than 1/10 of the local double bottom height. If necessary, the Society may require a welded flat bar to be arranged in lieu of the flange.

5.3.11 Docking

5.3.11.1 Docking of the vessel is to be evaluated and considered at the design stage by the designer. The bottom structure is to withstand the forces imposed by dry-docking the ship.

5.3.11.2 Docking brackets connecting the centreline girder and margin girder to the bottom plating, are to be connected to the adjacent bottom longitudinals and are to be flanged 75[mm] at their free edges. Docking brackets are to be fitted between plate floors at every frame and at a spacing not exceeding 1.25[m] on both sides of the centre girder. The thickness of brackets is to be same as that of the plate floors.

5.3.11.3 Alternative arrangements require special consideration of local buckling strength

of centre girder and local strength of bottom longitudinal in way of docking block.

5.4 Side structure

5.4.1 General

5.4.1.1 The ship's side shell and inner hull bulkheads may be stiffened longitudinally or vertically.

5.4.1.2 Where the side shell is stiffened longitudinally, the continuity of the side longitudinals within a distance of 0.15D from bottom or from strength deck is to be maintained in accordance with Chapter 3, Section 5, Cl.5.2.3. The web frames are to be fitted in line with the bottom transverses or plate floors.

5.4.1.3 The position, shape and reinforcement of sea inlets or other openings in side shell are to be in accordance with the requirements of Chapter 3, Section 6, Cl.6.5.6.

5.4.1.4 The thickness of the shell plating is to be increased locally by 50% in way of stern frame, propeller brackets and rudder horn. For reinforcements in way of anchor pockets, hawse pipes etc. refer to Chapter 14, Section 2, 2.1.

5.4.1.5 The transversely framed side structures are built with transverse frames possibly supported by side girders.

5.4.1.6 The longitudinally framed side structures are built with longitudinal ordinary stiffeners supported by side vertical primary supporting members.

5.4.1.7 Unless otherwise specified, horizontal side stringers are to be fitted aft of the collision bulkhead up to 0.2L aft of the fore end, in line with fore peak girders.

5.4.1.8 Side vertical primary supporting members are to be fitted in way of hatch end beams or similar large deck opening supporting transverse structure.

5.4.2 Sheer strake

5.4.2.1 Where a rounded gunwale is adopted the radius in general, is not to be less than 15 times the plate thickness.

5.4.2.2 Where the sheer strake extends above the deck stringer plate, the top edge of the sheer strake is to be kept free from notches and isolated welded fittings, and is to be ground smooth with rounded edges. Drainage openings with smooth transition in the longitudinal direction may be allowed on special consideration. Fixtures such as bulwarks, eye plates are not to be directly welded on the upper edge of sheer strake within 0.6L amidships.

5.4.2.3 The welding of deck fittings to rounded sheer strake within 0.6L amidships is not permitted, unless approved in each case.

5.4.2.4 Sheer strakes are to have breadths not less than 0.8 + L/200[m], measured vertically, but need not be greater than 1.8[m]. For ships of L< 90[m], it need not exceed 200D[mm]

5.4.2.5 Where the thickness of the strength deck plating is greater than that required for side plating, the sheer strake thickness is not to be less than the mean of the two values.

5.4.2.6 Longitudinal seam welds of rounded sheer strake are to be located outside the bent area at a distance not less than 5 times the maximum net thicknesses of the sheer strake.

5.4.2.7 The transition from a rounded gunwale to angular gunwale is to be designed to avoid any discontinuities.

5.4.2.8 The net thickness of a rounded sheer strake is to be not less than the actual net thickness of the adjacent deck plating.

5.4.2.9 The net thickness of a welded sheer strake is to be not less than that of the adjacent side plating, taking into account of use of higher strength steel.

5.5 Deck structure

5.5.1 General

5.5.1.1 In tankers, the deck is normally to be stiffened longitudinally in the cargo tank region, however, where L does not exceed 75[m], consideration may be given to transversely stiffened decks.

5.5.1.2 In dry cargo ships of L>120[m], the strength deck outside the line of hatchway openings is normally to be longitudinally stiffened.

5.5.1.3 The continuity of the deck longitudinals is to be maintained in accordance with Chapter 3, Section 5, Cl.5.2.3.

5.5.1.4 The deck within the line of hatchway openings is preferably to be stiffened transversely or alternatively the arrangements are to provide adequate transverse buckling strength. Where the deck outside the line of hatchway openings is framed longitudinally, the transverse beams or buckling stiffeners between the hatchways are to extend at least up to the second longitudinal from the hatch side or equivalent.

5.5.1.5 In ships with large hatch openings, the effective cross-sectional area of the deck between the hatchways is to be sufficient to withstand the transverse load acting on the ship's sides. Bending and shear stresses arising as a result of loading on the transverse bulkhead supported by the deck area and also as a result of displacements caused by torsion of the hull girder, are to be considered and the necessary reinforcements are to be provided.

5.5.1.6 The following items may be included in the effective cross-sectional area of the decks; corrosion additions, if any, are to be deducted:

- deck plating
- transverse beams and deck transverses
- hatch end beams (upon special consideration)
- cross section of stool at top of transverse bulkhead
- cross section of transverse bulkhead (if plane or horizontally corrugated) down to base of top wing tank or to 0.15D from deck.

5.5.1.7 The compressive stress in the above-mentioned items is not to be greater than 120/k [N/mm2], nor 80% of the critical buckling stress found in accordance with Chapter 9.

5.5.1.8 Hatchway corners are to be of streamlined, elliptical or circular shape as given in Chapter 3, Section 6, Cl.6.5.4.

5.5.1.9 Deck supporting structures under deck machinery, cranes and king posts are to be adequately stiffened.

5.5.1.10 The deck supporting structure consists of ordinary stiffeners (beams or longitudinals), longitudinally or transversely arranged, supported by primary supporting members which may be sustained by pillars.

5.5.1.11 Pillars or other supporting structures are generally to be fitted under heavy concentrated cargoes.

5.5.2 Stringer plate

5.5.2.1 Stringer plates are to have breadths not less than 0.8 + L/200[m], measured parallel to the deck, but need not be greater than 1.8[m].

5.5.2.2 Stringer plates of lower decks not extending over the full ship's length are to be gradually tapered or terminated with adequately sized brackets.

5.5.2.3 The net thickness of the stringer plate is to be not less than the actual net thickness of the adjacent deck plating.

5.5.2.4 In way of ends of bridges, poops and forecastles, the thickness of the strength deck stringer strake is to be increased by 20% over four frame spaces fore and also aft of the end bulkheads.

5.5.3 Watertight deck arrangement

Watertight decks are to be of the same strength as watertight bulkheads at corresponding levels. The means used for making them watertight, and the arrangements adopted for closing openings in them, are to be to the satisfaction of IRS.

5.5.4 Connection of deckhouses and superstructures

Connection of deckhouses and superstructures to the strength deck and hatch coamings is to be designed such that loads are transmitted into the under deck supporting structure.

5.6 Bulkhead structure

5.6.1 General

5.6.1.1 The requirements of this Section apply to longitudinal or transverse bulkhead structures which may be plane or corrugated.

5.6.1.2 Bulkheads may be horizontally or vertically stiffened. Horizontally framed bulkheads consist of horizontal ordinary stiffeners supported by vertical primary supporting members. Vertically framed bulkheads consist of vertical ordinary stiffeners which may be supported by horizontal girders.

5.6.1.3 The web height of vertical PSMs on bulkheads may be gradually tapered from bottom to deck.

5.6.1.4 Bulkheads are to be stiffened in way of deck girders.

5.6.1.5 Bulkhead girders and deep transverses are to be arranged in line with other primary supporting structure to the adjoining deck, side shell and bottom so as to facilitate the formation of continuous ring structures. Otherwise, equivalent scarphing arrangement is to be provided

5.6.1.6 Floors are to be fitted in the double bottom in line with the plane transverse bulkhead.

5.6.1.7 The main strength members included in the calculation of hull moment of inertia and section modulus are to extend continuously through the cargo region and sufficiently far towards the ends of the ship. Longitudinal bulkheads are to terminate at effective transverse bulkheads and large transition brackets are to be fitted in line with the longitudinal bulkheads. Where significant changes in structural arrangement occur, adequate transitional structure is to be provided.

5.6.1.8 Where the longitudinal watertight bulkheads contribute to longitudinal strength, the plating thickness is to be uniform for a distance of at least 0.1D from the deck and bottom. Refer Chapter 2, for applicable material grades.

5.6.1.9 If cargo is carried in a compartment adjacent to an oil fuel settling tank which may be heated, the compartment side of the bulkhead (or deck) is to be insulated, or equivalent arrangements provided.

5.6.1.10 The continuity of bulkhead longitudinal within a distance of 0.15D from the bottom or the strength deck is to be maintained in accordance with Chapter 3, Section 5, Cl.5.2.3.

5.6.1.11 Bulkheads or parts thereof supporting deck structure are also to be designed as pillars. The permissible axial loads and buckling strength are to be calculated in accordance with Chapter 9. In calculating sectional properties, the width of attached plating is to be equal to 35 times and not to be taken more than 40 times the plate net thickness.

5.6.1.12 A centerline wash bulkhead is to be fitted in deep tanks of fuel oil intended for ship's use extending from side to side. These apply to transverse and longitudinal wash bulkheads whose main purpose is to reduce the sloshing effect.

5.7 Cantilevers

The scantlings of cantilever beams and supporting frame will be specially considered.

5.8 Pillars

5.8.1 General

5.8.1.1 Pillars and pillar bulkheads are to be fitted in the same vertical line wherever possible, and elsewhere arrangements are to be made to transmit the out of line forces satisfactorily. The load at head and heel of pillars is to be effectively distributed and arrangements are to be made to ensure the adequacy and lateral stability of the supporting members. Where pillars support eccentric loads, they are to be strengthened for the additional bending moment imposed upon them.

5.8.1.2 Pillars are to be provided in line with the double bottom girder and /or floors or as close thereto as practicable.

5.8.1.3 Where pillars connected to the inner bottom are not located in way of the intersection of plate floors and girders, partial floors or girders or equivalent structures such as intercostal girders are to be fitted as necessary to support the pillars. Lightening holes or manholes are not to be cut in the floors and girders below the heels of pillars.

5.8.1.4 Inside spaces intended for products which may produce explosive gases or in tanks, hollow pillars are not to be used and strengthening at the heads and heels of pillars is not be obtained by means of doubling plates.

5.8.1.5 Where the hydrostatic pressure may result in tensile stresses in the pillar, their sectional area 'A' in [cm^2], is not be less than,

$$A = 70.A_L.P.k$$

where,

p = Design pressure in [N/mm^2] that causes the tensile stress in pillar.

A_L = Load area of deck, in [m^2], being supported by the pillar.

The weld area is to be such that the shear stresses in the welds of end connection does not exceed 80/k [N/mm^2]. Also, where pillars are fitted inside tanks or under watertight flats, the end connection is to be such that the tensile stress in the weld does not exceed 108/k [N/mm^2].

5.8.1.6 Doubling or insert plates are generally to be fitted at the head and heel of hollow pillars.

5.8.2 Connections

5.8.2.1 Where the pillars are likely to be subjected to tensile loads, the head and heel of pillars are to be efficiently secured to withstand the tensile loads and the doubling plates are generally to be replaced by insert plate.

5.8.2.2 The net thickness of doubling plates, when fitted, is to be not less than 1.5 times the net thickness of the pillar, (except in case of solid pillars).

5.8.2.3 The pillars are to have a bearing fit and are to be attached to the head and heel plates by continuous welding.

5.9 Aft peak arrangement

5.9.1 Application

The requirements of this section apply for the arrangement of structures located aft of the aft peak bulkhead and below bulkhead deck.

5.9.2 Minimum thickness requirement

The net thickness of the aft peak bulkhead plating in way of the stern tube penetration is to be at least 1.6 times the required thickness for the bulkhead plating itself or a doubling plate (in way of tanks, insert plate is to be used) of same thickness as the corresponding strake is to be fitted.

5.9.3 Bottom structure

5.9.3.1 Longitudinal framing

(i) Floors

- In case of single bottom, floors are to be fitted at every four frame spacing but spaced not more than 2.5[m].

- In case of double bottom, the spacing of plate floors is not to be greater than 3.6[m]. However, under deep tanks with height greater than 0.7 times the distance between inner bottom and main deck, the spacing of floors is normally not to exceed 2.5[m].

- The minimum depth of the floor at the centreline is not to be less than the required depth of the double bottom. Refer Chapter 3, Section 3, Cl.3.2.2.

(ii) Bottom girders

- Centerline girder is to be extended up to the transom bulkhead.

- In case of single bottom, the spacing of bottom girders is not to exceed 3.5[m] and are to be extended as far forward and aft as practicable.

- In case of double bottom, the spacing of the bottom girders is not to exceed 5.0[m] and are to be extended as far forward and aft as practicable.

5.9.3.2 Transverse framing

(i) Floors

- In case of single bottom, plate floors are to be fitted at every frame.

– In the after peak of single screw ships, the height of the floors is to be increased such that their upper edge is well above the stern tube.

– Heavy plate floors are to be fitted in way of the aft face of the rudder horn and in line with the webs in the rudder horn. They may be required to be carried up to the first deck or flat. In this area, cut outs, scallops or other openings are to be kept to a minimum.

(ii) Bottom girders

– Centerline girder is to be extended up to the transom bulkhead.

– In case of single bottom, the spacing of bottom girders is not to be greater than 2.5[m].

– In case of double bottom, the spacing of bottom girders is not to be greater than 4.0 [m] and are to be extended as far forward and aft as practicable.

5.9.4 Side structure

5.9.4.1 Longitudinal framing

– Web frames are to be aligned with floors and are to extend to the upper deck.

– Adequate deep beams are to be provided on deck in line with the web frames.

5.9.4.2 Transverse framing

(i) Platforms and stringers

• Platforms and side girders within the peak are to be arranged in line with those located in the area immediately forward.

• Where this arrangement is not possible due to the shape of the hull and for access, structural continuity between the peak and the structures of the area immediately forward is to be ensured by means of scarphing brackets.

• Where the aft peak is adjacent to a machinery space with longitudinal framing, the side girders in the aft peak are to be fitted with tapering brackets.

• Above the floors, transverse side framing is to be supported by one of the following arrangements:

- Side stringers spaced not more than 2.6[m] apart, supported by web frames or transverse bulkheads. The lower ends of the web frames (supporting the stringers) are to be supported under the tank top by suitable deep beams or plate floors to form a ring structure.

– Perforated flats spaced not more than 2.6[m] apart. The area of perforations in each flat is to be not less than 10% of the total area of the flat.

– A combination of the above arrangements.

(ii) Vertical peak frames

• Web frames are to be arranged at every four frame spaces in transverse framing and the scantling requirements as specified in Chapter 7, Section 6 to be provided.

• Peak frames are to be extended up to a deck located above waterline corresponding to the scantling draught.

• Peak frames are to be bracketed at top and bottom and in way of side stringers, the connection is to provide adequate shear strength.

5.9.5 Longitudinal wash bulkheads

A centreline longitudinal non-tight bulkhead (wash bulkhead) is to be fitted,

- in the upper part of the peak, and stiffened at each frame spacing.

- in peak spaces used as tanks, where the breadth of the tank exceeds 0.5B and also in deep tanks used for fuel oil extending from side to side.

– Where either the stern overhang is very large or the maximum breadth of the space divided by watertight and wash bulkheads is greater than 20[m], additional longitudinal wash bulkheads may be required.

– The area of perforations is to be between 5% to 10% of the total area of bulkhead. The plating is to be suitably stiffened in way of the openings and the arrangement of openings is to be such as to maintain adequate shear rigidity.

5.9.6 Stern tube

The thickness of the stern tube provided is to be at least same as the required thickness of the side plating adjacent to the stern frame.

5.9.7 Alternative design verification

The spacing and arrangement, not complying with sections defined in Cl.5.9.3, Cl.5.9.4 and Cl.5.9.5, would be specially considered based on grillage analysis or FE analysis. The acceptance criteria to be applied for grillage analysis are defined in Chapter 7, Section 6. A FE analysis is to be performed in accordance with the requirements in Chapter 8.

5.9.8 Stiffening of floors and girders in aft peak

5.9.8.1 Stiffeners on the floors and girders in aft peak ballast or fresh water tanks above propeller are to be designed in accordance with Cl.5.9.8.2 and Cl.5.9.8.3. This applies for stiffeners located in an area extending longitudinally between the forward edge of the rudder and the after end of the propeller boss and transversely within the diameter of the propeller.

5.9.8.2 The height of stiffeners, h_{stf}, in [mm], on the floors and girders are not to be less than:

$h_{stf} = 80\ell_{stf}$ for flat bar stiffeners.

$h_{stf} = 70\ell_{stf}$ for bulb profiles and flanged stiffeners,

Where:

ℓ_{stf} = Span of stiffener, in [m], as shown in Figure 5.9.8. For this purpose, the length need not be taken greater than 5[m].

5.9.8.3 End brackets are to be provided as follows:

- Brackets are to be fitted at the lower and upper ends when ℓ_{stf-t} exceeds 4[m]

- Brackets are to be fitted at the lower end when ℓ_{stf-t} exceeds 2.5[m], where:

ℓ_{stf-t} = total length of stiffener, in [m], as shown in Figure 5.9.8.

5.9.8.4 Edge stiffener thickness not to be less than h_{stf}/15.

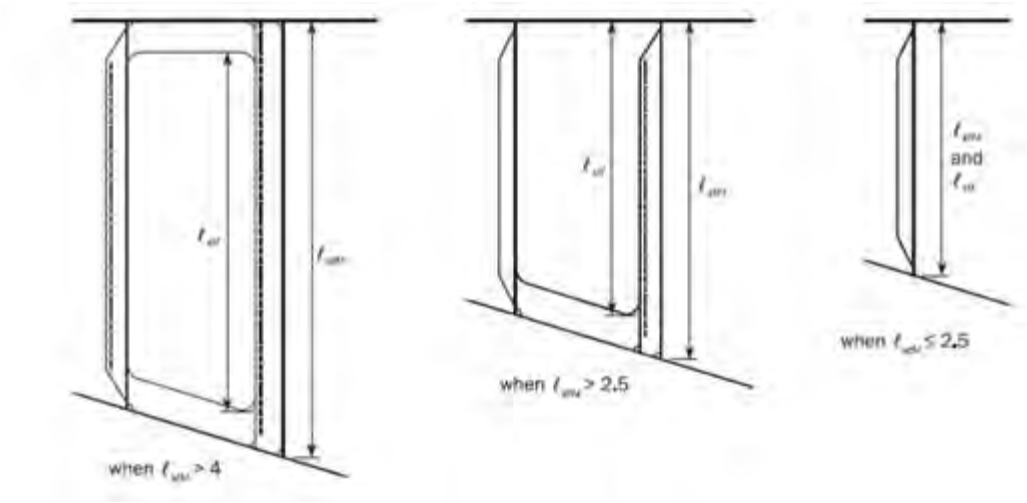

Figure 5.9.8: Floor and girder stiffening in the aft peak tank

5.10 Engine room arrangement

5.10.1 Application

5.10.1.1 The requirements of this section apply to the arrangement of structures located in the engine room. The requirements in Cl.5.10.2 to Cl.5.10.9 apply unless verification by means of direct analysis.

5.10.1.2 Requirements are given for engine room situated as follows:

- In the midship region.

- In the aft end region but with a compartment between it and the after peak bulkhead.

- In the aft end region where the after peak bulkhead forms the aft end of the machinery space.

Arrangements other than mentioned above are specially considered.

5.10.1.3 For midship engine room, if the shell and decks aft and forward of it are longitudinally framed, then longitudinal framing is to be adopted in engine room also.

5.10.1.4 For engine rooms situated aft, where the longitudinal framing terminates and is replaced by transverse framing, a suitable scarfing arrangement of the longitudinal framing extending at least three frame spaces to the adjacent structure is to be fitted.

5.10.1.5 Where openings in decks/bulkheads are provided in the engine room, the arrangements are to support the deck, side, and bottom structure.

5.10.1.6 All parts of the machinery, shafting, etc., are to be supported to distribute the loads into the ship's structure. The adjacent structure is to be suitably stiffened.

5.10.2 Double bottom structures

5.10.2.1 General

If the engine room is situated adjacent to the after peak, the double bottom is generally to be transversely framed. Elsewhere it may be transversely or longitudinally framed as appropriate.

5.10.2.2 Double bottom height

- The double bottom height at the centreline , irrespective of the location of the engine room, is not to be less than that defined in Chapter 3, Section 3, Cl.3.2.2.

- This height may need to be considerably increased in relation to the type and depth of main engine seatings. The above height is to be increased where the engine room is very large and where there is a considerable variation in draught between light ballast and full load conditions.

- Where the double bottom height in the engine room differs from that in adjacent spaces, structural continuity of longitudinal members is to be provided by sloping the inner bottom over an adequate e longitudinal extent. The knuckles in the sloped inner bottom are to be located in way of floors. Lesser double bottom height may be accepted in local areas provided that the overall strength of the double bottom structure is not thereby impaired.

5.10.2.3 Centreline girder

The double bottom is to be arranged with a centreline girder or side girders adjacent to centreline giving sufficient support for docking loads. Duct keel arrangement as per Cl.5.3.6 is acceptable instead of centerline girder.

5.10.2.4 Girders in way of machinery seatings

- Sufficient fore and aft girders are to be arranged in way of the main machinery to effectively distribute its weight and to ensure adequate rigidity of the structure. The girders are generally to extend over the full length of the engine room and are to be suitably scarfed into the bottom structure beyond. The height of the girders not be less than that of the floors in the engine room.

- Outboard of the engines, side girders are to be arranged, where practicable, to line up with the side girders in adjacent cargo spaces.

5.10.2.5 Longitudinal framing

- The bottom side girders are to be a continuation of any bottom longitudinals in the areas adjacent to the engine room and are generally to have a spacing not greater than 3 times that of longitudinals and in no case greater than 3[m].

- Plate floors are to be fitted at every second side frames. Additionally, under the main engine seatings, floors extending to the first side girder outside the engine seating, are to be fitted at intermediate frames.

5.10.2.6 Transverse framing

Where the double bottom in the engine room is transversely stiffened, plate floors are to be fitted at every frame.. In way of boilers, plate floors are to be fitted under the boiler bearers and other places as per requirements given in Cl.5.3.10.

5.10.3 Single bottom structures

5.10.3.1 General

For ships having a single bottom structure within the engine room, seatings are to be located above the floors and to be adequately connected to the latter and to the girders located below. Other arrangements will be specially considered..

5.10.3.2 Longitudinal framing

(i) Floors

- In way of main engine and thrust bearing, plate floors extending from side to side are to be fitted at every frame. In way of other areas of machinery spaces, the floors may be fitted at alternate frames.

• Additional plate floors are to be fitted under boiler foundations or other important machinery.

(ii) Girders

• The spacing and the arrangement of the centre line and side girders in a longitudinally framed single bottom are to be as per the requirements of Chapter 3, Section 5, Cl.5.3.8.1.

• The scantlings of the side girders are not to be less than that of the plate floors in the machinery space.

• Girders in way of engines are to be extended to the engine room bulkheads and suitably scarfed in to the bottom structure beyond. Alternatively, the engine girders are to be continued as side girder beyond the engine room.

5.10.3.3 Transverse framing

(i) Floors

• Plate floors are to be fitted at every frame.

• In the engine room, the thickness of floors webs and the face plate area are to be increased by 1[mm] and 50% respectively than the requirements as specified in Chapter 7, Section 3, Cl.3.3.1. The floors are not to be flanged.

• If the height of floors is reduced in way of crankcase, the face plate area is to be suitably increased, however the reduced height is normally not to be less than 2/3 of the depth of plate floor as specified in Chapter 7, Section 3, Cl.3.3.1 or B/16 whichever is greater.

• In way of engine room situated amidships the minimum depth of floors is to be at least 10% greater than that required elsewhere.

• In way of engine room situated aft, or where there is considerable rise of floor, the depth of the floors will be specially considered.

• Additional plate floors are to be fitted under boiler foundations or other important machinery.

(ii) Girders

• Sufficient fore and aft girders are to be arranged in way of machinery to effectively distribute its weight and ensure adequate rigidity of the structure.

• In midship engine room the girders are to be extended to the engine room bulkheads and are to be carried aft to support the foremost shaft tunnel bearing and in forward suitably scarfed in to the bottom structure.

• In engine room situated at the aft end, the girders are to be extended to the engine room bulkheads and suitably scarfed in to the bottom structure beyond. Alternatively, the engine girders are to be continued as side girder beyond the engine room.

5.10.4 Side structure

5.10.4.1 General

• In general, the engine room side shell stiffening is to be same as that of adjacent areas.

• In ships where the engine room is located aft and where the side shell is longitudinally framed, the longitudinal structure is to extend for the full length of the machinery space.

• Web frames are generally to be aligned with floors.

• End connections of side longitudinals at transverse bulkheads are to provide fixity, lateral support, and when not continuous are to be provided with soft-toe brackets. Brackets lapped onto the longitudinals are not to be fitted.

5.10.4.2 Longitudinal framing

• In case of side shell with longitudinal framing, the web frame spacing is not to be greater than four frame spacing.

• Web frames are to be connected at top and bottom to members of adequate stiffness and supported at lower decks by transverses or deep beams.

5.10.4.3 Transverse framing

• Where the engine room is situated aft, the spacing of web frames is generally not to exceed five transverse frame spaces. Web

frames extending from the tank top to the upper deck are to be connected at the top and bottom to members of suitable stiffness, and supported by deck transverses.

- In addition to the above if the span of the frames up to the lowest deck exceeds 6.5[m], a side stringer is to be provided to support the frames. These stringers are to be efficiently bracketed to bulkheads, and their connection to the web frames is to be such as to provide adequate continuity of face material.

- For two-stroke engines, web frames are generally to be fitted at the forward and aft ends of the engine. The depth of the girders should not be less than 2.5 times the depth of the cutout (if any) for the passage of secondary stiffener. The web frames are to be evenly distributed along the length of the engine.

- Greater web frame spacing may be accepted provided that cargo hold structural analysis in accordance with Chapter 8, Section 3 is carried out.

- Where the engine room is situated in the midship region, the spacing of web frames is generally not to exceed five transverse frame spaces and extending from the tank top to the level of the lowest deck above the load waterline.

5.10.5 Deck structure

5.10.5.1 Longitudinal framing

Where a longitudinal framing system is adopted, deck longitudinals are to be supported by deck transverses in line with web frames in association with pillars or pillar bulkheads. For the maximum spacing of deck transverses, refer Cl.5.10.4.2.

5.10.5.2 Transverse framing

Where a transverse framing system is adopted in engine room, deck beams are to be supported by a suitable arrangement of longitudinal girders in association with pillars or pillar bulkheads. Where fitted, deck transverses/deep beams are to be arranged in line with web frames to provide end fixity and transverse continuity of strength.

5.10.6 Inner bottom plating

5.10.6.1 Where main engines or thrust bearings are bolted directly to the inner bottom., the net thickness of the inner bottom plating is to be increased. Hold-down bolts are to be arranged as close as possible to floors and longitudinal girders. Manufacturer's recommendations are to be considered for plating thickness and the arrangements of hold-down bolts.

5.10.7 Manholes, lightening holes and wells

5.10.7.1 The number and size of manholes in floors/girders located in way of seatings and adjacent areas are to be kept minimum and permitted only where absolutely necessary for double bottom access and maintenance.

5.10.7.2 In general, manhole edges are to be stiffened with face plate; failing this, the floor plate is to be adequately stiffened with flat bars at manhole sides.

5.10.7.3 Drainage of the shaft tunnel is to be arranged through a well located at the aft end of the tunnel.

5.10.7.4 Lightening holes in engine foundations are to be kept as small as practicable and the edges are to be suitably reinforced.

5.10.8 Heavy equipment

5.10.8.1 Where heavy equipment is mounted directly on the inner bottom, the thickness of the floors and girders is to be suitably increased as per manufacturer's recommendation.

5.10.8.2 All parts of the machinery, shafting, etc., are to be supported to distribute the loads into the ship's structure. The adjacent structure is to be suitably stiffened

5.10.9 Machinery casings

Machinery casings are to be supported by a suitable arrangement of deck transverses and longitudinal girders in association with pillars or pillar bulkheads. In way of particularly large machinery casing openings, cross ties may be required and are to be arranged in line with deck transverses. Machinery casings are to be effectively framed and reinforced by deck transverses and girders around the openings.

5.11 Fore peak arrangement

5.11.1 Application

The requirements of this section apply for the arrangement of structures located forward of collision bulkhead and below bulkhead deck/freeboard deck.

5.11.2 Bottom structure

5.11.2.1 General

- The fore peak spaces are normally to have single bottom with transverse framing.

- The arrangement of the floors and centreline girder in the fore peak spaces are to be sufficient to give adequate stiffness to the structure. Webs and the upper edges of the floors and centreline girder are to be suitably stiffened.

5.11.2.2 Longitudinal framing

(i) Floors

- In case of single bottom, floors are to be fitted at every four frame spacing and generally spaced not more than 2.5[m].

- In case of double bottom, the spacing of plate floors is not to be greater than 3.6[m]. However, under deep tanks with height greater than 0.7 times the distance between inner bottom and main deck, the spacing of floors is normally not to exceed 2.5[m].

- The minimum depth of the floor at the centreline is not to be less than the required depth of the double bottom. Refer Chapter 3, Section 3, Cl.3.2.3.

(ii) Bottom girders

- In case of single bottom, the spacing of bottom girders is not to exceed 3.5[m] and are to be extended as far forward and aft as practicable.

- In case of double bottom, the spacing of the bottom girders is not to exceed 5.0[m] and are to be extended as far forward and aft as practicable.

- A supporting structure is to be provided at the centerline either by extending the centerline girder to the stem or by providing a deep girder or centerline bulkhead.

- In areas where the hull shape is very narrow, alternative arrangement, e.g. without centerline girder and with web fitted at every frame, may be accepted.

- Where a centerline girder is fitted, the minimum depth and thickness is not to be less than that required for the depth of the double bottom in the neighboring cargo hold region, and the upper edge is to be stiffened and to be connected to the collision bulkhead by means of a large end bracket.

5.11.2.3 Transverse framing

(i) Floors

- Plate floors are to be fitted at every frame. In case of ships of full form, the plate floors are to be supported by a centreline girder or a centreline wash bulkhead. In other cases, the centreline girder is to be carried as far forward as practicable.

(ii) Bottom girders

- In case of single bottom, the spacing of bottom girders is not to be greater than 2.5[m].

- In case of double bottom, the spacing of bottom girders is not to be greater than 4.0[m] and are to be extended as far forward and aft as practicable.

5.11.3 Side structure

5.11.3.1 Longitudinal framing

(i) Web frames

- Web frames are to be aligned with floors and are to extend to the upper deck.

- Adequate deep beams are to be provided on deck in line with the web frames.

(ii) Stringers

- Stringers aft of the collision bulkhead are to be continued as far forward as practicable.

- Where the depth of a tank exceeds 10[m], side transverses are generally to be supported

by one or more perforated flats or an arrangement of struts.

5.11.3.2 Transverse framing

(i) Peak frames

• Vertical peak frames of scantling as given in Chapter 7, Section 6, are to be provided at every frame and are to have the same vertical extension as the collision bulkhead(i.e. up to bulkhead deck). Peak frames are to be bracketed at top and bottom and in way of side stringers, the connection is to provide adequate shear strength.

• In way of a forward deep tank, web frames are to be fitted at every 5 frame spaces.

(ii) Stringers

• Above the floors, peak frames are to be supported by one of the following arrangements:

- Side stringers spaced about 2.6[m] apart and supported by (struts) panting beams (sections having the greater side vertically arranged) fitted at alternate frames.

The (struts) panting beams are to be bracketed to the frames and where the span is long, supported at the centreline by a complete or partial wash bulkhead or equally effective structure. Intermediate frames are to be bracketed to the stringer plates. The panting beams are to comply with buckling strength requirement given in Chapter 9, Section 5, 5.4.

– Side stringers spaced about 2.6[m] apart and supported by web frames. Web frames are to be in line with adequate deep beams on deck and floors in bottom to form a ring structure.

– Perforated flats/non-tight platforms spaced not more than 2.6[m] apart. The area of perforations in each flat is to be not less than 10 per cent of the total area of the flat. The plating is to be suitably framed in way of openings.

– A combination of the above arrangements.

• Where the depth of the fore peak space exceeds 10[m], a perforated flat is to be arranged at about mid-depth.

• Where the length of the peak spaces exceeds 10[m] and the side framing is supported as above, additional transverse strengthening in the form of transverse wash bulkheads or intermediate web frames are to be provided.

• The thickness of the plating and the section modulus of ordinary stiffeners in the perforated flats are not to be less than those required for the non-tight central longitudinal bulkhead.

5.11.4 Alternative design verification

The spacing and arrangement, other than those defined in Cl.5.11.2 and Cl.5.11.3 would be specially considered based on grillage analysis or FE analysis. The acceptance criteria to be applied for grillage analysis are defined in Chapter 7, Section 6. A FE analysis is to be performed in accordance with the requirements in Chapter 8.

5.11.5 Panting structures

5.11.5.1 Each panting beam is to be connected to the side frames and stringer by means of brackets whose arms are generally to be not less than twice the panting beam depth.

5.11.5.2 Side frames not supporting panting beams are to be connected to side stringer by means of brackets.

5.11.6 Breasthooks

Breasthooks are to have the same thickness of that required for platforms. They are to be arranged on the stem, in way of every side longitudinal in the case of longitudinal framing and at 1.0[m] in the case of transverse framing, extending aft for a length equal to approximately twice the breasthook spacing.

5.11.7 Wash bulkheads

- A centerline wash bulkhead is to be fitted in fore peak spaces used as tanks, where the breadth of the tank exceeds 0.5B.

- Where a centerline wash bulkhead is fitted, the lowest strake is to have thickness not less than required for a centerline girder.

- Webs of the primary supporting members are to be provided with end brackets and to be securely connected to the struts, if any.

- In general, openings in wash bulkheads are to have generous radii and the area of perforations is generally to be between 5% to 10% of the total area of bulkhead. The area of non-tight bulkhead is the whole cross-sectional area in one plane that covers the tank boundaries.

- The openings in the bulkhead plating is to be suitably stiffened to avoid high stress concentrations areas in way of connections with other structural members and the stiffeners are to be bracketed at top and bottom. Openings are to be located such as to affect as little as possible the plating sections adjacent to primary supporting members.

Section 6

Structural Detail Design

Symbols

For symbols not defined in this section, Refer to Chapter 1, Section 2.

6.1 Local reinforcements

6.1.1 Reinforcements at knuckles

6.1.1.1 Knuckles are in general to be stiffened to achieve out-of-plane stiffness by fitting ordinary stiffeners or equivalent means in line with the knuckle.

6.1.1.2 Whenever a knuckle in a main member (shell, longitudinal bulkhead etc.) is arranged, stiffening in the form of webs, brackets or profiles is to be connected to the members which they are to transfer the load (in shear). See example of reinforcement at main member and upper hopper knuckle in Figure 6.1.1.1 and 6.1.1.2 respectively.

6.1.1.3 Where stiffeners intersect the knuckle as shown in Figure 6.1.1.1, effective support is to be provided for the stiffeners in way of the knuckle by fitting brackets.

6.1.1.4 When the stiffeners of the shell, inner shell or bulkhead intersect a knuckle at a narrow angle, it may be accepted to interrupt the stiffener at the knuckle, provided that proper end support in terms of carling, bracket or equivalent is fitted. Alternative design solution with, e.g. closely spaced carlings fitted across the knuckle between longitudinal members above and below the knuckle may be accepted.

6.1.1.5 For longitudinal shallow knuckles, i.e. angle less than 10[deg], closely spaced carlings are to be fitted across the knuckle, between longitudinal members above and below the knuckle. Carlings or other types of reinforcement need not be fitted in way of shallow knuckles that are not subject to high lateral loads and/or high in-plane loads across the knuckle, such as deck camber knuckles.

6.1.1.6 Generally, the distance between the knuckle and the support stiffening in line with the knuckle is not be greater than 50[mm] within 0.6L. For shallow knuckles, i.e. angles less than 10 deg, the distance of 75[mm] is acceptable. Alternative arrangements can be considered based on fatigue analysis in accordance with Chapter 10.

6.1.1.7 When a stiffener or primary supporting member is knuckled within the length of the span, effective support is to be provided by fitting tripping bracket or equivalent for the support of the face plate, and tripping bracket or equivalent for supporting the knuckled web section, Refer Figure 6.1.1.3.

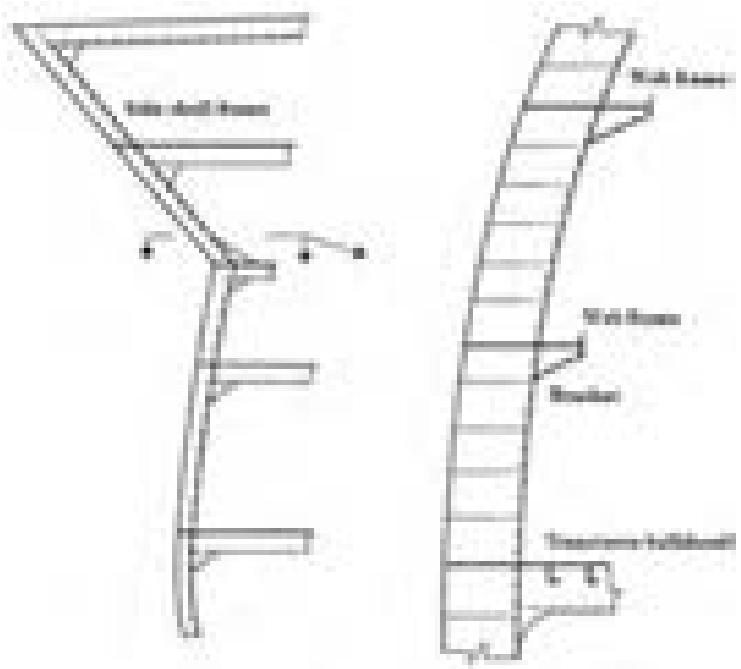

Figure 6.1.1.1: Reinforcement at main member knuckle

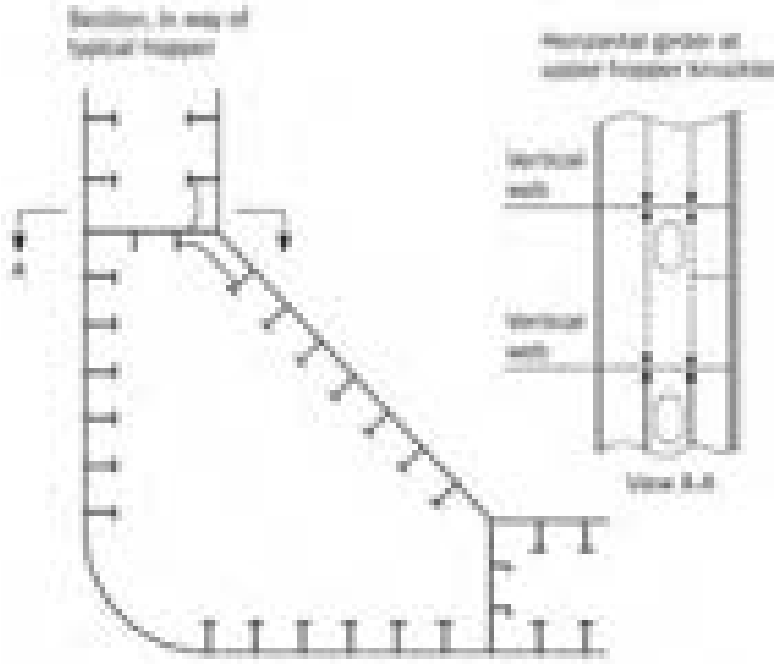

Figure 6.1.1.2: Reinforcement at upper hopper knuckle

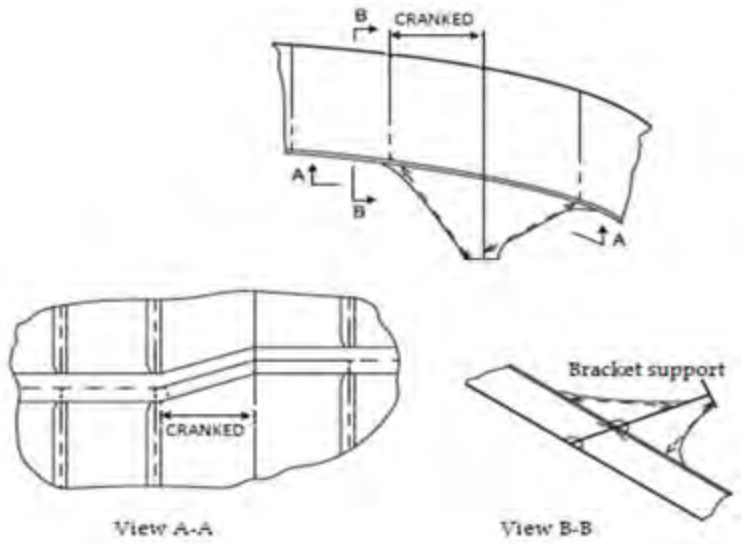

Figure 6.1.1.3: Reinforcement for knuckled stringer by bracket support

6.1.2 Knuckle support at integral bracket

If the flange transition between the stiffener and an integral bracket is knuckled, the flange is to be effectively supported in way of the knuckle. Alternatively, the flange may be curved with radius, in [mm], not less than,

$$r = \frac{0.4\, b_f^{\,2}}{t_f}$$

where:

b_f, t_f = Flange width and net thickness of the curved flange in [mm]. Refer Figure 6.1.2.

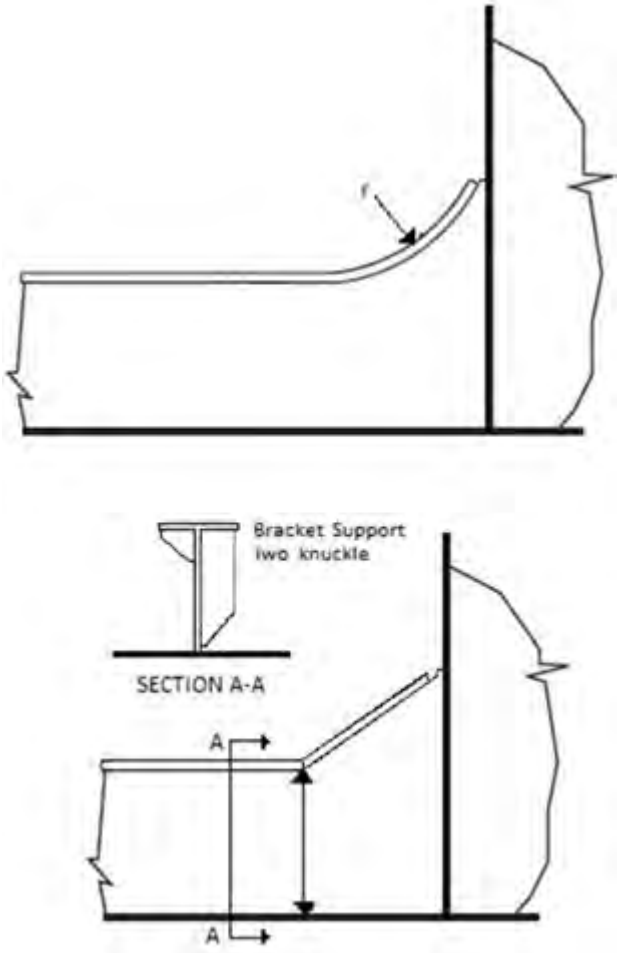

Figure 6.1.2: Reinforcement for knuckle support at integral bracket

6.1.3 Reinforcement in way of attachments for permanent means of access

Local reinforcement, considering location and strength, is to be provided in way of attachments to the hull structure for permanent means of access.

6.1.4 Reinforcement of deck structure in way of concentrated loads

The deck structure is to be reinforced in way of concentrated loads, such as anchor windlass, deck machinery, cranes, masts and derrick posts.

6.1.5 Reinforcement by insert plates

Insert plates are to be made of materials with, at least, the same specified minimum yield stress and the same grade as the plates to which they are welded.

6.2 Stiffeners

6.2.1 General

6.2.1.1 All type of stiffeners (excluding web stiffeners) in local areas are in general to be connected at their ends. However, in special cases sniped ends may be permitted. Requirements for the various types of connections (bracketed, bracketless or sniped ends) are given in Cl.6.2.2 to Cl.6.2.4.

6.2.1.2 Where the angle between the web plate of the stiffener and the attached plating is less than 50[deg], a tripping bracket is to be fitted spaced not more than 4 times the stiffener spacing. If the angle, α, between the web plate of an unsymmetrical stiffener and the attached plating is less than 50[deg], the face plate of the stiffener is to be fitted on the open angle side, Refer Figure 6.2.1.

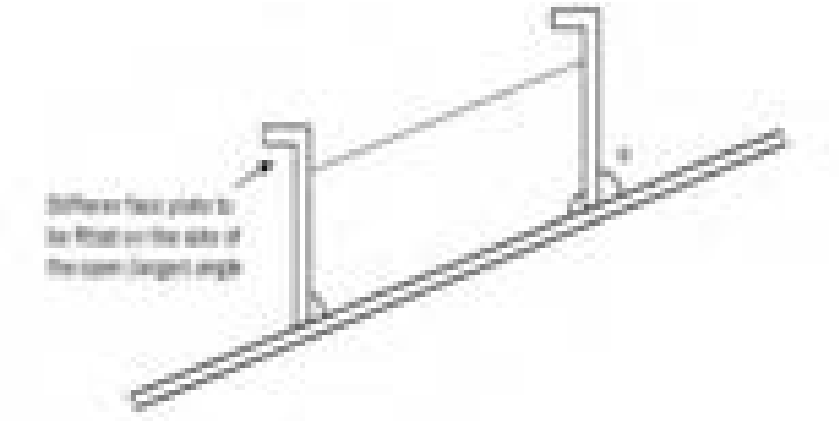

Figure 6.2.1: Stiffener on attached plating with an angle less than 50 deg

6.2.2 Bracketed end connections/attachments of stiffeners

6.2.2.1 General

- Where continuity of strength of longitudinal members is provided by brackets, the alignment of the brackets on each side of the primary supporting member is to be ensured, and the scantlings of the brackets are to be such that the combined stiffener/bracket section modulus and effective cross sectional area are not less than those of the member.

- At bracketed end connections, continuity of strength is to be maintained at the stiffener connection to the bracket and at the connection of the bracket to the supporting member.

6.2.2.2 Net web thickness of bracket

The net bracket web thickness, t_b, in [mm], is to comply with the following:

$$t_b \geq \left(2 + f_{bkt}\sqrt{Z}\right)\sqrt{\frac{R_{eH-stf}}{R_{eH-bkt}}}$$

and need not be greater than 13.5[mm].

where:

f_{bkt} = 0.2 for brackets with flange or edge stiffener. For edge stiffening, Refer 6.2.2.5.

= 0.3 for brackets without flange or edge stiffener.

Z = Net required section modulus, of the stiffener, in [cm^3]. In the case of two stiffeners connected, Z is the smaller net required section modulus of the two connected stiffeners.

R_{eH-stf} = Specified minimum yield stress of the stiffener material, in [N/mm^2].

R_{eH-bkt} = Specified minimum yield stress of the bracket material, in [N/mm^2].

Generally, thickness of the bracket not to be less than the lower of the web thickness of the two connected stiffeners.

6.2.2.3 Brackets size

Brackets are to be fitted at the ends of non-continuous stiffeners with arm lengths, l_{bkt} in [mm], taken as:

$$l_{bkt} = C_{bkt}\sqrt{\frac{Z}{t_b}}$$

l_{bkt} is not to be taken less than:

l_{bkt} = $1.8h_{stf}$ for connections where the end of the stiffener web is supported and the bracket is welded in line with the stiffener web or with offset necessary to enable welding, Refer item (c), (e), (f) in Figure 6.2.2.

l_{bkt} = $2.0\ h_{stf}$ for other cases, Refer items (a), (b) and (d) in Figure 6.2.2.

where:

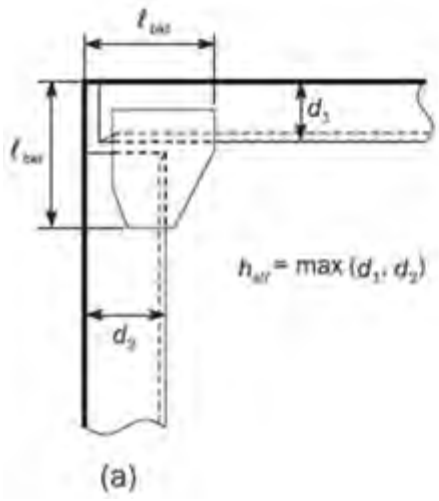
C_{bkt} = 65 for brackets with flange or edge stiffener

= 70 for brackets without flange or edge stiffener

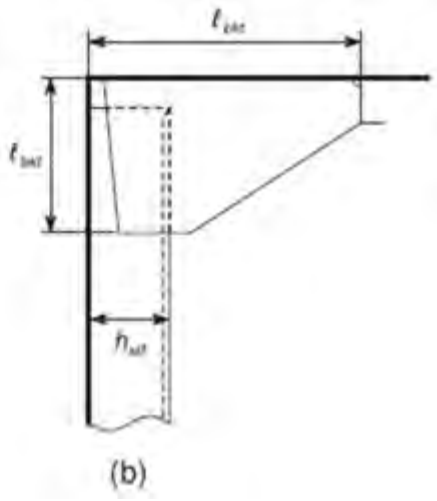
t_b = minimum net bracket thickness, in [mm].

For connections similar to item (b) in Figure 6.2.2, but not lapped, the bracket arm length is to comply with $l_{bkt} \geq h_{stf}$.

For connections similar to items (c) and (d) in Figure 6.2.2 where the smaller stiffener is connected to a primary supporting member or bulkhead, the bracket arm length is not be less than $2\ h_{stf}$.



(a)



(b)

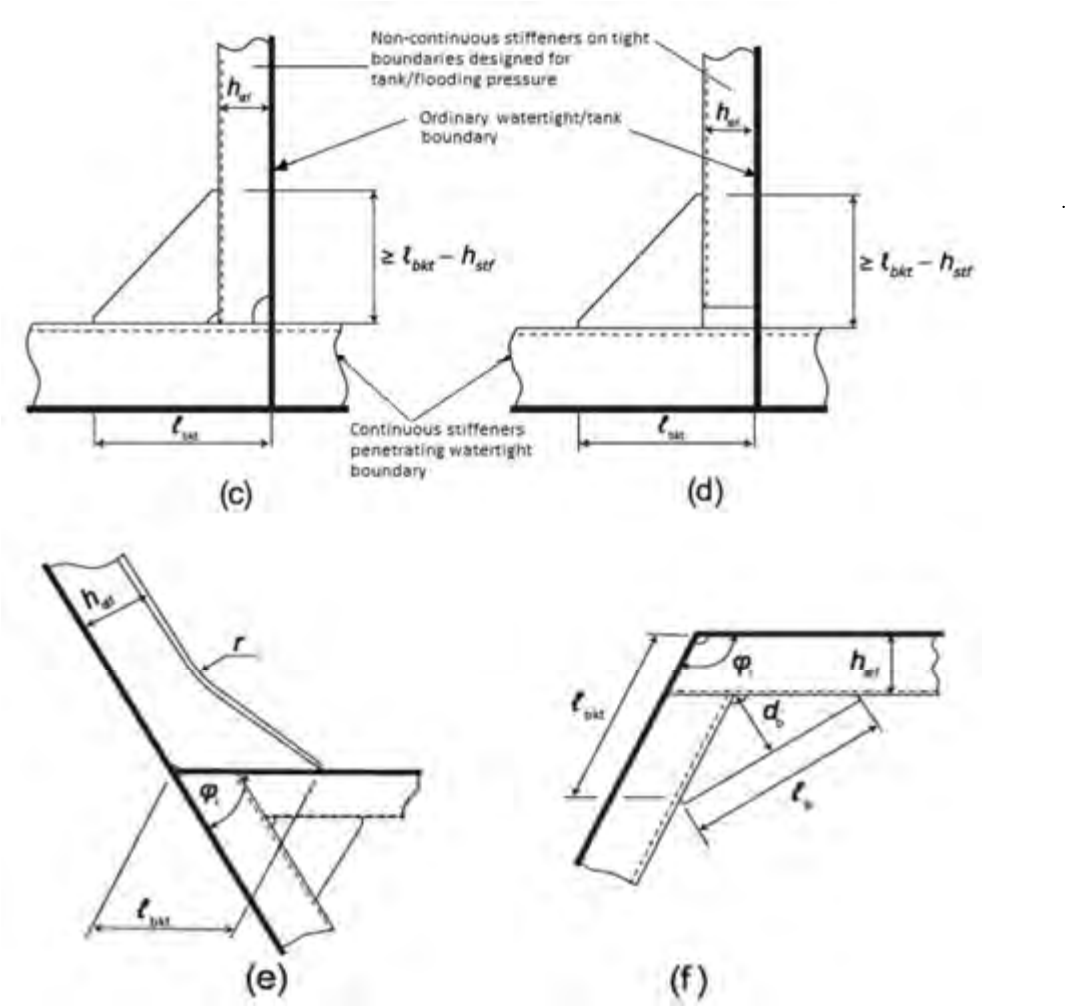


Figure 6.2.2: Bracket arm length of non-continuous stiffeners

6.2.2.4 Brackets with different arm lengths

The lengths of the arms, measured from the plating to the toe of the bracket, are to be such that:

$a, b \geq 0.8\ell_{bkt}$ and $a + b \geq 2.0\ell_{bkt}$ where ℓ_{bkt} is as defined in 6.2.2.3.

6.2.2.5 Edge stiffening of bracket

Where an edge stiffener is required, the web height of the edge stiffener, h_w in [mm], is not be less than:

$$h_w = 45\left(1 + \frac{Z}{2000}\right) \text{ but not less than } 50[\text{mm}].$$

where:

Z = Net required section modulus, of the stiffener, in [cm^3] as defined in 6.2.2.2.

Brackets subjected to compression is to fulfill the buckling requirement given in Chapter 9, Section 2 2.5.

6.2.3 Connection of continuous stiffeners

6.2.3.1 Stiffeners penetrating non-tight members: Connections for longitudinals and other stiffeners running continuously through girders (web frames, transverses, stringers, bulkheads etc.), may be without end brackets provided sufficient connection area is arranged for. Refer to Chapter 16, Section 3, Cl.3.5.3.

6.2.3.2 Stiffeners penetrating tight boundaries: Bracketed end connections are in general to be provided between non-continuous stiffeners on tight boundaries designed for tank pressure or flooding pressure and continuous stiffeners on adjacent boundaries, Refer item (c) and (d) in Figure 6.2.2.

6.2.3.3 Stiffeners penetrating tank boundaries: To prevent local plate bending due to relative deformation between the tank boundary stiffener and the stiffeners penetrating the tank boundary, brackets/stiffeners are to be fitted (Refer Figure 6.2.3).

For locations where the penetrating stiffeners are on a non-tight member e.g. a stringer or a girder, such brackets/stiffeners are omitted.

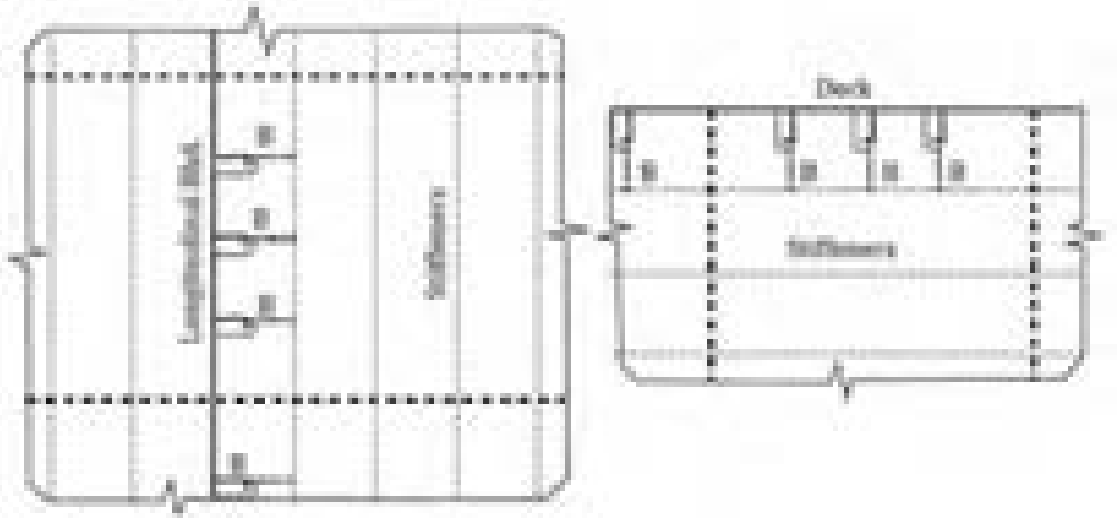

Figure 6.2.3: Brackets fitted in way of longitudinals penetrating a tank bulkhead (Transverse view)

6.2.4 Sniped ends

6.2.4.1 Sniped ends may be used where dynamic pressures are small, provided the net thickness of plating supported by the stiffener, in [mm], is not less than:

$$t_p = c_1 \sqrt{\left(1000\ell - \frac{s}{2}\right)\frac{s.P.k}{10^6}}$$

where:

P = Design pressure for the stiffener for the design load set being considered, in [kN/m^2]

c_1 = Coefficient for the design load set being considered, to be taken as:

= 1.2 for acceptance criteria set AC-I

= 1.1 for acceptance criteria set AC-II

ℓ = span of the sniped stiffener, in [m].

s = spacing of stiffeners, in [mm].

6.2.4.2 For sniped stiffeners fitted between stiffeners, the spacing s, in [mm], need not to be taken greater than 1000ℓ, where ℓ is the span of the sniped stiffener, in [m].

6.2.4.3 Sniped stiffeners are not to be used on structures in the vicinity of engines or generators in the machinery space or propeller impulse zone in the stern area nor on the shell envelope (at boundaries of sea chest).

6.2.4.4 Bracket toes and sniped stiffeners ends are to be terminated close to the adjacent member. The distance is not to exceed 40[mm] unless the bracket or member is supported by another member on the opposite side of the plating. Tapering of the sniped end is not to be more than 30[deg] in way of the toe where it is not practical to comply with this requirement, alternative arrangements are specially considered. The depth of toe or sniped end is, generally, not to exceed the thickness of the bracket toe or sniped end member, but need not be less than 15[mm].

6.2.5 Stiffeners on watertight bulkheads

6.2.5.1 Bulkhead stiffeners cut in way of watertight doors are to be supported by carlings extending to the adjacent stiffeners. Generally, the scantling of stiffeners adjacent to the door openings are to be designed to withstand this additional load. The carlings are to be located close to the door opening.

6.2.5.2 The watertight integrity of the bulkheads is to be ensured without taking strength of the doorframes into consideration.

6.2.5.3 The design pressure for ordinary watertight bulkheads is to be at least the pressure due to a head of water up to the bulkhead deck/ freeboard deck depending on the type of vessel. However, in damage conditions the head of water is to be considered in the worst situation at equilibrium, including intermediate stages of flooding. Refer Figure 6.2.5.

6.2.5.4 Where it is shown by damage stability calculations that the deepest equilibrium damaged waterline in way of the load point is below the freeboard deck, a reduced value of water head may be considered for bulkheads other than subdivision bulkheads.

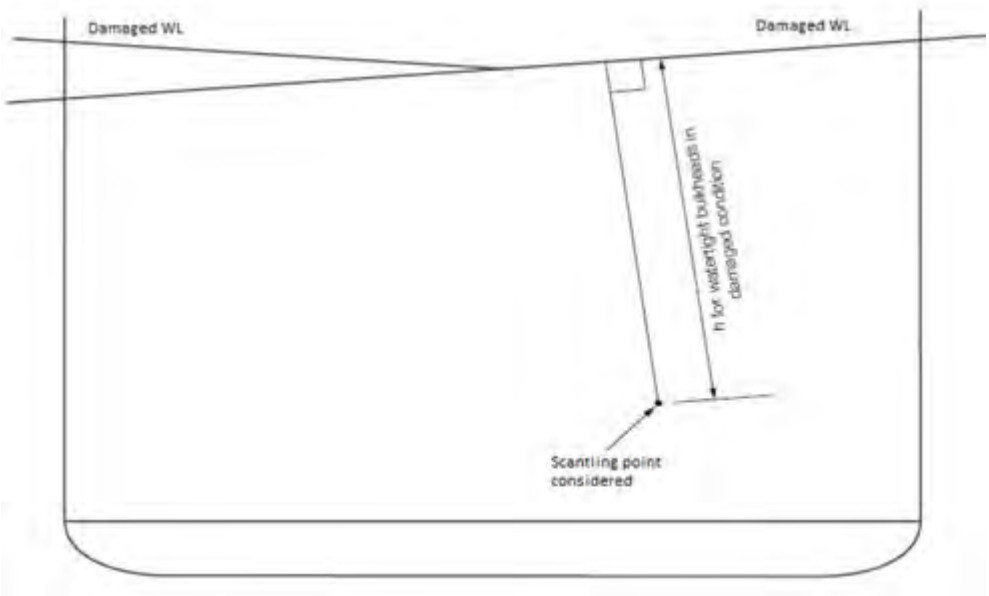

Figure 6.2.5: Heads for watertight bulkheads in damaged condition

6.3 Primary supporting members (PSM)

6.3.1 General

6.3.1.1 Primary supporting members web stiffeners, tripping brackets and end brackets are to comply with Cl.6.3.2 to Cl.6.3.4. Where the structural arrangement is such that these requirements cannot be complied with, adequate alternative arrangement with supporting calculations, if any, are to be submitted by the designer.

6.3.1.2 Abrupt changes of web height or cross section is to be avoided. Smooth transitions are to be provided.

6.3.2 Web stiffening arrangement

Web stiffeners arranged on primary supporting members are to comply with the requirements for scantlings of such stiffeners given in Chapter 9, Section 2, Cl.2.4.2.

6.3.3 Tripping bracket arrangement

6.3.3.1 In general girders are to be provided with tripping brackets and web stiffeners to obtain adequate lateral and web panel stability.

Tripping brackets welded to the face plate are generally to be fitted at every fourth stiffener in case of symmetrical sections and at every alternate stiffener in case of asymmetrical section , without exceeding 4[m].

6.3.3.2 Tripping brackets (Refer Figure 6.3.3) are generally to be fitted:

- at positions along the member span such that it satisfies the criteria of Chapter 9, Section 2, 2.5 for tripping bracket spacing and flange slenderness

- at the toes of end brackets

- at ends of continuous curved face plates not satisfying the radius criteria mentioned in Cl.6.1.2.

• in way of concentrated loads such as heels of pillars or cross ties.

• near a change of section

6.3.3.3 Tripping of flanges

Where the width of face plate on one side of the web exceeds $15t_f$, or 200[mm] whichever is lesser, the tripping brackets are to be connected to the face plate. In case of symmetrical face plate, backing brackets are to be fitted on other side of the tripping brackets.

6.3.3.4 Stiffeners are to be connected at ends. Where stiffener webs are not perpendicular to the shell plating adequate tripping brackets are to be fitted.

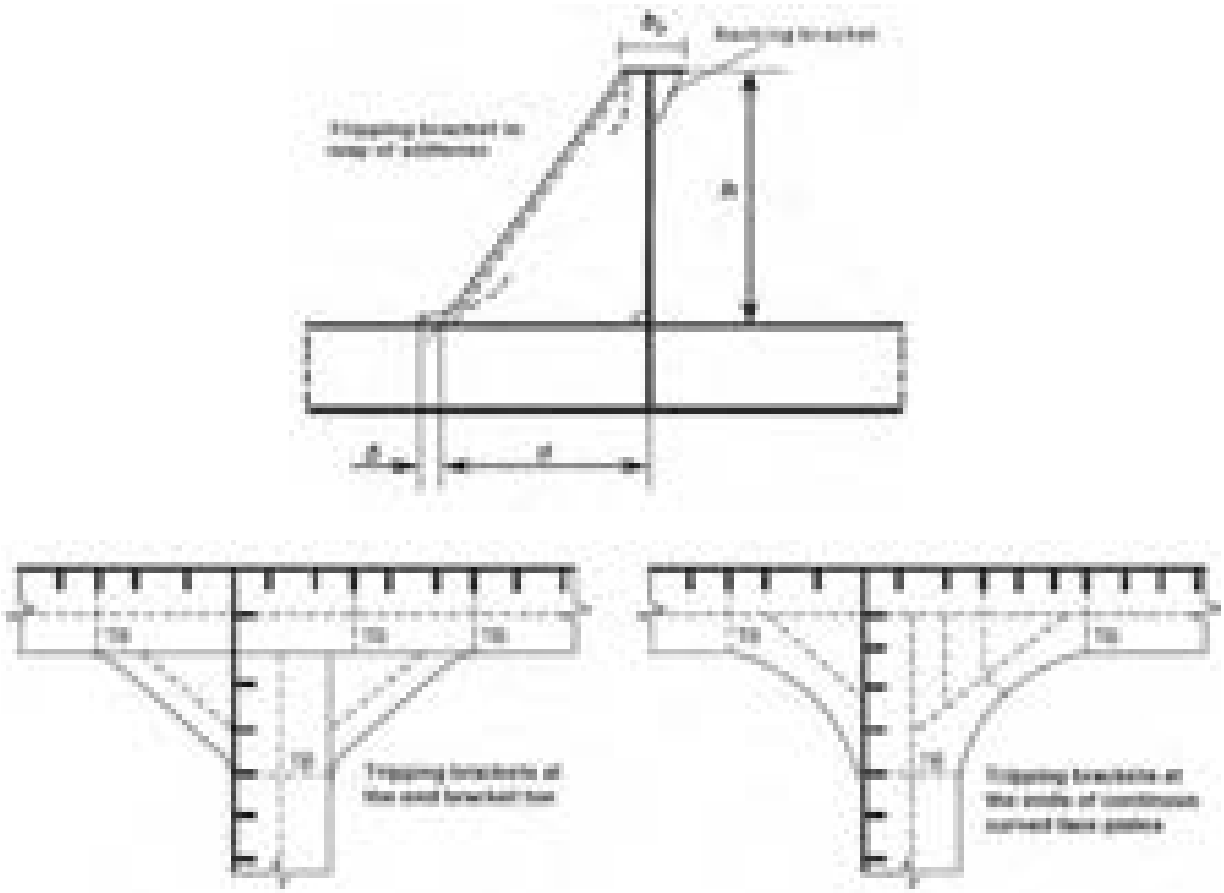

Figure 6.3.3: Tripping bracket arrangement for primary supporting members

6.3.4 Arm length and edge stiffening

6.3.4.1 The arm length, d in [m], of tripping brackets is not be less than the greater of the following values:

$$d = 0.38\,h$$

$$d = 0.85\,h\sqrt{\frac{s_t}{t_b}}$$

where:

h = height of tripping brackets, in [m], shown in Figure 6.3.3.

s_t = spacing of tripping brackets, in [m].

t_b = net thickness of tripping brackets, in [mm].

6.3.4.2 Tripping brackets on primary supporting members are to be stiffened by a flange or edge stiffener if the effective length of the edge, ℓ_b in [mm], is greater than:

$$\ell_b = 75t_b$$

where:

t_b = Bracket net web thickness, in [mm].

6.3.4.3 Additional stiffeners are to be fitted parallel to the free edge to ensure that the arm length of an unstiffened triangular end panel does not exceed 100t [mm].

6.3.4.4 The tripping brackets are to be adequately dimensioned at base and are to have a smooth transition to the adjoining stiffeners. It is recommended that the bracket toe should be designed as shown in Figure 6.3.3..

6.3.4.5 Where the span of frames exceeds 5[m] or the flange width is less than 1/20 of the span of stiffeners 'ℓ', tripping brackets are to be fitted at the middle of the span.

6.3.4.6 Forward of 0.15L from F.P., the tripping brackets are to be fitted on frames as shown in Figure 6.3.4. The spacing between tripping brackets is not to exceed 2.5[m] vertically.

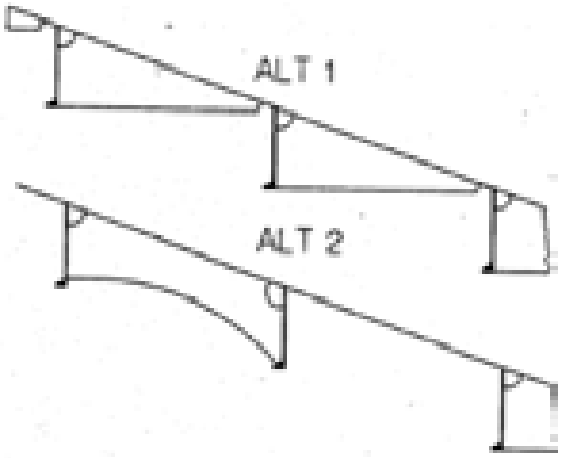

Figure 6.3.4: Alternative arrangements of tripping bracket

6.3.5 End connections/attachments

6.3.5.1 General

- Brackets or equivalent structure are to be provided at ends of primary supporting members.

- End brackets are generally to be made with soft toe in areas considered critical with respect to fatigue.

- Bracket less connections may be applied provided that there is adequate support of adjoining face plates, Refer Cl.6.3.6.

- The end attachments and supporting structure of the girders are to provide adequate resistance against rotation and displacement of the joint and effective distribution of the load from the member. Supporting members, to which the girders are being connected, may require additional strengthening to provide adequate stiffness to resist rotation of the joint.

- Where the end attachment provides only a low degree of restraint against rotation, the girder is generally to be extended beyond the point of support by at least two frame spaces before being gradually tapered.

- Connections between girders forming a ring system are to be such as to minimize stress concentrations at the junctions. Integral brackets are generally to be radiused or well rounded at the toes.

- Where the face plate of the girder is not continuous over the bracket, the free edge of the bracket is to be stiffened and the face plate of the girder is to be extended well beyond the toe of the bracket.

6.3.5.2 Scantling of end brackets

- In general, the arm lengths of brackets connecting PSMs, as shown in Figure 6.3.5.1 are not be less than the web depth of the member, and need not be taken greater than 1.5 times the web depth.

- The arm length 'a' including the depth of girder is not to be less than:

$$a = 83\sqrt{\frac{Z}{t}}$$

Z = The section modulus in [cm^3], of the girder to which the bracket is connected as defined in Cl.6.2.2.2.

- Direct strength calculations by means of grillage analysis or FE analysis will be considered as alternative basis for the scantlings. The acceptance criteria to be applied for grillage analysis are defined in Chapter 7, Section 6. A FE analysis is to be performed in accordance with the requirements in Chapter 8.

• The thickness of the bracket is, in general, not to be less than that of the PSM web plate.

• Scantlings of the end brackets are to be such that the section modulus of the PSM with end bracket, excluding face plate where it is sniped, is not to be less than that of the primary supporting member at mid-span. The net cross sectional area, A_f in [cm^2], of face plates of brackets is not be less than:

$$A_f = \ell_b \times t_b$$

where:

ℓ_b = length of bracket edge, in [m], Refer Figure 6.3.5.1. For brackets that are curved, the length of the bracket edge may be taken as the length of the tangent at the midpoint of the edge

t_b = minimum net bracket thickness, in [mm], as defined in Cl.6.2.2.2.

Moreover, the net thickness of the face plate is to be not less than that of the bracket web. Additional requirements with respect to buckling are given in Chapter 9, Section 2.

6.3.5.3 Arrangement of end brackets

• In addition, where the length of free edge of bracket, ℓ_b, is greater than 1.5[m], the web of the bracket is to be stiffened as follows:

- the net sectional area, in [cm^2], of web stiffeners is to be not less than the requirement for face plates given in Cl.6.3.5.2 not to be greater than 16.5ℓ, where ℓ is the span, in [m], of the stiffener.

– tripping flat bars are to be fitted. Where the width of the symmetrical face plate is greater than 400[mm], additional backing brackets are to be fitted.

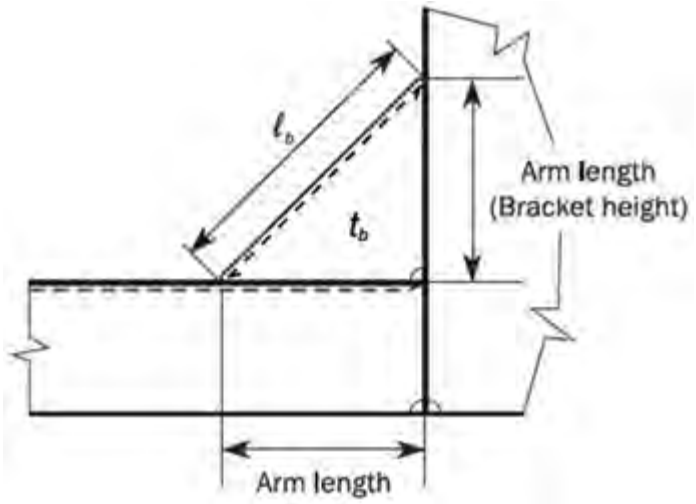

Figure 6.3.5.1: Dimensions of bracket

• For a ring system where the end bracket is integral with the webs of the members and the face plate is carried continuously along the edges of the members and the bracket, the full area of the largest face plate is to be maintained close to the mid-point of the bracket and gradually tapered to the smaller face plates.

• Butts in face plates are to be kept well clear of the bracket toes.

• Where a wide face plate abuts a narrower one, the taper is not to be greater than 1 to 4.

• The toes of brackets are not to land on unstiffened plating. The toe height is not to be greater than the thickness of the bracket toe, but need not be less than 15[mm]. In general, the end brackets of primary supporting members are to be soft-toed.

• Where primary supporting members are constructed of higher strength steel, particular attention is to be paid to the design of the end bracket toes in order to minimize stress concentrations.

• Where a face plate is welded onto the edge or welded adjacent to the edge of the end bracket, Refer Figure 6.3.5.2, the face plate is to be sniped and tapered at an angle not greater than 30[deg].

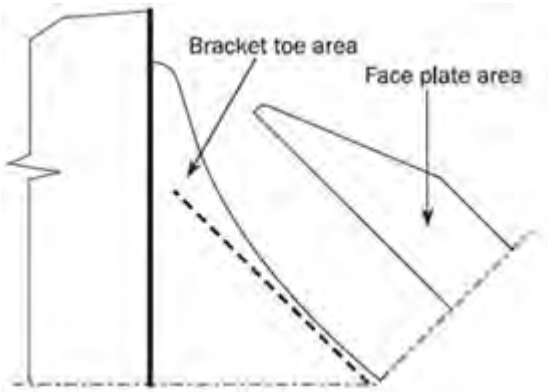

Figure 6.3.5.2: Bracket face plate adjacent to the edge

6.3.6 Bracketless end connections

6.3.6.1 Two-member connection

• The net thickness, t_b in [mm], of the common web at the joint of two-member bracketless connection, Refer Figure 6.3.6.1, is not to be less than the greater of the following:

$$t_b = \left(\frac{\sigma_1 A_1}{h_2} - \tau_2 t_2\right)\frac{k}{110}$$

$$t_b = \left(\frac{\sigma_2 A_2}{h_1} - \tau_1 t_1\right)\frac{k}{110}$$

and also, t_b is not to be less than t_1 and t_2.

where,

A_1, A_2 = minimum required flange area of member 1 and 2 respectively, in [mm^2].

h_1, h_2 = web height of member 1 and 2 respectively, in [mm].

t_1,t_2 = minimum required thickness of web of member 1 and 2 respectively, in [mm].

τ_1,τ_2 = average shear stress in member 1 and 2 respectively in [N/mm^2].

σ_1, σ_2 = bending stress at flange area of member 1 and 2 respectively, in [N/mm^2].

k = material factor for common web at corner, Refer Chapter 2.

• Bending and shear stress computation is to be carried out by considering each member separately as a beam with appropriate boundary conditions. The corner joint between the members is to be considered as fixed joint.

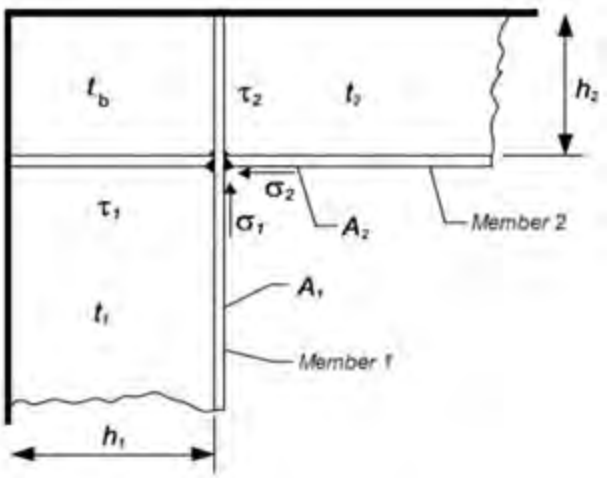

Figure 6.3.6.1: Bracketless end connection for two members

6.3.6.2 Three Member Connection

• In the case of three-member bracketless connection, when the flanges of member 1 and member 3 are continuous, Refer Figure 6.3.6.2, the thickness, t_b in [mm], of the common web at the joint is not to be less than the following:

$$t_b = \left(\frac{\sigma_2 A_2}{h_1} - \tau_1 t_1\right)\frac{k}{110}$$

and also, t_b is not to be less than t_1 and t_2.

• When the web height of member 1 and member 2 is more than $100t_b$, the common part of the corner web is to be stiffened.

• In the case of three-member bracketless connection, when the flanges of member 1 and member 3 are not continuous, the thickness, t_b of the common web at the joint is to be determined as given by Cl.6.3.6.1

• Welding of the extended face plates of the joining members to the common web at the corner is to be of sufficient length and size to transfer the axial loads from the face plates to the common web.

• Welding of the discontinuous and extended face plate to the continuous face plate is to be full penetration or deep penetration of equivalent strength.

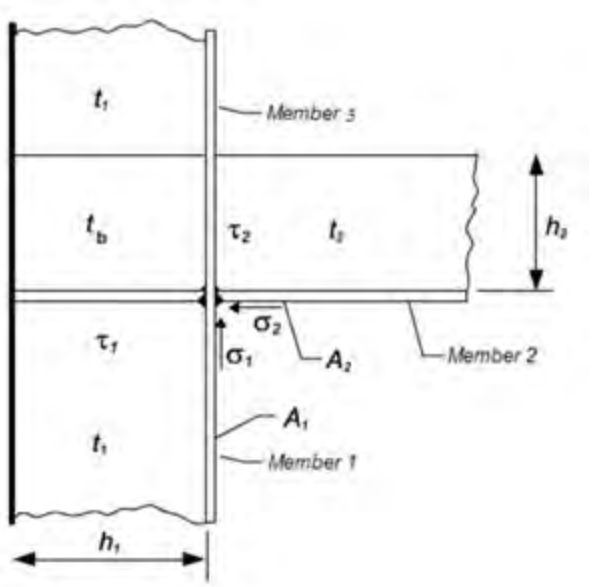

Figure 6.3.6.2: Bracketless end connection for three members

6.4 Corrugated bulkheads

6.4.1 Construction

6.4.1.1 The main dimensions a, R, c, d, t_f, t_w, S_c of corrugated bulkheads are defined in Figure 6.4.1.

6.4.1.2 The corrugation angle φ is generally not be less than 55[deg]. Corrugation angle between 45[deg] and 55[deg] may be accepted provided that the permissible stress/permissible utilization factor for overall bending is reduced by 10%, Refer Chapter 7, Section 5, Cl.5.1.1.5 for section modulus, Chapter 8, Section 3, Cl.3.4.2.4 for yield check and Chapter 9 Section 1, Cl.1.3.3 for buckling assessment.

6.4.1.3 Welds in a direction parallel to the bend axis are to be avoided in the zone of the bending.

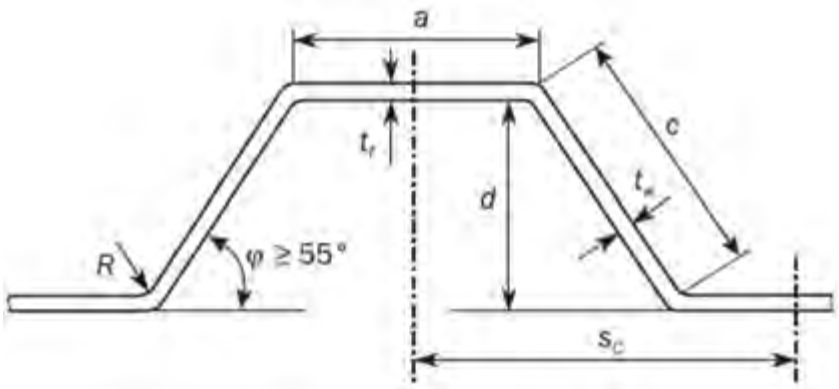

Figure 6.4.1: Dimensions of a corrugated bulkhead

6.4.2 Corrugated bulkhead depth

The depth of the corrugation, d, in [mm], is not to be less than:

$$d \geq \frac{1000\, l_c}{C}$$

where

l_c = Mean span of considered corrugation, in [m], as defined in 6.4.3.

C = Coefficient to be taken as:

15 for tank and water ballast cargo hold bulkheads.

18 for dry cargo hold bulkheads.

6.4.3 Span of corrugations

The length, l_c of the corrugations is to be taken as the distance shown in Figure 6.4.3. For the definition of l_c , the bottom of the upper stool is not be taken more than a distance from the deck at the centre line equal to:

- 3 times the depth of corrugation, for non-rectangular stool.

- 2 times the depth of corrugation, for rectangular stool.

l_{bdg} = effective bending span taken as the distance between supports, in [m]. For vertically corrugated bulkheads with stool tanks taken as the distance between the area centre of the upper stool A_U and the area centre of the lower stool A_L as shown in Figure 6.4.3.

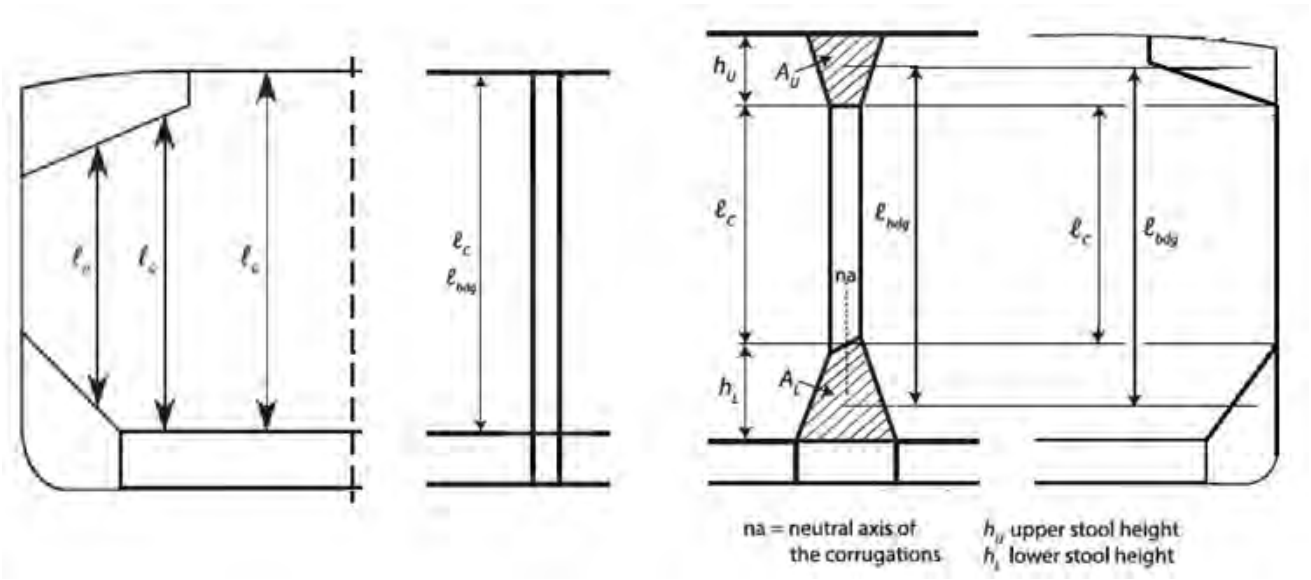

Figure 6.4.3: Span of the corrugations

6.4.4 Structural arrangements

Where corrugated bulkheads are cut in way of primary supporting members, corrugations on each side of the primary member are to be aligned with each other.

6.4.5 Corrugated bulkhead end supports

6.4.5.1 The strength continuity of corrugated bulkheads is to be maintained at the ends of corrugations.

6.4.5.2 Where a bulkhead is provided with a lower stool, floors or girders are to be fitted in line with both sides of the lower stool to ensure proper stress flow from the bulkhead to the plate floors.

Where a bulkhead is not provided with a lower stool, floors or girders are to be fitted in line with both flanges of the vertically corrugated transverse bulkhead. The supporting floors or girders are to be connected to each other by suitably designed shear plates.

6.4.5.3 At deck, if no upper stool is fitted, transverse or longitudinal stiffeners are to be fitted in line with the corrugation flanges.

6.4.5.4 The thickness and material properties of the floors, transverse or longitudinal deck stiffeners, in line with the corrugation flanges are to be at least equal to those provided for the corrugation flanges.

6.4.5.5 When the corrugation flange connected to the adjoining boundary structures (i.e. inner hull, side shell, longitudinal bulkhead, trunk, etc.) is smaller than 50% of the width of the typical corrugation flange, an advanced analysis of the connection is required.

6.4.6 Corrugation web support

For boundaries of tanks, brackets to be provided in line with the corrugation webs at lower end of vertical corrugations and at both ends for horizontal corrugations. Alternatively, supporting brackets in way of every knuckle of corrugation web may be fitted.

6.4.7 Bulkhead stool

Stool side plating is to be aligned with the corrugation flanges.

6.5 Openings

6.5.1 Openings and scallops in stiffeners

Air and drain holes as mentioned in Chapter 3, Section 4, Cl.4.2.2.2 are to comply with the following requirements:

6.5.1.1 Figure 6.5.1.1 shows examples of air holes, drain holes and scallops. In general, the ratio of a/b, as defined in Figure 6.5.1.1, is to be between 0.5 and 1.0. In fatigue sensitive areas further consideration may be required with respect to the details and arrangements of openings and scallops.

6.5.1.2 Openings and scallops are to be kept at least 200[mm] clear of the toes of end brackets, end connections and other areas of high stress concentration, measured along the length of the stiffener toward the mid-span and 50[mm] measured along the length in the opposite direction, Refer Figure 6.5.1.2. In areas where the shear stress is less than 60% of the permissible stress, alternative arrangements may be accepted.

The stopper holes/crack arrestor holes are also to be avoided in way of shaded area shown in Figure 6.5.1.2, since these areas are of high stress concentrations which lead to cracks and subsequently piping effect.

6.5.1.3 Closely spaced scallops or drain holes preferably of elliptical shape, i.e. where the distance between scallops/drain holes is less than twice the width b as shown in Figure 6.5.1.1, are not permitted in stiffeners contributing to the longitudinal strength. For other stiffeners, closely spaced scallops/drain holes are not permitted within 20% of the stiffener span measured from the end of the stiffener.

6.5.1.4 Openings are to be well rounded with smooth edges. Closely spaced scallops are not permitted in high strength steel members.

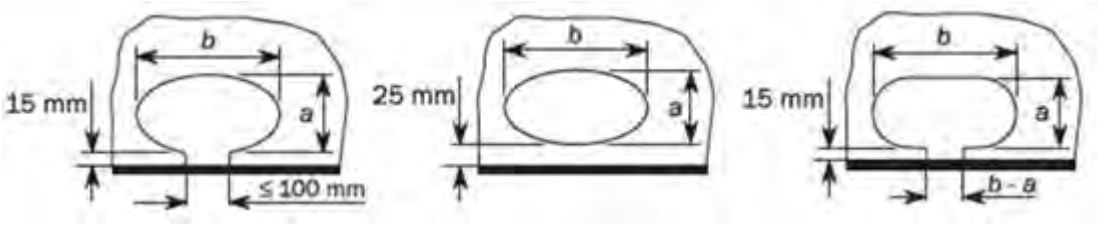

Figure 6.5.1.1: Examples of air holes, drain holes and scallops

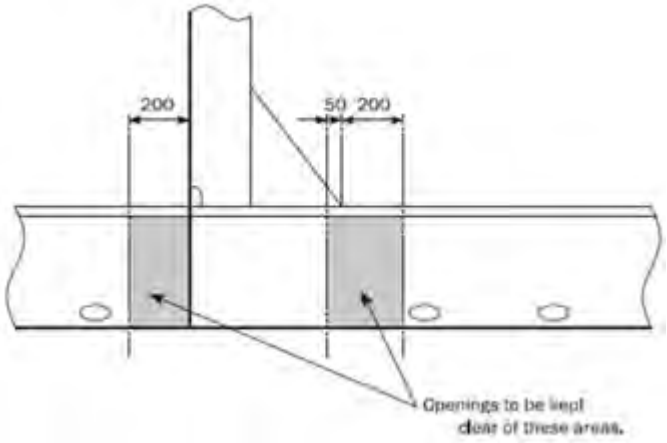

Figure 6.5.1.2: Location of air holes drain holes and crack arrestor holes

6.5.2 Openings in primary supporting members

6.5.2.1 General

• Manholes, lightening holes and other similar openings are to be avoided in way of concentrated loads and areas of high shear. In particular, manholes and similar openings are to be avoided in high stress areas unless the stresses in the plating and the panel buckling characteristics have been calculated and found satisfactory.

• Examples of high stress areas include:

– Vertical or horizontal diaphragm plates in narrow cofferdams/double plate bulkheads within one-sixth of their length from either end.

– Floors or double bottom girders close to their span ends.

– Primary supporting member webs in way of end bracket toes.

–Above the heads and below the heels of pillars.

• Where openings are arranged, the shape of openings is to be such that the stress concentration remains within acceptable limits. Openings are to be well rounded with smooth edges.

• Cut-outs for the passage of ordinary stiffeners are to be as small as possible and well-rounded with smooth edges.

• In general, the depth of cut-outs is to be not greater than 50% of the depth of the primary supporting member.

• Where openings are cut in the girder web, they are to be away from the girder ends and scallops for stiffeners; with their centre located as near to the neutral axis of the girder as practicable. Openings of depth exceeding 25% of the girder depth or 300[mm] and, of length exceeding the depth of the girder or 60% of the secondary stiffener spacing, are to be reinforced all around at the edge; or alternatively by providing horizontal and vertical stiffeners.

• The breadth of cut-out is to be kept as small as practicable and the top edge is to be rounded, or the corner radii made as large as practicable. The extent of direct connection of the web plating, or the scantlings of lugs or collars, is to be sufficient for the load to be transmitted from the secondary member.

6.5.2.2 Manholes and lightening holes

- Web openings as indicated below do not require reinforcement

– In single skin sections, having depth not exceeding 25% of the web depth and located so that the edges are not less than 40% of the web depth from the faceplate.

– In double skin sections, having depth not exceeding 50% of the web depth and located so that the edges are well clear of cut outs for the passage of stiffeners.

- For web openings without reinforcements of free edges, the length of openings is not be greater than:

– At the mid-span of primary supporting members: lesser of the distance between adjacent openings.

– At the ends of the span: 25% of the distance between adjacent openings.

- For openings cut in single skin sections, the length of opening is not to be greater than the web depth or 60% of the secondary stiffener spacing, whichever is greater.

- The ends of the openings are to be equidistant from the cut outs for stiffeners.

- Where lightening holes are cut in the brackets, the distance from the circumference of the hole to the free flange of brackets is not to be less than the diameter of the lightening hole.

- Openings which require reinforcement are according to Cl.6.5.3. Where larger openings are proposed, the arrangements and compensation are to be submitted to IRS.

6.5.2.3 Scallops, air- and drain holes

- Scallops are to be avoided in way of fatigue sensitive areas.

- Examples of fatigue sensitive areas include:

– Connections of transverse webs in double side or double bottom tanks to hopper tanks.

– Connections at horizontal stringer heel.

– Connections of vertically corrugated bulkhead to lower and upper stool diaphragms.

– Connections of vertically corrugated bulkhead without stool to inner bottom/hopper supporting structures.

– Connections of plain cofferdam bulkhead vertical frames to inner bottom longitudinal girders.

For spacing and dimensions of openings requirements given in Cl.6.5.1 to be followed.

6.5.3 Reinforcements around openings

6.5.3.1 Manholes and lightening holes are to be stiffened according to this requirement, except where alternative arrangements are demonstrated as satisfactory, i.e. the stresses in the plating and the panel buckling characteristics are to be calculated and proved to be satisfactory or with the analysis methods described in Chapter 8.

6.5.3.2 On members contributing to longitudinal strength, stiffeners are to be fitted along the free edges of the openings parallel to the vertical and horizontal axis of the opening.

6.5.3.3 Stiffeners may be omitted in one direction if the shortest axis is less than 400[mm] and in both directions if length of both axes is less than 300[mm]. Edge reinforcement may be used as an alternative to stiffeners, Refer Figure 6.5.3.1.

6.5.3.4 All openings are to be adequately framed; attention is to be paid to structural continuity, and abrupt changes of shape, section or plate thickness are to be avoided. Arrangements in way of corners and openings are to be such as to minimize the creation of stress concentrations.

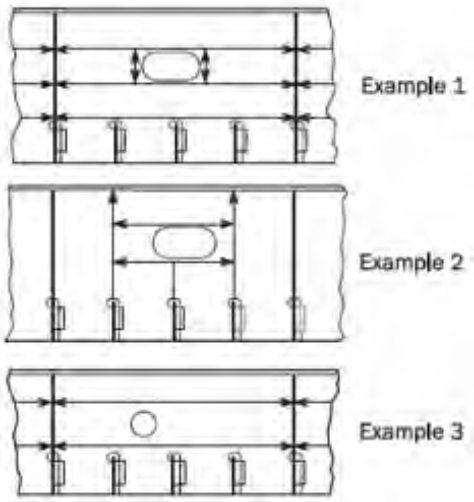

Figure 6.5.3.1: Web plate with openings

6.5.3.5 In the case of large openings in the web of PSMs (e.g. where a pipe tunnel is fitted in the double bottom), the secondary stresses in PSMs are to be considered for the reinforcement of these openings.

6.5.3.6 Where no FE analysis is performed, this may be carried out by assigning an equivalent net shear sectional area to the PSM obtained, in [cm^2], according from the following formula:

$$A_{sh} = \frac{A_{sh1}}{1 + \frac{32\, l_{shr}^2\, A_{sh1}}{I_1}} + \frac{A_{sh2}}{1 + \frac{32\, l_{shr}^2\, A_{sh2}}{I_2}}$$

where:

I_1, I_2 = Net moments of inertia, in [cm^4], of deep webs (1) and (2), respectively, with attached plating around their neutral axes parallel to the plating.

A_{sh1}, A_{sh2} = Net shear sectional areas, in [cm^2], of deep webs (1) and (2), respectively, taking account of the web height reduction by the depth of the cut out for the passage of the ordinary stiffeners, if any.

l_{shr} = Shear span, in [m], of deep webs (1) and (2) as defined in Chapter 3, Section 7. Deep web (1) and (2) are defined in Figure 6.5.3.2.

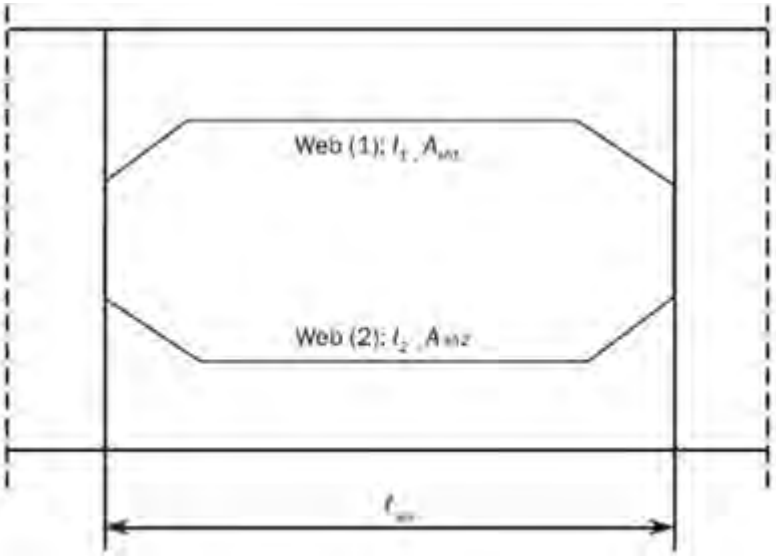

Figure 6.5.3.2: Large openings in the web of PSM

6.5.4 Openings in the deck contributing to longitudinal strength

6.5.4.1 General

• Openings in the strength deck are to be kept to a minimum and spaced as far as practicable from one another and from the ends of superstructures. Openings are to be located as far as practicable from high stress regions such as side shell platings, hatchway corners, or hatch side coamings.

• All openings in the strength deck are to have well rounded corners.

• Openings in the strength deck within 0.6L amidships (within the cargo hold region for ships with large hatch openings) are as far as practicable to be located inside the line of large hatch openings. Necessary openings outside this line are to be kept well clear of the ship's side and hatch corners as shown in Figure 6.5.4.1.

• Openings in lower decks are to be kept well clear of the main hatch corners and other areas of high stresses.

• Openings are generally to be located outside the limits as shown in Figure 6.5.4.1 in dashed area, defined by:

– The bent area of a rounded sheer strake, if any, or the side shell.

– $e = 0.25(B - b)$ from the edge of opening.

– $c = 0.07\ell + 0.1b$ or $0.25b$, whichever is greater.

where:

b = Width, in [m], of the hatchway considered, measured in the transverse direction, Refer Figure 6.5.4.1.

ℓ = Width, in [m], in way of the corner considered, of the cross deck strip between two consecutive hatchways, measured in the longitudinal direction, Refer Figure 6.5.4.1.

Transverse distance between the above limits and openings or between hatchways and openings as shown Figure 6.5.4.1 is not to be less than:

– $g_2 = 2a_2$ for circular openings.

– $g_1 = a_1$ for elliptical openings.

Transverse distance between openings as shown in Figure 6.5.4.1 is not to be less than:

– $2(a_1 + a_2)$ for circular openings.

– $1.5(a_1 + a_2)$ for elliptical openings.

where:

a_1 = Transverse dimension of elliptical openings, or diameter of circular openings.

a_2 = Transverse dimension of elliptical openings, or diameter of circular openings.

a_3 = Longitudinal dimension of elliptical openings, or diameter of circular openings.

Longitudinal distance between openings is not to be less than:

–$(a_1 + a_3)$ for circular openings.

– $0.75(a_1 + a_3)$ for elliptical openings and for an elliptical opening in line with a circular one.

• If the opening arrangements do not comply with these requirements, the hull girder longitudinal strength assessment is to be carried out by subtracting such opening areas, Refer Chapter 3, Section 6, Cl.6.5.4.6.

• Smaller openings in the strength deck within 0.6L amidships or within the cargo hold region for ships with large hatch openings, are to be reinforced as given in Cl.6.5.4.2 below. The area of these reinforcements is not to be included in the sectional areas used in the section modulus calculation.

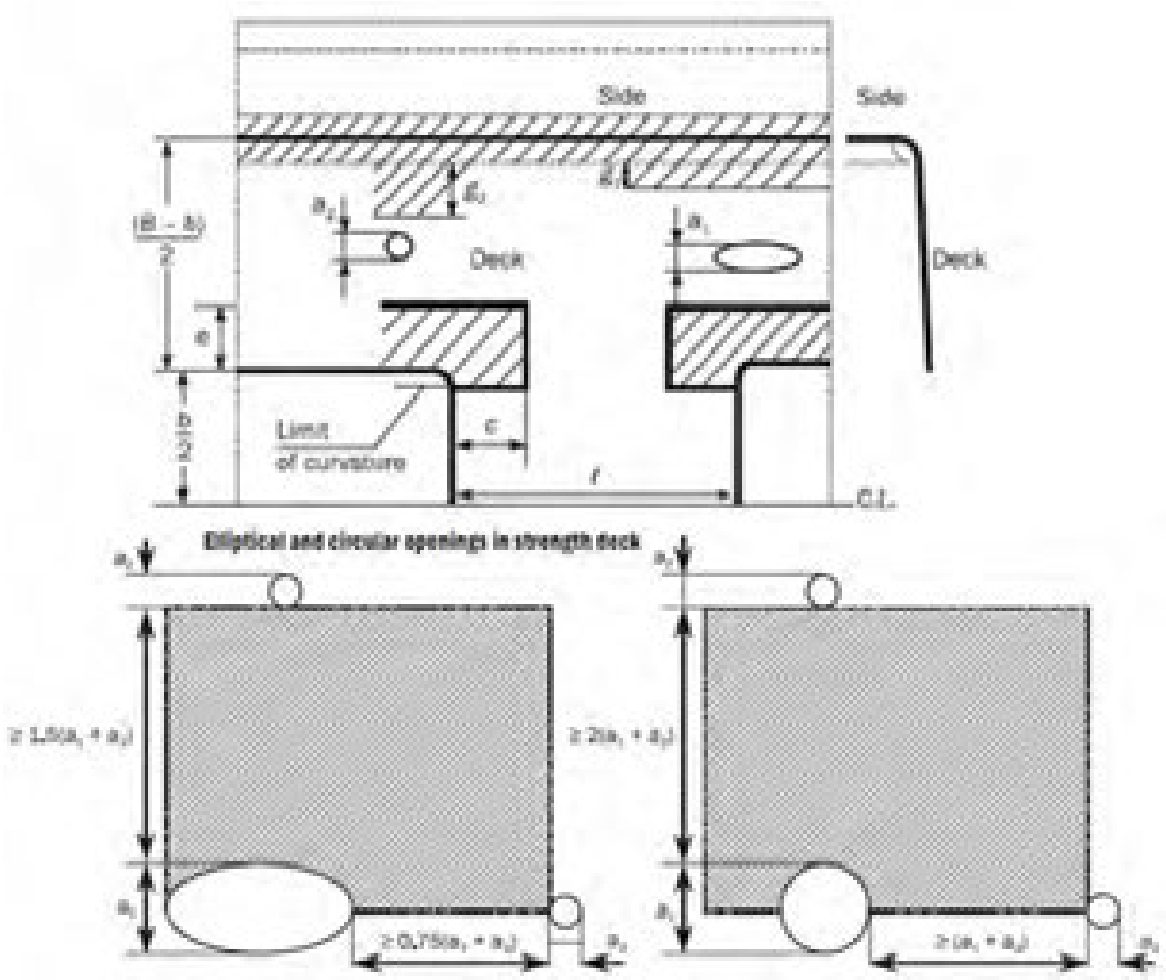

Figure 6.5.4.1: Position of openings in strength deck

6.5.4.2 Reinforcements

• Circular openings in strength deck within 0.6 L amidships and for ships with very large hatch openings within cargo hold region are to have edge reinforcement. The cross-sectional area of edge reinforcements, in [cm^2], is not to be less than:

$$A = 2.5\ d\ t$$

where,

d = diameter, in [m], of opening

t = net plate thickness of strength deck, in [mm].

The edge reinforcement of circular openings may be dispensed with, where the opening diameter is less than 300[mm] and the smallest distance from another opening is not less than 5 times the diameter of the smaller opening.

• The reinforcement is normally to be of a vertical ring welded to the plate edge. Alternative arrangements may be accepted provided the reinforcement is within a distance of 0.05d from the plate edge.

• Elliptical openings are to have their major axis in the fore and aft (longitudinal) direction. Where the ratio of the major axis to minor axis is less than 2 the openings are to be reinforced as circular openings taking d as the breadth of the opening (minor axis).

• Rectangular openings are to have their corners well rounded. Where corners are of circular shape the radius, (R) is not to be less than 20 % of the breadth of the opening and the edges are to be reinforced as circular openings taking d as the breadth of the opening. Special considerations with respect to longitudinal stresses and fatigue will be required in case of R < 0.2b.

• Where corners are of elliptical shape as given above or of streamlined shape, the reinforcement will generally not be required provided that the transverse extension of the curvature, a, shown in Figure 6.5.4.2 and Table 6.5.4 is not less than

$$a = 0.15b \text{ [m]}$$

• In way of the machinery spaces, special attention is to be paid to the maintenance of lateral stiffness by means of webs and heavy pillars in way of deck opening and casings.

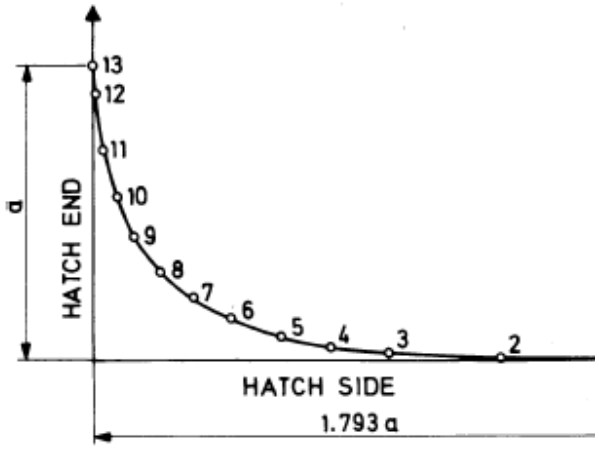

Figure 6.5.4.2: Streamlined deck corner

Table 6.5.4: Ordinates of streamlined corner		
Point	**Abscissa, x**	**Ordinate, y**
1	1.793a	0.0
2	1.381a	0.002a
3	0.987a	0.021a
4	0.802a	0.044a
5	0.631a	0.079a
6	0.467a	0.131a
7	0.339a	0.201a
8	0.224a	0.293a
9	0.132a	0.408a
10	0.065a	0.548a
11	0.022a	0.712a
12	0.022a	0.899a
13	0.0	1.00a

6.5.4.3 Corners of hatchways and Insert plates

• Where shapes other than the streamlined shape or equivalent are adopted, insert plates are to be fitted at the hatch corners in strength deck.

• Where insert plates are required, their net thickness is to be obtained, in [mm], from the following formula:

$$t_{INS} = \left(0.8 + 0.4\frac{b}{\ell}\right) t_{off}$$

without being taken less than t_{off} or greater than $1.6\, t_{off}$.

where:

t_{off} = offered net thickness, in [mm], of the deck at the side of the hatchways.

b = width, in [m], of the hatchway considered, measured in the transverse direction

ℓ = length, in [m], in way of the corner considered, of the cross-deck strip between two consecutive hatchways, measured in the longitudinal direction.

• For hatchways located within the cargo area, radiused insert plates, with thickness not less than determined above, are to be fitted in way of corners where the plating cut-out has a circular profile. The radius of circular corners is to be not less than:

– 5% of the hatch width, where a continuous longitudinal deck girder is fitted below the hatch coaming

– 8% of the hatch width, where no continuous longitudinal deck girder is fitted below the hatch coaming.

• Corner radius, in the case of the arrangement of two or more hatchways athwartship, is considered by IRS on a case-by-case basis.

• For hatchways located within the cargo area, insert plates are, in general, not required in way of corners where the plating cut-out has an elliptical or parabolic profile and the half axes of elliptical openings, or the half lengths of the parabolic arch, are not less than:

– 1/20 of the hatchway width or 600[mm], whichever is the lesser, in the transverse direction

– twice the transverse dimension, in the fore and aft direction (longitudinal direction)

• For the extreme corners of end hatchways, insert plates are required. The net thickness of these insert plates is to be 60 % greater than

the net offered thickness of the adjacent deck plating and the extent of the insert plate is shown in Figure 6.5.4.3 which d1, d2, d3 and d4 are to be greater than the stiffener spacing.

- A lower thickness may be accepted by IRS on the basis of calculations showing that stresses at hatch corners are lower than permissible values.

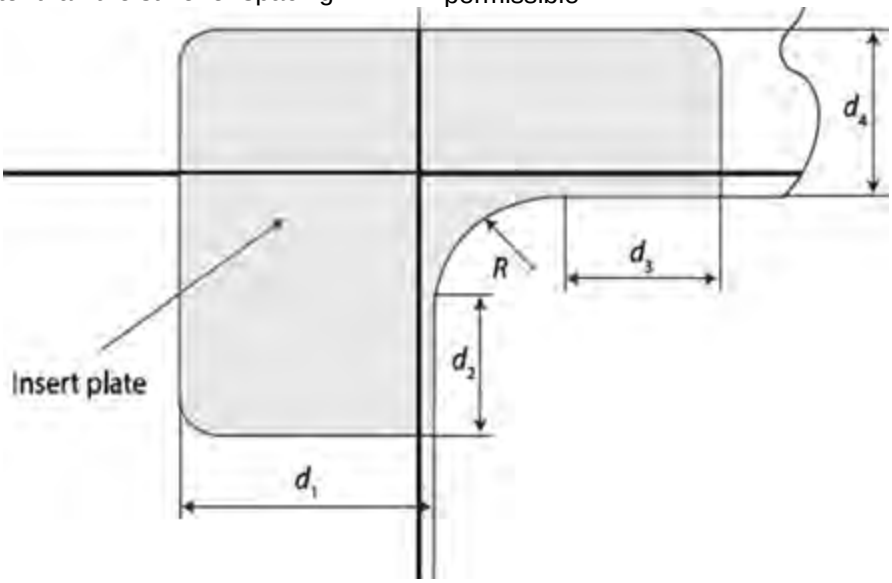

Figure 6.5.4.3: Hatch corner insert plate

- The butts of insert plates are to be well clear of those in coaming.

- For hatchways located outside the cargo area, a reduction in the thickness of the insert plates in way of corners may be considered by IRS on a case-by-case basis.

- For ships having length, L≥150[m], the corner radius, the thickness and the extent of insert plate may be determined by the results of a direct calculations according to Chapter 8, including buckling check and fatigue strength assessment of hatch corners according to Chapter 9 and Chapter 10 respectively.

6.5.4.4 Definitions of openings

The following definitions of opening are to be applied:

(i) Large openings are:

- Elliptical openings exceeding 2.5[m] in length or 1.2[m] in breadth.
- Circular openings exceeding 0.9[m] in diameter.

(ii) Small openings (i.e. lightening holes, single scallops in way of seams, etc.) are openings that are not large ones.

(iii) Manholes.

(iv) Isolated openings are openings spaced not less than 1[m] apart in the ship's transverse/vertical direction.

6.5.4.5 Large openings, manholes and nearby small openings

Large openings and manholes are to be deducted from the sectional area used in hull girder moment of inertia and section modulus. When small openings are spaced less than 1[m] apart in the ship's transverse/vertical direction to large openings or manholes, the total breadth of them is to be deducted from the sectional area.

Additionally, isolated small openings which do not comply with the arrangement requirements given in Chapter 3, Section 6, Cl.6.5.4.1 are to be deducted from the sectional areas included in the hull girder transverse sections.

Large openings and scallops where scallop-welding is applied, are always to be deducted from the sectional areas used in the hull girder moment of inertia and section modulus calculation.

6.5.4.6 Isolated small openings

Isolated small openings in one transverse section in the strength deck or bottom area need not be deducted from the sectional areas

included in the hull girder transverse sections, provided that:

$$\sum b_s \leq 0.06\left(B - \sum b\right)$$

where,

$\sum b_s$ = Total breadth of isolated small openings, in [m], in the strength deck or bottom area at the transverse section considered, determined as indicated in Figure 6.5.4.6, not deducted from the section area as per Cl.6.5.4.5.

$\sum b$ = Total breadth of large openings, in [m], at the transverse section considered, determined as indicated in Figure 6.5.4.6, deducted from the section area as defined in Cl.6.5.4.5.

Where the total breadth of isolated small openings Σb_s does not fulfil the above criteria, only the excess of breadth is to be deducted from the sectional areas included in the hull girder transverse sections.

Smaller openings (manholes, lightening holes, single scallops in way of seams etc.) need not to be deducted provided that the sum of their breadths or shadow area breadths in one transverse section does not reduce the section modulus at deck or bottom by more than 3% and provided that the height of lightening holes, draining holes and single scallops in longitudinals or longitudinal girders does not exceed 25% of the web depth, for scallops maximum 75[mm].

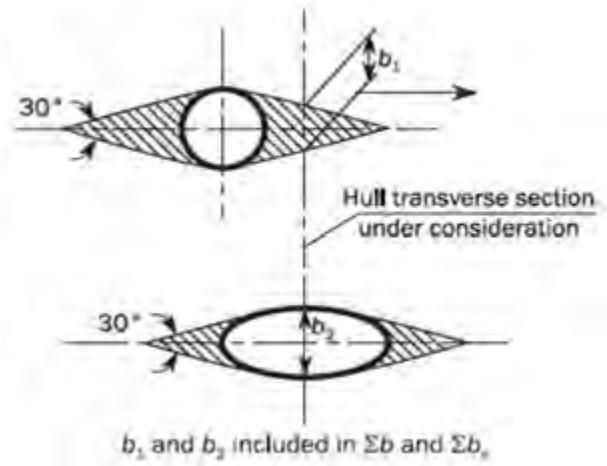

Figure 6.5.4.6: Calculation of $\sum b$ and $\sum b_s$

6.5.4.7 Lightening holes, draining holes and single scallops

Lightening holes, draining holes and single scallops in longitudinals need not be deducted if their height is less than $0.25h_w$, where h_w is the web height of the longitudinals, in [mm]. Otherwise, the excess is to be deducted from the sectional area or compensated.

6.5.4.8 Non-continuous decks and longitudinal bulkheads

When calculating the effective area in way of non-continuous decks and longitudinal bulkheads, the effective area is to be taken as shown in Figure 6.5.4.8. The shadow areas, which are not effective for hull girder bending but effective for hull girder shear force, are obtained by drawing two tangent lines with an angle of 15[deg] to the longitudinal axis of the ship.

The shadow area of an opening is the area forward and aft of the opening enclosed by lines drawn tangential to the corners of the opening and intersecting each other to form an included angle of 30[deg] as shown in Figure 6.5.4.8.

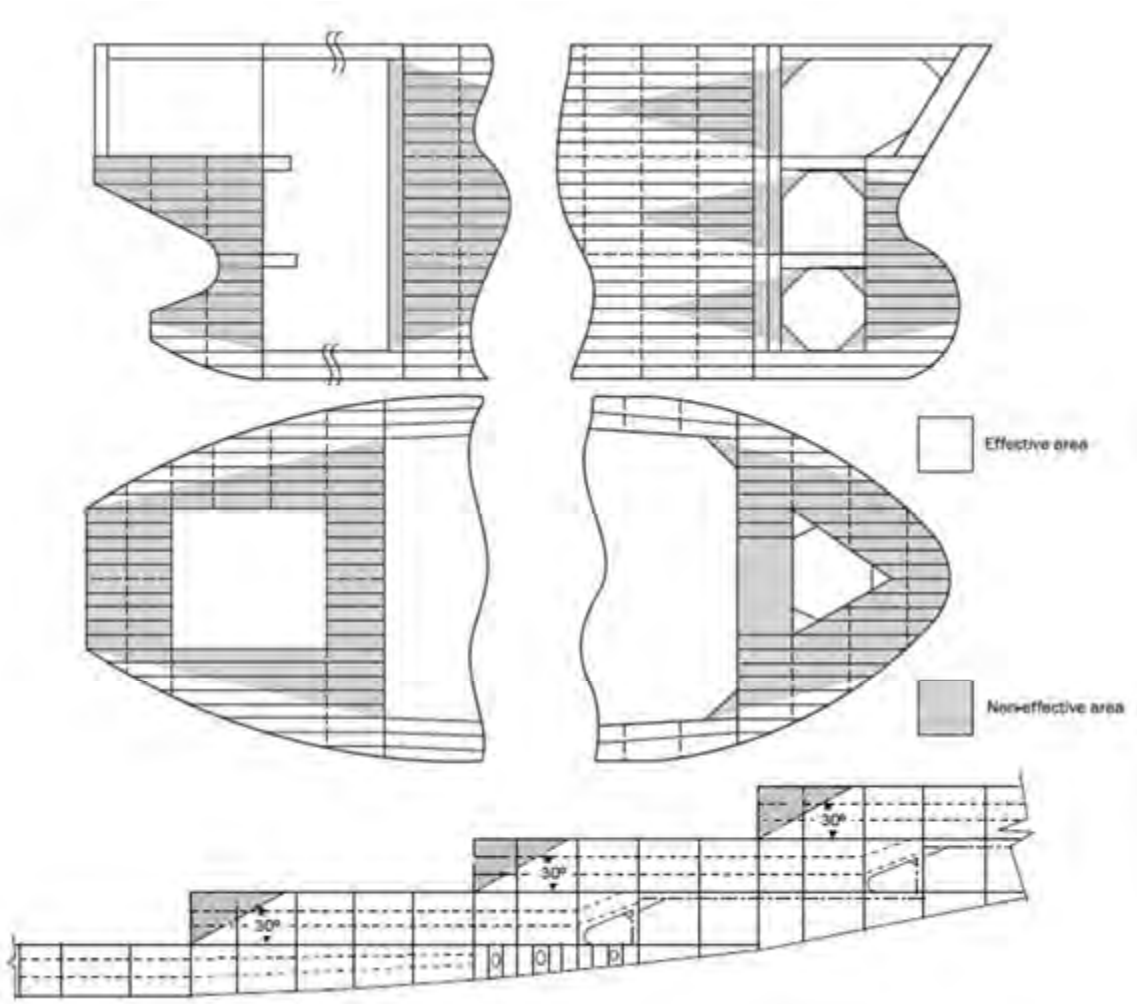

Figure 6.5.4.8: Effective area in way of non-continuous decks and bulkheads

6.5.5 Openings in side shell, longitudinal bulkheads and girders

6.5.5.1 Openings in the side shell, longitudinal bulkheads and longitudinal girders are to be located at a vertical distance below the strength deck or termination of rounded deck corner not less than.

– two times the opening breadth, in case of rectangular opening

– two times the opening diameter, in case of circular opening

– the opening minor axis, in case of elliptical openings.

6.5.5.2 Smaller openings in the outer bottom within 0.6L amidships or within the cargo hold region for ships with large hatch openings are to be reinforced as given in Cl.6.5.4.2. The area of these reinforcements is not to be included in the sectional areas used in the section modulus calculation.

6.5.5.3 Openings in side shell subjected to large shear stresses are to be of circular shape and are to be reinforced as given in Cl.6.5.4.2 irrespective of the size of opening.

6.5.5.4 Where openings are cut in the shell plating for windows or side scuttles, hawses, scuppers, sea valves etc., they are to have well rounded corners. If they exceed 700[mm], the openings are to be reinforced by framing, a thicker plate or a ring.

6.5.5.5 Openings in the ship sides, e.g. for cargo ports, are to be well rounded at the corners and located well clear of superstructure ends or any openings in the deck areas at sides of hatchways.

6.5.5.6 Openings for sea intakes are to be well rounded at the corners and, within 0.6L amidships, located outside the bilge strakes.

6.5.5.7 Where arrangements are such that sea intakes are unavoidably located in the curved zone of the bilge strakes, such openings are to be elliptical with the major axis in the longitudinal direction. Openings for stabilizer fins are considered by IRS on a case-by-case basis.

6.5.5.8 In general, compensation will not be required for holes in the steer strake which are located away from the gunwale or any deck openings situated outside the line of the main hatchways and whose depth does not exceed 20% of the depth of the sheer strake or 380 [mm], whichever is the lesser. Openings are not to be cut in a rounded gunwale.

6.5.5.9 The keel plate is normally not to have any openings.

6.5.5.10 In the bilge plate, within 0.6L amidships, openings are to be avoided as far as practicable. Any necessary openings in the bilge plate are to be kept well clear of the bilge keel.

Section 7

Structural Idealisation

Symbols

For symbols not defined in this section, Refer to Chapter 1, Section 2.

PSM = Primary Supporting Member.

EPP = Elementary Plate Panel.

LCP = Load Calculation Point.

φ_w = Angle, in [deg], between the stiffener or PSM web and the attached plating, Refer Figure 7.4.3.

φ_w is to be taken equal to 90[deg] if the angle is greater than or equal to 75[deg].

l_{bdg} = Effective bending span, in [m], as defined in Cl.7.1.1 for stiffeners and Cl.7.1.7 for PSM.

l_{shr} = Effective shear span, in [m], as defined in Cl.7.1.3 for stiffeners and Cl.7.1.8 for PSM.

l = Full length of stiffener or of PSM, in [m], between their supports.

s = Stiffener spacing, in [mm], as defined in Cl.7.2.1.

S = Primary supporting member spacing, in [m], as defined in Cl.7.2.2.

a = Length, in [mm], of EPP as defined in Cl.7.5.1.

b = Breadth, in [mm], of EPP as defined in Cl.7.5.1.

h_{stf} = Stiffener height, including the face plate, in [mm].

t_p = Net thickness of attached plate, in [mm].

t_w = Net web thickness, in [mm].

b_f = Breadth of flange, in [mm].

t_f = Net thickness of flange, in [mm].

7.1 Structural idealization of stiffeners and Primary Supporting Members

7.1.1 Effective bending span of stiffeners

7.1.1.1 Where arrangements differ from those defined in this article, span definition may be specially considered.

7.1.1.2 The effective bending span l_{bdg} of stiffeners is to be measured as shown in Figure 7.1.1.1 for single skin structures and Figure 7.1.1.2 for double skin structures.

7.1.1.3 If the web stiffener is sniped at the end or not attached to the stiffener under consideration, the effective bending span is to be taken as the full lengths between PSMs unless a backing bracket is fitted.

7.1.1.4 The effective bending span may be reduced where brackets are fitted to the flange or free edge of the flat bar stiffeners. Brackets fitted on the side opposite to that of the stiffener with respect to attached plating are not to be considered as effective in reducing the effective bending span.

7.1.1.5 In single skin structures, the effective bending span of a stiffener supported by a bracket or by a web stiffener on one side only of the primary supporting member web, is to be taken as the total span between primary supporting members as shown in item (a) of Figure 7.1.1.1. If brackets are fitted on both sides of the primary supporting member, the effective bending span is to be taken as in items (b), (c) and (d) of Figure 7.1.1.1.

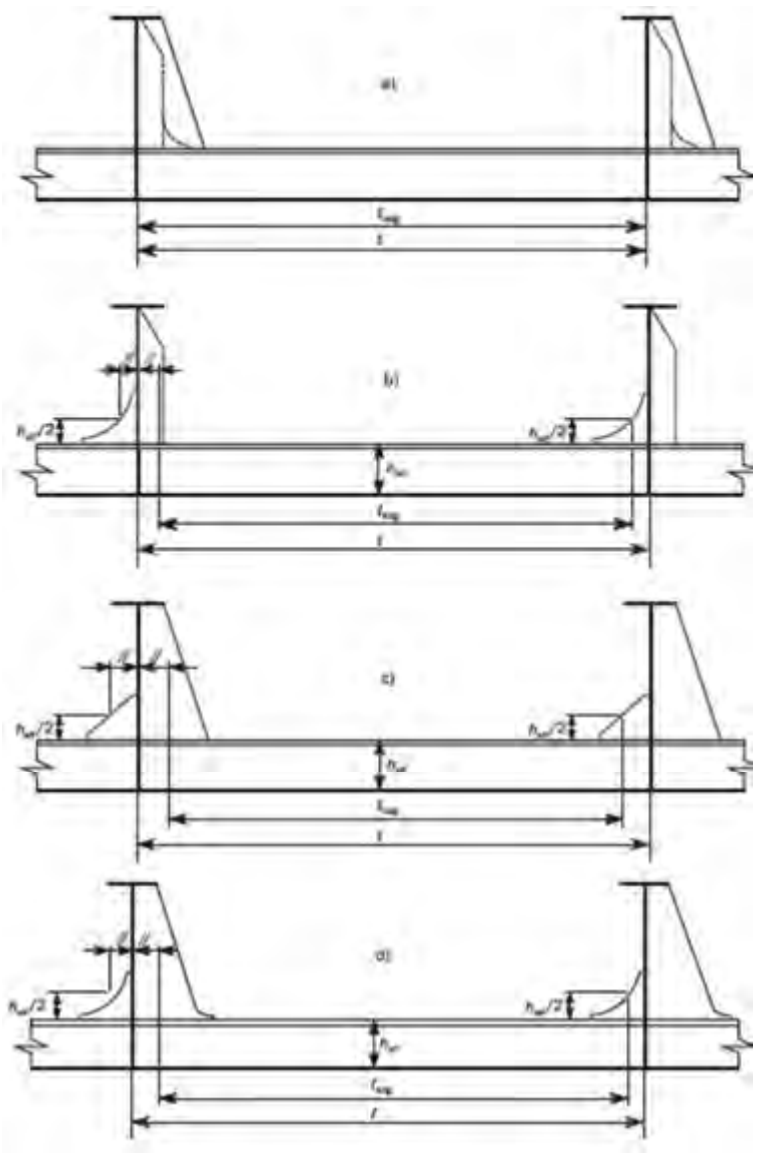

Figure 7.1.1.1: Effective bending span of stiffeners supported by web stiffeners (single skin construction)

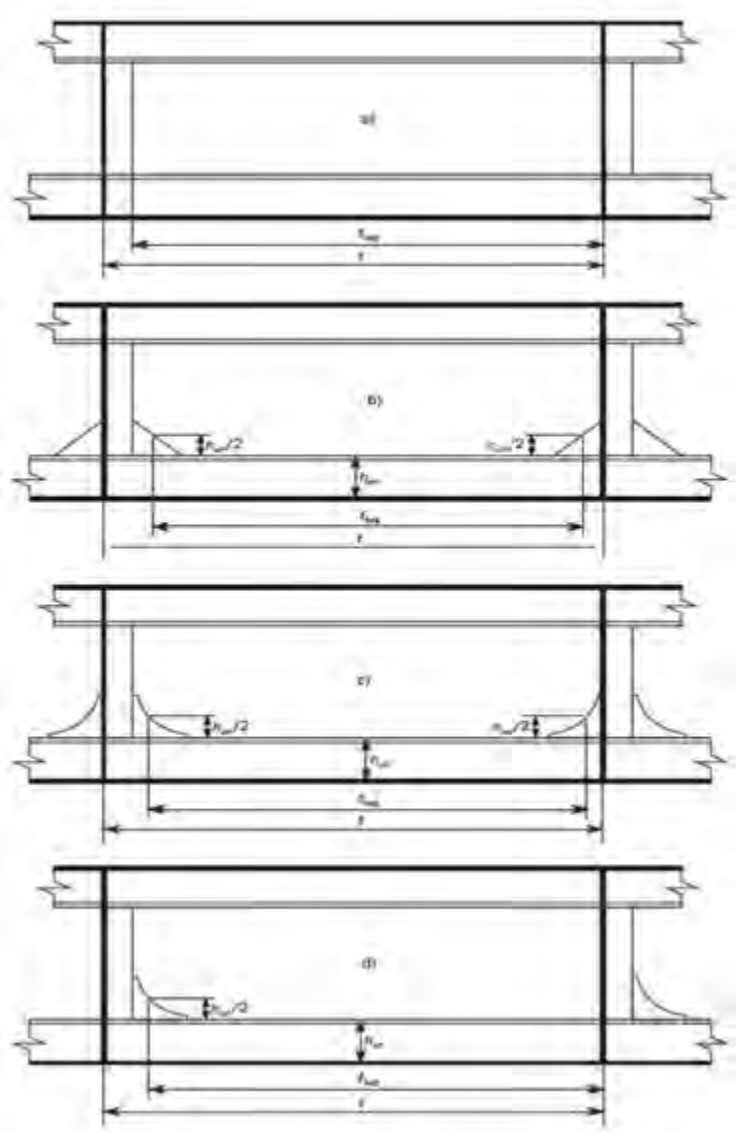

Figure 7.1.1.2: Effective bending span of stiffeners supported by web stiffeners (double skin construction)

7.1.2 Effective bending span of stiffeners with continuous flange along bracket edge

Where the flange of the stiffener is continuous along the edge of the bracket, the effective bending span is to be taken to the position where the depth of the bracket is equal to one quarter of the depth of the stiffener, Refer Figure 7.1.2.

7.1.3 Effective shear span of stiffeners

7.1.3.1 The effective shear span, l_{shr} in [m], of stiffeners is to be measured as shown in Figure 7.1.3.1 for single skin structures and Figure 7.1.3.2 for double skin structures.

7.1.3.2 The effective shear span may be reduced for brackets fitted on either the flange or the free edge of the flat bar stiffeners, or for brackets fitted to the attached plating on the side opposite to that of the stiffener.

7.1.3.3 If brackets are fitted at both the flange or free edge of the stiffener, and to the attached plating on the side opposite to the stiffener the effective shear span may be reduced using the longer effective bracket arm.

7.1.3.4 Regardless of support detail, the full length of the stiffener may be reduced by a minimum of s/4000 [m] at each end of the member, hence the effective shear span l_{shr}, is not be taken greater than:

$$l_{\mathrm{shr}} = l - \frac{\mathrm{s}}{2000}$$

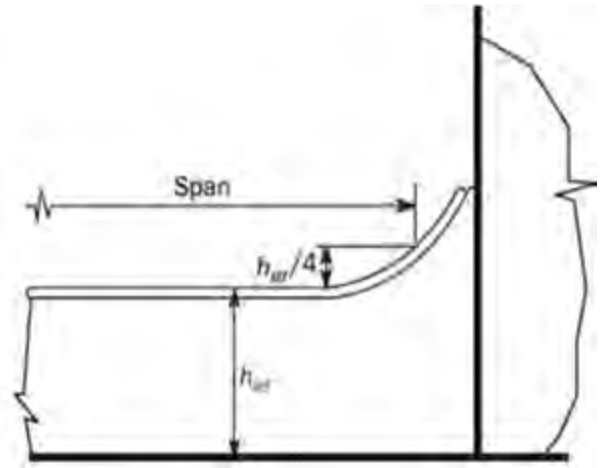

Figure 7.1.2: Effective bending span of stiffener with continuous flange along bracket edge

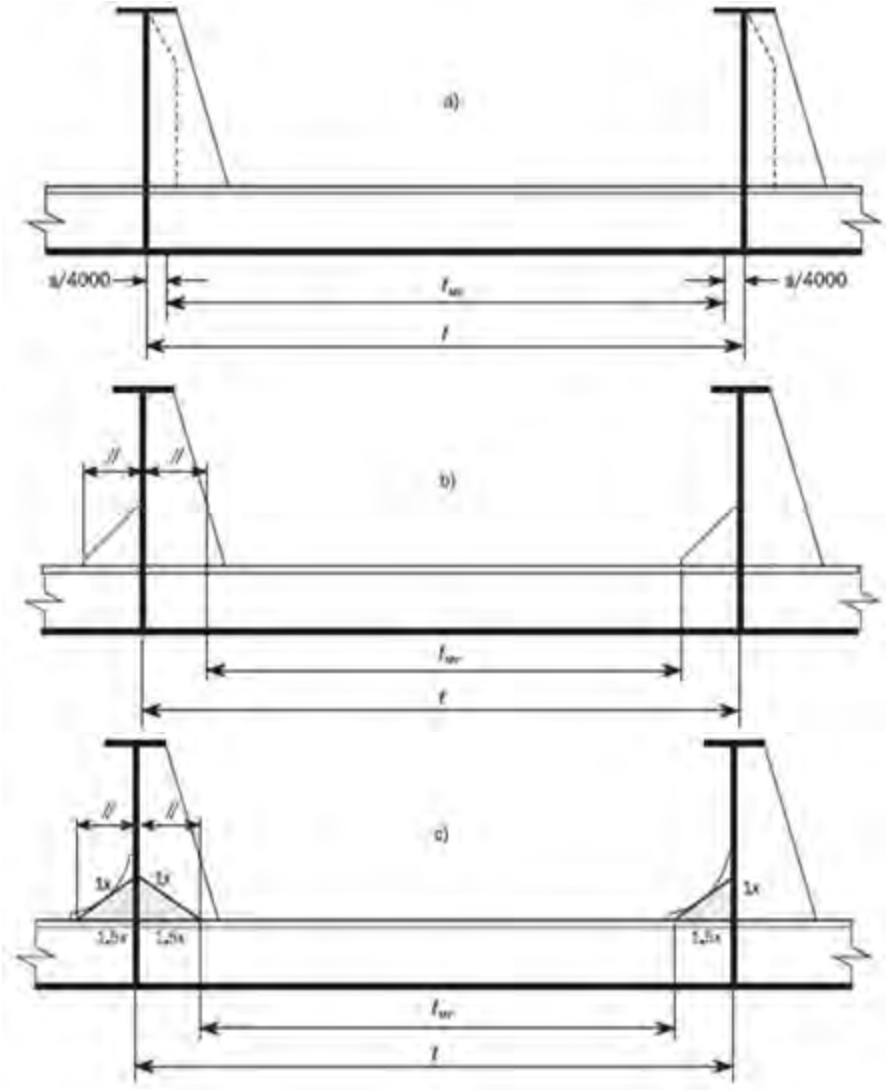

Figure 7.1.3.1: Effective shear span of stiffeners supported by web stiffeners (single skin construction)

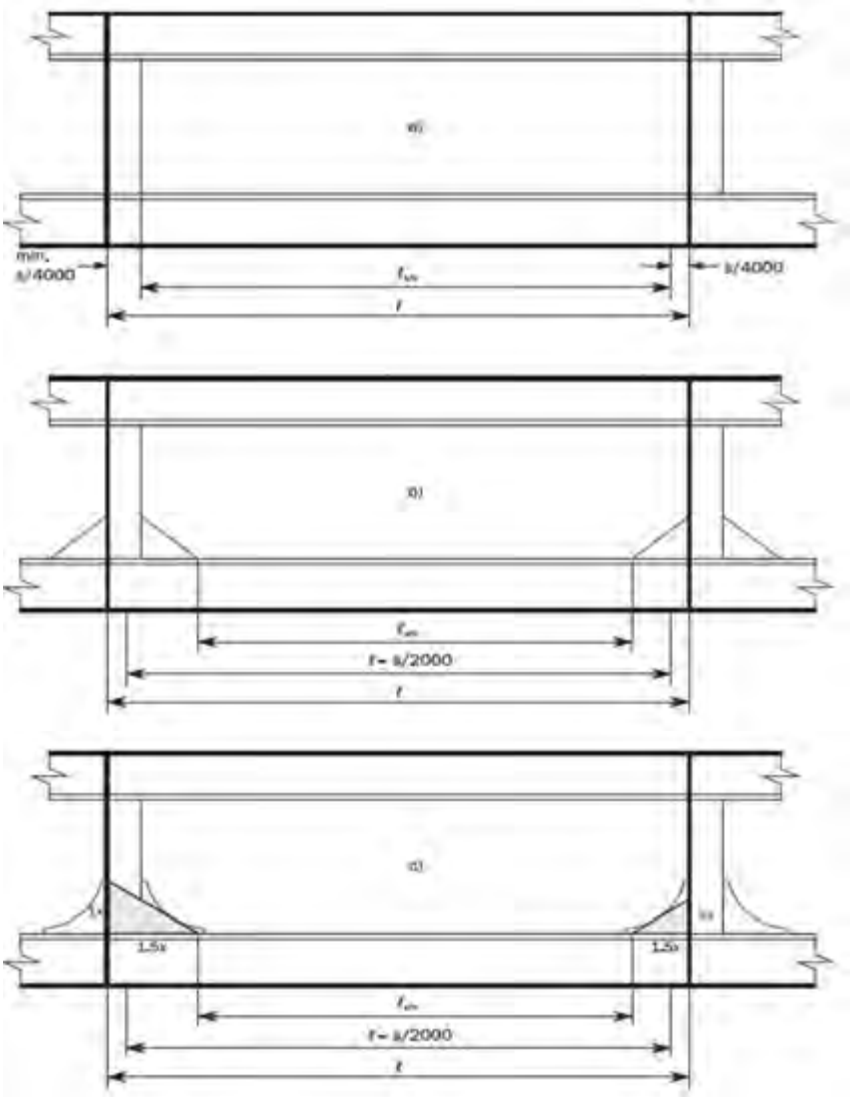

Figure 7.1.3.2: Effective shear span of stiffeners supported by web stiffeners (double skin construction)

7.1.4 Effective shear span of stiffeners with continuous flange along bracket edge

7.1.4.1 For curved and/or long brackets (high length/height ratio), the effective bracket length is to be taken as the maximum inscribed 1:1.5 right angled triangle as shown in item (c) of both Figure 7.1.3.1 and Figure 7.1.3.2.

7.1.4.2 Where the face plate of the stiffener is continuous along the curved edge of the bracket, the bracket length to be considered for determination of the span point location is not to be taken greater than 1.5 times the length of the bracket arm as shown in Figure 7.1.4.

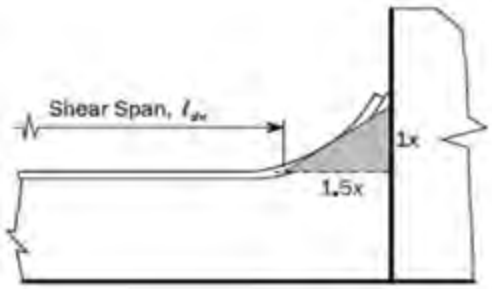

Figure 7.1.4: Effective shear span for local support members with continuous face plate along bracket edge

7.1.5 Effect of hull form shape on span of stiffeners

For curved stiffeners, the span is defined as the chord length between span points to be measured at the flange for stiffeners with a flange, and at the free edge for flat bar stiffeners, Refer Figure 7.1.5. The calculation of the effective span is to be in accordance with requirements given in Cl.7.1.1 and Cl.7.1.3.

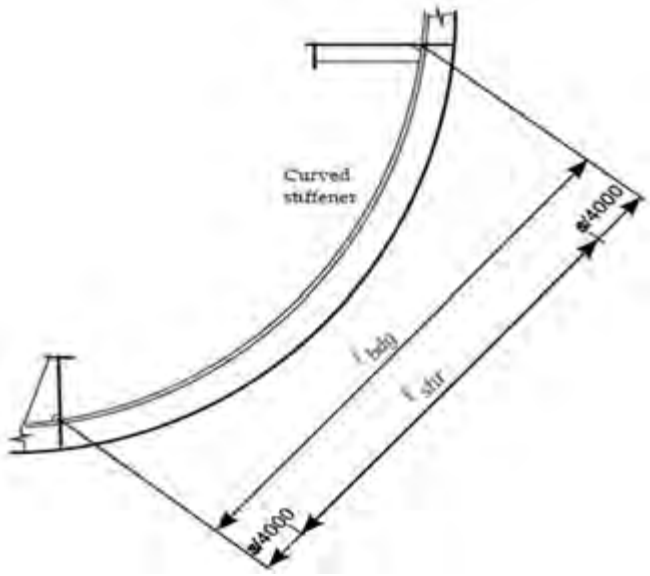

Figure 7.1.5: Effective span of curved stiffener

7.1.6 Effective span of stiffeners supported by struts

7.1.6.1 The arrangement of stiffeners supported by struts is not allowed for ships over 120[m] in length.

7.1.6.2 Stiffeners supported by struts are not allowed in way of boundaries to cargo tanks or fuel oil tanks.
Struts, in general, are not to be fitted in way where cargo is discharged by grabs, or heavy liquid cargoes are carried, or in the bottom forward slamming area;

Particular attention is to be paid to deflection of members and to the ability of the structure to resist buckling. Where necessary, additional calculations will be required.

7.1.6.3 The bending and shear spanl_{bdg} and l_{shr}, of stiffeners supported by one strut fitted at mid distance of the primary supporting members is to be taken as 0.8l, Refer Figure 7.1.6.1.

7.1.6.4 In case where two struts are fitted at 1/3 and 2/3 length between primary supporting members, the bending and shear span, l_{bdg} and l_{shr}, of stiffeners is to be taken as 0.7l, Refer Figure 7.1.6.2.

7.1.6.5 When the ratio between the net section modulus of the larger stiffeners and the smaller stiffeners connected by strut(s) exceeds 1.5, the above reduction in the bending span is not applicable.

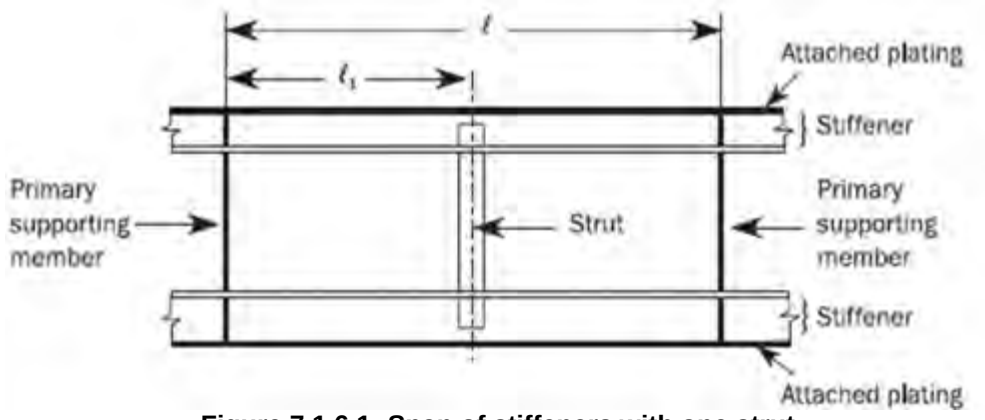

Figure 7.1.6.1: Span of stiffeners with one strut

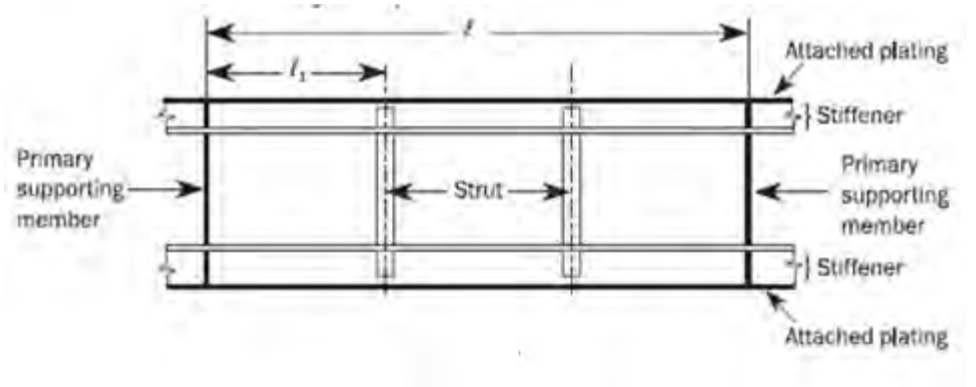

Figure 7.1.6.2: Span of stiffeners with two struts

7.1.7 Effective bending span of primary supporting members

7.1.7.1 The effective bending span, l_{bdg}, in [m], of a primary supporting member without end bracket is to be taken as the length of the member between supports.

7.1.7.2 The effective bending span, l_{bdg} of a primary supporting member may be taken as less than the full length of the member between supports provided that suitable end brackets are fitted.

7.1.7.3 The effective bending span l_{bdg}, in [m], of a primary supporting member with end brackets is taken between points where the depth of the bracket is equal to half the web height of the primary supporting member as shown in item (b) of Figure 7.1.7. The effective bracket used to define these span points are to be taken as given in Cl.7.1.10.

7.1.7.4 In case of brackets where the face plate of the member is continuous along the face of the bracket, as shown in items (a), (c) and (d) of Figure 7.1.7, the effective bending span l_{bdg}, in m, is taken between points where the depth of the bracket is equal to one quarter the web height of the primary supporting member. The effective bracket used to define these span points is to be taken as given in Cl.7.1.10.

7.1.7.5 For straight brackets with a length to height ratio greater than 1.5, the span point is to be taken to the effective bracket; otherwise, the span point is to be taken to the fitted bracket.

7.1.7.6 For curved brackets, for span positions above the tangent point between fitted bracket and effective bracket, the span point is to be taken to the fitted bracket; otherwise, the span point is to be taken to the effective bracket.

7.1.7.7 For arrangements where the primary supporting member face plate is carried on to the bracket and backing brackets are fitted, the span point need not be taken greater than to the position where the total depth reaches twice the depth of the primary supporting member. Arrangements with small and large backing brackets are shown in items (e) and (f) of Figure 7.1.7.

7.1.7.8 For arrangements where the height of the primary supporting member is maintained and the face plate width is increased towards the support; the effective bending span may be taken to a position where the face plate breadth reaches twice the nominal breadth. Attention is to be paid to tripping of the flanges as per Section 6, Cl.6.3.3.4.

7.1.8 Effective shear span of primary supporting members

7.1.8.1 The effective shear span of the primary supporting member may be reduced compared to effective bending span, and taken between the toes of the effective brackets supporting the member, where the toes of effective brackets are as shown in Figure 7.1.8. The effective bracket used to define the toe point is given in Cl.7.1.10.

7.1.8.2 For arrangements where the effective backing bracket is larger than the effective bracket in way of face plate, the shear span is to be taken as the mean distance between toes of the effective brackets as shown in item (f) of Figure 7.1.8.

7.1.9 Effect of hull form shape on span of primary supporting members

For curved primary supporting members, the span is defined as the chord length between span points. The calculation of the effective span is to be in accordance with requirements given in Cl.7.1.8.

7.1.10 Effective bracket definition

The effective bracket is defined as the maximum size of right angled triangular bracket with a length to height ratio of 1.5 that fits inside the fitted bracket. Refer Figure 7.1.7 for examples.

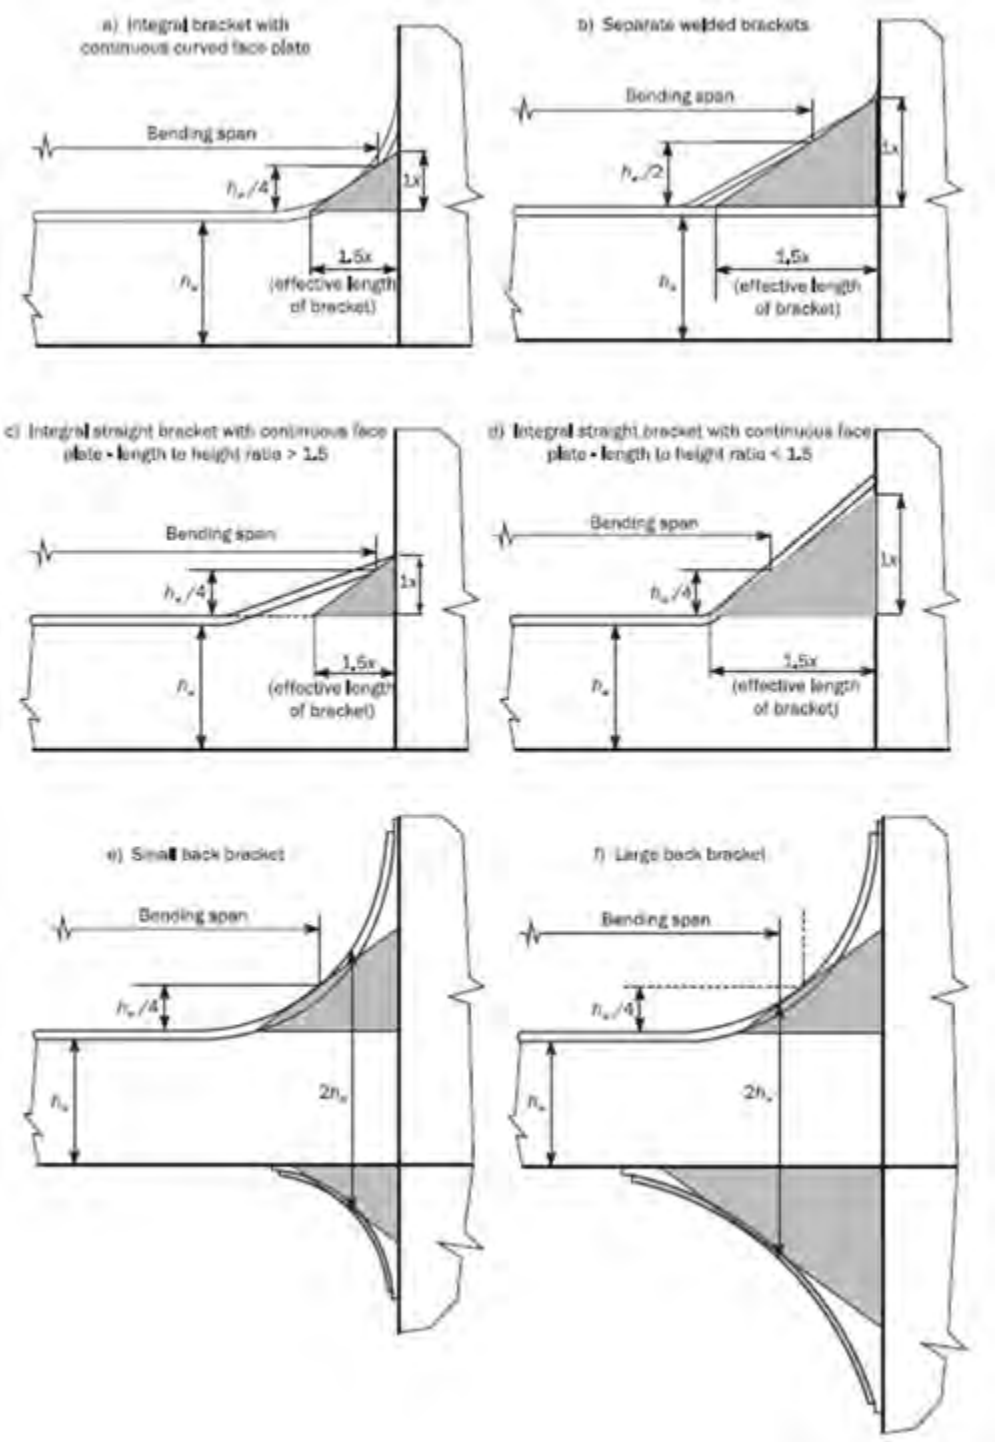

Figure 7.1.7: Effective bending span of primary supporting member

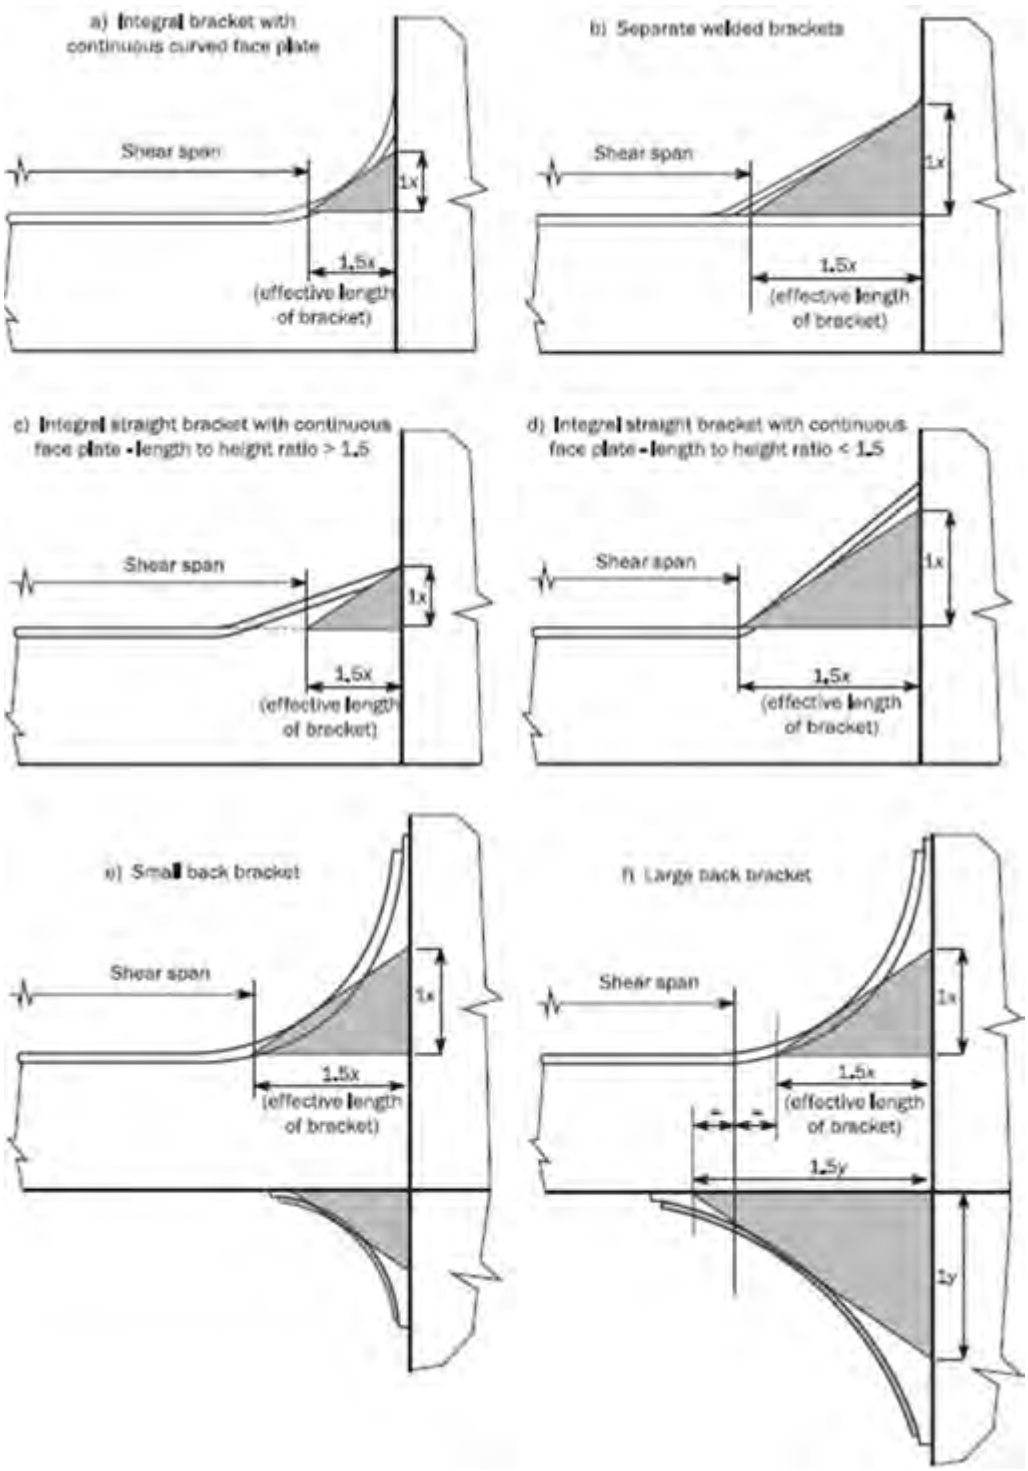

Figure 7.1.8: Effective shear span of primary supporting member

7.2 Spacing and load supporting breadth

7.2.1 Stiffeners

Stiffener spacing, s, in [mm], for the calculation of the effective attached plating of stiffeners is to be taken as the mean spacing between stiffeners and taken equal to, Refer Figure 7.2.1:

$$s = \frac{b_1 + b_2 + b_3 + b_4}{4}$$

where:

b_1, b_2, b_3, b_4 = Spacing between stiffeners at ends, in [mm].

In general, the loading breadth supported by stiffener is to be taken equal to s.

7.2.2 Primary supporting member

Primary supporting member spacing, S, for the calculation of the effective attached plating of primary supporting members is to be taken as the mean spacing between adjacent primary supporting members, and taken equal to, Refer Figure 7.2.1.

$$S = \frac{b_1 + b_2 + b_3 + b_4}{4}$$

where:

b_1, b_2, b_3, b_4 = Spacings between primary supporting members at ends, in [mm].

In general, the loading breadth supported by a primary supporting member is to be taken equal to S.

7.2.3 Spacing of curved plating

For curved plating, the stiffener spacing, s or the primary supporting member spacing, S is to be measured on the mean chord between members.

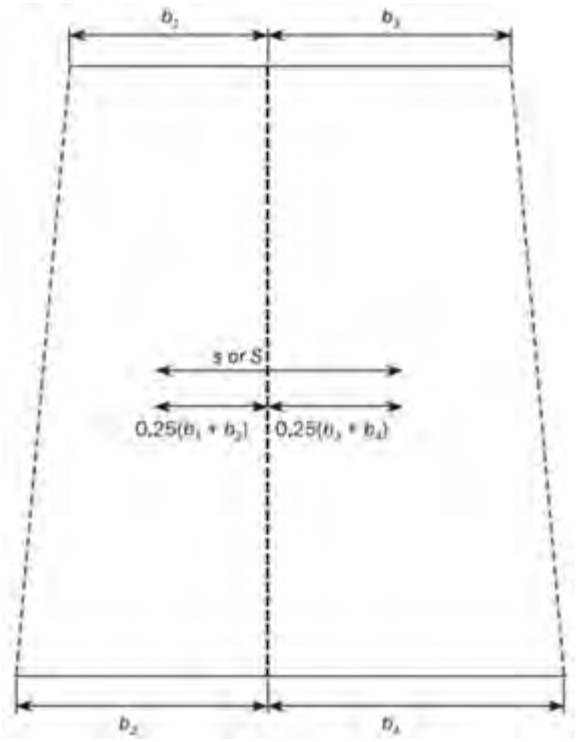

Figure 7.2.1: Spacing of plating

7.3 Effective breadth of attached plating

7.3.1 Stiffeners

The effective breadth, b_{eff}, in [mm], of the attached plating to be considered in the actual net section modulus for the yielding check of stiffeners is to be obtained from the following formulae:

7.3.1.1 where the plating extends on both sides of the stiffener:

$$b_{eff} = \min(200l\ ;\ s)$$

7.3.1.2 where the plating extends on one side of the stiffener, i.e. stiffeners bounding openings:

$$b_{eff} = \min(100l\ ;\ 0.5s)$$

However, where the attached plate net thickness is less than 8[mm], the effective breadth is not be taken greater than 600[mm]. The effective breadth, b_{eff}, in [mm], of the attached plating to be considered for the buckling check of stiffeners is given in Chapter 9, Section 5, Cl.5.2.3.5.

7.3.2 Primary supporting members

7.3.2.1 The effective breadth of attached plating, b_{eff}, in [m], for calculating the section modulus and/or moment of inertia of a primary supporting member with uniform load is to be taken as:

$$b_{eff} = S\,.\min\left[\frac{1.12}{1 + \frac{1.75}{\left(\frac{l_{bdg}}{S\sqrt{3}}\right)^{1.6}}}\ ;\ 1.0\right] \text{ for } \frac{l_{bdg}}{S\sqrt{3}} \geq 1$$

$$b_{eff} = 0.407\left(\frac{l_{bdg}}{\sqrt{3}}\right) \text{ for } \frac{l_{bdg}}{S\sqrt{3}} < 1$$

7.3.2.2 For double skin sections such as double bottom or double side structures with uniform load, full flange effectivity may normally be assumed for the members representing the floors or web frames. The effective breadth of attached plating, b_{eff} in [m], is to be taken as:

$$b_{eff} = S$$

7.3.2.3 Within $0.1l_{bdg}$ from the end of bending span or in way of concentrated point loads, the effective breadth b_{eff^*} in [m] of the attached plating is to be taken as:

$$b_{eff^*} = 0.5.b_{eff}$$

7.3.2.4 In case of girders on corrugated bulkheads which run across the corrugations, the effective width of attached plating is to be taken as 10% of that obtained from Cl.7.3.2.1.

7.3.2.5 The effective cross-sectional area of the attached plating is not to be less than that of the face plate.

7.3.3 Effective area of curved face plate and attached plating of primary supporting members

The effective net area given in Cl.7.3.3.1 and Cl.7.3.3.2 below is only applicable to curved face plates and curved attached plating of primary supporting members. It is not applicable for the area of web stiffeners parallel to the face plate.

The effective net area is applicable to primary supporting members for the following calculations:

- Actual net section modulus used for comparison with the scantling requirements in Chapter 7.

- Actual effective net area of curved face plates, modelled by beam elements, used in Chapter 8.

7.3.3.1 The effective net area, $A_{eff-n50}$, in [mm^2], is to be taken as:

$$A_{eff-n50} = C_f.t_{f-n50}.b_f$$

where:

C_f = Flange efficiency coefficient is to be obtained from the following formula but not to be greater than 1.0. Refer Figure 7.3.3.2:

$$C_f = C_{f1}\frac{1.285}{\beta k_1} \quad \text{for symmetrical face plate}$$

$$C_f = 0.18 + \frac{0.08}{\beta^2} \quad \text{for unsymmetrical face plate}$$

$$C_f = C_{f1}\frac{1.285}{\beta} \quad \text{for attached plating of box girders}$$

C_{f1} = Coefficient taken equal to:

- For symmetrical face plates,

$$C_{f1} = \frac{(\sinh k_1\beta\ \cosh k_1\beta + \sin k_1\beta\ \cos k_1\beta)}{(\cosh k_1\beta)^2 + (\cos k_1\beta)^2}$$

- For attached plating of box girders with two webs,

$$C_{f1} = \frac{0.78\ (\sinh\beta + \sin\beta)(\cosh\beta - \cos\beta)}{(\sinh\beta)^2 + \sin^2\beta}$$

- For attached plating of box girders with multiple webs,

$$C_{f1} = \frac{1.56\ (\cosh\beta - \cos\beta)}{\sinh\beta + \sin\beta}$$

β = Coefficient calculated as:

$$\beta = \frac{1.285\ b_1}{\sqrt{r_f\ t_f}},\ \text{in [rad]}$$

k_1 = Coefficient calculated as:

= 1.4+1.25$(1.4-\beta)^3$ for $\beta < 1.4$

= 1.4 for $\beta \geq 1.4$

b_1 = Breadth, in [mm], to be taken equal to:

- for symmetrical face plates, b_1 = 0.5(b_f – t_{w-n50})

- for unsymmetrical face plates, $b_1 = b_f$

- for attached plating of box girders, $b_1 = s_w - t_{w-n50}$

s_w = Spacing of supporting webs for box girders, in [mm].

t_{f-n50} = Net flange thickness in [mm].

For calculation of C_f and β of unsymmetrical face plates, t_{f-n50} is not be taken greater than t_{w-n50}.

t_{w-n50} = Net web plate thickness, in [mm].

r_f = Radius of curved face plate or attached plating, in [mm], Refer Figure 7.3.3.1 at mid thickness

b_f = Breadth of face plate or attached plating, in [mm], Refer Figure 7.3.3.1.

7.3.3.2 The effective net area, $A_{eff-n50}$ in [mm^2], of curved face plates supported by radial

brackets, or attached plating supported by radial stiffeners, is given by:

$$A_{eff-n50} = \left(\frac{3r_f\, t_f + C_f s_r^2}{3r_f\, t_f + s_r^2}\right) t_f . b_f$$

where:

s_r = Spacing of tripping brackets or web stiffeners or stiffeners normal to the web plating, in [mm], Refer Figure 7.3.3.1.

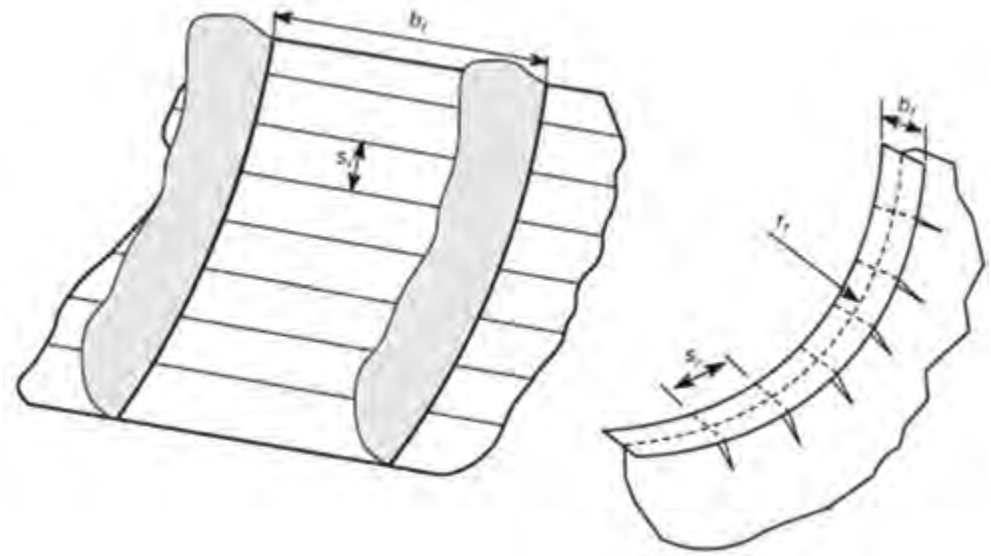

Figure 7.3.3.1: Curved shell panel and face plate

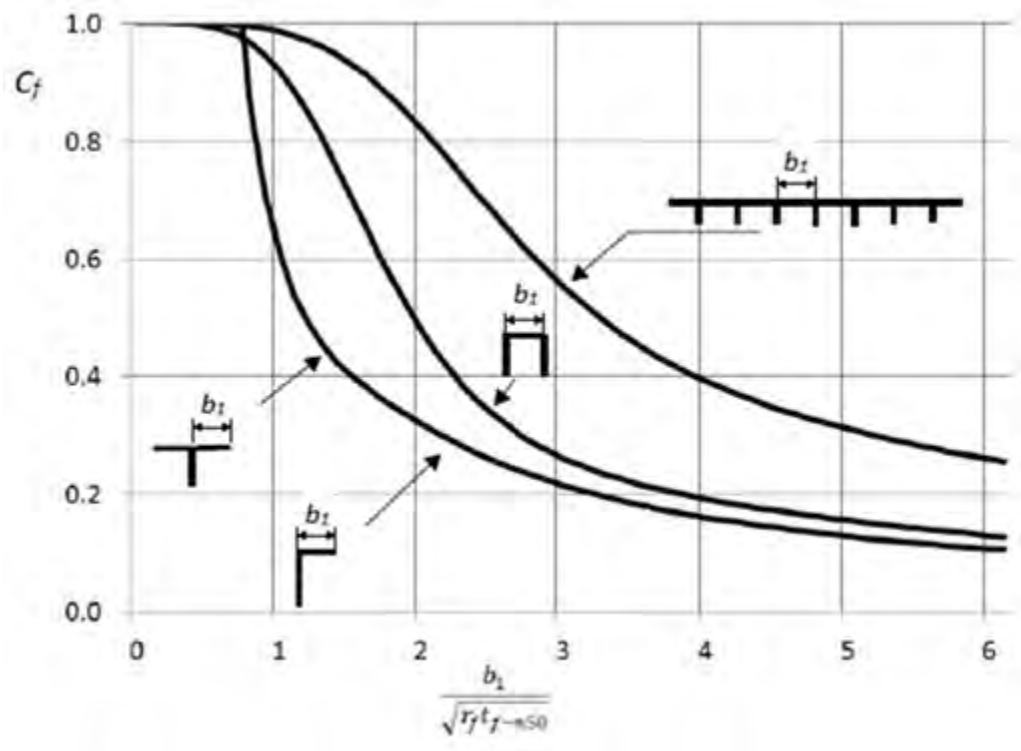

Figure 7.3.3.2: Flange efficiency coefficient for curved face plates

7.4 Geometrical properties of stiffeners and primary supporting members

7.4.1 Stiffener profile with a bulb section

The properties of bulb profile sections are to be determined by direct calculations. Where direct calculation of properties is not possible, a bulb section may be taken equivalent to an

angle section. The net dimensions of the equivalent angle section are to be obtained, in [mm], from the following formulae.

$$h_w = h'_w - \frac{h'_w}{9.2} + 2$$

$$b_f = \alpha\left(t'_w + \frac{h'_w}{6.7} - 2\right)$$

$$t_f = \frac{h'_w}{9.2} - 2$$

$$t_w = t'_w$$

where:

h'_w, t_w = Net height and net thickness of a bulb section, in [mm], as shown in Figure 7.4.1

α = Coefficient equal to:

$$\alpha = 1.1 + \frac{(120 - h'_w)^2}{3000} \quad \text{for } h'_w \leq 120$$

$$\alpha = 1.0 \quad \text{for } h'_w > 120$$

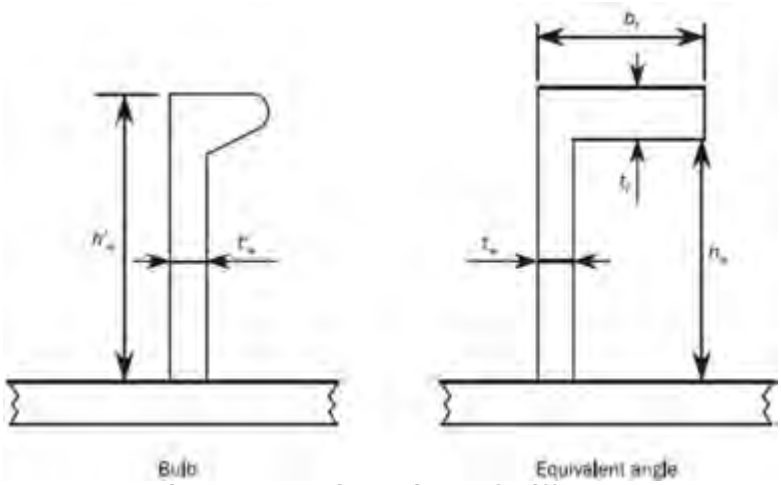

Figure 7.4.1: Dimensions of stiffeners

7.4.2 Net elastic shear area of stiffeners

The net elastic shear area, A_{shr}, in [cm^2], of stiffeners is to be taken as:

$$A_{shr} = d_{shr}\, t_w\, 10^{-2}$$

d_{shr} = Effective shear depth of stiffener, in [mm], as defined in Cl.7.4.3.

t_w = Net web thickness of the stiffener, in [mm] as defined in Chapter 2, Section 4, Figure 4.6.2.

7.4.3 Effective shear depth of stiffeners

The effective shear depth of stiffeners, d_{shr}, in [mm], is to be taken as:

$$d_{shr} = \left(h_{stf} - 0.5t_{c-stiff} + t_p + 0.5t_{c-pl}\right)$$

$$\text{for } 75° \leq \varphi_w \leq 90°$$

$$d_{shr} = \left(h_{stf} - 0.5t_{c-stiff} + t_p + 0.5t_{c-pl}\right) \sin\varphi_w$$

$$\text{for } \varphi_w < 75°$$

where:

h_{stf} = Height of stiffener, in [mm], as defined in Chapter 2, Section 4, Figure 4.6.2.

t_p = Net thickness of the stiffener attached plating, in [mm], as defined in Chapter 2, Section 4, Figure 4.6.2.

φ_w = Angle, in [deg], as defined in Figure 7.4.3.

φ_w is to be taken as 90[deg] if the angle is greater than or equal to 75[deg].

7.4.4 Elastic net section modulus and net moment of inertia of stiffeners

The elastic net section modulus, *Z* of stiffeners, in [cm^3], and the net moment of inertia, I, in [cm^4] of stiffeners is to be taken as:

$$Z = (Z_{stf}) \quad \text{for } 75° \leq \varphi_w \leq 90°$$

$$Z = (Z_{stf}) \sin\varphi_w \quad \text{for } \varphi_w < 75°$$

$$I = (I_{st}) \text{ for } 75° \leq \varphi_w \leq 90°$$

$$I = (I_{st}) \sin \varphi_w \text{ for } \varphi_w < 75^\circ$$

where:

Z_{stf} = Net section modulus of the stiffener, in [cm^3], considered perpendicular to its attached plate, i.e., with φ_w = 90[deg].

I_{st} = Net moment of inertia of the stiffener, in [cm^4], considered perpendicular to its attached plate, i.e., with φ_w = 90[deg].

φ_w = Angle, in [deg], as defined in Figure 7.4.3.

φ_w is to be taken as 90[deg] if the angle is greater than or equal to 75[deg].

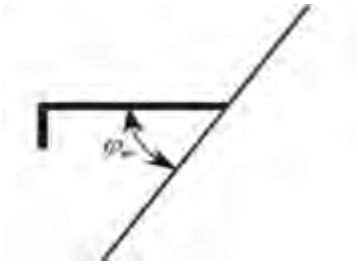

Figure 7.4.3: Angle between stiffener web and attached plating

7.4.5 Effective net plastic shear area of stiffeners

The net plastic shear area, A_{shr-pl}, of stiffeners, in [cm^2], which is used for assessment against impact loads is to be taken as:

$$A_{shr-pl} = A_{shr}$$

where:

A_{shr} = Net elastic shear area, in [cm^2], as defined in Cl.7.4.2.

7.4.6 Effective net plastic section modulus of stiffeners

The effective net plastic section modulus, Z_{pl}, of stiffeners, in [cm^3], with attached plating which is used for assessment against impact loads, is to be taken as:

$$Z_{pl} = \frac{h_w t_w (h_w + t_p)}{2000} + \frac{(2\gamma - 1) A_f (h_{f-ctr} + t_p/2)}{1000} \text{ for } 75^\circ \leq \varphi_w \leq 90^\circ$$

$$Z_{pl} = \frac{h_w t_w (h_w + t_p) \sin \varphi_w}{2000} + \frac{(2\gamma - 1) A_f \left((h_{f-ctr} + t_p/2) \sin \varphi_w - b_{f-ctr} \cos \varphi_w \right)}{1000} \text{ for } \varphi_w < 75^\circ$$

where:

t_p = Net thickness of the stiffener attached plating, in [mm], as defined in Chapter 2, Section 4, Figure 4.6.2.

t_w = Net web thickness of the stiffener, in [mm] as defined in Chapter 2, Section 4, Figure 4.6.2.

h_w = Depth of stiffener web, in [mm], taken equal to:

- For T, L (rolled and built-up) and flat bar profiles, as defined in Chapter 2, Section 4, Figure 4.6.2.

- For L2, L3 as defined in Chapter 2, Section 4, Figure 4.6.2.

- For bulb profiles, to be taken as defined in Cl.7.4.1.

γ = coefficient equal to:

$$\gamma = \frac{1 + \sqrt{3 + 12\beta}}{4}$$

β = coefficient equal to:

- For L profiles without a mid-span tripping bracket, but not to be taken greater than 0.5.

$$\beta = \frac{t_w^2 \, \ell_{bdg}^2}{80 \, b_f^2 \, t_f \, h_{f-ctr}} 10^6 + \frac{t_w}{2 b_f}$$

- For other cases, 0.5.

A_f = net cross sectional area of flange, in [mm^2]:

- For flat bar stiffeners, $A_f = 0$

- For other stiffeners, $A_f = b_f . t_f$

b_{f-ctr} = Distance from mid thickness of stiffener web to the centre of the flange area, in [mm].

- For rolled angle profiles and bulb profiles

$$b_{f-ctr} = 0.5(b_f - t_w)$$

- For T profiles

$$b_{f-ctr} = 0$$

h_{f-ctr} = Height of stiffener measured to the mid thickness of the flange, in [mm]:

- For profiles with flange of rectangular shape except for L3 profiles and for bulb profiles

$$h_{f-ctr} = h_w + 0.5t_f$$

- For L3 profiles as defined in Chapter 2, Section 4, Figure 4.6.2.

$$h_{f-ctr} = h_w - d_e - 0.5t_f$$

d_e = Distance from upper edge of web to the top of the flange, in [mm], for L3 profiles, Refer Chapter 2, Section 4, Figure 4.6.2.

t_f = Net flange thickness, in [mm]

- For flat bar stiffeners, $t_f = 0$

- For bulb profiles to be taken as defined in Cl.7.4.1.

7.4.7 Primary supporting member web not perpendicular to attached plating

Where the primary supporting member web is not perpendicular to the attached plating, the actual net shear area in [cm^2], and the actual net section modulus, in [cm^3], can be obtained from the following formulae:

- Actual net shear area:

$$A_{sh-n50} = A_{sh-0-n50} \sin\varphi_w \quad \text{for } \varphi_w < 75°$$

$$A_{sh-n50} = A_{sh-0-n50} \quad \text{for } 75° \leq \varphi_w \leq 90°$$

- Actual net section modulus:

$$Z_{n50} = Z_{perp-n50} \sin\varphi_w \quad \text{for } \varphi_w < 75°$$

$$Z_{n50} = Z_{perp-n50} \quad \text{for } 75° \leq \varphi_w \leq 90°$$

where:

$A_{sh-0-n50}$= Actual net shear area, in [cm^2], of the primary supporting member assumed to be perpendicular to the attached plating, to be taken equal to:

$$A_{sh-0-n50} = (h_w + t_{f-n50} + t_{p-n50})t_{w-n50}10^{-2}$$

h_w = Web height of PSM, in [mm].

t_{f-n50} = Net thickness of flange in [mm].

t_{p-n50} = Net thickness of plate in [mm].

t_{w-n50} = Net thickness of web in [mm].

$Z_{perp-n50}$ = Actual section modulus, in [cm^3], with its attached plating of the primary supporting member assumed to be perpendicular to the attached plating.

φ_w = angle, in [deg], between web and attached plating, Refer Figure 7.4.7.

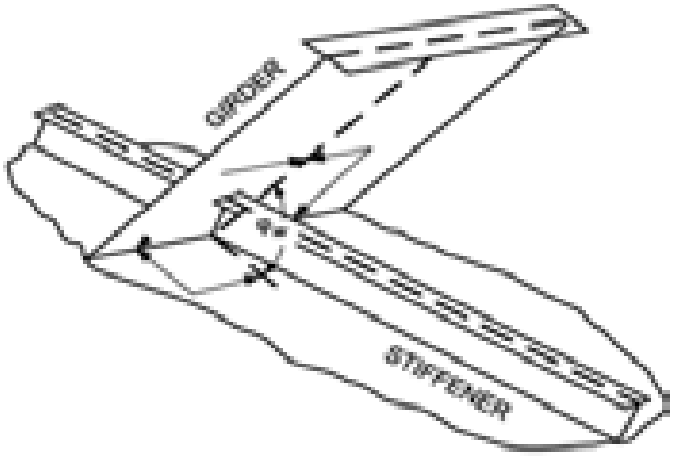

Figure 7.4.7: The web angle φ_w of primary supporting members

7.4.8 Shear area of primary supporting members with web openings

7.4.8.1 The effective web height, h_{eff}, in [mm], to be considered for calculating the effective net shear area, A_{sh-n50}, is to be taken as the lesser of:

$$h_{eff} = h_w$$

$$h_{eff} = h_{w3} + h_{w4}$$

$$h_{eff} = h_{w1} + h_{w2} + h_{w4}$$

where:

h_w = web height of PSM, in [mm]

$h_{w1}, h_{w2}, h_{w3}, h_{w4}$ = dimensions as shown in Figure 7.4.8.1.

Where an opening is located at a distance less than $h_w/3$ from the cross-section under consideration, h_{eff} is to be taken as the smaller of the net height and the net distance through the opening. Refer Figure 7.4.8.1.

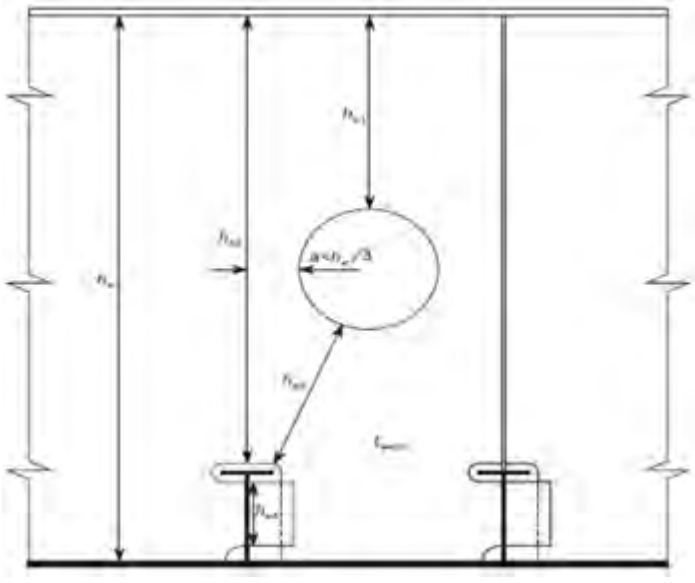

Figure 7.4.8.1: Effective shear area in way of web openings

7.4.8.2 The effective net cross-sectional area of the girder web, in [cm^2], is to be taken as:

$$A_{w-n50} = 0.01 h_{eff} . t_{w-n50}$$

where,

h_{eff} = Net web height, [mm], after deduction of cutouts at the section under consideration.

7.4.8.3 Where the PSM flange is not parallel to the attached plate (girder flange is at an angle $[\theta]$ to the length of the girder), the effective net web area, in [cm^2], is to be taken as:

$$A_{w-n50} = 0.01 h_{eff} \cdot t_{w-n50} + 1.3 A_{F-n50} \cdot \sin 2\theta \sin \theta$$

where:

h_{eff} = net web height, [mm], after deduction of cutouts at the considered section as shown in Figure 7.4.8.2.

A_{F-n50} = Actual net flange area in [cm^2].

θ = Angle of slope of continuous flange in [deg] as shown in Figure 7.4.8.2.

t_{w-n50} = Net thickness of web in [mm] as shown in Figure 7.4.8.2.

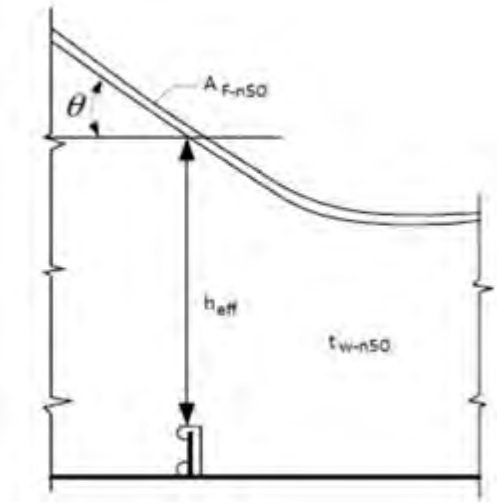

Figure 7.4.8.2: Effective web area in way of brackets

7.5 Plates

7.5.1 Idealisation of EPP

7.5.1.1 Elementary Plate Panel (EPP)

An elementary plate panel (EPP) is the unstiffened part of the plating between stiffeners and/or primary supporting members. The plate panel length, a, and breadth, b, of the EPP are defined as the longest and shortest plate edges, respectively, as shown in Figure 7.5.1.1.

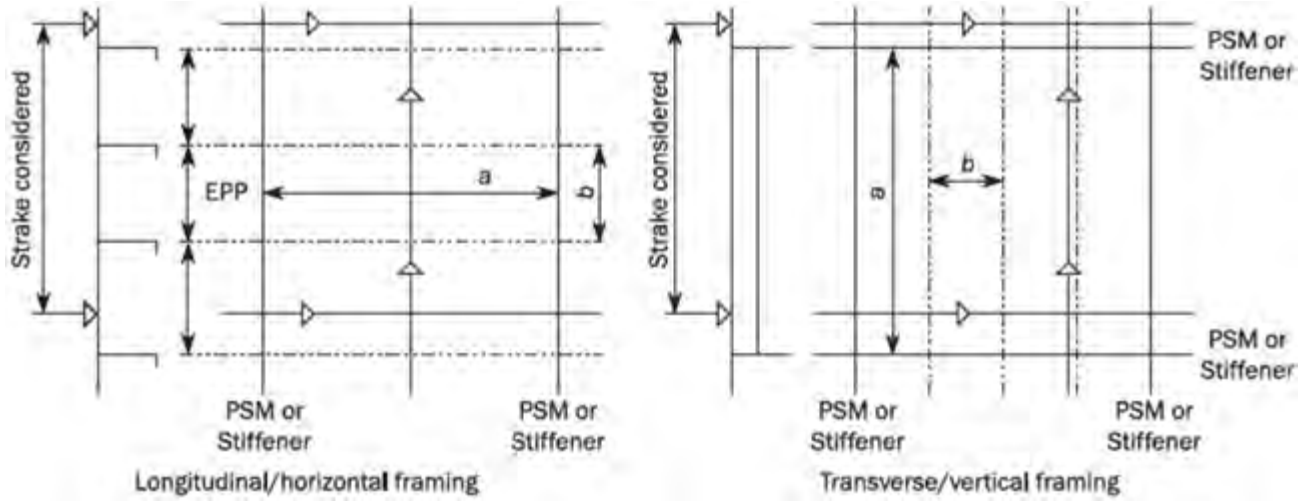

Figure 7.5.1.1: Elementary Plate Panel (EPP) definition

7.5.1.2 Strake required thickness

The required thickness of a plate strake is to be taken as the greatest value required for each EPP within that strake. The requirements given in Table 7.5.1 are to be applied for the selection of strakes to be considered as shown in Figure 7.5.1.2. The maximum corrosion addition within a strake is to be applied according to Chapter 3, Section 5.

Table 7.5.1: Strake considered in a given EPP		
	a/b > 2	**a/b < 2**
$a_1 > b/2$	All strakes (St1, St2, St3, St4)	All strakes (St1, St2, St3, St4)
$a_1 \leq b/2$	Strakes St2 and St4	All strakes (St1, St2, St3, St4)

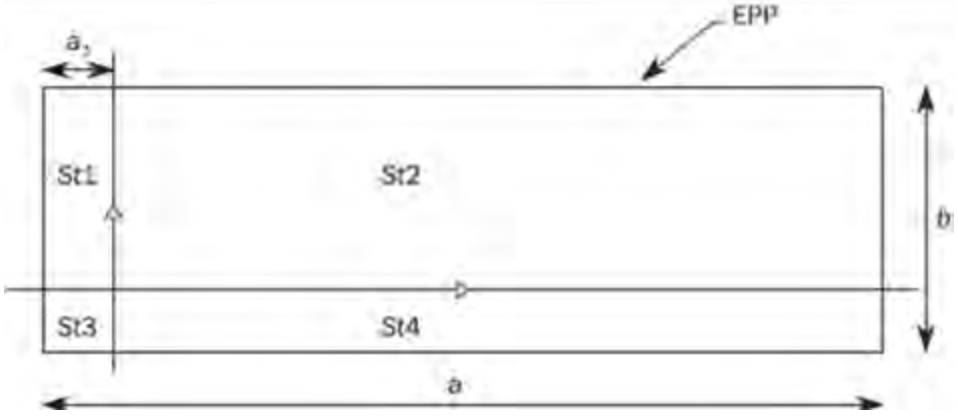

Figure 7.5.1.2: Strake considered in a given EPP

where:

a_1 = Distance, in [mm], measured inside the considered strake in the direction of the long edge of the EPP, between the strake boundary weld seam and the EPP edge.

For direct strength assessment, the EPP is idealised with the mesh arrangement in the finite element model.

7.5.2 Load calculation point

7.5.2.1 Yielding

For the yielding check, the local pressure and hull girder stress, used for the calculation of the local scantling requirements are to be taken at the Load Calculation Point (LCP) having coordinates x, y and z as defined in Table 7.5.2.1.

Table 7.5.2.1: LCP coordinates for yielding						
LCP coordinates	**General (1)**		**Horizontal plating**		**Vertical transverse structure and transverse stool plating**	
	Longitudinal framing Figure 7.5.2.1	**Transverse framing Figure 7.5.2.2**	**Longitudinal framing**	**Transverse framing**	**Horizontal framing Figure 7.5.2.3**	**Vertical framing Figure 7.5.2.4**
x coordinate	Mid-length of the EPP		Mid-length of the EPP		Corresponding to y and z values	
y coordinate	Corresponding to x and z coordinates		Outboard y value of the EPP		Outboard y value of the EPP, taken at z level (2)	
z coordinate	Lower edge of the EPP	The greater of lower edge of the EPP or lower edge of the strake	Corresponding to x and y values		Lower edge of the EPP	The greater of lower edge of the EPP or lower edge of the strake

1) All structures other than horizontal platings or vertical transverse structures.
2) For transom plate, the y coordinate of the LCP is to be taken corresponding to y value at side shell at z level of the load calculation point, for the external dynamic pressure calculation

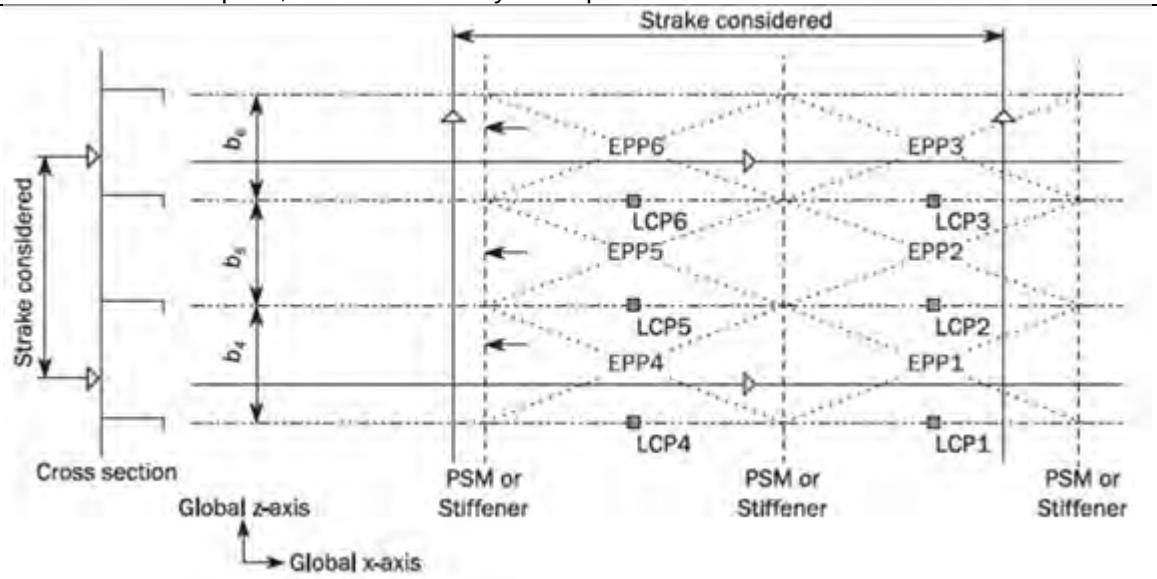

Figure 7.5.2.1: LCP for longitudinal plating with longitudinal framing

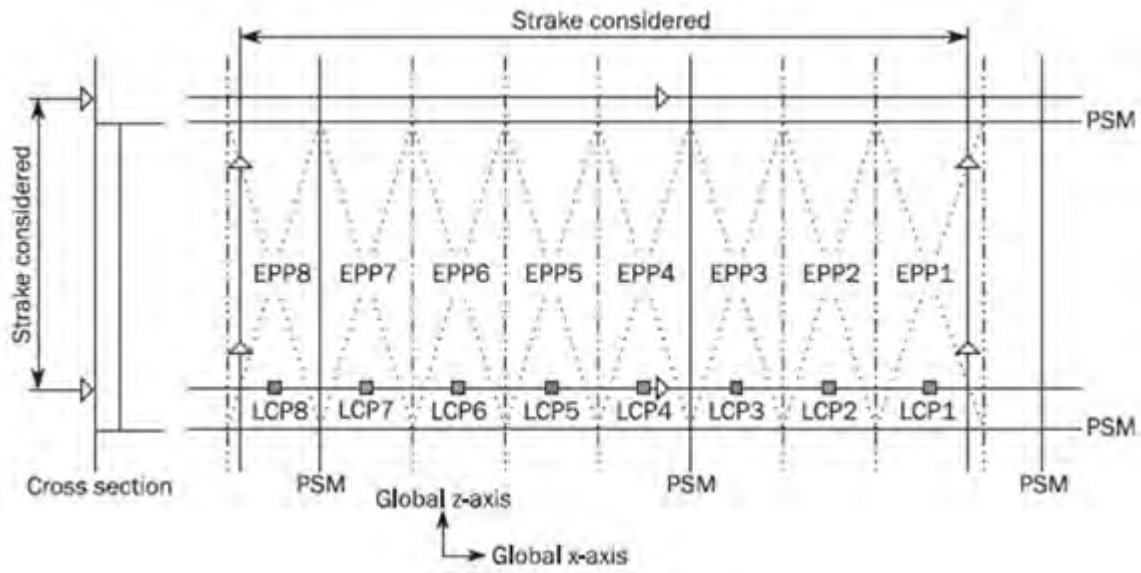

Figure 7.5.2.2: LCP for longitudinal plating with transverse framing

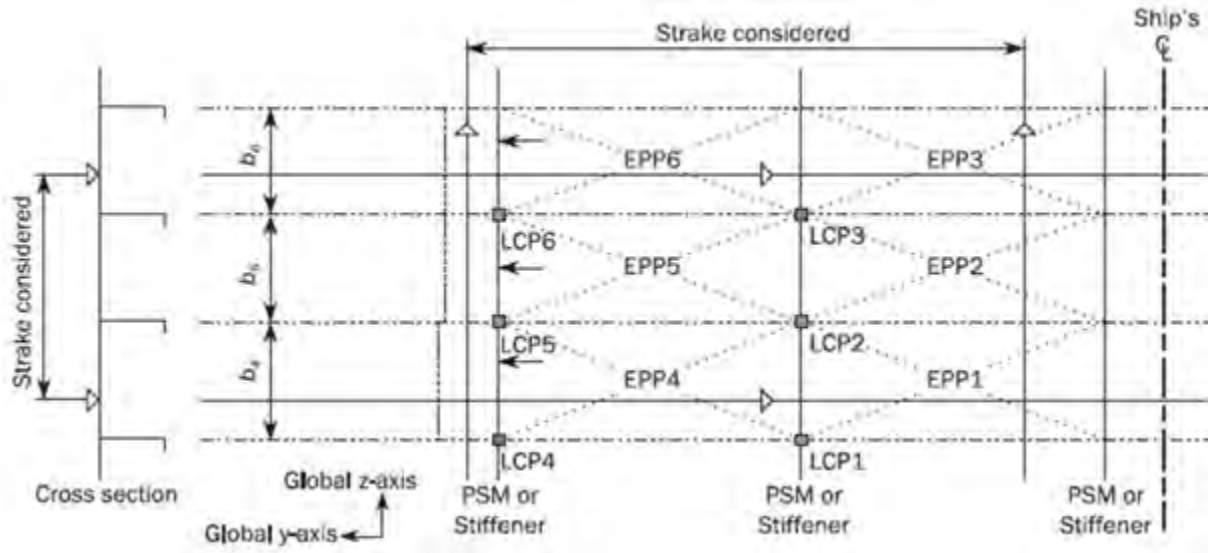

Figure 7.5.2.3: LCP for horizontal framing on transverse vertical structure

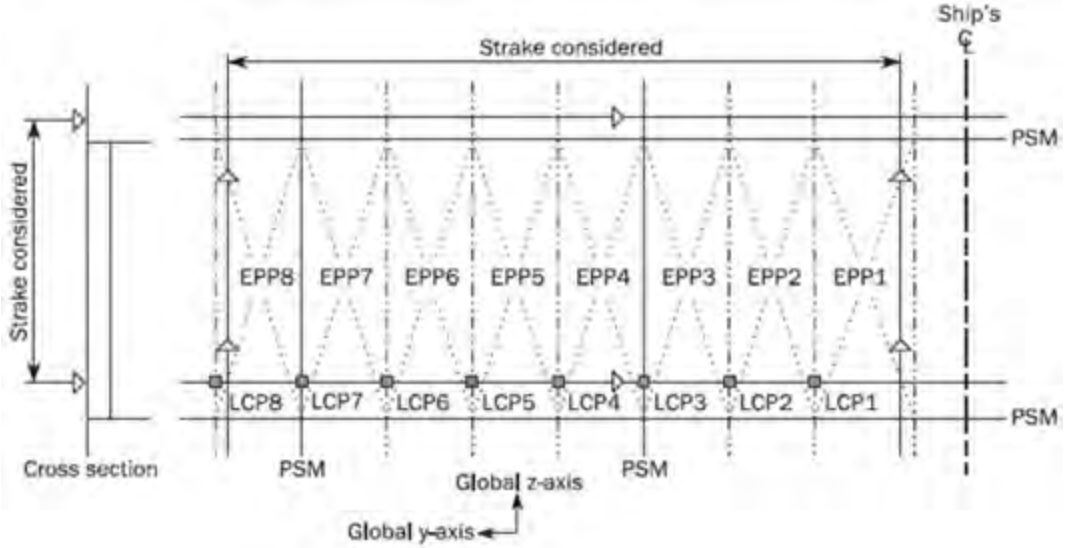

Figure 7.5.2.4: LCP for vertical framing on transverse vertical structure

7.5.2.2 Buckling

• For the prescriptive buckling check of the EPP according to Chapter 9, the LCP for the pressure and for the hull girder stresses are defined in Table 7.5.2.2.

• For the FE buckling check, Chapter 8 is applicable.

Table 7.5.2.2: LCP coordinates for plate buckling

LCP coordinates	**LCP for pressure**	**LCP for hull girder stresses Figure 7.5.2.5**		
		Bending stresses (1)		**Shear stresses**
		Non horizontal plate	Horizontal plate	
x coordinate	Same coordinates as LCP for yielding Refer Table 7.5.2.1	Mid-length of the EPP		
y coordinate		Both upper and lower ends of the EPP (points A1 and A2)	Outboard and inboard ends of the EPP (points A1 and A2)	Mid-point of EPP (point B)
z coordinate		Corresponding to x and y values		
(1) The bending stress for curved plate panel is the mean value of the stresses calculated at points A1 and A2.				

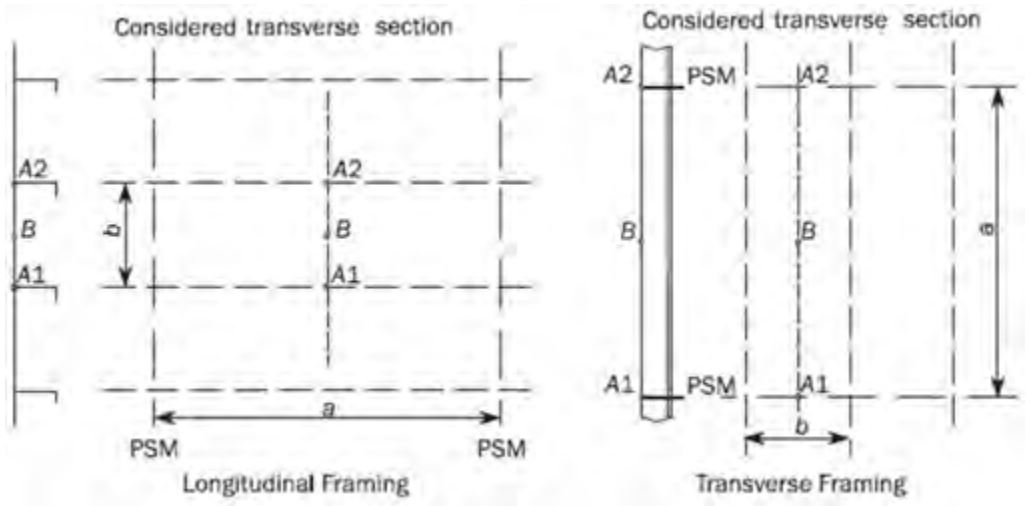

Figure 7.5.2.5: LCP for plate buckling – hull girder stresses

7.6 Stiffeners

7.6.1 Reference point

The requirements for section modulus for stiffeners relate to the reference point giving the minimum section modulus. This reference point is generally located as shown in Figure 7.6.1 for typical profiles.

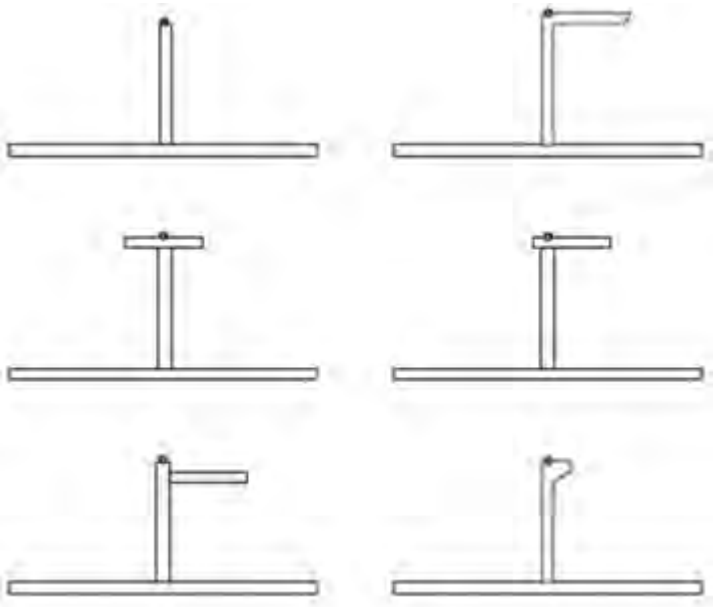

Figure 7.6.1: Reference point for calculation of section modulus and hull girder stress for local scantling assessment

7.6.2 Load calculation points

7.6.2.1 LCP for Pressure

The load calculation point for the pressure is located at:

- Middle of the full length, ℓ, of the considered stiffener.

- The intersection point between the stiffener and its attached plate.

For stiffeners located on transom plate, the y coordinate of the load calculation point is to be taken corresponding to y value at side shell at z level of the load calculation point, for the external dynamic pressure calculation.

7.6.2.2 LCP for hull girder bending stress

The load calculation point for the hull girder bending stresses is defined as follows:

- For yielding check, according to Chapter 7.

- At the middle of the full length, ℓ, of the considered stiffener

– At the reference point given in Figure 7.6.1.

- For prescriptive buckling check, according to Chapter 9.

– At the middle of the full length, ℓ, of the considered stiffener.

– At the intersection point between the stiffener and its attached plate.

7.6.3 Non-horizontal stiffeners

The lateral pressure, P is to be calculated as the maximum between the value obtained at middle of the full length, ℓ, and the value obtained from the following formulae:

7.6.3.1 When the upper end of the vertical stiffener is below the lowest zero pressure level,

$$P = \frac{P_u + P_L}{2}$$

7.6.3.2 When the upper end of the vertical stiffener is at or above the lowest zero pressure level, Refer Figure 7.6.3.

$$P = \frac{\ell_1}{\ell}\frac{P_L}{2}$$

where:

ℓ_1 = Distance, in [m], between the lower end of vertical stiffener and the lowest zero pressure level.

P_u, P_L = Lateral pressures at the upper and lower end of the vertical stiffener span ℓ, respectively.

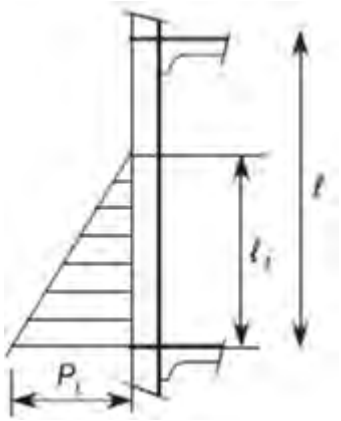

Figure7.6.3: Definition of pressure for vertical stiffeners

7.7 Primary supporting members

7.7.1 Load calculation point

The load calculation point is located at the middle of the full length, ℓ, at the attachment point of the primary supporting member with its attached plate.

For primary supporting members located on transom plate, the y coordinate of the load calculation point is to be taken corresponding to y value at side shell at z level of load calculation point for the external dynamic pressure calculation.

Chapter 4

Stability

Contents

Section

1 *General*

2 *Intact Stability*

3 *Damage Stability*

4 *Damage Control Plan and Booklet*

Section 1

General

1.1 Application

1.1.1 All ships will be assigned class only after it has been demonstrated that their intact stability and damage stability (where applicable) are to be in compliance with standards laid down by the relevant Administration

1.1.2 The level of stability is not to be less than that provided by these Rules.

1.1.3 Special consideration may be given to the ships registered for a restricted service by IRS based on the acceptance of the Flag Administration.

1.1.4 Where other criteria for stability are accepted by the Administration concerned, such criteria may be used for the purpose of classification.

Section 2

Intact Stability

2.1 General

2.1.1 The level of intact stability in any case is not to be less than that required by Part A of the International Code on Intact Stability, 2008 (IMO Resolution MSC 267(85), as amended) as applicable to the type of ship being considered.

2.1.2 For pontoons of all sizes, in case the Administration concerned has not laid down criteria for intact stability, it is recommended that the criteria indicated below or equivalent are satisfied:

- Chapter 2, Section 2.2 of Part B of the International Code on Intact Stability, 2008 (Resolution MSC 267(85)).

2.1.3 Each ship is to be provided with a stability booklet approved by IRS and is to be made available onboard. The Intact stability booklet is to include information as is necessary to enable the Master by a rapid and simple process to obtain accurate guidance as to the Intact stability of the ship under varying conditions of service.

2.1.4 The format and content of the stability book is further described in Model Loading and Stability Manual (MSC/Circ.920). In addition, information such as design limitations, maximum speed, worst intended weather conditions or other information regarding the handling of the vessel that the Master needs to

operate the ship is also to be included to the booklet.

2.1.5 Stability data and associated plans are to be drawn up in the working language of the ship and any other language, the Administration may require. Reference is also made to the International Safety Management (ISM) Code, adopted by the IMO by resolution A.741(18). All translations of the stability booklet are to be approved.

2.1.6 If used, permanent ballast is to be located in accordance with a plan approved by IRS and in a manner that prevents shifting of position. Permanent ballast is not to be removed from the ship or relocated within the ship without the approval of IRS. Permanent ballast particulars are to be noted in the ship's stability booklet as a separate item. Permanent solid ballast is to be installed under the supervision of IRS.

2.2 Documentation

2.2.1 For the purpose of the examination of intact stability, plans/ booklets/ documents as indicated below are to be submitted:

a) Lines plan and offset tables
b) Draft Mark plan
c) Tank Capacity Plan
d) External Watertight and Weathertight Integrity plan / Freeboard plan
e) Preliminary Intact stability manual
f) Permanent Ballast Arrangement Plan (As Applicable)
g) Inclining test and lightship survey procedure
h) Inclining test or lightship survey report
i) Final Intact stability manual

2.2.2 Preliminary Intact stability manual

2.2.2.1 This manual provides general stability information, including documentation necessary to demonstrate compliance with the applicable Rules and Regulations where the light ship particulars are based on estimation.

2.2.3 Final Intact stability manual

2.2.3.1 Final stability manual based on the results of the inclining test or the lightship check is to be submitted for examination.

2.2.4 External watertight and weathertight integrity

2.2.4.1 The plan is to contain information on all external openings leading to compartments affecting stability calculations.

2.2.4.2 The following information is to be shown on the plan:

a) Superstructures and deckhouses contributing to buoyancy in intact or damage stability calculations

b) Position of each opening (longitudinal, transverse and vertical)

c) Type of closing appliance (watertight, weather tight or unprotected)

d) Alarms, indicators, remote controls and signboards fitted for each opening/closing appliance

e) Spaces that each opening lead to

Alternatively, the above information may be shown on the Damage Control Plan.

Section 3

Damage Stability

3.1 Application

3.1.1 The damage stability calculations and criteria to be applied depending on the ship type as described by its Class notation and corresponding requirements specified in Part 5 of the Rules and additional requirements laid down by the relevant Administration (if any).

3.1.2 For tankers (ships carrying oil, chemical and gas) assigned with a tropical freeboard, the corresponding loading conditions and damage stability calculations are to be submitted in the damage stability booklet.

3.1.3 All ships are required to comply with the applicable damage stability requirements in accordance with the following:

a) Part B and Part B-1 through B-4 of Chapter II-1 of SOLAS 1974, as amended for passenger ships regardless of length and cargo ships having load line length "L_L" of 80[m] and above.

Cargo ships which are shown to comply with any other damage stability regulations indicated in the following (3.1.3 b) to g)) are excluded from the applicability of the above.

b) Regulation 27 of ILLC 1966 as applied to tankers and dry cargo vessels in compliance with Resolutions A.320(IX) and A.514(13) provided that in the case of ships to which regulation 27(9) applies, main transverse watertight bulkheads, to be considered effective, are spaced according to paragraph 12(f) of resolution A.320(IX). Compliance with Reg.27 of ILLC Protocol 1988 is accepted as equivalent to the above.

In case ships for which Reg.27 of ILLC applies are intended to carry deck cargo also, then a limiting GM or KG curve is to be provided to the master in the stability manual based on compliance with the probabilistic damage stability analysis of SOLAS Chapter II-1 Part B-1. In such cases the KG used for demonstrating compliance with the deterministic damage stability requirements of ILLC Reg.27 should be same as that used for the probabilistic damage stability calculations required by SOLAS Chapter II-1 Part B-1 at the deepest subdivision loadline.

c) Annex I (Regulation 28) of MARPOL 1973/78, for Oil Tankers except that combination carriers with Type B freeboard are not excluded.

d) IBC Code, as amended for Chemical Tankers in general.

e) IGC Code, as amended for Liquefied Gas Carriers.

f) IGF Code, as amended for Low-flashpoint or gaseous fuel ships.

g) Resolution MSC 235(82) for Offshore Supply Vessels.

h) Resolution MSC 266(84) for Special Purpose Ships.

3.2 Documentation

3.2.1 For all ships to which damage stability requirements apply, damage stability calculations are to be submitted. The damage stability calculations are to include:

3.2.1.1 List of the characteristics (volume, center of gravity, permeability) of each compartment which can be damaged.

3.2.1.2 A table of openings in bulkheads, decks and side shell reporting all the information about:

- Identification of the opening

- Vertical, transverse and horizontal location

- Type of closure: sliding, hinged or rolling for doors

-Type of tightness: watertight, weathertight, semi watertight or unprotected

- Operating system: remote control, local operation, indicators on the bridge, television surveillance, water leakage detection, audible alarm, as applicable

- Foreseen utilization: open at sea, normally closed at sea, kept closed at sea

3.2.1.3 List of all damage cases corresponding to the applicable requirements.

3.2.1.4 Detailed results of damage stability calculations for all the loading conditions foreseen in the applicable requirements.

3.2.1.5 Limiting GM/KG curve, if foreseen in the applicable requirements.

3.2.1.6 Capacity plan.

3.2.1.7 Cross and down flooding devices and the calculations thereof according to MSC 362(92) with information about diameter, valves, pipe lengths and coordinates of inlet/outlet.

3.2.1.8 Watertight and weathertight door plan with pressure calculation.

3.2.1.9 Side contour and wind profile.

3.2.1.10 Pipes and damaged area when the destruction of these pipes results in progressive flooding.

3.2.2 Additional information for the probabilistic approach

In addition to the information listed in Cl.3.2.1, the following is to be provided:

- Subdivision length 'L_S'

- Initial draughts and the corresponding GM-values

- Required subdivision index 'R'

- Attained subdivision index 'A' with a summary table for all contributions for all damaged zones.

- Draught, trim, GM in each damaged condition

- Damage extent and definition of damage cases with probabilistic values ('p',' 'v' and 'r') *

- Righting lever (including GZ_{max} and range) with factor of survivability, 's'

- Critical weathertight and unprotected openings with their angle of immersion

- Details of sub-compartments with amount of in-flooded water/lost buoyancy with their centre of gravity

* For definition of symbols, SOLAS as amended is to be referred.

3.2.3 Internal watertight integrity plan

3.2.3.1 This plan is to contain items affecting damage stability calculations, such as internal subdivision, possibility of progressive flooding from one compartment to another through internal openings, pipes, tunnels or ventilation ducts and pipes, ducts, tunnels in the damage penetration zone specified in the applicable damage assumptions. The following information is to be shown on the plan:

(a) Internal watertight boundaries (bulkheads, decks and tunnels)

(b) Internal openings in these boundaries such as: doors, hatches, stairways, ventilation ducts and so forth

(c) Spaces each opening leads to (for ventilation ducts)

(d) Type of closing appliance (watertight, weather tight or unprotected)

(e) Alarms, indicators, remote controls and fitted for each opening/closing appliance

(f) Marking of the damage penetration zone, as specified in the applicable damage assumptions, on various waterlines/decks and cross sections

(g) Pipes, ducts and tunnels in the marked damage penetration zone and spaces where these lead

(h) Information on materials in piping if it is intended to use heat sensitive materials

3.2.4 The Damage stability booklet is to be revised whenever there is any major modification / conversion to the vessel resulting in the change of initial loading conditions used for computation.

Section 4

Damage Control Plan and Booklet

4.1 General

4.1.1 The damage control plan and damage control booklet are intended to provide ship's crew with clear information on the ship's watertight subdivision and equipment/ means related to maintaining the boundaries and effectiveness of the subdivision so that, in the event of damage to the ship causing flooding, proper precautions can be taken to prevent progressive flooding through openings therein and effective action can be taken quickly to mitigate and, where possible, recover the ship's loss of stability. The damage control plan and damage control booklet are to be clear and easy to understand.

4.2 Application

4.2.1 Damage Control Plan and Booklet are to be provided:

4.2.1.1 For all cargo ships (not less than 500 gross tonnage) and All passenger ships

a) Which are constructed on or after 01 January 2009

(Chapter II-1, Reg.19 of 2006 amendments to SOLAS 1974)

4.2.1.2 For dry cargo ships (not less than 500 gross tonnage)

a) Which are constructed on or after 01 February 1992 and before 01 January 2009

(Chapter II-1, Reg.23-1 of 1989 amendments to SOLAS 1974,)

4.2.1.3 For Passenger ships

a) Which are constructed on or after 25 May 1980 and before 01 September 1984

(Chapter II-1, Reg.20 of SOLAS 1974)

b) Which are constructed on or after 01 September 1984 and before 01 January 2009

(Chapter II-1, Reg.23 of 1981 amendments to SOLAS 1974)

4.3 Requirements

4.3.1 Damage Control Plan and Booklet is to include information in accordance with the following:

- IMO MSC.1/Circular 919 "*Guidelines for Damage Control Plans*" for vessels constructed before 01 January 2009,

- IMO MSC.1/Circular 1245 "*Guidelines for Damage Control Plans and Information to the master*" for vessels constructed on or after 01 January 2009,

- IMO MSC.1/Circular 1570 "*Amendments to section 3 of the Guidelines for Damage Control Plans and Information to the Master (MSC.1/Circular 1245)*" for passenger ships built on or after 09 June 2017

4.3.2 For passenger ships, the damage control plan is to be permanently exhibited or readily available on the navigating bridge, as well as in the ship's control station, safety centre or equivalent.

4.3.3 For cargo ships the damage control plan is to be permanently exhibited or readily available on the navigating bridge. Furthermore, the damage control plan is to be permanently exhibited or readily available in the cargo control room, all ship's office or other suitable location

Section 1

General

Symbols

For symbols not defined in this section, Refer to Chapter 1, Section 2.

1.1 Application

1.1.1 This chapter provides the design load for strength and fatigue assessments. The load combinations are to be derived for the design load scenarios specified in Section 6.

1.1.2 The scantlings of various hull members are to be based on the design values of ship motions, accelerations, lateral pressures and forces given in this Chapter. The design values of pressure caused by slamming, bow impact and sloshing are given in Chapter 11 dealing with specific structures.

1.1.3 Additional requirements applicable to specific ship types are defined in Part 5.

1.1.4 IRS may accept the values of wave induced dynamic loads derived from direct calculations in lieu of formulas given in Sections 4 and Section 5 provided the calculations are submitted for approval. In this regard, due consideration is to be given to the environmental conditions, probability of occurrence and uncertainties in load and response predictions.

1.2 Definitions

1.2.1 Still water loads

Still water loads are loads that are acting on the hull structure when a ship is floating in still (calm) water.

1.2.2 Wave loads/Dynamic loads

Wave loads are those due to wave pressures and ship motions.

1.2.3 Impact loads

Impact loads are those that have a duration much shorter than the period of the wave loads.

1.2.4 Local loads

Local loads are pressures and forces which are directly applied to the individual structural members such as plate panels, ordinary

stiffeners and primary supporting members. They consist of:

a) Still water local loads constitute of hydrostatic external sea pressures and the static pressures and forces induced by the weights carried by the ship.

b) Wave local loads constitutes of external sea pressures due to waves and the inertial pressures and forces induced by the ship accelerations.

c) Impact local loads due to Slamming (Bow and Bottom slamming) and Sloshing (tank sloshing) pressures.

1.2.5 Hull girder loads

Hull girder loads are (still water, wave and impact) forces and moments which result as effects of local loads acting on the ship as a whole and considered as a beam.

1.2.6 Load case

A load case is a combination of hull girder and local loads applied to the ship structure.

1.2.7 Coordinate system

The coordinate system is defined in Chapter 1, Section 2.5, Cl.2.5.1.

1.2.8 Sign convention for ship motions

The ship motions are defined with respect to the ship's centre of gravity (COG) as shown in Figure 1.2.8, where:

- positive surge is translation in the *X*-axis direction (positive forward)
- positive sway is translation in the Y-axis direction (positive towards port side of ship)
- positive heave is translation in the Z-axis direction (positive upwards)
- positive roll motion is positive rotation about a longitudinal axis through the COG (starboard down and port up)
- positive pitch motion is positive rotation about a transverse axis through the COG (bow down and stern up)
- positive yaw motion is positive rotation about a vertical axis through the COG (bow moving to port and stern to starboard).

1.2.9 Equivalent Design Wave (EDW)

The dynamic loads associated with each dynamic load case are based on the Equivalent Design Wave (EDW) concept. The EDW concept applies a consistent set of dynamic loads to the ship such that specified dominant load response is equivalent to the required long term response value.

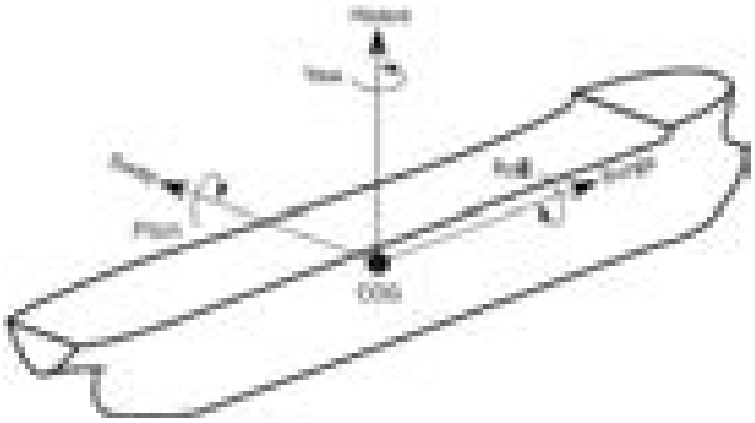

Figure 1.2.8: Definition of positive motions

1.3 Load definition criteria

1.3.1 Hull girder loads

The still water, wave and impact hull girder loads are used for the determination of:

a) the hull girder strength, according to the requirements of Chapter 6.

b) the structural scantling of plating, ordinary stiffeners and primary supporting members contributing to the hull girder strength, in combination with the local loads given in Section 4 and Section 5.

1.3.2 Local loads

The local loads defined in Cl.1.2.4 are to be calculated for each load cases considered. The wave local loads are to be calculated on the basis of the reference values of ship motions and accelerations as specified in Section 2, for sea pressures, Refer Section 4 and internal pressures and forces, Refer Section 5.

The local loads are used in the structural scantling of:

a) Plating, according to Chapter 7, Section 4

b) Ordinary stiffeners, according to Chapter 7, Section 5

c) Primary supporting members, according to Chapter 7, Section 6

1.4 Probability level for strength and fatigue assessments

The probability levels of loads are considered as follows:

- Wave induced dynamic loads for strength assessment excluding fatigue are at a probability level of 10^{-8}

- Wave induced dynamic loads for fatigue assessment are at a probability level of 10^{-2}.

1.5 Loads for strength assessment

The strength assessment is to be undertaken for all design load scenarios and the final assessment is to be made on the most onerous strength requirement.

Each design load scenario for strength assessment is composed of a Static (S) load case or a Static + Dynamic (S+D) load case, where the static and dynamic loads are dependent on the loading condition being considered.

The static loads are defined in the following sections:

- Still water hull girder loads in Section 3.

- External loads in Section 4.

- Internal loads in Section 5.

The EDWs for the strength assessment and the dynamic load combination factors for global loads are listed in Section 2, 2.4.

The dynamic load components are defined in the following sections:

- Dynamic hull girder load components in Section 3.

- External loads in Section 4.

- Internal loads in Section 5.

1.6 Loads for fatigue assessment

Each design load scenario for fatigue assessment is composed of a Static + Dynamic (S+D) load case, where the static and dynamic loads are dependent on the loading condition being considered.

The static loads are defined in the following sections:

- Still water hull girder loads in Section 3.

- External loads in Section 4.

- Internal loads in Section 5.

The EDWs for the fatigue assessment are listed in Section 2, 2.5.

The dynamic load components are defined in the following sections:

- Dynamic hull girder load components in Section 3.

- External loads in Section 4.

- Internal loads in Section 5.

Section 2

Ship motions and Accelerations

Symbols

For symbols not defined in this section, refer to Chapter 1, Section 2.

ρ = Density of liquid cargo or dry cargo, [t/m^3].

P = Design pressure [N/mm^2]

C_w = Wave Coefficient

$= 0.0856L \text{ for } L < 90[m]$

$= 10.75 - \left[\frac{300-L}{100}\right]^{1.5} \text{ for } 90 \leq L \leq 300[m]$

$= 10.75 \text{ for } 300 \leq L \leq 350[m]$

$= 10.75 - \left[\frac{L-350}{150}\right]^{1.5} \text{ for } 350 \leq L \leq 500[m]$

a_o = Common acceleration parameter

$$= (1.58 - 0.47C_b)\left(\frac{2.4}{\sqrt{L}} + \frac{34}{L} - \frac{600}{L^2}\right)$$

not to be taken more than 0.7

T_r = Roll period, in [s], as defined in Cl.2.1.2.1.

$\emptyset$ = Roll angle, in [deg], as defined in Cl.2.1.2.1.

T_p = Pitch period, in [s], as defined in Cl.2.1.2.2.

θ = Pitch angle, in [deg], as defined in Cl.2.1.2.2.

f_{ps} = Coefficient to be taken for strength assessment which is dependent on the applicable design load scenario specified in Section 6, and to be taken as:

For unrestricted service:

= 1.0 for extreme sea loads design load scenario.

= 0.8 for the ballast water exchange design load scenario.

= 0.8 for the accidental flooded design load scenario at sea.

= 0.4 for the harbour and tank testing design load scenario

For vessels with service restriction:

= $1.R_s$ for design load scenario specified in Section 6 except for harbour and tank testing design load scenario

= 0.4 for the harbour and tank testing design load scenario

where,

R_s = Service restriction factor

= 0.75 for coastal service

= 0.65 for restricted service

= 0.55 for sheltered water service.

For definitions of service limitations, Refer Part 1, Chapter 1.

f_{fa} = 0.9; fatigue coefficient

f_β = heading correction factor

For strength assessment:

= 1.05 in general

= 0.8 for BSR and BSP load cases for the extreme sea loads design load scenario

= 1.0 for HSA, OST and OSA load cases for the extreme sea loads design load scenario.

= 1.0 for ballast water exchange at sea, harbour and tank testing, accidental flooded design load scenarios.

For fatigue assessment: = 1.0.

R = vertical coordinate, in [m], of the ship rotation centre, is to be taken as:

$$R = \min\left[\left(\frac{D}{4} + \frac{T_{LC}}{2}\right), \frac{D}{2}\right]$$

a_{roll-y} = Transverse acceleration due to roll, in [m/s^2], as defined in Cl.2.1.4.2.

$a_{pitch-x}$ = Longitudinal acceleration due to pitch, in [m/s^2], as defined in Cl.2.1.4.1.

a_{roll-z} = Vertical acceleration due to roll, in [m/s^2], as defined in Cl.2.1.4.3.

$a_{pitch-z}$ = Vertical acceleration due to pitch, in [m/s^2], as defined in Cl.2.1.4.3.

T_{LC} = draught, in [m], amidships for the considered loading condition.

In case loading condition is not defined, T_{LC} = T_{SC} is to be applied.

f_T = Ratio between draught at a loading condition and scantling draught, is to be taken as:

$$f_T = \frac{T_{LC}}{T_{SC}} \quad \text{but is not to be taken less than } 0.5.$$

f_{xl} = Ratio between X-coordinate of the load point and L, to be taken as:

$$f_{xl} = \frac{x}{L}$$

but not to be taken less than 0 or greater than 1.0

x, y, z = X, Y and Z coordinates, in [m], of the considered point with respect to the coordinate system, as defined in Section 1, Cl.1.2.8

f_{lp} = Factor depending on longitudinal position along the ship, to be taken as:

$$f_{lp} = 1.0 \text{ for } x/L \leq 0.5$$

$$f_{lp} = -1.0 \text{ for} \frac{x}{L} > 0.5$$

f_{lp-OST} = Factor for the longitudinal distribution of the torsional moment for the OST load case, as defined in Section 3, Cl.3.6.4.

f_{lp-OSA} = Factor for the longitudinal distribution of the torsional moment for the OSA load case as defined in Section 3, Cl.3.6.4.

WS = Weather side, side of the ship exposed to the incoming waves

LS = Lee side, sheltered side of the ship away from the incoming waves

M_{wv} = Vertical wave bending moment, in [kN-m], defined in Section 3

Q_{wv} = Vertical wave shear force, in [kN], defined in Section 3

M_{Wh} = Horizontal wave bending moment, in [kN-m], defined in Section 3

M_{wt} = Torsional wave bending moment, in [kN-m], defined in Section 3

C_{WV} = Load combination factor to be applied to the vertical wave bending moment

C_{QW} = Load combination factor to be applied to the vertical wave shear force

C_{WH} = Load combination factor to be applied to the horizontal wave bending moment

C_{WT} = Load combination factor to be applied to the wave torsional moment

C_{XS} = Load combination factor to be applied to the surge acceleration

C_{XP} = Load combination factor to be applied to the longitudinal acceleration due to pitch

C_{XG} = Load combination factor to be applied to the longitudinal acceleration due to pitch motion

C_{YS} = Load combination factor to be applied to the sway acceleration

C_{YR} = Load combination factor to be applied to the transverse acceleration due to roll

C_{YG} = Load combination factor to be applied to the transverse acceleration due to roll motion

C_{ZH} = Load combination factor to be applied to the heave acceleration

C_{ZR} = Load combination factor to be applied to the vertical acceleration due to roll

C_{ZP} = Load combination factor to be applied to the vertical acceleration due to pitch

2.1 Ship motions and accelerations

2.1.1 General

The ship motions and accelerations are assumed to be sinusoidal. The motion values defined by the formulae in this section are

single amplitudes, i.e. half of the 'crest to trough' height.

2.1.2 Ship motions

2.1.2.1 Roll motions

The roll period T_r, in [s], to be taken as:

$$T_r = \frac{2.3\ \pi\ k_r}{\sqrt{g.\ GM}}$$

The roll angle ∅, in [deg], to be taken as:

$$\emptyset = \frac{9000(1.25 - 0.025\ T_r)f_p f_{bk}}{(B + 75)\pi}$$

where:

f_p = Coefficient to be taken as:

= f_{ps} for strength assessment.

= $f_{fa}[0.23 - 4f_T B \times 10^{-4}]$ for fatigue assessment

f_{bk} = 1.2 for ships without bilge keel.

= 1.0 for ships with bilge keel or fin stabilizers.

T_r is not be taken greater than 30[s]. Minimum value of T_r resulting from various possible combinations of k_r and GM is to be used.

k_r = Roll radius of gyration, in [m], in the considered loading condition. In case k_r has not been carried out, the values given in Table 2.1.2, may be used.

GM = Metacentric height, in [m], in the considered loading condition. In case GM is not available, the following values from Table 2.1.2, may be used for guidance.

Table 2.1.2: Table for k_r and GM Values

Loading condition (1) (2) (4)	Notation/ Ship Types	k_r	GM
Full load condition / Homogeneous loading	**OIL TANKER, ESP**	0.35 B	0.12 B
	BULK CARRIER, ESP, SELF-UNLOADING BULK CARRIER ESP		
	CONTAINER SHIP with B ≤ 32.2[m]		0.05 B
	CONTAINER SHIP with B ≥ 40.0[m]		0.11 B
	Other ships		0.07 B
	ORE CARRIER, ESP	0.25 B	0.12 B
Full load condition / Homogeneous heavy cargo	**BULK CARRIER, ESP, SELF-UNLOADING BULK CARRIER ESP**	0.42 B	0.25B
	ORE CARRIER, ESP	0.25 B	
Full load condition / Alternate heavy cargo	**BULK CARRIER, ESP, SELF-UNLOADING BULK CARRIER ESP**	0.40 B	0.20 B
	ORE CARRIER, ESP	0.20 B	
Full load condition / Alternate light cargo	**BULK CARRIER, ESP, SELF-UNLOADING BULK CARRIER ESP**	0.35 B	0.12 B
	ORE CARRIER, ESP	0.20 B	
Partial load condition	**OIL TANKER, ESP**	0.40 B	0.24 B
	ASPHALT CARRIER CHEMICAL TANKER, ESP COMBINATION CARRIER	0.35 B	0.07 B
Heavy ballast condition	**BULK CARRIER, ESP, SELF-UNLOADING BULK CARRIER ESP**	0.40 B	0.25 B
	ORE CARRIER, ESP	0.35 B	0.30 B
Normal ballast condition	**OIL TANKER, ESP**	0.45 B	0.33 B
	BULK CARRIER, ESP, SELF-UNLOADING BULK CARRIER ESP		
	ORE CARRIER, ESP	0.35 B	
	Other ships	0.45 B	0.18 B

Steel coil loading (3)	**All ships intended to carry steel coils**	0.42 B	0.25 B
Linear interpolation may be used for 32.2 [m] ≤ B ≤ 40.0 [m].			

(1) For flooded loading conditions, the values of k_r and GM are to be taken as for the full load condition unless provided in the loading manual.

(2) For Multiple port loading conditions of bulk carrier ESP, self-unloading bulk carrier ESP, ore carrier ESP and combination carrier (limited to direct strength analysis)

- loading conditions with draught greater than or equal to $0.9T_{sc}$, the values of k_r and GM, unless provided in the loading manual, are to be taken as those from the most appropriate full load condition.
- loading conditions with draught between T_{BH} and $0.9T_{sc}$, the values of k_r and GM, unless provided in the loading manual, are to be obtained by linear interpolation, based on the draught, between the heavy ballast condition and the most appropriate full load condition.
- loading conditions with a draught below T_{BH}, the values of k_r and GM for the heavy ballast condition are to be used.

(3) When steel coil loading condition is provided by the designer in the loading manual, this condition is to be assessed with the values of k_r and GM taken from the above Table 2.1.2.

(4) Block Loading conditions are to be assessed with k_r and GM values given in Table 2.1.2 for Homogeneous heavy cargo loading condition.

2.1.2.2 Pitch motions

The pitch period T_p, in [s], is to be taken as:

$$T_p = \sqrt{\frac{2\pi\lambda_\varphi}{g}}$$

where:

$$\lambda_\varphi = 0.6(1 + f_T)L$$

The pitch angle, in [deg], is to be taken as given in formula below and need not to be taken greater than 20[deg].

$$\theta = 1350\, f_p L^{-0.94}\left[1.0 + \left(\frac{2.57}{\sqrt{gL}}\right)^{1.2}\right]$$

where:

f_p = Coefficient to be taken as:

For strength assessment

$f_p = f_{ps}$

For fatigue assessment

$f_p = f_{fa}[(0.27 - 0.02f_T) - (13 - 5f_T)L \times 10^{-5}]$

2.1.3 Ship accelerations

The design values of various acceleration components are normally to be taken as:

2.1.3.1 Surge acceleration

The longitudinal acceleration due to surge, in [m/s^2], is to be taken as:

$$a_{surge} = 0.2\, f_p\, a_o\, g$$

where:

f_p = Coefficient to be taken as:

For strength assessment

$f_p = f_{ps}$

For fatigue assessment

$f_p = f_{fa}[(0.27) - (15 + 4f_T)L \times 10^{-5}]$

2.1.3.2 Sway acceleration

The transverse acceleration due to sway, in [m/s^2], is to be taken as:

$$a_{sway} = 0.3\, f_p\, a_o\, g$$

where:

f_p = Coefficient to be taken as:

For strength assessment

$f_p = f_{ps}$

For fatigue assessment

$f_p = f_{fa}[(0.24) - (6 - 2f_T)B \times 10^{-4}]$

2.1.3.3 Heave acceleration

The vertical acceleration due to heave, a_{heave} in [m/s^2], is to be taken as:

$$a_{heave} = \frac{0.7\, a_o\, g}{\sqrt{C_b}} f_p$$

where:

f_p = Coefficient to be taken as:

For strength assessment

$f_p = f_{ps}$

For fatigue assessment

$f_p = f_{fa}[(0.27 + 0.02f_T) - 17L \times 10^{-5}]$

2.1.3.4 Roll acceleration

The roll acceleration, a_{roll}, in [rad/s^2], is to be taken as:

$$a_{roll} = \emptyset \frac{\pi}{180}\left(\frac{2\pi}{T_r}\right)^2 f_p$$

f_p = Coefficient to be taken as:

For strength assessment

$f_p = f_{ps}$

For fatigue assessment

$f_p = f_{fa}[0.23 - 4f_T B \times 10^{-4}]$

$\emptyset$ = Roll angle using f_p equal to 1.0.

2.1.3.5 Pitch acceleration

The pitch acceleration, a_{pitch}, in [rad/s^2], is to be taken as:

$$a_{pitch} = \theta \frac{\pi}{180}\left(\frac{2\pi}{T_p}\right)^2 f_p$$

where:

θ = pitch angle using f_p equal to 1.0

f_p = Coefficient to be taken as:

For strength assessment

$f_p = f_{ps}$

For fatigue assessment

$f_p = f_{fa}[0.28 - (5 + 6f_T)L \times 10^{-5}]$

2.2 Accelerations at any position

2.2.1 General

The accelerations used to derive the inertial loads at any position are defined with respect to the ship fixed coordinate system. The acceleration values defined in Cl.2.2.2 and Cl.2.2.3 include the gravitational acceleration components due to the instantaneous roll and pitch angles.

The accelerations to be applied for the dynamic load cases defined in Section 2.3 are given in Cl. 2.2.2.

The combined accelerations as defined in Cl.2.2.3 are provided for advisory purposes and may be used for other design purpose when the maximum design acceleration values are required, for e.g. crane foundations, machinery foundations, etc.

2.2.2 Accelerations for dynamic load cases for L ≥ 90[m].

2.2.2.1 Longitudinal acceleration

The longitudinal acceleration at any position for each dynamic load case, in [m/s^2], is to be taken as:

$$a_x = \left[-C_{XG}\, g\, \sin\theta + C_{XS}\, a_{surge} + C_{XP}\, a_{pitch}(z - R)\right]$$

2.2.2.2 Transverse acceleration

The transverse acceleration at any position for each dynamic load case, in [m/s^2], is to be taken as:

$$a_y = \left[C_{YG}\, g\, \sin\varphi + C_{YS}\, a_{sway} - C_{YR}\, a_{roll}(z - R)\right]$$

2.2.2.3 Vertical acceleration

The vertical acceleration at any position for each dynamic load case, in [m/s^2], is to be taken as:

$$a_z = \left[C_{ZH}\, a_{heave} + C_{ZR}\, a_{roll} \cdot y - C_{ZP}\, a_{pitch}(x - 0.45L)\right]$$

2.2.3 Combined accelerations

The combined accelerations in the ship's vertical, transverse, and longitudinal directions are to be taken as below:

2.2.3.1 Longitudinal acceleration

The combined longitudinal acceleration, a_ℓ in [m/s^2] at any position, (combined effect of surge and pitch) is to be taken as:

$$a_\ell = \sqrt{a_{surge}^2 + \left[\left(g \sin\theta + a_{pitch-x}\right)\right]^2}$$

where,

a_{surge} = surge acceleration given in Cl.2.1.3.1.

$a_{pitch-x}$ = Longitudinal acceleration due to pitch, in [m/s^2]

= $a_{pitch}(z - R)$

2.2.3.2 Transverse acceleration

The combined transverse acceleration, a_t in [m/s^2] at any position, is to be taken as:

$$a_t = \sqrt{a_{sway}^2 + \left[\left(g \sin\varphi + a_{roll-y}\right)\right]^2}$$

where,

a_{sway} = sway/yaw acceleration given in Cl.2.1.3.2.

a_{roll-y} = Transverse acceleration due to roll, in [m/s^2]

= $a_{roll}(z - R)$

2.2.3.3 Vertical acceleration

The combined vertical acceleration, a_v in [m/s^2] at any position, (combined effect of heave, pitch and roll;)

$$a_v = \sqrt{\left(a_{heave}^2 + a_{roll-z}^2 + a_{pitch-z}^2\right)}$$

where,

a_{heave} = heave acceleration as given in Cl.2.1.3.3.

$a_{pitch-z}$ = Vertical acceleration due to pitch, in [m/s^2]

= $a_{pitch}(x - 0.45L)$

= $a_{pitch}\left|(x - 0.45L)\right|$ for L<90[m].

a_{roll-z} = Vertical acceleration due to roll, in [m/s^2]

= $a_{roll}\, y$

= $a_{roll}\left|y\right|$ for L<90[m].

2.3 Dynamic load cases

2.3.1 Definition of dynamic load cases

The following EDW is to be used to generate the dynamic load cases for structural assessment for L ≥ 90[m]:

- HSM load cases: HSM-1 and HSM-2: head sea EDWs that minimize and maximize the vertical wave bending moment amidships respectively.

- HSA load cases: HSA-1 and HSA-2: head sea EDWs that maximize and minimize the head sea vertical acceleration at FP respectively.

- FSM load cases: FSM-1 and FSM-2: following sea EDWs that minimize and maximize the vertical wave bending moment amidships respectively.

- BSR load cases: BSR-1P and BSR-2P: beam sea EDWs that minimize and maximize the roll motion downward and upward on the port side respectively with waves from the port side.

BSR-1S and BSR-2S: beam sea EDWs that maximize and minimize the roll motion downward and upward on the starboard side respectively with waves from the starboard side.

- BSP load cases: BSP-1P and BSP-2P: beam sea EDWs that maximize and minimize the hydrodynamic pressure at the waterline amidships on the port side respectively.

BSP-1S and BSP-2S: beam sea EDWs that maximize and minimize the hydrodynamic pressure at the waterline amidships on the starboard side respectively.

- OST load cases: OST-1P and OST-2P: oblique sea EDWs that minimize and maximize the torsional moment at 0.25L from the AE with waves from the port side respectively.

OST-1S and OST-2S: oblique sea EDWs that maximize and minimize the torsional moment at 0.25L from the AE with waves from the starboard side respectively.

- OSA load cases: OSA-1P and OSA-2P: oblique sea EDWs that maximize and minimize the pitch acceleration with waves from the port side respectively.

OSA-1S and OSA-2S: oblique sea EDWs that maximize and minimize the pitch acceleration with waves from the starboard side respectively.

HSA and OSA load cases are not be used for fatigue assessment.

Note 1: 1 and 2 denote the maximum or the minimum dominant load component for each EDW.

Note 2: P and S denote that the weather side is on port side or starboard side respectively.

2.3.2 Application

The dynamic load cases described in this section are to be used for determining the dynamic loads required by the design load scenarios described in Section 6. These dynamic load cases are to be applied to the following structural assessments:

2.3.2.1 Strength assessment:

- for plating, stiffeners and primary supporting members by prescriptive methods
- for hull girder strength
- for the direct strength method (FE analysis) assessment of structural members.

2.3.2.2 Fatigue assessment:

- for structural details covered by simplified stress analysis.
- for structural details covered by FE stress analysis.

2.4 Dynamic load cases for strength assessment

2.4.1 Description of dynamic load cases

Table 2.4.1.1 to Table 2.4.1.3 describe the ship motions responses and the global loads corresponding to each dynamic load case to be considered for the strength assessment for L ≥ 90[m].

Table 2.4.1.1: Ship responses for HSM, HSA and FSM load cases – Strength assessment

Loadcase	HSM-1	HSM-2	HSA-1	HSA-2	FSM-1	FSM-2

2.4.2 Load combination factors

The load combinations factors, LCFs for the global loads and inertia load components for strength assessment are defined in:

Table 2.4.2.1: LCFs for HSM, HSA and FSM load cases.

Table 2.4.2.2: LCFs for BSR and BSP load cases.

Table 2.4.2.3: LCFs for OST and OSA load cases.

Table 2.4.2.1: Load combination factors, LCF's for HSM, HSA and FSM load cases								
Load component		**LCF**	**HSM-1**	**HSM-2**	**HSA-1**	**HSA-2**	**FSM-1**	**FSM-2**

Section 3

Hull girder loads

Symbols

For symbols not defined in this section, Refer to Chapter 1, Section 2.

f_β = heading correction factor as defined in Section 2.

For strength assessment:

= 1.05 in general

= 0.8 for BSR and BSP load cases for the extreme sea loads design load scenario for L≥90[m].

= 1.0 for HSA, OST and OSA load cases for the extreme sea loads design load scenario for L≥90[m].

= 1.0 for ballast water exchange at sea, harbour and tank testing design load scenario.

For fatigue assessment: = 1.0.

f_{fa} = 0.90; fatigue coefficient

3.1 Application

3.1.1 General

The hull girder loads for the static (S) design load scenarios is to be taken as the still water loads defined in 3.3.

The total hull girder loads for the static plus dynamic (S+D) design load scenarios are to be derived for each load case and are to be taken as the sum of the still water loads defined in 3.3 and the dynamic loads defined in 3.6.

In general, these Rules are valid for ships not exceeding 500[m] in length (L), having a breadth (B), not exceeding one-fifth of the length (L), nor 2.5 times the depth (D) to the strength deck and having a block coefficient, C_b >0.6. Vessels beyond these proportions will be specially considered.

For container ships the hull girder vertical wave bending moment and shear force defined in Part 5 is to apply in lieu of vertical bending moment and shear force defined in this section. (Refer UR S11A)

3.2 Sign convention for hull girder loads

3.2.1 The sign conventions of vertical bending moments, vertical shear forces, horizontal bending moments and torsional moments at any ship transverse section are as shown in Figure 3.2.1, below:

- The vertical bending moments M_{sw} and M_{wv} are positive when they induce tensile stresses in the strength deck (hogging bending moment) and negative when they induce tensile stresses in the bottom (sagging bending moment)

- The vertical shear forces Q_{sw} and Q_{wv} are positive in the case of downward resulting forces acting aft of the transverse section and upward resulting forces acting forward of the transverse section under consideration

- The horizontal bending moment M_{wh} is positive when it induces tensile stresses in the starboard side and negative when it induces tensile stresses in the port side

- The torsional moment M_{wt} is positive in the case of resulting moment acting aft of the transverse section following negative rotation around the X-axis, and of resulting moment acting forward of the transverse section following positive rotation around the *X*-axis.

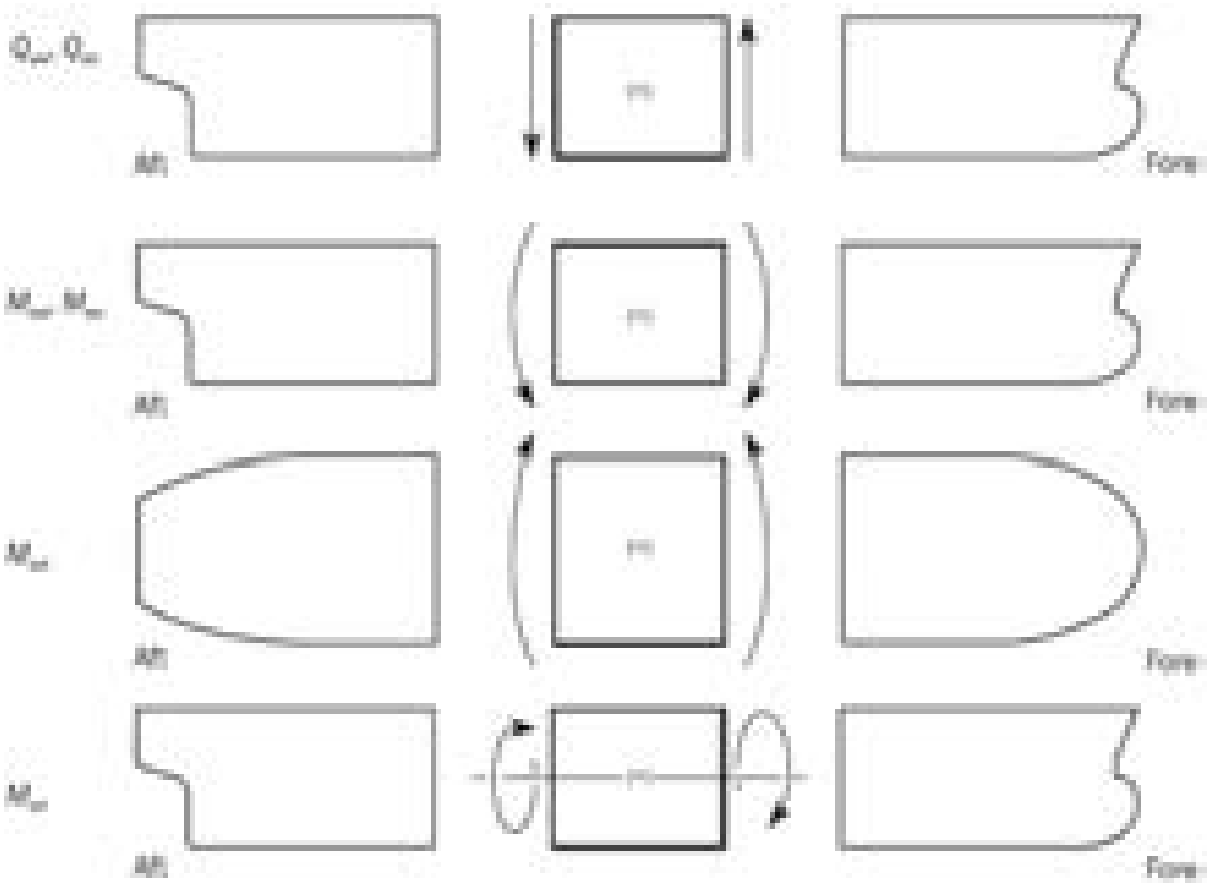

Figure 3.2.1: Sign conventions for shear force $\mathbf{Q_{sw}}, \mathbf{Q_{wv}}$ and bending moment $\mathbf{M_{sw}}, \mathbf{M_{wv}}, \mathbf{M_{wh}}, \mathbf{M_{wt}}$

3.3 Still water hull girder loads

3.3.1 General

3.3.1.1 Seagoing and harbour/sheltered water conditions

Permissible still water bending moments and shear forces for seagoing operations to be provided for ships with L>65[m], (Refer Cl.3.4.2, Cl.3.4.3, Cl.3.5.1 and Cl.3.5.2) and may upon consideration also be requested for smaller ships.

For ships with L≤65[m], still water bending moment in seagoing condition defined in Cl.3.4.1 is to be taken as the rule minimum value.

The permissible still water hull girder loads to be given at points of local maxima for the design loading conditions. For typical cargo vessels permissible values at the following points to be provided:

- at each transverse bulkhead in the cargo area
- at the middle of cargo compartments
- at the collision bulkhead
- at the engine room forward bulkhead
- at the mid-point between the forward and aft engine room bulkheads.

The permissible hull girder bending moments and shear forces at any other position may be obtained by linear interpolation.

3.3.1.2 Flooded condition

The designer is to provide the envelope of permissible still water bending moment and shear force in flooded condition.

3.3.2 Still water loads for the fatigue assessment

The still water bending moment and shear force values and distribution to be used for the fatigue assessment are to be taken as the most typical values applicable for the loading conditions that the ship will operate in for most of its life. The

definition of loading conditions to be used for specific ship types, refer Part 5.

3.4 Vertical still water bending moment

3.4.1 Minimum still water bending moment in seagoing condition

The minimum still water bending moment, $M_{sw-h-min}$ and $M_{sw-s-min}$, in [kN-m], in hogging and sagging condition, respectively in seagoing condition may be taken as:

Hogging conditions:

$$M_{sw-h-min} = f_{sw}((171C_wL^2B(C_b + 0.7)10^{-3}) - M_{wv-h-mid})$$

Sagging conditions:

$$M_{sw-s-min} = -0.85\, f_{sw}((171C_wL^2B(C_b + 0.7)10^{-3}) + M_{wv-s-mid})$$

where:

$M_{wv-h-mid}$ = Vertical wave bending moment for strength assessment in hogging condition, as defined in 3.6 using f_p and f_m equal to 1.0.

$M_{wv-s-mid}$ = Vertical wave bending moment for strength assessment in sagging condition, as defined in 3.6 using f_p and f_m equal to 1.0.

f_{sw} = Distribution factor along the ship length. To be taken as, Refer Figure 3.4.1:

= 0.0 for x ≤ 0

= 0.15 at x = 0.1 L

= 1.0 for 0.3 L ≤ x ≤ 0.7 L

= 0.15 at x = 0.9 L

= 0.0 for x ≥ 1L

Intermediate values of f_{sw} are to be obtained by linear interpolation.

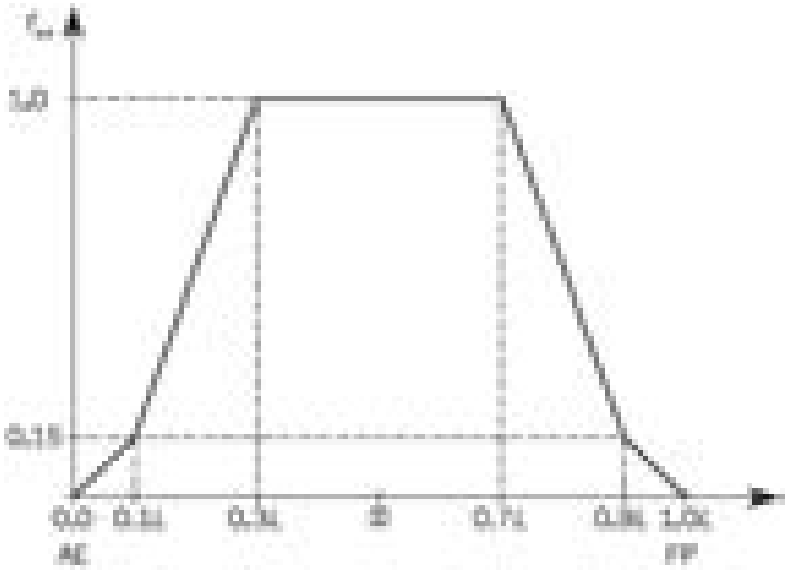

Figure 3.4.1: Distribution factor f_{sw}

3.4.2 Permissible vertical still water bending moments for sea going conditions

The permissible vertical still water bending moments, M_{sw-h} and M_{sw-s} in [kN-m], for hogging and sagging respectively, in seagoing condition at any longitudinal position are to envelop:

- The most severe still water bending moments calculated, in hogging and sagging conditions, respectively, for the seagoing loading conditions defined in Section 7.
- The most severe still water bending moments for the seagoing loading conditions defined in the loading manual.
- The minimum still water bending moment defined in Cl.3.4.1.

3.4.3 Permissible vertical still water bending moments for harbour and tank testing condition

The permissible vertical still water bending moments, $M_{sw-har-h}$ and $M_{sw-har-s}$ in [kN-m] for hogging and sagging respectively, in the

harbour r and tank testing condition at any longitudinal position are to envelop:

- The most severe still water bending moments, in hogging and sagging conditions, respectively, for the harbour loading conditions defined in Section 7

- The most severe still water bending moments for the harbour loading conditions defined in the loading manual.

- The permissible still water bending moment defined in Cl.3.4.2.

- The minimum still water bending moment defined in Cl.3.4.1 increased by 25%.

3.5 Vertical still water shear force

3.5.1 Permissible still water shear force in sea going conditions

The positive and negative permissible vertical still water shear forces, Q_{sw-pos} and Q_{sw-neg} in [kN], in seagoing condition at any longitudinal position are to envelop:

- The most severe still water shear forces, positive or negative, for the seagoing loading conditions defined in Section 7.

- The most severe still water shear forces for the seagoing loading conditions defined in the loading manual.

3.5.2 Permissible still water shear force in harbour and tank testing condition

The positive and negative permissible vertical still water shear forces, Q_{sw-har} in [kN], in the harbour and tank testing condition at any longitudinal position are to envelop:

- The most severe still water shear forces, positive or negative, for the seagoing loading conditions defined in Section 7

- The most severe still water shear forces for the harbour loading conditions defined in the loading manual

- The permissible still water shear forces defined in Cl.3.5.1.

3.6 Dynamic hull girder loads

3.6.1 Vertical wave bending moment

3.6.1.1 The vertical wave bending moments at any longitudinal position, in [kN-m], is to be taken as:

Hogging condition:

$$M_{wv-h} = +0.19\, f_m\, f_p\, f_{nl-vh}\, C_w L^2\, B\, C_b$$

Sagging condition:

$$M_{wv-s} = -0.19\, f_m\, f_p\, f_{nl-vs}\, C_w L^2\, B\, C_b$$

where:

f_m = Distribution factor for strength assessment for vertical wave bending moment along the ship's length, to be taken as:

= 0.0 for x ≤ 0

= 1.0 for 0.4 L ≤ x ≤ 0.65 L

= 0.0 for x ≥ L

Intermediate values of f_m are to be obtained by linear interpolation, Refer Figure 3.6.1(a1).

f_{nl-vh} = coefficient considering non-linear effects applied to hogging, is to be taken as:

= 1.0 for strength and fatigue assessment

f_{nl-vs} = coefficient considering non-linear effects applied to sagging, is to be taken as:

$0.58\frac{C_b + 0.7}{C_b}$ for strength assessment

= 1 for fatigue assessment

f_p = coefficient to be taken as

$f_p = f_{ps}$ for strength assessment

= $0.9(0.27 - (6 + 4f_T)L.10^{-5})$ for fatigue assessment

C_b = Not to be taken as less than 0.6

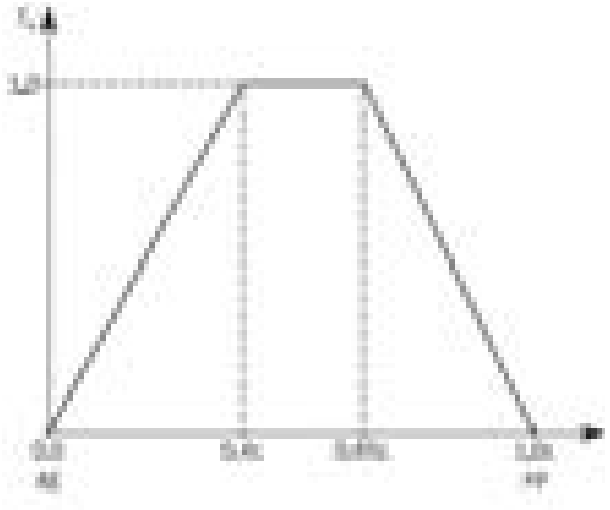

Figure 3.6.1(a1): Distribution factor f_m

3.6.1.2 However, for ships with high speed and/or large flare in the forebody, the value of f_m is to be modified as per Table 3.6.1 based on C_{AV} and C_{AF} given below, Refer Figure 3.6.1(b):

$$C_{AV} = \frac{C_v . V}{\sqrt{L}}$$

$$C_{AF} = \frac{C_v . V}{\sqrt{L}} + \frac{A_{dk} - A_{wp}}{L\, Z_{fp}}$$

$$C_v = \frac{\sqrt{L}}{50} \text{ for } L < 100[m]$$

$$= 0.2 \text{ for } L \geq 100[m]$$

A_{dk} = Projected area in horizontal plane of uppermost deck (including forecastle deck if any), forward of 0.2L from F.P. in [m^2]

A_{wp} = Area of waterplane at draught T_{SC}, forward of 0.2L abaft of F.P. in [m^2]

Z_{fp} = Vertical distance, in [m], measured at F.P., from the waterline at draught T_{SC}, to the uppermost deck (or forecastle deck).

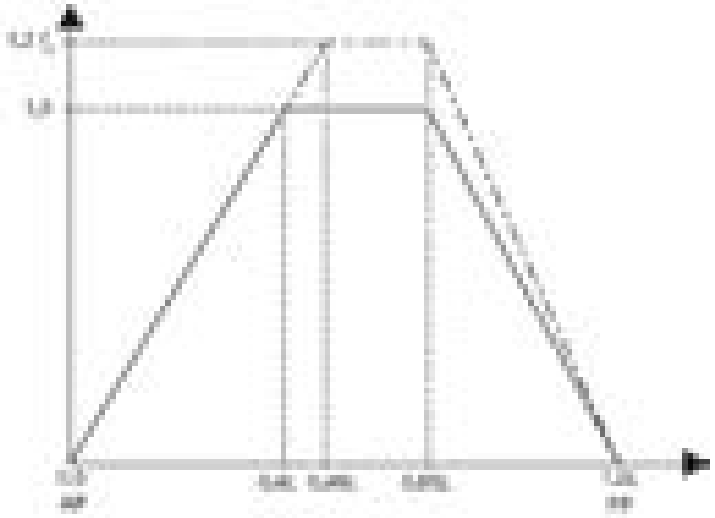

Figure 3.6.1(b): Distribution factor f_m with and without adjustment

Table 3.6.1: Adjustments to factor f_m values for high speed/flare				
	$C_{AV} \leq 0.28$		**$C_{AV} \geq 0.32$**	
	Load condition	**Curve**	**Load condition**	**Curve**
$C_{AF} \leq 0.4$	Hogging	No adjustments	Hogging	1.2 between 0.48L and 0.65L from AP. 0.0 at FP. and AP.
	Sagging	No adjustments	Sagging	No adjustments
$C_{AF} \geq 0.5$	Hogging	No adjustments	Hogging	No adjustments
	Sagging	1.2 between 0.48L and 0.65L from AP. 0.0 at FP. and AP.	Sagging	1.2 between 0.48L and 0.65L from AP. 0.0 at FP. and AP.
For intermediate values of C_{AV} and/or C_{AF}, values of f_m are to be obtained by linear interpolation.				

The adjustment is limited to the control for buckling as given in Chapter 8.

3.6.2 Vertical wave shear force

3.6.2.1 The rule vertical wave shear force Q_{wv} , in [kN] at any section along the length of the ship is to be taken as:

$$Q_{wv-pos} = 0.52\, f_{q-pos}\, f_p\, C_w L\, B\, C_b$$

$$Q_{wv-neg} = -(0.52\, f_{q-neg}\, f_p\, C_w L\, B\, C_b)$$

where,

f_{q-pos} = Distribution factor along the ship length for positive wave shear force, to be taken as:

= 0.0 for x ≤ 0

= 0.92 f_{nl-vh} for 0.2 L ≤ x ≤ 0.3 L

= 0.7 for 0.4 L ≤ x ≤ 0.6 L

= 1.0 f_{nl-vs} for 0.7 L ≤ x ≤ 0.85 L

= 0.0 for x ≥ L

Intermediate values of f_{q-pos} are to be obtained by linear interpolation, Refer Figure 3.6.2(a1).

f_{q-neg} = Distribution factor along the ship length for negative wave shear force, to be taken as:

= 0.0 for x ≤ 0

= 0.92 f_{nl-vs} for 0.2 L ≤ x ≤ 0.3 L

= 0.7 for 0.4 L ≤ x ≤ 0.6 L

= 1.0 f_{nl-vh} for 0.7 L ≤ x ≤ 0.85 L

= 0.0 for x ≥ L

Intermediate values of f_{q-neg} are to be obtained by linear interpolation, Refer Figure 3.6.2(a2).

f_{nl-vh}, f_{nl-vs} = Coefficient considering nonlinear effects defined in Cl.3.6.1.1.

f_p = coefficient to be taken as

= $f_p = f_{ps}$ for strength assessment

= $0.9.(0.27 - (17 - 8f_T)L.10^{-5})$ for fatigue assessment

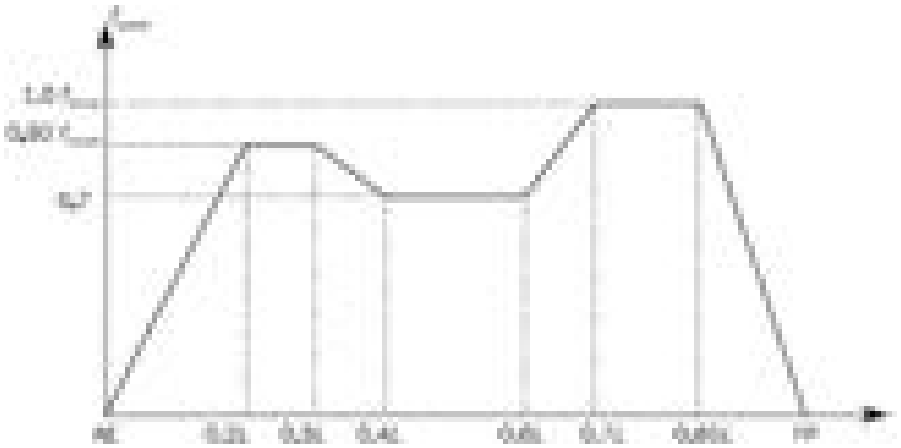

Figure 3.6.2(a1): Distribution factor of positive vertical shear force f_{q-pos}

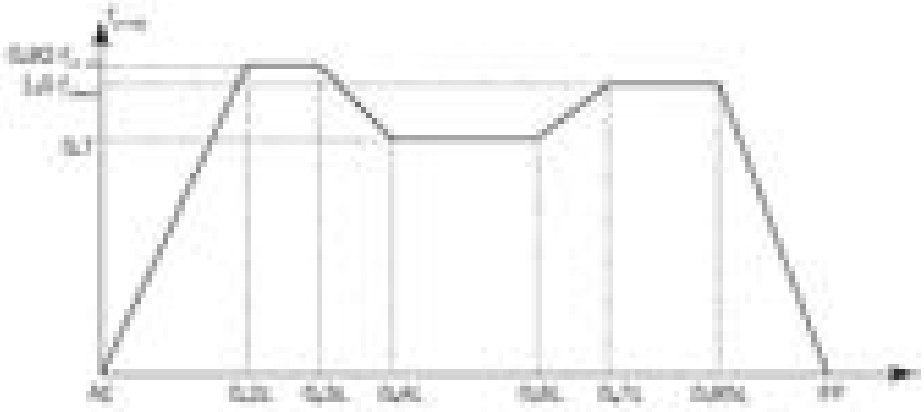

Figure 3.6.2(a2): Distribution factor of positive vertical shear force $\mathbf{f_{q-neg}}$

However, for ships with high speed and/or large flare in the forebody, the adjustments to $\mathbf{f_{q-pos}}$ and $\mathbf{f_{q-neg}}$ as given in Cl.3.6.2.2 apply for hull girder buckling strength check in accordance with Chapter 9, Section 3.

3.6.2.2 If required by Cl.3.6.2.1 $\mathbf{f_{q-pos}}$ and $\mathbf{f_{q-neg}}$ is to be adjusted according to Table 3.6.2. Refer Figure 3.6.2(b1) and Figure 3.6.2(b2).

Table 3.6.2: Adjustments to $\mathbf{f_{q-pos}}$ and $\mathbf{f_{q-neg}}$ for high speed/flare

	$\mathbf{C_{AV} \leq 0.28}$		$\mathbf{C_{AV} \geq 0.32}$	
	Load condition	**Curve**	**Load condition**	**Curve**
$\mathbf{C_{AF} \leq 0.4}$	Hogging	No adjustments	Hogging	1.2 between 0.7L and 0.85L from AP. 0.0 at FP. and AP.
	Sagging	No adjustments	Sagging	No adjustments
$\mathbf{C_{AF} \geq 0.5}$	Hogging	No adjustments	Hogging	No adjustments
	Sagging	1.2 between 0.7L and 0.85L from AP. 0.0 at FP. and AP.	Sagging	1.2 between 0.7L and 0.85L from AP. 0.0 at FP. and AP.
For intermediate values of $\mathbf{C_{AV}}$ and/or $\mathbf{C_{AF}}$, values of f_q are to be obtained by linear interpolation.				

$\mathbf{C_{AV}}$ **=** as defined in Cl.3.6.1

$\mathbf{C_{AF}}$ = as defined in Cl.3.6.1

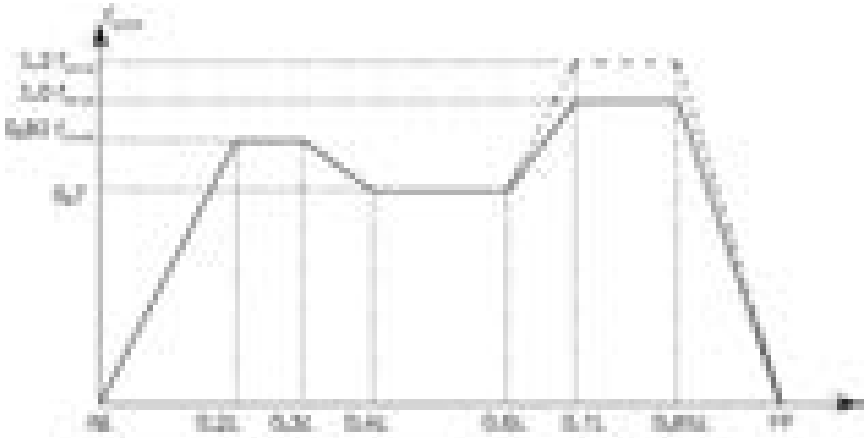

Figure 3.6.2(b1): Distribution factor of positive vertical shear force $\mathbf{f_{q-pos}}$, with and without adjustment

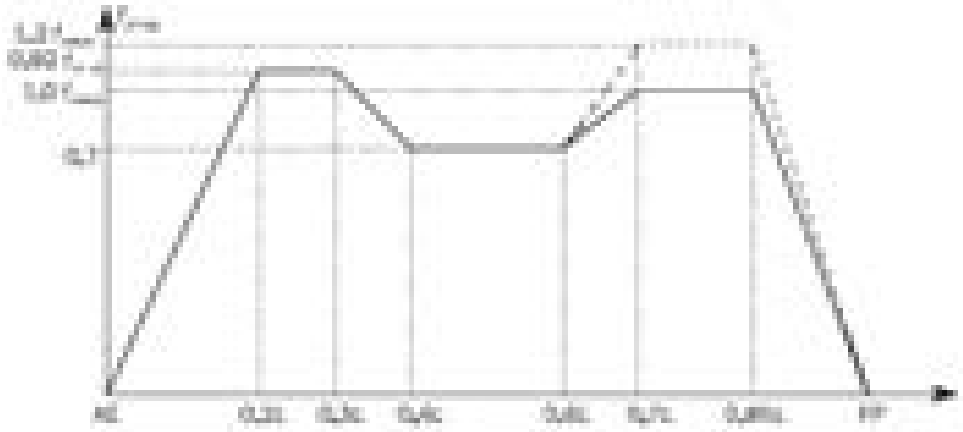

Figure 3.6.2(b2): Distribution factor of positive vertical shear force f_{q-neg}, with and without adjustment

3.6.3 Horizontal wave bending moment

The horizontal wave bending moment at any longitudinal position, in [kN-m], is to be taken as:

$$M_{wh} = \left(0.31 + \frac{L}{2800}\right) f_{nl-h}\, f_m\, f_p C_w\, L^2\, T_{LC}\, C_b$$

where,

f_m = Distribution factor defined in Cl.3.6.1.1.

f_{nl-h} = Coefficient considering nonlinear effect to be taken as:

= 0.9 for strength assessment

= 1.0 for fatigue assessment

f_p = coefficient to be taken as

$f_p = f_{ps}$ for strength assessment

$= 0.9.[(0.2 + 0.04f_T) + (11 - 8f_T)L.10^{-5}]$ for fatigue assessment

3.6.4 Wave torsional moment

3.6.4.1 The wave torsional moment at any longitudinal position with respect to the ship baseline, in [kN-m], is to be taken as:

$$M_{WT} = f_p(M_{wti} + M_{wt2})$$

where,

$$M_{wt1} = 0.4\, f_{t1} C_w \sqrt{\frac{L}{T_c}} B^2\, D\, C_b$$

$$M_{wt2} = 0.22\, f_{t2} C_w\, L\, B^2\, C_b$$

f_{t1}, f_{t2} = Distribution factors, taken as: -

f_{t1} = 0 for x < 0

$= \left|\sin\left(\frac{2\pi x}{L}\right)\right|$ for 0 ≤ x ≤ L

= 0 for x > L

f_{t2} = 0 for x < 0

$= \sin^2\left(\frac{\pi x}{L}\right)$ for 0 ≤ x ≤ L

= 0 for x > L

f_p = coefficient to be taken as

$= f_{ps}$ for strength assessment

$=0.9.(0.2 + (5f_T - 4.25)B.10^{-4})$

for fatigue assessment

3.6.4.2 The factors for the longitudinal distribution of the torsional moment for the OST load case is to be taken as follows:

f_{lp-OST} = 5 f_{xl} for x/L < 0.2

f_{lp-OST} = 1.0 for 0.2 ≤ x/L < 0.4

f_{lp-OST} = -7.6 f_{xl} +4.04 for 0.4 ≤ x/L < 0.65

f_{lp-OST} = -0.9 for 0.65 ≤ x/L < 0.85

f_{lp-OST} = 6 f_{xl} - 6.0 for 0.85 ≤ x/L

3.6.4.3 The factors for the longitudinal distribution of the torsional moment for the OSA load case is to be taken as follows:

f_{lp-OSA} = - (0.2+0.3 f_T) for x/L < 0.4

f_{lp-OSA} = - (0.2+0.3 f_T)$(5.6 - 11.5f_{xl})$ for 0.4 ≤ x/L < 0.6

f_{lp-OSA} = 1.3(0.2+0.3 f_T) for 0.6 ≤ x/L

3.7 Hull girder loads for dynamic load cases for L ≥ 90[m].

3.7.1 General

The dynamic hull girder loads to be applied for the dynamic load cases defined in Section 2, 2.3, are given in Cl.3.7.2 to Cl.3.7.5.

3.7.2 Vertical wave bending moment

The vertical wave bending moment, M_{wv-LC}, in [kN-m], to be used for each dynamic load case defined in Section 2, 2.3, is defined in Table 3.7.2.

Table 3.7.2: Vertical wave bending moment for dynamic load cases

Load combination factor	$\mathbf{M_{wv-LC}}$
$C_{WV} \geq 0$	$f_\beta\, C_{WV}\, M_{wv-h}$
$C_{WV} < 0$	$f_\beta\, C_{WV}\, \lvert M_{wv-s}\rvert$

where:

C_{WV} = Load combination factor for vertical wave bending moment, to be taken as specified in Section 2.

M_{wv-h}, M_{wv-s} = Hogging and sagging vertical wave bending moment taking into account the considered design load scenario, as defined in Cl.3.6.1.

3.7.3 Vertical wave shear force

The vertical wave shear force, Q_{wv-LC} , in [kN], to be used for each dynamic load case defined in Section 2, 2.3 is defined in Table 3.7.3.

Table 3.7.3: Vertical wave shear force for dynamic load cases

Load combination factor	$\mathbf{Q_{wv-LC}}$
$C_{QW} \geq 0$	$f_\beta\, C_{QW}\, Q_{wv-pos}$
$C_{QW} < 0$	$f_\beta\, C_{QW} \lvert Q_{wv-neg}\rvert$

where:

C_{QW} = Load combination factor for vertical wave shear force, to be taken as specified in Section 2.

M_{wv-pos}, M_{wv-neg} = Positive and negative vertical wave shear force taking into account the considered design load scenario, as defined in Cl.3.6.2.

3.7.4 Horizontal wave bending moment

The horizontal wave bending moment, M_{wh-LC}, in [kN-m], to be used for each dynamic load case defined in Section 2, 2.3, is to be taken as:

$$M_{wh-LC} = f_\beta\, C_{WH}\, M_{wh}$$

where:

C_{WH} = Load combination factor for horizontal wave bending moment, to be taken as specified in Section 2.

M_{wh} = Horizontal wave bending moment taking account of the appropriate design load scenario, as defined in Cl.3.6.3.

3.7.5 Wave torsional moment

The wave torsional moment, M_{wt-LC}, in [kN-m], to be used for each dynamic load case defined in Section 2, 2.3, is to be taken as:

$$M_{wt-LC} = f_\beta\, C_{WT}\, M_{wt}$$

where:

C_{WT} = Load combination factor for wave torsional moment, to be taken as specified in Section 2.

M_{wt} = Wave torsional moment taking account of the appropriate design load scenario, as defined in Cl.3.6.4.

Section 4

External Loads

Symbols

For symbols not defined in this section, Refer to Chapter 1, Section 2.

λ = Wave length, in [m]

B_x = Moulded breadth at the waterline, in [m], at the considered cross section.

f_{yB} = Ratio between Y-coordinate of the load point and B_x, to be taken as:

$$f_{yB} = \left|\frac{2y}{B_x}\right| \text{ but not greater than } 1.0$$

= 1, when $B_x = 0$

f_{yB1} = Ratio between Y-coordinate of the load point and B, to be taken as:

$$f_{yB1} = \left|\frac{2y}{B}\right| \text{ but not greater than } 1.0$$

f_{xl} = Ratio between X-coordinate of the load point and L, to be taken as:

$$f_{xl} = \frac{x}{L}$$

but not be taken less than 0.0 or greater than 1.0

C_w = Wave coefficient defined in Section 2

f_T = Ratio as defined in Section 2

$P_{W,WL}$ = Wave pressure at the waterline, [kN/m^2], for the considered dynamic load case

$$P_{W,WL} = P_W$$

for $z = T_{LC}$, $\quad y = B_x/2$ when $y \geq 0$,

$$y = -B_x/2 \text{ when } y < 0$$

h_W = Water head equivalent to the pressure at waterline, in [m], to be taken as:

$$h_w = \frac{P_{W,WL}}{\rho . g}$$

f_β = heading correction factor as defined in Section 2.

4.1 Sea pressure

4.1.1 Total pressure

4.1.1.1 The external pressure, P_{ex} at any load point of the hull, in [kN/m^2], for the static (S) design load scenarios, is to be taken as:

$$P_{ex} = P_s \text{ but not less than 0.}$$

4.1.1.2 The total pressure P_{ex} at any load point of the hull for the static plus dynamic (S+D) design load scenario, is to be derived from each dynamic load case and is to be taken as:

$$P_{ex} = P_s + P_w$$

where:

P_s = Hydrostatic pressure, in [kN/m^2], defined in Cl.4.1.2.

P_w = Wave pressure, in [kN/m^2], is defined in Cl.4.1.3.2 to Cl.4.1.3.8 for L ≥ 90[m] and Cl.4.1.3.10 for L < 90[m].

4.1.2 Hydrostatic pressure

The hydrostatic pressure, P_s at any load point, in [kN/m^2], is obtained from Table 4.1.2. Refer also Figure 4.1.2.

Table 4.1.2: Hydrostatic pressure, P_s

Location	Hydrostatic pressure, P_s in [kN/m^2]
$z \leq T_{LC}$	$\rho\, g(T_{LC} - z)$
$z > T_{LC}$	0

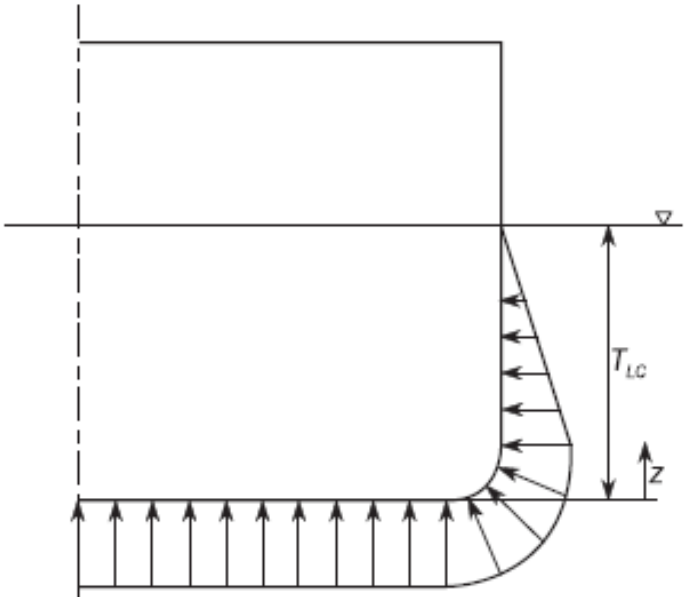

Figure 4.1.2: Hydrostatic pressure, P_s

4.1.3 External dynamic pressures for strength assessment

4.1.3.1 General

The hydrodynamic pressures for each dynamic load case defined in Section 2, 2.3 are defined in Cl.4.1.3.2 to Cl.4.1.3.8.

For ships with L ≥ 90[m], the wave pressure at any point, P_{w-max}, is to be taken as the greatest pressure obtained from any of the load cases determined by Cl.4.1.3.2 to Cl.4.1.3.8.

4.1.3.2 Hydrodynamic pressures for HSM load cases

The hydrodynamic pressures, P_W, for HSM-1 and HSM-2 load cases, at any load point, in [kN/m^2], are to be obtained from Table 4.1.3(a). Refer Figure 4.1.3(b1) and Figure 4.1.3(b2).

Table 4.1.3(a): Hydrodynamic pressures for HSM load cases

	Wave pressure, in [kN/m^2]		
Load case	$\mathbf{z \leq T_{LC}}$	$\mathbf{T_{LC} < z \leq h_W + T_{LC}}$	$\mathbf{z > h_W + T_{LC}}$
HSM-1	$P_W = \max(-P_{HS}, \rho.g(z - T_{LC}))$	$P_W = P_{W,WL} - \rho.g(z - T_{LC})$	$P_W = 0$
HSM-2	$P_W = \max(P_{HS}, \rho.g(z - T_{LC}))$		

where:

$$P_{HS} = f_\beta f_{ps} f_{nl} f_h k_a k_p f_{yz} C_w \sqrt{\frac{L_0 + \lambda - 125}{L}}$$

f_{nl} = Coefficient considering non-linear effects, to be taken as:

For extreme sea loads design load scenario:

= 0.7 at $f_{xl} = 0$

= 0.9 at $f_{xl} = 0.3$

= 0.9 at $f_{xl} = 0.7$

= 0.6 at $f_{xl} = 1.0$

For ballast water exchange design load scenario:

= 0.85 at $f_{xl} = 0$

= 0.95 at $f_{xl} = 0.3$

= 0.95 at $f_{xl} = 0.7$

= 0.80 at $f_{xl} = 1.0$

Intermediate values are obtained by linear interpolation.

f_{yz} = Girth distribution coefficient, to be taken as:

$$f_{yz} = \frac{Z}{T_{LC}} + f_{yB} + 1$$

f_h = Coefficient to be taken as:

$$f_h = 3.0(1.21 - 0.66f_T)$$

k_a = Amplitude coefficient in the longitudinal direction of the ship, to be taken as:

$$k_a = (0.5 + f_T)\left[\left(3 - 2\sqrt{f_{yB}}\right) - \frac{20}{9}f_{xl}\left(7 - 6\sqrt{f_{yB}}\right)\right] + \frac{2}{3}(1 - f_T) \text{ for } f_{xl} < 0.15$$

$$k_a = 1.0 \text{ for } 0.15 \leq f_{xl} < 0.7$$

$$k_a = 1 + (f_{xl} - 0.7)\left\{\left(\frac{40}{3}f_T - 5\right) + 2(1 - f_{yB})\left[\frac{18}{C_b}f_T(f_{xl} - 0.7) - 0.25(2 - f_T)\right]\right\} \text{ for } f_{xl} \geq 0.7$$

λ = Wave length of the dynamic load case, in [m], to be taken as

$$\lambda = 0.6L(1 + f_T)$$

k_p = Phase coefficient to be obtained from Table 4.1.3(b). Intermediate values are to be interpolated.

Table 4.1.3(b): Definition of phase coefficient k_p

f_{xl}	0	0.3-0.1f_T	0.35-0.1f_T	0.8-0.2f_T	0.9-0.2f_T	1.0
k_p	$-0.25f_T(1 + f_{yB})$	-1	1	1	-1	-1

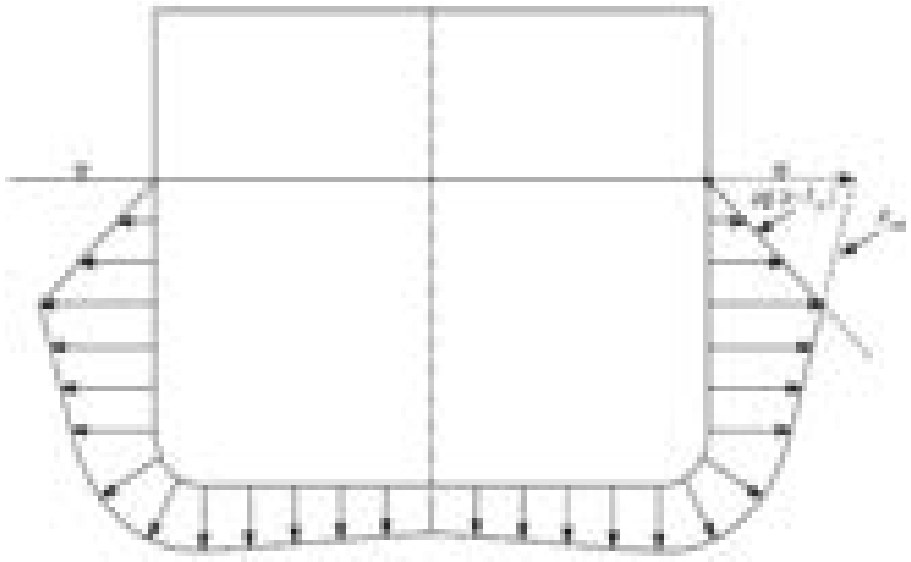

Figure 4.1.3(b1): Transverse distribution amidships of dynamic pressure for HSM-1, HSA-1 and FSM-1 load cases

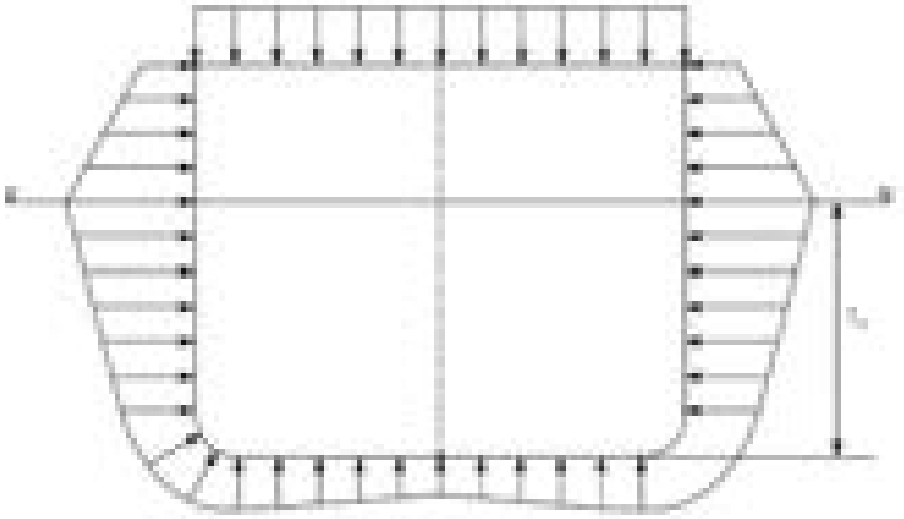

Figure 4.1.3(b2): Transverse distribution amidships of dynamic pressure for HSM-2, HSA-2 and FSM-2 load cases

4.1.3.3 Hydrodynamic pressures for HSA load cases

The hydrodynamic pressures, P_W, for HSA-1 and HSA-2 load cases, at any load point, in [kN/m^2], are to be obtained from Table 4.1.3(c). Refer Figure 4.1.3(b1) and Figure 4.1.3(b2).

Table 4.1.3(c): Hydrodynamic pressures for HSA load cases

	Wave pressure, in [kN/m^2]		
Load case	$\mathbf{z \leq T_{LC}}$	$\mathbf{T_{LC} < z \leq h_W + T_{LC}}$	$\mathbf{z > h_W + T_{LC}}$
HSA-1	$P_W = \max(-P_{HS}, \rho.g(z - T_{LC}))$	$P_W = P_{W,WL} - \rho.g(z - T_{LC})$	$P_W = 0$
HSA-2	$P_W = \max(P_{HS}, \rho.g(z - T_{LC}))$		

where:

P_{HS} = As defined in Cl.4.1.3.2

f_{nl} = As defined in Cl.4.1.3.2

f_{yz} = As defined in Cl.4.1.3.2

f_h = Coefficient to be taken as:

$f_h = 2.4(1.21 - 0.66f_T)$

k_a = Amplitude coefficient in the longitudinal direction of the ship, to be taken as defined in Cl.4.1.3.2

λ = Wave length of the dynamic load case, in m, as defined in Cl.4.1.3.2

k_p = Phase coefficient to be obtained from Table 4.1.3(c1). Intermediate values are to be interpolated.

Table 4.1.3(c1): Definition of phase coefficient k_p

f_{xl}	0	0.3-0.1f_T	0.5-0.2f_T	0.8-0.2f_T	0.9-0.2f_T	1.0
k_p	$1.5 - f_T - (0.5f_{yB})$	-1	1	1	-1	-1

4.1.3.4 Hydrodynamic pressures for FSM load cases

The hydrodynamic pressures, P_W, for FSM-1 and FSM-2 load cases, at any load point, in [kN/m^2], are to be obtained from Table 4.1.3(d). Refer Figure 4.1.3(b1) and Figure 4.1.3(b2).

Table 4.1.3(d): Hydrodynamic pressures for FSM load cases			
	Wave pressure, in [kN/m²]		
Load case	$\mathbf{z \leq T_{LC}}$	$\mathbf{T_{LC} < Z \leq h_W + T_{LC}}$	$\mathbf{Z > h_W + T_{LC}}$
FSM-1	$P_W = \max(-P_{FS}, \rho.g(z - T_{LC}))$	$P_W = P_{W,WL} - \rho.g(z - T_{LC})$	$P_W = 0$
FSM-2	$P_W = \max(P_{FS}, \rho.g(z - T_{LC}))$		

where:

$$P_{FS} = f_\beta\, f_{ps}\, f_{nl}\, f_h\, k_a\, k_p\, f_{yz}\, C_w \sqrt{\frac{L_0 + \lambda - 125}{L}}$$

f_{nl} = Coefficient considering non-linear effects, to be taken as:

= 0.9 for extreme sea loads design load scenario:

= 0.95 for ballast water exchange design load scenario:

f_{yz} = Girth distribution coefficient, to be taken as:

$$f_{yz} = \frac{Z}{T_{LC}} + f_{yB} + 1$$

f_h = Coefficient to be taken as, $f_h = 2.6$

k_a = Amplitude coefficient in the longitudinal direction of the ship, to be taken as:

$$k_a = 1 + (3.75 - 2f_T)(1 - 5f_{xl})(1 - f_{yB}) \text{ for } f_{xl} < 0.2$$

$$k_a = 1.0 \text{ for } 0.2 \leq f_{xl} < 0.9$$

$$k_a = 1 + 20\,(1 - f_{yB})(f_{xl} - 0.9) \text{ for } f_{xl} \geq 0.9$$

λ = Wave length of the dynamic load case, in [m], to be taken as

$$\lambda = 0.6L(1 + 2/3\, f_T)$$

k_p= Phase coefficient to be obtained from Table 4.1.3(d1). Intermediate values are to be interpolated.

Table 4.1.3(d1): Definition of phase coefficient k_p						
f_{xl}	0	$0.35\text{-}0.1f_T$	$0.5\text{-}0.2f_T$	0.75	0.8	1.0
k_p	$-0.75\text{-}0.25f_{yB}$	-1	1	1	-1	$-0.75\text{-}0.25f_{yB}$

4.1.3.5 Hydrodynamic pressures for BSR load cases

The hydrodynamic pressures, P_W, for BSR-1 and BSR-2 load cases, at any load point, in [kN/m²], are to be obtained from Table 4.1.3(e). Refer Figure 4.1.3(e1) and Figure 4.1.3(e2).

Table 4.1.3(e): Hydrodynamic pressures for BSR load cases			
	Wave pressure, in [kN/m²]		
Load case	$\mathbf{z \leq T_{LC}}$	$\mathbf{T_{LC} < Z \leq h_W + T_{LC}}$	$\mathbf{Z > h_W + T_{LC}}$
BSR-1P	$P_W = \max(P_{BSR}, \rho.g(z - T_{LC}))$	$P_W = P_{W,WL} - \rho.g(z - T_{LC})$	$P_W = 0$
BSR-2P	$P_W = \max(-P_{BSR}, \rho.g(z - T_{LC}))$		
BSR-1S	$P_W = \max(P_{BSR}, \rho.g(z - T_{LC}))$		
BSR-2S	$P_W = \max(-P_{BSR}, \rho.g(z - T_{LC}))$		

where:

For BSR-1P and BSR-2P load cases.

$$P_{BSR} = f_{\beta}\, f_{nl} \left[10y \sin \emptyset + 0.88 f_{ps} C_w \sqrt{\frac{L_0 + \lambda - 125}{L}} \left(f_{yB1} + 1 \right) \right]$$

For BSR-1S and BSR-2S load cases.

$$P_{BSR} = f_{\beta}\, f_{nl} \left[-10y \sin \emptyset + 0.88 f_{ps} C_w \sqrt{\frac{L_0 + \lambda - 125}{L}} \left(f_{yB1} + 1 \right) \right]$$

f_{nl} = Coefficient considering non-linear effects, to be taken as:

= 1.0 for extreme sea loads design load scenario

= 1.0 for ballast water exchange design load scenario

λ = Wave length of the dynamic load case, in [m], to be taken as

$$\lambda = \frac{g}{2\pi} T_R^2$$

where,

P_D = Green sea pressure on exposed deck as defined in 4.2.

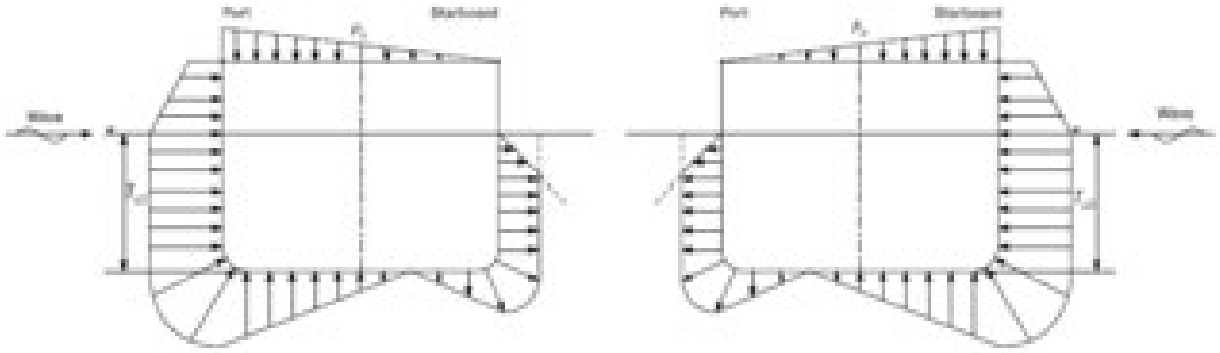

Figure 4.1.3(e1): Transverse distribution of dynamic pressure for BSR-1P (left) and BSR-1S (right) load cases

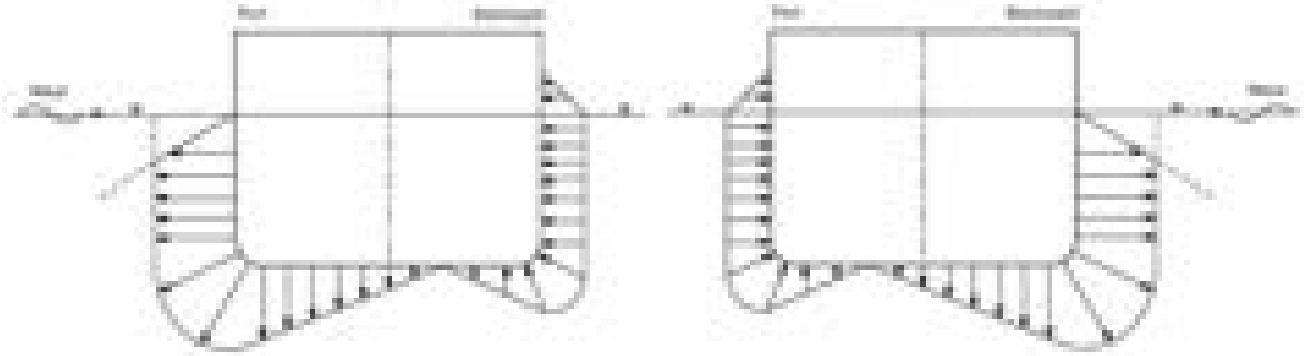

Figure 4.1.3(e2): Transverse distribution of dynamic pressure for BSR-2P (left) and BSR-2S (right) load cases

4.1.3.6 Hydrodynamic pressures for BSP load cases

The hydrodynamic pressures, P_W, for BSP-1 and BSP-2 load cases, at any load point, in [kN/m^2], are to be obtained from Table 4.1.3(f). Refer Figure 4.1.3(f1) and Figure 4.1.3(f2).

Table 4.1.3(f): Hydrodynamic pressures for BSP load cases			
	Wave pressure, in [kN/m²]		
Load case	$\mathbf{z \leq T_{LC}}$	$\mathbf{T_{LC} < Z \leq h_W + T_{LC}}$	$\mathbf{Z > h_W + T_{LC}}$
BSP-1P	$P_W = \max(P_{BSP}, \rho.g(z - T_{LC}))$	$P_W = P_{W,WL} - \rho.g(z - T_{LC})$	$P_W = 0$
BSP-2P	$P_W = \max(-P_{BSP}, \rho.g(z - T_{LC}))$		
BSP-1S	$P_W = \max(P_{BSP}, \rho.g(z - T_{LC}))$		
BSP-2S	$P_W = \max(-P_{BSP}, \rho.g(z - T_{LC}))$		

where:

$$P_{BSP} = 4.5\, f_\beta\, f_{ps}\, f_{nl}\, f_{yz}\, C_w \sqrt{\frac{L_0 + \lambda - 125}{L}}$$

λ = Wave length of the dynamic load case, in [m], to be taken as

$$\lambda = 0.2L(1 + 2f_T)$$

f_{yz} = Girth distribution coefficient, to be taken as:

For BSP-1P and BSP-2P

$$f_{yz} = 2\frac{Z}{T_{LC}} + 2.5\, f_{yB1} + 0.5 \text{ for } y \geq 0$$

$$f_{yz} = 2/3\frac{Z}{T_{LC}} + 1/2\, f_{yB1} + 0.5 \text{ for } y < 0$$

For BSP-1S and BSP-2S

$$f_{yz} = 2/3\frac{Z}{T_{LC}} + 1/2\, f_{yB1} + 0.5 \text{ for } y \geq 0$$

$$f_{yz} = 2\frac{Z}{T_{LC}} + 2.5\, f_{yB1} + 0.5 \text{ for } y < 0$$

f_{nl} = Coefficient considering non-linear effects, to be taken as:

For extreme sea loads design load scenario:

= 0.60 at $f_{xl} = 0$

= 0.80 at $f_{xl} = 0.3$

= 0.80 at $f_{xl} = 0.7$

= 0.60 at $f_{xl} = 1.0$

For ballast water exchange design load scenario:

= 0.60 at $f_{xl} = 0$

= 0.80 at $f_{xl} = 0.3$

= 0.80 at $f_{xl} = 0.7$

= 0.60 at $f_{xl} = 1.0$

Intermediate values are obtained by linear interpolation.

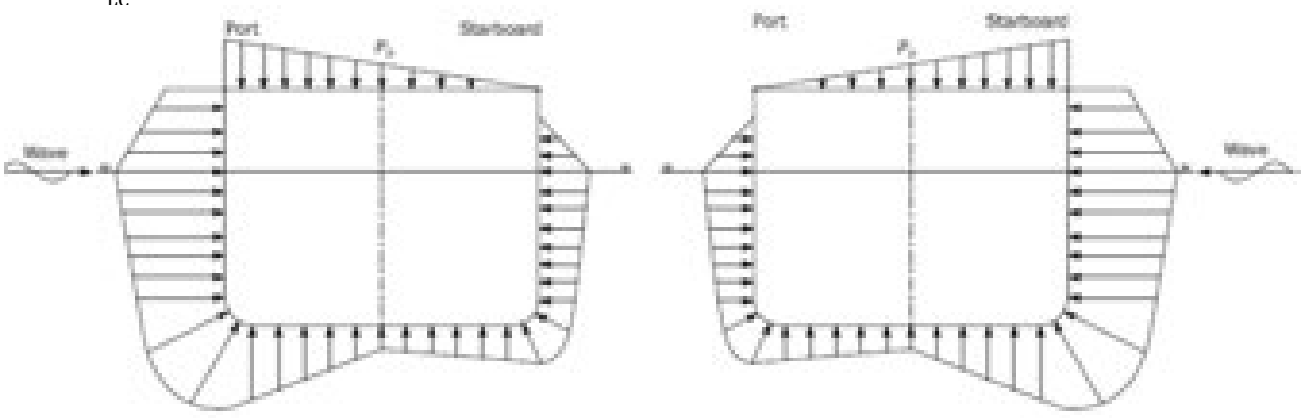

Figure 4.1.3(f1): Transverse distribution of dynamic pressure for BSP-1P (left) and BSP-1S (right) load cases

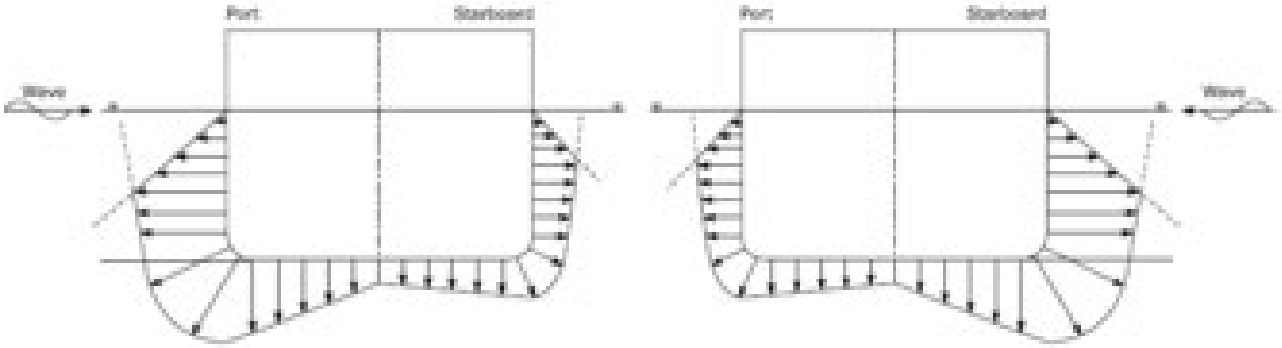

Figure 4.1.3(f2): Transverse distribution of dynamic pressure for BSP-2P (left) and BSP-2S (right) load cases

4.1.3.7 Hydrodynamic pressures for OST load cases

The hydrodynamic pressures, P_W, for OST-1 and OST-2 load cases, at any load point, in [kN/m^2], are to be obtained from Table 4.1.3(g). Refer Figure 4.1.3(g1) and Figure 4.1.3(g2).

Table 4.1.3(g): Hydrodynamic pressures for OST load cases			
	Wave pressure, in [kN/m^2]		
Load case	$\mathbf{z \leq T_{LC}}$	$\mathbf{T_{LC} < Z \leq h_W + T_{LC}}$	$\mathbf{Z > h_W + T_{LC}}$
OST-1P	$P_W = \max(P_{OST}, \rho.g(z - T_{LC}))$	$P_W = P_{W,WL} - \rho.g(z - T_{LC})$	$P_W = 0$
OST-2P	$P_W = \max(-P_{OST}, \rho.g(z - T_{LC}))$		
OST-1S	$P_W = \max(P_{OST}, \rho.g(z - T_{LC}))$		
OST-2S	$P_W = \max(-P_{OST}, \rho.g(z - T_{LC}))$		

where:

$$P_{OST} = 1.38\, f_{ps}\, f_{nl}\, k_a\, k_p\, f_{yz}\, C_w \sqrt{\frac{L_0 + \lambda - 125}{L}}$$

f_{yz} = Girth distribution coefficient, obtained from Table 4.1.3(g1).

λ = Wave length of the dynamic load case, in [m], to be taken as

$\lambda = 0.45L$

f_{nl} = Coefficient considering non-linear effects, to be taken as:

= 0.8 for extreme sea loads design load scenario

= 0.9 for ballast water exchange design load scenario

k_a = Amplitude coefficient in the longitudinal direction of the ship, to be obtained from Table 4.1.3(g2).

k_p = Phase coefficient to be obtained from Table 4.1.3(g3). Intermediate values are to be interpolated.

Table 4.1.3(g1): Definition of girth distribution coefficient, f_{yz}		
Transverse position	**OST-1P - OST-2P**	**OST-1S - OST-2S**

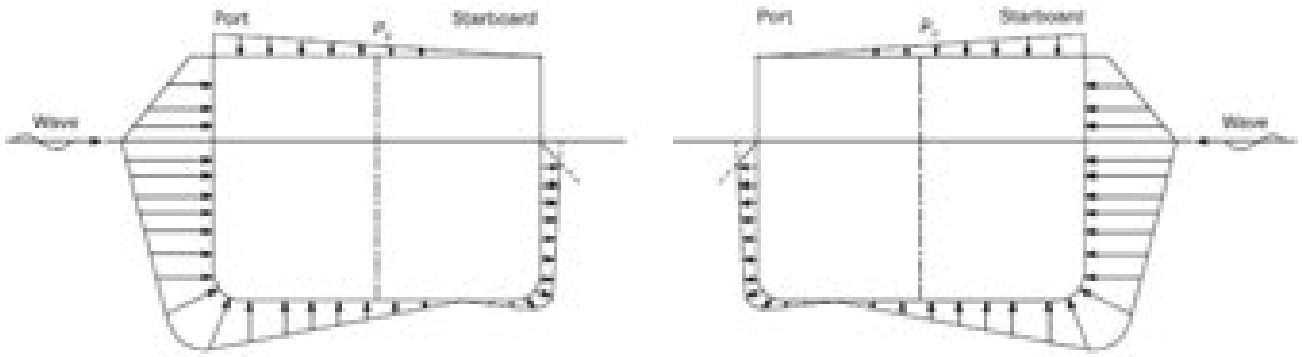

Figure 4.1.3(g2): Transverse distribution of dynamic pressure for OST-2P (left) and OST-2S (right) load cases

4.1.3.8 Hydrodynamic pressures for OSA load cases

The hydrodynamic pressures, P_W, for OSA-1 and OSA-2 load cases, at any load point, in [kN/m^2], are to be obtained from Table 4.1.3(h). Refer Figure 4.1.3(h1) and Figure 4.1.3(h2).

Table 4.1.3(h): Hydrodynamic pressures for OSA load cases

	Wave pressure, in [kN/m^2]		
Load case	$\mathbf{z \leq T_{LC}}$	$\mathbf{T_{LC} < Z \leq h_W + T_{LC}}$	$\mathbf{Z > h_W + T_{LC}}$
OSA-1P	$P_W = \max(P_{OSA}, \rho.g(z - T_{LC}))$	$P_W = P_{W,WL} - \rho.g(z - T_{LC})$	$P_W = 0$
OSA-2P	$P_W = \max(-P_{OSA}, \rho.g(z - T_{LC}))$		
OSA-1S	$P_W = \max(P_{OSA}, \rho.g(z - T_{LC}))$		
OSA-2S	$P_W = \max(-P_{OSA}, \rho.g(z - T_{LC}))$		

where:

$$P_{OSA} = 0.81\, f_{ps}\, f_{nl}\, k_a\, k_p\, f_{yz}\, C_w \sqrt{\frac{L_0 + \lambda - 125}{L}} (1 + 0.5 f_T)$$

f_{yz} = Girth distribution coefficient, obtained from Table 4.1.3(h1).

λ = Wave length of the dynamic load case, in [m], to be taken as

$\lambda = 0.7L$

f_{nl} = Coefficient considering non-linear effects, to be taken as:

For extreme sea loads design load scenario:

= 0.50 at $f_{xl} = 0$

= 0.80 at $f_{xl} = 0.3$

= 0.80 at $f_{xl} = 0.7$

= 0.60 at $f_{xl} = 1.0$

For ballast water exchange design load scenario:

= 0.75 at $f_{xl} = 0$

= 0.90 at $f_{xl} = 0.3$

= 0.90 at $f_{xl} = 0.7$

= 0.80 at $f_{xl} = 1.0$

Intermediate values are obtained by linear interpolation.

k_a = Amplitude coefficient in the longitudinal direction of the ship, to be obtained from Table 4.1.3(h2).

k_p = Phase coefficient to be obtained from Table 4.1.3(h3). Intermediate values are to be interpolated.

Table 4.1.3(h1): Definition of girth distribution coefficient, f_{yz}		
Transverse position	**OSA-1P - OSA-2P**	**OSA-1S - OSA-2S**
$y \geq 0$	$5.5\frac{z}{T_{LC}} + 5.3f_{yB} + 2.2$	$0.9\frac{z}{T_{LC}} + 0.4f_{yB} + 2.2$
$y < 0$	$0.9\frac{z}{T_{LC}} + 0.4f_{yB} + 2.2$	$5.5\frac{z}{T_{LC}} + 5.3f_{yB} + 2.2$

	1.0	$0.5f_T - 1.25 + (0.2 - 0.1f_T)f_{yB}$	$0.5f_T - 1.25 + (0.25 - 0.5f_T)f_{yB}$

4.1.3.9 Envelope of dynamic pressure

The envelope of wave pressure at any point, P_{w-max} is to be taken as the greatest pressure obtained from any of the load cases determined by Cl.4.1.3.2 to Cl.4.1.3.8.

4.1.3.10 Envelope wave pressure for L< 90[m]

For ships with L< 90[m] the envelope wave pressure, P_w, as obtained from Table 4.1.3(j) is to be used in lieu of the pressures defined in Cl.4.1.3.2 to Cl.4.1.3.8.

The total pressure P_{ex} at any load point of the hull (bottom and side shell, including sides of the superstructure) for the static plus dynamic (S+D) design load scenario on, is to be derived from each dynamic load case and is to be taken as:

$$P_{ex} = P_s + P_w$$

where:

P_s = Hydrostatic pressure, in [kN/m^2], defined in Cl.4.1.2.

P_w = Wave pressure, in [kN/m^2], as defined in Table Cl.4.1.3(j).

P_{ex} also not to be taken less than

$\lceil \min\{(20 + 0.5(L - 90))R_s\}, 50R_s \rceil$ in [kN/m^2].

Table 4.1.3(j): Wave pressure in [kN/m^2], for ships with L $<$ 90[m]

Wave pressure on bottom shell, side shell and superstructure side in [kN/m^2]			
For bottom shell below waterline			$P_w = P_{w-head(bwl)}$
For side shell below waterline			$P_w =$ greater of $(P_{w-head(bwl)})$ and $P_{w-beam(bwl)}$
For side shell above waterline			$P_w =$ greater of $(P_{w-head(awl)})$ and $P_{w-beam(awl)}$
Dynamic pressure in head sea condition	$P_{w-head(bwl)}$	Below waterline	$1.8R_s\left[(3K_s + 0.8)C_w + 135\frac{\lvert y\rvert}{(B+75)} - 1.2(T_{LC} - z)\right]$
	$P_{w-head(awl)}$	Above waterline	$1.8R_s\left[(3K_s + 0.8)C_w + 135\frac{\lvert y\rvert}{(B+75)}\right] - 10(z - T_{LC})$
Dynamic pressure in beam sea condition	$P_{w-beam(bwl)}$	Below waterline	$17R_s\left[\lvert y\rvert\frac{\emptyset}{360}.\pi + C_B\left(\frac{\lvert y\rvert + 0.8C_w}{14}\right)\left(0.7 + 2\frac{z}{T_{LC}}\right)\right]$
	$P_{w-beam(awl)}$	Above waterline	$17R_s\left[\lvert y\rvert\frac{\emptyset}{360}.\pi + 2.7C_B\left(\frac{\lvert y\rvert + 0.8C_w}{14}\right)\right] - 10(z - T_{LC})$

where:

$P_{w-head(bwl)}, P_{w-head(awl)}, P_{w-beam(bwl)}, P_{w-beam(awl)}$ are dynamic pressures, in head sea or beam sea conditions as given above.

R_s = Reduction factor related to service restriction as defined in Section 2.

$$K_s = C_B + \frac{0.83}{\sqrt{C_B}} \text{ at and aft of rule AP}$$

$$K_s = C_B \text{ for } 0.2 \le x/L \le 0.6$$

$$K_s = C_B + \frac{1.33}{C_B} \text{ at and forward of FP.}$$

Intermediate values to be linearly interpolated.

C_w = as defined in Section 2.

$\emptyset$ = Roll angle, in [deg], Refer Section 2.

y = Offset of the load point in consideration in [m] not to be taken less than B/4.

z = Vertical distance [m] from the baseline to the load coordinate point.

4.1.4 External dynamic pressures for fatigue assessment for L≥ 90[m]

4.1.4.1 General

The external pressure P_{ex} at any load point of the hull for the fatigue static plus dynamic (S+D) design load scenario, is to be derived from each fatigue dynamic load case and is to be taken as:

$$P_{ex} = P_s + P_w \text{ but not less than 0.}$$

where:

P_s = Hydrostatic pressure, in [kN/m^2], defined in Cl.4.1.2.

P_w = Wave pressure, in [kN/m^2], is defined in Cl.4.1.4.2 to Cl.4.1.4.6.

4.1.4.2 Hydrodynamic pressures for HSM load cases

The hydrodynamic pressures, P_W, for HSM-1 and HSM-2 load cases, at any load point, in [kN/m^2], are to be obtained from Table 4.1.4(a).

Table 4.1.4(a): Hydrodynamic pressures for HSM load cases

	Wave pressure, in [kN/m^2]		
Load case	$\mathbf{z \le T_{LC}}$	$\mathbf{T_{LC} < Z \le h_W + T_{LC}}$	$\mathbf{Z > h_W + T_{LC}}$
HSM-1	$P_W = \max(-P_{HS}, \rho.g(z - T_{LC}))$	$P_W = P_{W,WL} - \rho.g(z - T_{LC})$	$P_W = 0$
HSM-2	$P_W = \max(P_{HS}, \rho.g(z - T_{LC}))$		

where:

$$P_{HS} = f_p\, f_h\, k_a\, k_p\, f_{yz}\, C_w \sqrt{\frac{L_0 + \lambda - 125}{L}}$$

f_{yz} = Girth distribution coefficient, to be taken as:

$$f_{yz} = \frac{Z}{T_{LC}} + f_{yB} + 1$$

f_h = Coefficient to be taken as:

$$f_h = 2.75(1.21 - 0.66 f_T)$$

f_p = coefficient to be taken as

= $f_{fa}((0.21 + 0.02 f_T) + (6 - 4 f_T)L.10^{-5})$ for fatigue assessment

k_a = Amplitude coefficient in the longitudinal direction of the ship, to be taken as:

$$k_a = 1.0 + 3f_T - (1.0 + f_T)f_{yB} + \left[5(1.0 + f_T)f_{yB} - 15f_T\right]f_{xl} \text{ for } f_{xl} < 0.2$$

$$k_a = 1.0 \text{ for } 0.2 \le f_{xl} < 0.6$$

$$k_a = 1 + (f_{xl} - 0.6)\{(13.5 - 3.5f_T)f_{yB} + (14.5f_T - 17) + 40(1 - f_{yB})(f_{xl} - 0.6)\} \text{for } f_{xl} \ge 0.6$$

λ = Wave length of the dynamic load case, in [m], to be taken as

$$\lambda = 0.6L(1 + f_T)$$

k_p = Phase coefficient to be obtained from Table 4.1.4(b). Intermediate values are to be interpolated.

Table 4.1.4(b): Definition of phase coefficient k_p

f_{xl}	0	0.3-0.1f_T	0.5-0.2f_T	0.9-0.4f_T	0.9-0.2f_T	1.0
k_p	$(1 - f_T) + (0.5 - f_T)f_{yB}$	-1	1	1	-1	-1

4.1.4.3 Hydrodynamic pressures for FSM load cases

The hydrodynamic pressures, P_W, for FSM-1 and FSM-2 load cases, at any load point, in [kN/m^2], are to be obtained from Table 4.1.4(c).

Table 4.1.4(c): Hydrodynamic pressures for FSM load cases			
	Wave pressure, in [kN/m^2]		
Load case	$\mathbf{z \leq T_{LC}}$	$\mathbf{T_{LC} < Z \leq h_W + T_{LC}}$	$\mathbf{Z > h_W + T_{LC}}$
FSM-1	$P_W = \max(-P_{FS}, \rho.g(z - T_{LC}))$	$P_W = P_{W,WL} - \rho.g(z - T_{LC})$	$P_W = 0$
FSM-2	$P_W = \max(P_{FS}, \rho.g(z - T_{LC}))$		

where:

$$P_{HS} = f_p\, f_h\, k_a\, k_p\, f_{yz}\, C_w \sqrt{\frac{L_0 + \lambda - 125}{L}}$$

f_h = Coefficient to be taken as, $f_h = 2.6$

f_p = coefficient to be taken as

= $f_{fa}((0.21 + 0.02f_T) + (6 - 4f_T)L.10^{-5})$ for fatigue assessment

f_{yz} = Girth distribution coefficient, to be taken as:

$$f_{yz} = \frac{Z}{T_{LC}} + f_{yB} + 1$$

k_a = Amplitude coefficient in the longitudinal direction of the ship, to be taken as:

$k_a = 1 + (3.5 - 2f_T)(1 - 5f_{xl})(1 - f_{yB})$ for $f_{xl} < 0.2$

$k_a = 1.0$ for $0.2 \leq f_{xl} < 0.9$

$k_a = 1 + 15\,(1 - f_{yB})(f_{xl} - 0.9)$ for $f_{xl} \geq 0.9$

λ = Wave length of the dynamic load case, in [m], to be taken as

$$\lambda = 0.6L(1 + 2/3\, f_T)$$

k_p = Phase coefficient to be obtained from Table 4.1.4(c1). Intermediate values are to be interpolated.

Table 4.1.4(c1): Definition of phase coefficient k_p						
f_{xl}	0	$0.35\text{-}0.1f_T$	$0.5\text{-}0.2f_T$	0.75	$0.9\text{-}0.1f_T$	1.0
k_p	$-0.75\text{-}0.25f_{yB}$	-1	1	1	-1	$-0.5\text{-}0.5f_{yB}$

4.1.4.4 Hydrodynamic pressures for BSR load cases

The hydrodynamic pressures, P_W, for BSR-1 and BSR-2 load cases, at any load point, in [kN/m^2], are to be obtained from Table 4.1.4(d).

Table 4.1.4(d): Hydrodynamic pressures for BSR load cases			
	Wave pressure, in [kN/m^2]		
Load case	$\mathbf{z \leq T_{LC}}$	$\mathbf{T_{LC} < Z \leq h_W + T_{LC}}$	$\mathbf{Z > h_W + T_{LC}}$
BSR-1P	$P_W = \max(P_{BSR}, \rho.g(z - T_{LC}))$	$P_W = P_{W,WL} - \rho.g(z - T_{LC})$	$P_W = 0$
BSR-2P	$P_W = \max(-P_{BSR}, \rho.g(z - T_{LC}))$		
BSR-1S	$P_W = \max(P_{BSR}, \rho.g(z - T_{LC}))$		
BSR-2S	$P_W = \max(-P_{BSR}, \rho.g(z - T_{LC}))$		

where:

For BSR-1P and BSR-2P load cases.

$$P_{BSR} = \left[10y \sin \emptyset + 0.88 f_p C_w \sqrt{\frac{L_0 + \lambda - 125}{L}} \left(f_{yB1} + 1\right)\right]$$

For BSR-1S and BSR-2S load cases.

$$P_{BSR} = \left[-10y \sin \emptyset + 0.88 f_p C_w \sqrt{\frac{L_0 + \lambda - 125}{L}} \left(f_{yB1} + 1\right)\right]$$

f_p = coefficient to be taken as

= $f_{fa}\left((0.21 + 0.04 f_T) - (12 f_T - 2)B.10^{-4}\right)$ for fatigue assessment

λ = Wave length of the dynamic load case, in [m], to be taken as

$$\lambda = \frac{g}{2\pi} T_R^2$$

4.1.4.5 Hydrodynamic pressures for BSP load cases

The hydrodynamic pressures, P_W, for BSP-1 and BSP-2 load cases, at any load point, in [kN/m^2], are to be obtained from Table 4.1.4(e).

Table 4.1.4(e): Hydrodynamic pressures for BSP load cases

	Wave pressure, in [kN/m^2]		
Load case	$\mathbf{z \le T_{LC}}$	$\mathbf{T_{LC} < Z \le h_W + T_{LC}}$	$\mathbf{Z > h_W + T_{LC}}$
BSP-1P	$P_W = \max\left(P_{BSP}, \rho . g(z - T_{LC})\right)$	$P_W = P_{W,WL} - \rho . g(z - T_{LC})$	$P_W = 0$
BSP-2P	$P_W = \max\left(-P_{BSP}\ \rho . g(z - T_{LC})\right)$		
BSP-1S	$P_W = \max\left(P_{BSP}, \rho . g(z - T_{LC})\right)$		
BSP-2S	$P_W = \max\left(-P_{BSP}, \rho . g(z - T_{LC})\right)$		

where:

$$P_{BSP} = 4.5\ f_p\ f_{yz}\ C_w \sqrt{\frac{L_0 + \lambda - 125}{L}}$$

λ = Wave length of the dynamic load case, in [m], to be taken as

$$\lambda = 0.2L(1 + 2f_T)$$

f_{yz} = Girth distribution coefficient, to be taken as:

For BSP-1P and BSP-2P

$$f_{yz} = 2\frac{Z}{T_{LC}} + 2.5\ f_{yB1} + 0.5 \text{ for } y \ge 0$$

$$f_{yz} = 2/3\frac{Z}{T_{LC}} + 1/2\ f_{yB1} + 0.5 \text{ for } y < 0$$

For BSP-1P and BSP-2P

$$f_{yz} = 2/3\frac{Z}{T_{LC}} + 1/2\ f_{yB1} + 0.5 \text{ for } y \ge 0$$

$$f_{yz} = 2\frac{Z}{T_{LC}} + 2.5\ f_{yB1} + 0.5 \text{ for } y < 0$$

f_p = coefficient to be taken as

= $f_{fa}(0.2 + (8 + 16 f_T)10^{-3})$ for fatigue assessment

4.1.4.6 Hydrodynamic pressures for OST load cases

The hydrodynamic pressures, P_W, for OST-1 and OST-2 load cases, at any load point, in [kN/m^2], are to be obtained from Table 4.1.4(f).

Table 4.1.4(f): Hydrodynamic pressures for OST load cases

	Wave pressure, in [kN/m^2]		
Load case	$\mathbf{z \le T_{LC}}$	$\mathbf{T_{LC} < Z \le h_W + T_{LC}}$	$\mathbf{Z > h_W + T_{LC}}$
OST-1P	$P_W = \max(P_{OST}, \rho.g(z - T_{LC}))$	$P_W = P_{W,WL} - \rho.g(z - T_{LC})$	$P_W = 0$
OST-2P	$P_W = \max(-P_{OST}\ \rho.g(z - T_{LC}))$		
OST-1S	$P_W = \max(P_{OST}, \rho.g(z - T_{LC}))$		
OST-2S	$P_W = \max(-P_{OST}, \rho.g(z - T_{LC}))$		

where:

$$P_{OST} = 1.38\ f_p\ k_a\ k_p\ f_{yz}\ C_w \sqrt{\frac{L_0 + \lambda - 125}{L}}$$

f_{yz} = Girth distribution coefficient, obtained from Table 4.1.4(f1).

f_p = coefficient to be taken as

= $f_{fa}((0.25 - 0.02f_T) + (12f_T - 9)B.10^{-4})$ for fatigue assessment

λ = Wave length of the dynamic load case, in [m], to be taken as

$$\lambda = 0.45L$$

k_a = Amplitude coefficient in the longitudinal direction of the ship, to be obtained from Table 4.1.4(f2).

k_p = Phase coefficient to be obtained from Table 4.1.4(f3). Intermediate values are to be interpolated.

Table 4.1.4(f1): Definition of girth distribution coefficient, f_{yz}

Transverse position	**OST-1P - OST-2P**	**OST-1S - OST-2S**
$y \ge 0$	$5\frac{z}{T_{LC}} + 3.3f_{yB} + 1.7$	$\frac{z}{T_{LC}} + 0.3f_{yB} + 1.7$
$y < 0$	$\frac{z}{T_{LC}} + 0.3f_{yB} + 1.7$	$5\frac{z}{T_{LC}} + 3.3f_{yB} + 1.7$

4.2 Loads on exposed decks

4.2.1 Application

4.2.1.1 The external pressures and forces on exposed decks are only to be applied for strength assessment, i.e. yield and buckling assessment.

4.2.1.2 The green sea pressures defined in Cl.4.2.2 for exposed decks are to be considered independently of the pressures due to distributed cargo or other equipment loads and any concentrated forces due to cargo or other unit equipment loads, defined in Cl.4.2.3.1 and Cl.4.2.3.2 respectively.

4.2.2 Green sea loads

4.2.2.1 Pressure on exposed deck

The external dynamic pressure due to green sea loading, P_D, at any point of an exposed deck, in [kN/m^2], for the static plus dynamic (S + D) design load scenarios are to be derived for each dynamic load case and be taken as defined below.

The external dynamic pressure due to green sea loading, P_D, at any point of an exposed deck for the static (S) design load scenarios is zero.

4.2.2.2 Effect of wave breakers need not be considered for green sea pressure calculation.

4.2.2.3 HSM, HSA and FSM load cases for L≥ 90[m]

The external pressure, P_D, for HSM, HSA and FSM load cases, at any load point of an exposed deck is to be obtained, in [kN/m^2], from the following formula:

$P_D = \chi P_w$ but not to be taken less than χP_{D-min}.

where:

$P_w = P_{w,D}$.

$P_{w,D}$ = Pressure in [kN/m^2] obtained at side of the exposed deck for HSM, HSA and FSM load cases as defined in Cl.4.1.3.

P_{D-min} = Minimum pressure on exposed freeboard deck, in [kN/m^2], to be taken as:

P_{D-min} = 0 for global or partial ship finite element analysis according to Chapter 8

= 0 for PSM grillage according to Chapter 7
= as defined in Table 4.2.2.1, for other cases

χ = Coefficient defined in Table 4.2.2.2.

Table 4.2.2.1: Minimum pressures on exposed decks for HSM, HSA, FSM load cases		
Location	**Minimum pressure on exposed deck, P_{D-min}, in [kN/m^2]**	
	$L_{LL} \geq 100[m]$	$L_{LL} < 100[m]$
$X_{LL}/L_{LL} \leq 0.75$	34.3	$14.9 + 0.195L_{LL}$
$X_{LL}/L_{LL} > 0.75$	$34.3 + \left(14.8 + a(L_{LL} - 100)\right)\left(4\frac{X_{LL}}{L_{LL}} - 3\right)$	$12.2 + \frac{L_{LL}}{9}\left(5\frac{X_{LL}}{L_{LL}} - 2\right) + 3.6\frac{X_{LL}}{L_{LL}}$
where: a = coefficient taken equal to: a = 0.356 for type A, type B-60 and type B-100 freeboard ships a = 0.0726 for type B freeboard ships X_{LL} = X-coordinate of the load point measured from the aft end of the freeboard length L_{LL}.		

Table 4.2.2.2: Coefficient for pressure on exposed decks	
Exposed deck location	χ
Freeboard deck	1.00
Superstructure deck including forecastle deck	0.75
1st tier of deckhouse	0.56
2nd tier of deckhouse	0.42
3rd tier of deckhouse	0.32
4th tier of deckhouse	0.25
5th tier of deckhouse	0.20
6th tier of deckhouse	0.15
7th tier of deckhouse and above	0.10

4.2.2.4 BSR, BSP, OST and OSA load cases for L≥ 90[m]

The external pressure, P_D, for BSR,BSP,OST and OSA load cases, at any load point of an exposed deck is to be obtained, in [kN/m^2], by linear interpolation between the pressures at the port and starboard deck edges, Refer also Figure 4.1.3(e1), Figure 4.1.3(f1), Figure 4.1.3(g2) and Figure 4.1.3(h1):

$$P_{D,stbd} = \chi P_{w,D-stbd}$$

$$P_{D,pt} = \chi P_{w,D-pt}$$

where:

$P_{w,D-stbd}$ = Pressure obtained at starboard deck edge for BSR, BSP, OST or OSA load cases as defined in Cl.4.1.3, as appropriate.

$P_{w,D-pt}$ = Pressure obtained at port deck edge for BSR, BSP, OST and OSA load cases as defined in Cl.4.1.3, as appropriate.

χ = Coefficient defined in Table 4.2.2.2.

4.2.2.5 Envelope of dynamic pressures on exposed deck

The envelope of dynamic pressure at any point of an exposed deck, P_{D-max}, is to be taken as the greatest pressure obtained from any of the load cases determined by Cl.4.2.2.3 and Cl.4.2.2.4.

4.2.2.6 Envelope of dynamic pressures on exposed deck for L< 90[m]

For ships with L< 90[m] the envelope of dynamic pressure, on weather deck is to be obtained from Table 4.1.3(j) for side shell above waterline and not be less than minimum design pressure, as given below:

$P_D = P_w$ but not to be taken less than χP_{D-min}.

where:

P_w = Pressure in [kN/m^2] obtained as per Table 4.1.3(j) for side shell above waterline.

P_{D-min} = Minimum pressure on exposed freeboard deck, in [kN/m^2], as defined in Table 4.2.2.1.

χ = Coefficient defined in Table 4.2.2.2.

4.2.3 Loads carried on exposed deck

4.2.3.1 Pressure due to distributed load

If a distributed load is carried on an exposed deck or platform, for example deck cargo or other equipment, the static and dynamic pressures due to this distributed load are to be considered.

The total pressure P_{dl},in [kN/m^2], due to this distributed load for the static (S) design load scenario is to be taken as

$$P_{dl} = P_{dl-s}$$

The pressure P_{dl}, in [kN/m^2], due to this distributed load for the static plus dynamic (S+D) design load scenario is to be derived for each dynamic load case and is to be taken as:

$$P_{dl} = P_{dl-s} + P_{dl-d}$$

where:

P_{dl-s} = Static pressure, in [kN/m^2], due to the distributed load, minimum 3.5 [kN/m^2], including self-weight, unless a higher load is defined by the designer

P_{dl-d} = Dynamic pressure, in [kN/m^2], due to the distributed load, in [kN/m^2], to be taken as:

$$P_{dl-d} = f_\beta P_{dl-s} \frac{a_z}{g}$$

a_z = Vertical acceleration, in [m/s^2], at the centre of gravity of the distributed load, for the considered load case, to be obtained according to Section 2, Cl.2.2.2.3.

For ships with L< 90[m],

$$P_{dl-d} = P_{dl-s} \frac{a_v}{g}$$

where,

a_v = Combined vertical heave acceleration as given in Cl.2.2.3.3.

$a_{pitch-z}$ = Vertical acceleration due to pitch, in [m/s^2]

$= a_{pitch} |(x - 0.45L)|$

a_{roll-z} = Vertical acceleration due to roll, in [m/s^2]

$= a_{roll} |y|$

4.2.3.2 Concentrated force due to unit load for L≥ 90[m]

If a unit load, for example deck cargo, is carried on an exposed deck, the static and dynamic forces due to the unit load carried are to be considered.

The force F_U, in [kN], due to this concentrated load for the static (S) design load scenarios, is to be taken as:

$$F_U = F_{U-s}$$

The longitudinal force,F_{U-x} transverse force F_{U-y} and vertical force F_{U-z}, in [kN], due to this concentrated load for the static plus dynamic (S + D) design load scenarios is to be taken as:

$$F_{U-x} = m_u\, a_{x-u}$$

$$F_{U-y} = m_u\, a_{y-u}$$

$$F_{U-z} = F_{U-s} + m_u\, a_{z-u}$$

F_{U-s} = Static force, in [kN], due to the unit load to be taken equal to:

$= m_u . g$

m_u = mass of the unit load carried, in [t]

$a_{x-u}, a_{y-u}, a_{z-u}$ = Combined accelerations, in [m/s^2], as defined in Table 4.2.3.

a_ℓ, a_t, a_v = Combined longitudinal, transverse and vertical accelerations, in [m/s^2], as defined in Cl.2.2.3.

The combined vertical acceleration $a_{v-pitch}$ in [m/s^2] at any position, for load combination head sea, Refer Table 4.2.3, be taken as:

$$a_{v-pitch} = \sqrt{(a_{heave}^2 + a_{pitch-z}^2)}$$

The combined vertical acceleration a_{v-roll} in [m/s^2] at any position, for load combination beam sea, Refer Table 4.2.3, be taken as:

$$a_{v-roll} = \sqrt{(a_{heave}^2 + a_{roll-z}^2)}$$

where,

a_{heave} = heave acceleration as given in Cl.2.1.3.3.

$a_{pitch-z}$ = Vertical acceleration due to pitch, in [m/s^2]

$= a_{pitch}(x - 0.45L)$

a_{roll-z} = Vertical acceleration due to roll, in [m/s^2]

$= a_{roll}.y$

The accelerations acting on supporting structures and securing systems for heavy units of cargo, equipment or structural components are to be taken as given below in Table 4.2.3:

Table 4.2.3: Combined accelerations for heavy deck cargo units and equipment

Load combination	$\mathbf{a_{x-u}}$	$\mathbf{a_{y-u}}$,	$\mathbf{a_{z-u}}$
Head sea 1	a_l	0	$a_{v-pitch}$
Beam sea 1	0	a_t	a_{v-roll}
Oblique sea 1	$0.67\ a_l$	$0.67\ a_t$	a_v

Note:
1)For uplift conditions, the $a_{z-u} = -a_v$
2) The horizontal accelerations a_{x-u} and a_{y-u} are to be applied in the direction(s) giving maximum response.

Guidance note:

1) For heavy units with centre of gravity (COG) less than $b_c/4$ or $\ell_c/4$ above the deck it is attached to, the horizontal accelerations a_{x-u} and a_{y-u} ,can be neglected, where b_c and ℓ_c are the breadth and length, in [m] of the unit.

2) The longitudinal force,F_{U-x} transverse force F_{U-y} and vertical force F_{U-z}, in [kN], due to this concentrated load for the static plus dynamic (S + D) design load scenarios can be derived for each dynamic load case when these forces are considered in combination with hull girder loads.

4.2.3.3 Forces due to heavy units of cargo and equipment for L< 90[m]

For ships with L< 90[m], the gravity and acceleration forces in [kN] due to heavy units of cargo and equipment is to be taken as combination of the longitudinal force,F_{U-x} transverse force F_{U-y} and vertical force F_{U-z}, acting simultaneously. Worst among the following two sets of combination are to be considered..

$$F_{U-z} = m_u\left(g + 0.5a_{heave} + a_{pitch-z}\right)$$

$$F_{U-x} = m_u\left(g\sin\theta - 0.6a_{surge} + a_{pitch-x}\right)$$

$$F_{U-y} = 0$$

or

$$F_{U-z} = m_u\left(g + a_{heave} + a_{roll-z}\right)$$

$$F_{U-x} = 0$$

$$F_{U-y} = m_u\left(g\sin\emptyset + a_{roll-y}\right)$$

where,

m_u = as defined in Cl.4.2.3.2.

$a_{pitch-z}$ = Vertical acceleration due to pitch, in [m/s^2]

$= a_{pitch}|(x - 0.45L)|$

$a_{pitch-x}$ = Longitudinal acceleration due to pitch, in [m/s^2]

$= a_{pitch}(z - R)$

a_{roll-y} = Transverse acceleration due to roll, in [m/s^2]

$= a_{roll}(z - R)$

a_{roll-z} = Vertical acceleration due to roll, in [m/s^2]

$= a_{roll}\,|y|$

4.2.4 External pressure on hatch covers

The external pressures on hatch covers are only to be applied for strength assessment.

The green sea loads at any load point of a hatch cover, P_{HC}, in [kN/m^2], is to be taken as follows:

- For cargo hold analysis according to Chapter 8.

$P_{HC} = P_D - \rho g(z_{HC} - D)$ without being less than 0.

- For other cases: Refer Chapter 12, Section 6, Cl.6.2.

P_D = Green Sea pressure, in [kN/m^2], on the deck in way of the hatch cover obtained according to Cl.4.2.2, considering χ equal to 1.0.

z_{HC} = z coordinate of the top of the hatch cover, in [m].

If a distributed load or a unit load is carried on a hatch cover, the pressure is to be obtained according to Chapter 12, Section 6, Cl.6.2.3.

4.3 External pressures on superstructure and deckhouses

4.3.1 Application

4.3.1.1 The external pressures on superstructure and deckhouses are only to be applied for strength assessment. These pressures are to be considered as dynamic pressures and are to be applied to the appropriate structure without any static pressure load component.

4.3.1.2 The pressure defined in Cl.4.3.4 are only applicable to the requirements given in Chapter 7, Section 8.

4.3.2 Exposed superstructure and deckhouse tops

The lateral pressure for exposed superstructure and deckhouse tops, in [kN/m^2], is to be taken according to Cl.4.2.2.

4.3.3 Sides of superstructures

The design pressure for the external sides of superstructures, P_{sl}, in [kN/m^2], is to be taken as:

$$P_{sl} = 2.1R_s.C_w.C_F(C_b + 0.7)\frac{20}{10 + (Z_{SD} - T_{sc})}$$

where:

C_F = Distribution factor according to Table 4.3.3.

Z_{SD} = Z coordinate, in [m], of the midpoint of stiffener span, or of the middle of the elementary plate panel.

Table 4.3.3: Distribution factor C_F

Location	C_F
$x/L < 0.2$	$1.0 + \frac{5}{C_b}\left(0.2 - \frac{x}{L}\right)$ without taking x/L less than 0.1
$x/L \geq 0.2$	1.0

4.3.4 End bulkheads of superstructures and deckhouse walls

4.3.4.1 The external pressure, P_A, for the aft and forward external bulkheads of superstructures and deckhouse walls (front, side and aft bulkheads), in [kN/m^2], is to be taken as:

$$P_A = 10.f_n f_c[f_b f_d - (Z_{SD} - T_{sc})]$$

but is not to be less than P_{A-min}.

where:

f_n = Coefficient defined in Table 4.3.4.1.

f_c = Coefficient, to be taken as:

$$f_c = 0.3 + 0.7\frac{b_1}{B_1}$$

For exposed parts of machinery casings, f_c is to be taken equal to 1

The value of (b_1/B_1) is not to be taken less than 0.25.

b_1 = Breadth of deckhouse at the position considered.

B_1 = Actual maximum breadth of ship on the exposed weather deck at the position considered.

L, L_1 = Length of ship in [m], L_1 need not be taken greater than 300[m]

f_b = Coefficient defined in Table 4.3.4.2.

f_d = Coefficient defined in Table 4.3.4.3.

Values of "f_d' may be linearly interpolated from Table 4.3.4.3.

P_{A-min} = Minimum lateral pressure, in [kN/m^2], as defined in Table 4.3.4.4.

Z_{SD} = vertical distance, in [m], taken at mid-height of the bulkhead or wall with respect to the reference coordinate system defined in Chapter 1, Section 1.

Guidance note:

Longitudinal deckhouse walls in recesses with limited length and protected from green sea loads may be defined as superstructure side, hence Cl.4.3.3 applies.

Table 4.3.4.1: Values of coefficient 'f_n'

Type of bulkhead	Location	Values of 'f_n'	Maximum values of 'f_n'
Unprotected front bulkhead [1)]	Lowest tier [2)]	$2.0 + \frac{L_1}{120}$	4.5
	Second tier	$1.0 + \frac{L_1}{120}$	3.5
	Third tier	$0.5 + \frac{L_1}{150}$	2.5
	Fourth tier	$0.9\left(0.5 + \frac{L_1}{150}\right)$	2.25
	Fifth tier and above	$0.8\left(0.5 + \frac{L_1}{150}\right)$	2
Protected front bulkhead [1)]	Lowest, second and third tiers	$0.5 + \frac{L_1}{150}$	2.5
	Fourth tier	$0.9\left(0.5 + \frac{L_1}{150}\right)$	2.25
	Fifth tier and above	$0.8\left(0.5 + \frac{L_1}{150}\right)$	2
Side bulkheads [3)]	Lowest, second and third tiers	$0.5 + \frac{L_1}{150}$	2.5
	Fourth tier	$0.9\left(0.5 + \frac{L_1}{150}\right)$	2.25
	Fifth tier and above	$0.8\left(0.5 + \frac{L_1}{150}\right)$	2
Aft end bulkheads	All tiers: Abaft amidships	$0.7 - \frac{0.8x}{L} + \frac{L_1}{1000}$	$1 - \frac{0.8x}{L}$
	All tiers: Forward of amidships	$0.5 - \frac{0.4x}{L} + \frac{L_1}{1000}$	$0.8 - \frac{0.4x}{L}$

1) The front bulkhead of a superstructure or deckhouse may be considered as protected when it is located less than B_X behind another superstructure or deckhouse, and the width of the front bulkhead being considered is less than the width of the aft bulkhead of the superstructure or deckhouse forward of it. B_X is the local breadth of the ship at the front bulkhead.

2) The lowest tier is normally that tier which is directly situated above the uppermost continuous deck to which the moulded depth, D is measured. However, when (D-T_{SC}) exceeds the minimum non-corrected tabular freeboard (according to ILLC as amended) by at least one standard superstructure height (as defined in Chapter 1, Section 2, Cl.2.2.5), then this tier may be defined as the 2nd tier and the tier above as the 3rd tier.

3) Applicable only to side bulkheads of deckhouses

Table 4.3.4.2: Values of coefficient 'f_b'

Bulkhead Location (1)	Values of 'f_b'
$\frac{x}{L} \leq 0.45$	$1.0 + \left[\frac{\frac{x}{L} - 0.45}{C_b + 0.2}\right]^2$
$\frac{x}{L} > 0.45$	$1.0 + 1.5\left[\frac{\frac{x}{L} - 0.45}{C_b + 0.2}\right]^2$

where:
C_b= Block coefficient with 0.60<Cb<0.80. For aft deckhouse bulkheads located forward of amidships, C_b need not be taken less than 0.80.
Note (1) For deckhouse sides, the deckhouse is to be subdivided into parts of approximately equal length, not exceeding 0.15L each, and x is to be taken as the X-coordinate of the centre of each part considered.

Table 4.3.4.3: Values of coefficient 'f_d'

Length L of ship, in [m]	Values of 'f_d'
$L \leq 150$	$\frac{L}{10} \cdot e^{(-L/300)} + \left[\frac{L}{150}\right]^2 - 1.0$
$150 \leq L < 300$	$\frac{L}{10} \cdot e^{(-L/300)}$
$L \geq 300$	11.03

Table 4.3.4.4: Values of 'P_{A-min}'

Length L of ship, in [m]	Lowest tier of unprotected fronts	Elsewhere (1)
	'P_{A-min}' in [kN/m^2]	
$L \leq 50$	30	15
$50 < L < 250$	$25 + \frac{L}{10}$	$12.5 + \frac{L}{20}$
$L \geq 250$	50	25

(1) For the 4th tier and above, P_{A-min} is to be taken equal to 12.5[kN/m^2] for the front bulkhead, and 2.5[kN/m^2] for deckhouse side and aft wall.

Section 5

Internal Loads

Symbols

For symbols not defined in this section, Refer to Chapter 1, Section 2.

∅ = Roll angle, in [deg], as defined in Cl.2.1.2.1.

θ = Pitch angle, in [deg], as defined in Cl.2.1.2.2.

a_{heave} = Vertical acceleration due to heave in [m/s^2], as defined in Cl.2.1.3.3.

a_{surge} = Longitudinal acceleration due to surge in [m/s^2], as defined in Cl.2.1.3.1.

a_{roll-y} = Transverse acceleration due to roll, in [m/s^2], as defined in Cl.2.1.4.2.

$a_{pitch-x}$ = Longitudinal acceleration due to pitch, in [m/s^2], as defined in Cl.2.1.4.1.

a_{roll-z} = Vertical acceleration due to roll, in [m/s^2], as defined in Cl.2.1.4.3.

$a_{pitch-z}$ = Vertical acceleration due to pitch, in [m/s^2], as defined in Cl.2.1.4.3.

x,y,z = X, Y and Z coordinates, in [m], of the load point with respect to the reference coordinate system defined in Section 1, Cl.1.2.7.

x_G, y_G, z_G = X, Y and Z coordinates, in [m], of the volumetric centre of gravity of the tank, considered with respect to the reference coordinate system defined in Section 1, Cl.1.2.7.

a_X, a_Y, a_Z = Longitudinal, transverse and vertical accelerations, in [m/s^2], at x_G, y_G, z_G, as defined in Section 2, Cl.2.2.2.

f_β = heading correction factor as defined in Section 2.

ρ_L = Density of liquid in the tank and ballast hold, in [t/m^3], normally not to be taken less than:

For strength assessment:

ρ_L = 1.025 for all liquids including oil and product cargoes. If a tank filled at 98% is intended to carry heavier liquid cargoes than 1.025 (i.e.$\rho_{max_-LM} > 1.025$), then $\rho_L = \rho_{max-LM}$.

For Fatigue assessment:

ρ_L = 0.9 for oil and oil product cargoes

ρ_L = 1.025 for ballast tanks

$\rho_L = \rho_{max-LM}$ for cargo tanks intended to carry liquid other than oil products and for cargo tanks intended to carry oil products with density exceeding 1.025[t/m^3]

ρ_{max-LM} = Maximum liquid cargo density in [t/m^3], associated with a full tank at 98%, from any section on in the ship's loading manual or value specified by the designer.

f_{cd} = Factor for joint probability of occurrence of liquid cargo density and maximum sea state in 25 years design life, to be taken as:

For strength assessment with FE analysis of cargo tanks filled with oil or oil products cargo

f_{cd} = 0.88 for $\rho_L \leq$ 1.025[t/m^3]

= 1.0 for ρ_L > 1.025[t/m^3]

For other cases

f_{cd} = 1.0

Z_{top} = Z coordinate of the highest point of tank, excluding small hatchways, in [m].

h_{air} = Height of air pipe or overflow pipe above the top of the tank, in [m].

P_{PV} = Design vapour pressure, in [kN/m^2], not to be taken less than 25[kN/m^2].

P_{drop} = Overpressure, in [kN/m^2], due to sustained liquid flow through air pipe or

overflow pipe in case of overfilling or filling during flow through ballast water exchange. It is to be defined by the designer, but not to be less than 25[kN/m^2].

5.1 **Pressures due to liquids**

5.1.1 Total pressure

5.1.1.1 Pressures for the strength and fatigue assessments in intact conditions

The internal pressure due to liquid acting on any load point of a watertight boundary (tank and ballast holds), in [kN/m^2], for the static (S) design load scenarios, given in Section 6, is to be taken as:

$$P_{in} = P_{ls} \text{ but not less than } 0$$

The internal pressure due to liquid acting on any load point of a watertight boundary (tank and ballast holds), in kN/m^2, for the static plus dynamic (S + D) design load scenarios is to be derived for each dynamic load case and is be taken as:

$$P_{in} = P_{ls} + P_{ld} \text{ but not less than } 0$$

where:

P_{ls} = Static pressure due to liquid in watertight boundaries (tank and ballast holds), in [kN/m^2], as defined in Cl.5.1.2.

P_{ld} = Dynamic inertial pressure due to liquid in watertight boundaries (tank and ballast holds), in [kN/m^2], as defined in Cl.5.1.3.1 for L≥ 90[m] and Cl.5.1.3.2 for L< 90[m].

5.1.1.2 Pressures for the strength assessments of flooded conditions

The internal pressure in flooded condition, in [kN/m^2], acting on any load point of the watertight boundary of a hold, tank or other space for the flooded static (S) design load scenario, given in Section 6, is to be taken as:

$$P_{in-f} = P_{fs} \text{ but not less than } \rho\, g\, d_o$$

where:

P_{fs} = Static pressure of seawater due to flooding in the compartment, in [kN/m^2], as defined in Cl.5.1.4.

d_0 = Distance, in m, to be taken as:

= 0.02L for L<120[m]

= 2.4 for L≥120[m]

5.1.2 Static liquid pressure in intact conditions

5.1.2.1 Static liquid pressure for strength assessment

(a) Normal operations at sea

The static pressure due to liquid in watertight boundaries (tank and ballast holds), P_{ls-1} during normal operations at sea, in [kN/m^2], is to be taken as:

- For cargo tanks filled with liquid cargo/for tanks arranged with pressure relief valves

$$P_{ls-1} = f_{cd}\, \rho_L\, g(Z_{top} - Z) + P_{PV}$$

- For other cases

$$P_{ls-1} = \rho_L\, g(Z_{top} - Z + 0.5\, h_{air})$$

(b) Normal operations at harbour operations

The static pressure, P_{ls-2} due to liquid in watertight boundaries (tank and ballast holds), for harbour operations, in [kN/m^2], is to be taken as:

- For cargo tanks filled with liquid cargo/for tanks arranged with pressure relief valves

$$P_{ls-2} = \rho_L\, g(Z_{top} - Z) + P_{PV}$$

- For other cases

$$P_{ls-2} = \rho_L\, g(Z_{top} - Z) + P_0$$

where:

P_0 = Static pressure, in [kN/m^2], to be taken as:

P_0 = 0.2L+ 6 for L < 90[m]

= 24 for L ≥ 90[m]

for ballast hold in dry cargo vessels:

P_0 = 0

However, in mechanically propelled cargo ships of 500GT and above and passenger ships, for tanks forming part of the watertight subdivision, P_0 is to be taken as not less than 24[kN/m^2]. For this purpose, tanks meeting any of the following conditions are to be considered as part of watertight subdivision:

(i) Tanks considered watertight in damage stability calculations.

(ii) Double bottom tanks, peak tanks or tanks bounded by main transverse watertight bulkheads required as per Chapter 3, Section 2, Cl.2.1.1.

(c) Flow through ballast water exchange

The static pressure, P_{ls-3} due to liquid in ballast tanks associated with flow through ballast water exchange operations, in [kN/m^2], is to be taken as:

$$P_{ls-3} = \rho_L \, g(Z_{top} - Z + h_{air}) + P_{drop}$$

(d) Sequential ballast water exchange

The static pressure, P_{ls-4} due to liquid in ballast tanks associated with sequential ballast water exchange operations, in [kN/m^2], is to be taken as:

$$P_{ls-4} = \rho_L \, g(Z_{top} - Z + 0.5 \, h_{air})$$

(e) Ballasting using ballast water treatment system

The static pressure, due to liquid in watertight boundaries (tank and ballast holds), associated with ballasting operations using a ballast water treatment system is to be taken as defined for sequential ballast exchange in Cl.5.1.2.1(d). The ship designer has to inform IRS, if the ballast water treatment system implies additional pressure to be considered as P_{drop}, etc in addition to the pressure defined in Cl.5.1.2.1(d).

(f) Tank testing

The static pressure P_{ls-ST} in [kN/m^2], acting on plates and stiffeners subject to tank testing, is to be taken as:

$$P_{ls-ST} = 10(Z_{ST} - Z)$$

where:

Z_{ST} = Testing load height, in [m], as defined in Table 5.1.2.

The actual strength testing is to be carried out in accordance with Chapter 17, Section 3.4, Table 3.4.1.

In order to assess the structure, static design pressures are to be applied. No inertial pressure is to be considered as acting on plates and stiffeners subject to tank testing.

Table 5.1.2: Design testing load height, Z_{ST}	
Compartment	**Load height**
Double bottom tanks	The greater of the following: $Z_{ST} = Z_{top} + h_{air}$ $Z_{ST} = Z_{top} + 2.4$ $Z_{ST} = Z_{bd}$
Double side tanks	The greater of the following: $Z_{ST} = Z_{top} + h_{air}$ $Z_{ST} = Z_{top} + 2.4$ (See Note 3) $Z_{ST} = Z_{bd}$
Hopper side tanks[1)], topside tanks[1)], double side tanks[1)]	The greater of the following: $Z_{ST} = Z_{top} + h_{air}$ $Z_{ST} = Z_{top} + 2.4$ (See Note 3) $Z_{ST} = Z_{bd}$
Deep tanks (other than those listed elsewhere in this table)	The greater of the following: $Z_{ST} = Z_{top} + h_{air}$ $Z_{ST} = Z_{top} + 2.4$ (See Note 3)
Fore and aft peaks used as tank	The greater of the following: $Z_{ST} = Z_{top} + h_{air}$ $Z_{ST} = Z_{top} + 2.4$ (See Note 3)
Cargo oil tanks [2)]	The greater of the following: $Z_{ST} = Z_{top} + h_{air}$ $Z_{ST} = Z_{top} + 2.4$ (See Note 3) $Z_{ST} = Z_{top} + 0.1P_{PV}$
Fuel Oil Tanks	The greater of the following: $Z_{ST} = Z_{top} + h_{air}$ $Z_{ST} = Z_{top} + 2.4$ (See Note 3) $Z_{ST} = Z_{top} + 0.1P_{PV}$ $Z_{ST} = Z_{bd}$
Ballast hold of bulk carriers	$Z_{ST} = Z_h$
Chain locker	$Z_{ST} = Z_c$
Independent tanks (Edible liquid Tanks)	The greater of the following: $Z_{ST} = Z_{top} + h_{air}$ $Z_{ST} = Z_{top} + 0.9$
Chemical carriers	The greater of the following: $Z_{ST} = Z_{top} + 0.1P_{PV}$ $Z_{ST} = Z_{top} + 2.4$ (See Note 3)
Ballast ducts	The greater of the following: • testing load height corresponding to ballast pump maximum pressure • stetting of any pressure relief valve

where:
Z_{bd} = Z coordinate, in [m], of the bulkhead deck
Z_h = Z coordinate, in [m], of the top of hatch coaming
Z_c = Z coordinate, in [m], of the top of chain pipe.

1) Applicable to double bottom tank connected with hopper side tanks, topside tanks or double side tanks.
2) Tank test load is not applicable for cargo tanks carrying LNG.
3) For vessels of L < 90[m], the head of water above highest point of tank may be (0.2L + 0.6) [m], but not less than 1.0[m]. However, in mechanically propelled cargo ships of 500GT and above and passenger ships, for tanks forming part of the watertight subdivision (See Pt.3, Ch.5, Cl.5.1.2.1(b)), head of water above the highest point of tank is to be 2.4[m].

5.1.2.2 Static liquid pressure for fatigue assessment

The static pressure due to liquid in watertight boundaries (tank and ballast holds), P_{ls} to be used for the fatigue assessment, in [kN/m^2], is to be taken as:

$$P_{ls} = \rho_L g(Z_{top} - Z)$$

for all tanks (cargo and water ballast tanks, ballast hold and other tanks).

5.1.3 Dynamic liquid pressure

5.1.3.1 The dynamic pressure, P_{ld} due to liquid in watertight boundaries (tank and ballast holds), in [kN/m^2] is to be taken as:

$$P_{ld} = f_\beta f_{cd} \rho_L \left[a_Z(z_0 - z) + f_{ull-l} a_x(x_0 - x) + f_{ull-t} a_y(y_0 - y)\right]$$

where:

f_{ull-l} = Longitudinal acceleration correction factor for the ullage space above the liquid in watertight boundaries (tank and ballast holds), taken as:

For strength assessment:

= 0.62 for cargo tanks filled with any liquids including water ballast

= 1.0 for other cases

For fatigue assessment:

For cargo tanks and ballast holds

$$f_{ull-l} = 0.5 + \frac{|z_0 - z|}{\ell_{fs}} \frac{180}{\theta\pi}$$

f_{ull-l} = 1.0 for other cases.

f_{ull-l} is not to be less than 0.0 nor greater than 1.0

f_{ull-t} = Transverse acceleration correction factor to account for the ullage space above the liquid in watertight boundaries (tank and ballast holds), taken as:

For strength assessment:

= 0.67 for cargo tanks filled with any liquids including water ballast.

= 1.0 for other cases.

For fatigue assessment:

For cargo tanks and ballast holds

$$f_{ull-t} = 0.5 + \frac{|z_0 - z|}{b_{top}} \frac{180}{\emptyset\pi}$$

f_{ull-t} = 1.0 for other cases.

f_{ull-t} is not to be less than 0 nor greater than 1.0

ℓ_{fs} = Cargo tank length at the top of the tank or length of the ballast hold hatch coaming, in [m].

b_{top} = Cargo tank breadth at the top of the tank or breadth of the ballast hold hatch coaming, in [m] determined at mid length of the tank or ballast hold hatch coaming.

x_0 = X coordinate, in [m], of the reference point.

y_0 = Y coordinate, in [m], of the reference point.

z_0 = Z coordinate, in [m], of the reference point.

The reference point is to be taken as the point with the highest value of V_j, calculated for all points that define the upper boundary of the tank or ballast hold as follows:

$$V_j = a_x(x_j - x_G) + a_y(y_j - y_G) + (a_z + g)(z_j - z_G)$$

where:

x_j = X coordinate, in [m], of the point j on the upper boundary of the tank or ballast hold.

y_j = Y coordinate, in [m], of the point j on the upper boundary of the tank or ballast hold.

z_j = Z coordinate, in [m], of the point j on the upper boundary of the tank or ballast hold.

The following simplified method of determination of the reference point assuming a rectangular shape with area equal A_{top} of the top of the tank or the ballast hold hatch coaming is acceptable, Refer Figure 5.1.3:

$$x_j = x_{top} \pm 0.5\ell_{fs}$$

$$y_j = y_{top} \pm 0.5b_{top}$$

where

x_{top} = X coordinate, in [m], of the centre of the rectangular area A_{top} at the top of the tank or the ballast hold hatch coaming.

y_{top} = Y coordinate, in [m], of the centre of the rectangular area A_{top} at the top of the tank or the ballast hold hatch coaming.

The area of a rectangular shape at the top of the tank or the ballast hold hatch coaming, in [m^2].

$A_{top} = \ell_{fs} \, . \, b_{top}$

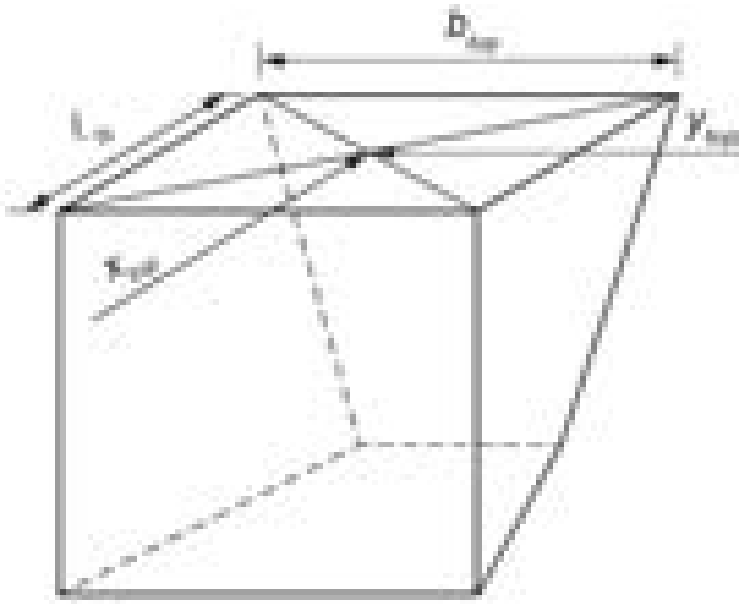

Figure 5.1.3: Area of a rectangular shape at the top of a tank

5.1.3.2 Dynamic liquid pressure for ships with L < 90[m]

The dynamic pressure, in [kN/m^2], due to liquid in watertight boundaries for ships with L< 90[m], may be taken as:

$$p_{ld} = \max\begin{pmatrix}(0.5a_{heave} + a_{pitch-z})\rho_L . h_s + (g\sin\theta - 0.6a_{surge} + a_{pitch-x})\rho_L . \ell \\ (a_{heave} + a_{roll-z})\rho_L . h_s + (g\sin\emptyset + a_{roll-y})\rho_L . b\end{pmatrix}$$

where:

ρ_L = Density of liquid carried in the tank and ballast hold, in [t/m^3].

h_s = Vertical distance, in [m] from the load point to the top of the tank.

ℓ = The largest longitudinal distance in [m], from the load point to the tank corner at the top of the tank which is the furthermost away from the load point. For tank tops with stepped contour, the uppermost tank corner will normally be decisive.

b = The largest athwartship distance in [m], from the load point to the tank corner at the top of the tank which is the furthermost away from the load point. For tank tops with stepped contour, the uppermost tank corner will normally be decisive.

$\emptyset$ = Roll angle, in [deg], as defined in Cl.2.1.2.1.

θ = Pitch angle, in [deg], as defined in Cl.2.1.2.2.

a_{heave} = heave acceleration as given in Cl.2.1.3.3.

a_{surge} = surge acceleration given in Cl.2.1.3.1.

$a_{pitch-z}$ = Vertical acceleration due to pitch, in [m/s^2]

$= a_{pitch}\,|(x - 0.45L)|$

$a_{pitch-x}$ = Longitudinal acceleration due to pitch, in [m/s^2]

$= a_{pitch}(z - R)$

a_{roll-y} = Transverse acceleration due to roll, in [m/s^2]

$= a_{roll}(z - R)$

a_{roll-z} = Vertical acceleration due to roll, in [m/s^2]

$= a_{roll}\,|y|$

5.1.4 Static pressure in flooded conditions

5.1.4.1 Static pressure in flooded compartments

The internal pressure in flooded condition, P_{fs} in [kN/m^2], on watertight bulkheads is to be taken as:

$$P_{fs} = \rho\, g\, h_{fs} \text{ but not less than 0.}$$

where:

h_{fs} = Pressure height, in [m], in flooded condition, to be taken as:

$$h_{fs} = \max\begin{Bmatrix} Z_{fd} - Z \\ |Y| \sin\theta_{dam} + (Z_{dam} - Z)\cos\theta_{dam} \end{Bmatrix}$$

where,

Z_{fd} = Z coordinate, in [m], of the freeboard deck at side in way of the transverse section considered or the deepest equilibrium waterline in the damaged condition (T_{dam}) whichever is the greater.

Z_{dam} = Z coordinate, in [m], of the deepest equilibrium waterline at centre line in the damaged condition (or in intermediate stages of flooding).

θ_{dam} = Angle, in [deg], between the deepest equilibrium waterline in the damaged condition (or in intermediate stages of flooding) and the base line.

For ships where damage stability calculations are not applicable,

$$h_{fs} = Z_{fd} - Z$$

where,

Z_{fd} = Z coordinate, in [m], of the freeboard deck/bulkhead deck at side in way of the transverse section considered.

5.2 Non-exposed decks and platforms

5.2.1 Application

The loads defined in Cl.5.2.2 and Cl.5.2.3 are applicable to non-exposed decks, accommodation decks, wheelhouse decks and platforms in machinery space.

5.2.2 Pressure due to distributed load

If a distributed load is carried on a deck, the static and dynamic pressures due to this distributed load are to be considered. The dynamic distributed loads are to be calculated according to Section 4, Cl.4.2.3.1.

The static distributed load, P_{dl-s} in [kN/m^2], including self-weight are to be defined by the designer without being less than:

- 2.5 [kN/m^2] (0.25 [t/m^2] distributed mass) for accommodation decks and platforms in general

- 3.5 [kN/m^2] (0.35 [t/m^2] distributed mass) for wheelhouse deck

- 10 [kN/m^2] (1.0 [t/m^2] distributed mass) for platforms in machinery space.

- 7H [kN/m^2] (0.7H[1)] [t/m^2] distributed mass) for tween deck, tween deck hatch covers and inner bottom in way of cargo and stores

where,

H = Tween deck height or height in [m], measured up to the top of hatchway coaming above

[1)] Note:
In case of ships where due to large volumetric capacity of cargo spaces the stowage rate is less than 0.7 [t/m^3], a reduction in the value of distributed load may be considered, if requested for.

5.2.3 Concentrated force due to unit load

Concentrated forces on non-exposed decks are to be calculated according to Section 4, Cl.4.2.3.2 or Cl.4.2.3.3 as applicable.

5.3 Pressure for internal structures in tanks

5.3.1 The pressure, in [kN/m^2], for internal structures in tanks, e.g. web of primary supporting members, is to be taken as:

$$P_{int} = 12$$

5.4 Dry bulk cargo pressures

5.4.1 Total pressure

The total pressure due to dry bulk cargo acting on any load point of a cargo hold boundary, in [kN/m^2], is to be:

$P_{in} = P_{bs}$ for strength assessment of intact conditions for static (S) design load scenarios as given in Section 6.

$P_{in} = P_{bs} + P_{bd}$ for strength assessment of intact conditions and fatigue assessment for static (S) plus dynamic (S+D) design load scenarios as given in Section 6.

where:

P_{bs}= Static pressure due to dry bulk cargo in [kN/m^2], as defined in Cl.5.4.2.

P_{bd} = Dynamic inertial pressure due to dry bulk cargo for each dynamic load case in [kN/m^2], as defined in Cl.5.4.3.1 for L≥ 90[m] and Cl. 5.4.3.2 for L< 90[m].

5.4.2 Static pressure

The dry bulk cargo static pressure P_{bs}, in [kN/m^2], is to be taken as:

$$P_{bs} = \rho_c \, g \, K_c \, (z_B - z) \text{ but not less than 0.}$$

where,

ρ_c = Density of bulk cargo, in [t/m^3] for the loading condition considered.

K_c = Coefficient taken equal to:

= $\cos^2\alpha + \sin^2\alpha(1 - \sin\Psi)$ for inner bottom, hopper tank, transverse and longitudinal bulkheads, lower stool, vertical upper stool, inner side and side shell

= 0 for topside tank, main deck and sloped upper stool.

α = Angle, in [deg], between panel considered and the horizontal plane.

Ψ = Assumed angle of repose, in [deg], of bulk cargo (considered drained and removed); to be taken as:

= 20° for light bulk cargo (e.g. coal, grain)

= 25° for bulk cement cargo

= 35° for heavy bulk cargo (e.g. ore)

z_B = Height of the upper surface of the cargo above the baseline in way of the load point, in [m], to be taken as, Refer Figure 5.4.2:

$$z_B = h_{DB} + h_c$$

h_{DB} = Height in [m], of the double bottom at the centreline, measured at mid-length of the cargo hold.

h_c = Height of bulk cargo, in [m], from the inner bottom to the upper surface of bulk cargo.

$$h_c = \frac{\frac{M}{\rho_c \ell_h} + \frac{V_{LS}}{\ell_h} + (h_{HT} - h_{DB}) b_{HT}}{2 Y_{HT}}$$

where:

M = Mass of cargo, in [t], in the hold depending on the loading condition considered.

ℓ_h = Length in [m], of the hold to be taken as the longitudinal distance between the transverse bulkheads which form boundaries of the hold considered.

V_{LS} = Volume in [m^3], of the transverse bulkhead lower stool (above the inner bottom), to be taken equal to zero in the case of bulkheads fitted without lower stool.

h_{HT} = Height in [m], of the hopper tank to be taken as the vertical distance from the baseline to the top of the hopper tank.

b_{HT} = Breadth in [m], of the hopper tank to be taken as the transverse distance from the outermost double bottom girder to the outermost point of the hopper tank.

Y_{HT} = Half breadth in [m], of the hold measured at the middle of ℓ_h and at a vertical level corresponding to the top of the hopper tank.

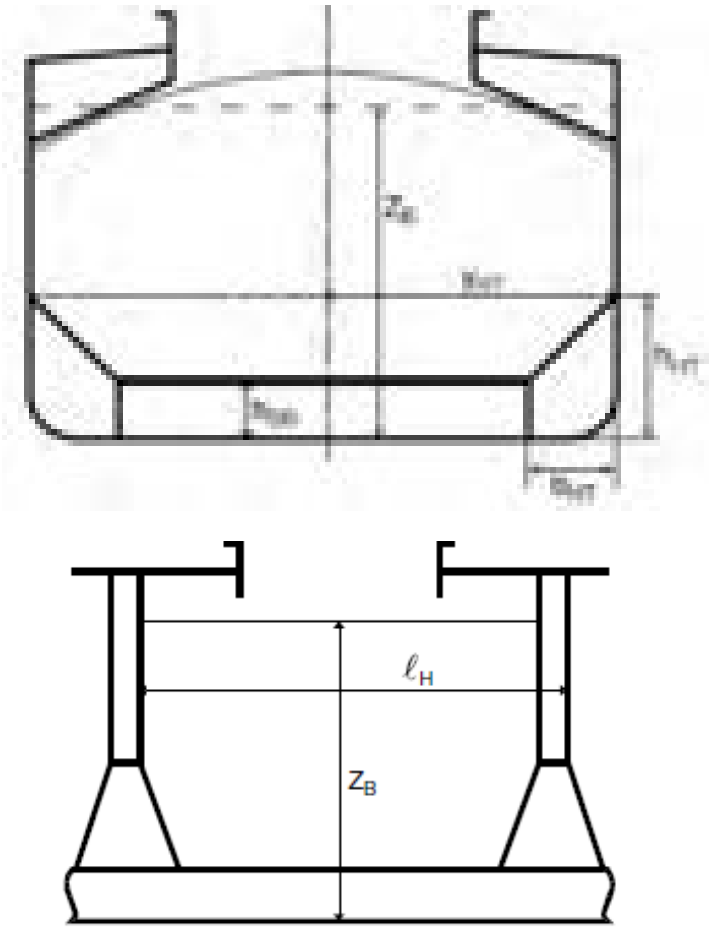

Figure 5.4.2: Rated upper surface of the bulk cargo

5.4.3 Dynamic dry bulk cargo pressure

5.4.3.1 The dynamic dry bulk cargo pressure P_{bd}, in [kN/m^2], for each load case is to be taken as:

$$P_{bd} = f_\beta \, \rho_c \, a_z \, K_c \, f_{dc} \, (z_B - z) \quad \text{for } z \leq z_B$$

$$P_{bd} = 0 \quad \text{for } z > z_B$$

where,

f_{dc} = Dry cargo factor:

= 1.0 for strength assessment

= 0.5 for fatigue assessment

For vessels designed to carry heavy bulk cargoes which are also required to carry lighter cargoes, the pressure 'p' based on maximum mass of cargo to be carried in the hold and filled up to the top of hatch coaming would also require to be considered.

5.4.3.2 Dynamic dry bulk cargo pressure for ships with L < 90[m]

The dynamic dry bulk cargo pressure P_{bd}, in [kN/m^2], for ships with L < 90[m], is to be taken as:

$$P_{bd} = \rho_c \, a_v \, K_c \, f_{dc} \, (z_B - z) \quad \text{for } z \leq z_B$$

$$P_{bd} = 0 \quad \text{for } z > z_B$$

where,

a_v = Combined vertical heave acceleration as given in Cl.2.2.3.3.

$a_{pitch-z}$ = Vertical acceleration due to pitch, in [m/s^2]

$= a_{pitch} \, |(x - 0.45L)|$

a_{roll-z} = Vertical acceleration due to roll, in [m/s^2]

$= a_{roll} \, |y|$

Section 6

Design Load Scenarios

Symbols

For symbols not defined in this section, Refer to Chapter 1, Section 2.

VBM = Design vertical bending moment, in [kN-m].

M_{sw-h}, M_{sw-s} = Permissible hull girder hogging and sagging vertical still water bending moment in seagoing condition, in [kN-m], as defined in Section 3, Cl.3.4.2.

M_{sw-har} = Permissible hull girder hogging and sagging still water bending moment for harbour operation, in [kN-m], as defined in Section 3, Cl.3.4.3.

M_{wv} = Vertical wave bending moment in seagoing condition, in [kN-m], at the hull transverse section being considered in hogging and sagging, as defined in Section 3, Cl.3.6.1.

M_{wv-LC} = Vertical wave bending moment for a considered dynamic load case, in [kN-m], as defined in Section 3, Cl.3.7.2.

HBM = Design horizontal bending moment, in [kN-m].

M_{wh-LC} = Horizontal wave bending moment for a considered dynamic load case, in [kNm] as defined in Section 3, Cl.3.7.4.

M_{wT-LC} = Wave torsional moment for a considered dynamic load case, in [kN-m], as defined in Section 3, Cl.3.7.5.

VSF = Design vertical shear force, in [kN].

Q_{sw} = Permissible hull girder positive and negative still water shear force limits for seagoing operation, in [kN], as defined in Section 3, Cl.3.5.1.

Q_{sw-har} = Permissible hull girder positive and negative still water shear force limits for harbour operation, in [kN], as defined in Section 3, Cl.3.5.2.

Q_{wv-LC} = Vertical wave shear force for a considered dynamic load case, in in [kN] as defined in Section 3, Cl.3.7.3.

P_{ex} = Design external pressure, in [kN/m^2].

P_s = Static sea pressure at considered draught, in [kN/m^2], as defined in Section 4.

P_w = Dynamic pressure for a considered dynamic load case, in [kN/m^2], as defined in Section 4.

P_D = Green sea load for a considered dynamic load case, in [kN/m^2], as defined in Section 4.

P_{in} = Design internal pressure, in [kN/m^2], as defined in Section 5.

P_{in-f} = Design internal pressure in flooded condition, in [kN/m^2], as defined in Section 5.

P_{ls-ST} = Tank testing pressure, in [kN/m^2], as defined in Section 5.

P_{int} = Minimum pressure for internal structures in tanks as given in Section 5.

P_{ls-1} = Static tank pressure during normal operations at sea as given in Section 5.

P_{ls-2} = Static tank pressure during normal operations at harbour as given in Section 5.

P_{ls-3} = Static tank pressure during flow through ballast water exchange as given in Section 5.

P_{ls-4} = Static tank pressure during sequential ballast water exchange as given in Section 5.

P_{ld} = Dynamic liquid pressure in tank for a considered dynamic load case, in [kN/m^2], as defined in Section 5.

P_{fs} = Static pressure in compartments and tanks in flooded condition, in [kN/m^2], as defined in Section 5.

P_{dl-s} = Static pressure on non-exposed decks and platforms, in [kN/m^2], as defined in Section 5.

P_{dl-d} = Dynamic pressure on non-exposed decks and platforms for a considered dynamic load case, in [kN/m^2], as defined in Section 5.

P_{bs} = Static pressure due to dry bulk cargo in [kN/m^2], as defined in Section 5.

P_{bd} = Dynamic inertial pressure due to dry bulk cargo for each dynamic load case in [kN/m^2], as defined in Section 5.

F_{U-s} = Static load acting on supporting structures and securing systems for heavy units or cargo, equipment or structural components, in [kN], as defined in Section 4.

F_{U-d} = Dynamic load acting on supporting structures and securing systems for heavy units of cargo, equipment or structural components, in [kN], as defined in Section 4.

6.1 Application

6.1.1 This section gives the design load scenarios that are to be used for:

- Strength assessment by prescriptive and direct analysis (Finite Element Method, FEM) methods, as given in Cl.6.2.1.

- Fatigue assessment by prescriptive and direct analysis (FEM) methods, as given in 6.3.

6.1.2 For the strength assessment, the principal design load scenarios consist of either S (Static) loads or S+D (Static + Dynamic) loads. In some cases, the letter 'A' prefixes the S or S+D to denote that this is an accidental design load scenario. There are some additional design load scenarios to be considered which relate to impact (I) loads, sloshing (SL) loads and fatigue (F) load. Design load scenarios for impact loads (I) are given in Chapter 11, Section 2, Section 3 and Section 4. Design load scenarios for sloshing loads in tanks (SL) are given in Chapter 11, Section 7.

6.2 Design load scenarios for strength assessment

6.2.1 Principal design load scenarios

6.2.1.1 The principal design load scenarios are given in Table 6.2.1.1 for ships with L ≥ 90[m].

Table 6.2.1.1: Principal design load scenarios

Section 7

Loading Conditions

Symbols

For symbols not defined in this section, Refer to Chapter 1, Section 2.

7.1 Loading Conditions

7.1.1 Definition

7.1.1.1 Departure conditions

The departure conditions are to be based on bunker tanks not taken less than 95% full and other consumables taken at 100% capacity.

7.1.1.2 Arrival conditions

The arrival conditions are to be based on 10% of the maximum capacity of bunker, fresh water and stores.

7.1.2 General

Still water bending moments, M_{sw} [kN-m], and still water shear forces, Q_{sw} [kN], are to be calculated and submitted along the ship length for design cargo and ballast loading conditions as specified in Cl.2.3.3 together with the distribution of lightship weights.

For these calculations, downward loads are assumed to be taken as positive values, and are to be integrated in the forward direction from the aft end of L. The sign conventions of M_{sw} and Q_{sw} to be followed as given in Chapter 5, Section 3, 3.2.

All the design loading conditions are to be evaluated for at least departure and arrival conditions.

The severest loading condition from the loading manual, midship section drawing or otherwise specified by the Designer are to be considered for the longitudinal strength and for local strength check of plating, ordinary stiffeners and primary supporting members.

7.1.3 Seagoing Conditions

In general, the following loading conditions, based on amounts of bunkers, fresh water and stores at departure and arrival, are to be considered for the calculations of M_{sw} and Q_{sw}.

Where the amount and disposition of consumables at any intermediate stage of the voyage are considered more severe, calculations for such intermediate conditions are to be submitted in addition to those for departure and arrival conditions. Also, where any ballasting and/or deballasting is intended during voyage, calculations of the intermediate condition just before and just after ballasting and/or deballasting any ballast tank are to be submitted and where approved, included in the loading manual for guidance.

a) General cargo ships, Container Ships, passenger ships, roll on-roll off ships and refrigerated cargo carriers, Ore Carriers and Bulk Carriers:

- Homogeneous loading conditions at maximum draught
- Ballast conditions
- Special loading conditions, e.g. container or light load conditions at less than the maximum draught, heavy cargo, empty holds or non-homogeneous cargo conditions deck cargo conditions, etc., where applicable
- Short voyage or harbour conditions, where applicable
- Docking condition afloat
- Loading and unloading transitory conditions, where applicable

b) Oil Tankers:

- Homogeneous loading conditions (excluding dry and clean ballast tanks) and ballast or part-loaded conditions for both departure and arrival
- Any specified non-uniform distribution of loading

- Mid-voyage conditions relating to tank cleaning or other operations where these differ significantly from the ballast conditions

- Docking condition afloat

- Loading and unloading transitory conditions

c) Chemical Tankers:

- Conditions as specified for oil tankers

- Conditions for high density or heated cargo and segregated cargo where these are included in the approved cargo list

d) Liquefied Gas Carriers:

- Homogeneous loading conditions for all approved cargoes for both arrival and departure

- Ballast conditions for both arrival and departure

- Cargo condition where one or more tanks are empty or partially filled or where more than one type of cargo having significantly different densities is carried, for both arrival and departure

- Harbour condition for which an increased vapour pressure has been approved

- Docking condition afloat

e) Combination Carriers:

- Conditions as specified for oil tanker and cargo ships.

f) All ships:

- Any other loading condition likely to result in high bending moments and/or shear forces (including docking conditions, as appropriate).

7.1.4 Partially Filled Ballast Tanks in seagoing condition

For permissible use of partially filled ballast tanks in design loading conditions, Refer Cl.7.1.4.1, Cl.7.1.4.2, Cl.7.1.4.3.

7.1.4.1 Partially filled ballast tanks in ballast loading condition

(i) Ballast loading conditions involving partially filled peaks and/or other ballast tanks at departure, arrival or during intermediate conditions are not to be used as design conditions unless:

- permissible bending and shear stresses are not exceeded for all filling levels between empty and full; and

- for bulk carriers, the requirement for longitudinal strength of hull girder in flooded conditions as per Part.5, Chapter 1, Section 2.2 are complied with for all filling levels between empty and full.

(ii) To demonstrate the strength compliance with all filling levels between empty and full, it will be acceptable if, the still water bending moment, shear force and torsional moment, if applicable, are calculated and shown within the relevant permissible limits. These values are to be obtained for each condition at departure, arrival and where required by Cl.7.1.3 at any intermediate condition, with the tanks intended to be partially filled are assumed to be:

- empty
- full
- partially filled at intended level.

(iii) Where multiple tanks are intended to be partially filled, all combinations of empty, full or partially filled at intended level for those tanks are to be investigated.

(iv) However, for conventional ore carriers with large wing water ballast tanks in the cargo area, where empty or full ballast water filling levels of one or maximum two pairs of these tanks lead to the ship's trim exceeding one of the following conditions, it is sufficient to demonstrate compliance with maximum, minimum and intended partial filling levels of these one or maximum two pairs of ballast tanks such that the ship's condition does not exceed any of these trim limits. Filling levels of all other wing ballast tanks are to be considered between empty and full. The trim conditions mentioned above are:

- Trim by stern of 3% of the ship's length, or

- Trim by bow of 1.5% of the ship's length, or

- Any trim that cannot maintain propeller immersion (I/D) not less than 25%, where:

I = distance from propeller centerline to the waterline

D = propeller diameter. Refer Figure 7.1.4.

The maximum and minimum filling levels of the above mentioned pairs of wing water ballast tanks are to be indicated in the loading manual.

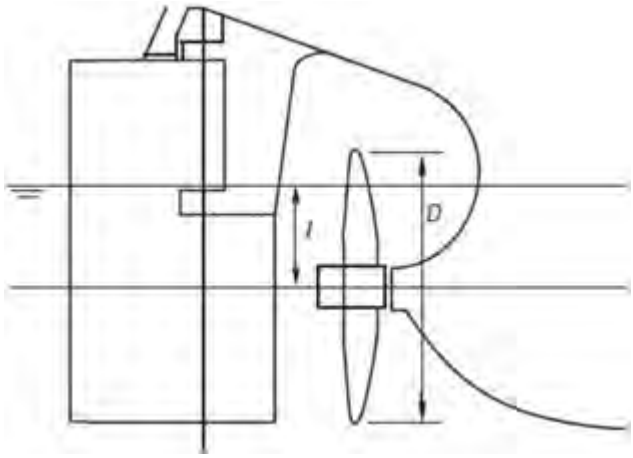

Figure 7.1.4: Propeller immersion

7.1.4.2 Partially filled ballast tanks in cargo loading condition

In cargo loading conditions, the requirements given in Cl.7.1.4.1 above needs to be applied to peak ballast tanks only.

7.1.4.3 Partially filled ballast tanks in Sequential ballast water exchange condition

Requirements of Cl.7.1.4.1 and Cl.7.1.4.2 above are not applicable to ballast water exchange using the sequential method. However, bending moment and shear force calculations for each deballasting or ballasting stage in the ballast water exchange sequence are to be included in the loading manual or ballast water management plan of any vessel that intends to employ the sequential ballast water exchange method.

7.1.5 Harbour conditions

The following harbour conditions are to be included in the loading manual:

- Conditions representing typical complete loading and unloading operations.

- Docking condition afloat.

- Propellers inspection afloat condition, in which the propeller shaft centreline is at least D/4 above the waterline in way of the propeller. Ships with podded propulsion system arrangements are to be specially considered.

Section 8

Guidelines for Ballast Loading Conditions of Cargo Vessels Involving Partially Filled Ballast Tanks

8.1. General

8.1.1 This Section is intended for guidance and interpretation of Cl.7.1.4.1 i.e. partially filled ballast tanks in ballast loading conditions.

8.1.2 Case A and B are generally applicable for ballast loading conditions for any cargo vessel which might have one Ballast Water (BW) Tank (or one pair of BW Tanks) partially filled.

8.1.3 Case C is showing the conditions necessary for checking longitudinal strength for a conventional ore carrier with two pairs of large wing water ballast tanks partly filled during the ballast voyage.

8.1.4 Where applicable, similar considerations are to be given to other cargo vessels covered where ballast loading conditions involving partially filled ballast tanks may cause concerns for the longitudinal strength of the vessels.

8.1.5 This Section does not apply to CSR Bulk Carriers and Oil Tankers or to Container Ships.

8.1.6 In the Figures, the conditions only intended for strength verification (not operational) are marked with a star (*).

8.2 Case A and B

8.2.1 Case A

Figure 1 shows Case A, with a cargo vessel where partial filling of BW Tank no. 6 (P/S) is permitted and may take place at any time during the ballast voyage. Intermediate condition(s) should be specified as shown in the Figure, however filling/partial filling of BW Tank no. 6 (P/S) may be done at any step to keep acceptable trim and propeller immersion during the ballast voyage.

To obtain full operational flexibility regarding the filling level of BW Tank no. 6 (P/S), loading conditions A2 (full at departure)* and A8 (empty at arrival)* are to be added for strength verification.

Additional conditions (full and empty BW Tank no. 6 (P/S)) related to the intermediate conditions A3-A6 are not necessary as A2* and A8* will be the most critical one.

8.2.2 Case B

Figure 2 shows Case B, with a cargo vessel where partial filling of BW Tank no. 6 (P/S) to a given level (f6-int%) will be done after a specified % consumables is reached, see conditions B2 and B3. Before this % consumables (shown as 50% in this Figure) is reached, BW Tank no. 6 (P/S) shall be kept empty. When reaching a given level of consumables (shown as 20% in Figure 2), BW Tank no. 6 (P/S) are to be kept full, see conditions B5 and B6. Two additional intermediate conditions (B4* and B7*) are to be added for longitudinal strength verification.

In order to categorize a vessel according to Case B, clear operational guidance for partial filling of ballast tanks, in association with the consumption level as shown in Figure 2, is to be given in the loading manual. If such operational guidance is not given, Case A is to be applied.

Case A has no limitation of consumables, whereas Case B has limitation of consumables.

8.3 Case C – Conventional (with usual arrangement of WBT) ore carrier with two pairs of partially filled ballast water tanks.

8.3.1 Figure 3(a) show the operational loading conditions, departure condition (C1), four intermediate conditions (C2-C5) and arrival condition (C6), for a conventional (with usual arrangement of WBT) ore carrier with partial filling of both BW tank no.1 (P/S) and 7 (P/S) during voyage. Refer Table 8.3.1.

8.3.2 Figure 3(b) and Figure 3(c) show the additional twelve loading conditions (C1-1 ~ C1-12) which are to be added for longitudinal strength verification of the departure condition (C1).

8.3.3 Figure 3(d) to Figure 3(i) show the additional 32 loading conditions (C2-1 ~ C2-12, C3-1 ~ C3-4, C4-1 ~ C4-12 and C5-1 ~ C5-4) which are to be added for longitudinal strength verification of the intermediate conditions (C2 ~ C5).

8.3.4 Figure 3(j) and Figure 3(k) show the additional twelve loading conditions (C6-1 ~ C6-12) which are to be added for longitudinal strength verification of the arrival condition (C6).

8.3.5 For the additional loading conditions, the maximum and the minimum filling level of BW tank are according to trim and propeller immersion limitations indicated in Cl.7.1.4.1:

Table 8.3.1: Filling level in partially filled BW tanks nos.1 (P/S) and 7 (P/S) for the operational conditions during ballast voyage.

Loading condition	Consumables	Filling level, WBT 1(P/S)	Filling level, WBT 7(P/S)
C1- Departure	100%	f_{1dep}%	f_{7dep}%
C2– Intermediate 1	50% [(i)]	f_{1dep}%	f_{7dep}%
C3 – Intermediate 2	50% [(i)]	f_{1int}%	f_{7int}%
C4 – Intermediate 3	20% [(i)]	f_{1int}%	f_{7int}%
C5 – Intermediate 4	20% [(i)]	f_{1arr}%	f_{7arr}%
C6 - Arrival	10% [(i)]	f_{1arr}%	f_{7arr}%

Note:
[(i)] % consumables to be specified, indicated to 50% and 20 %

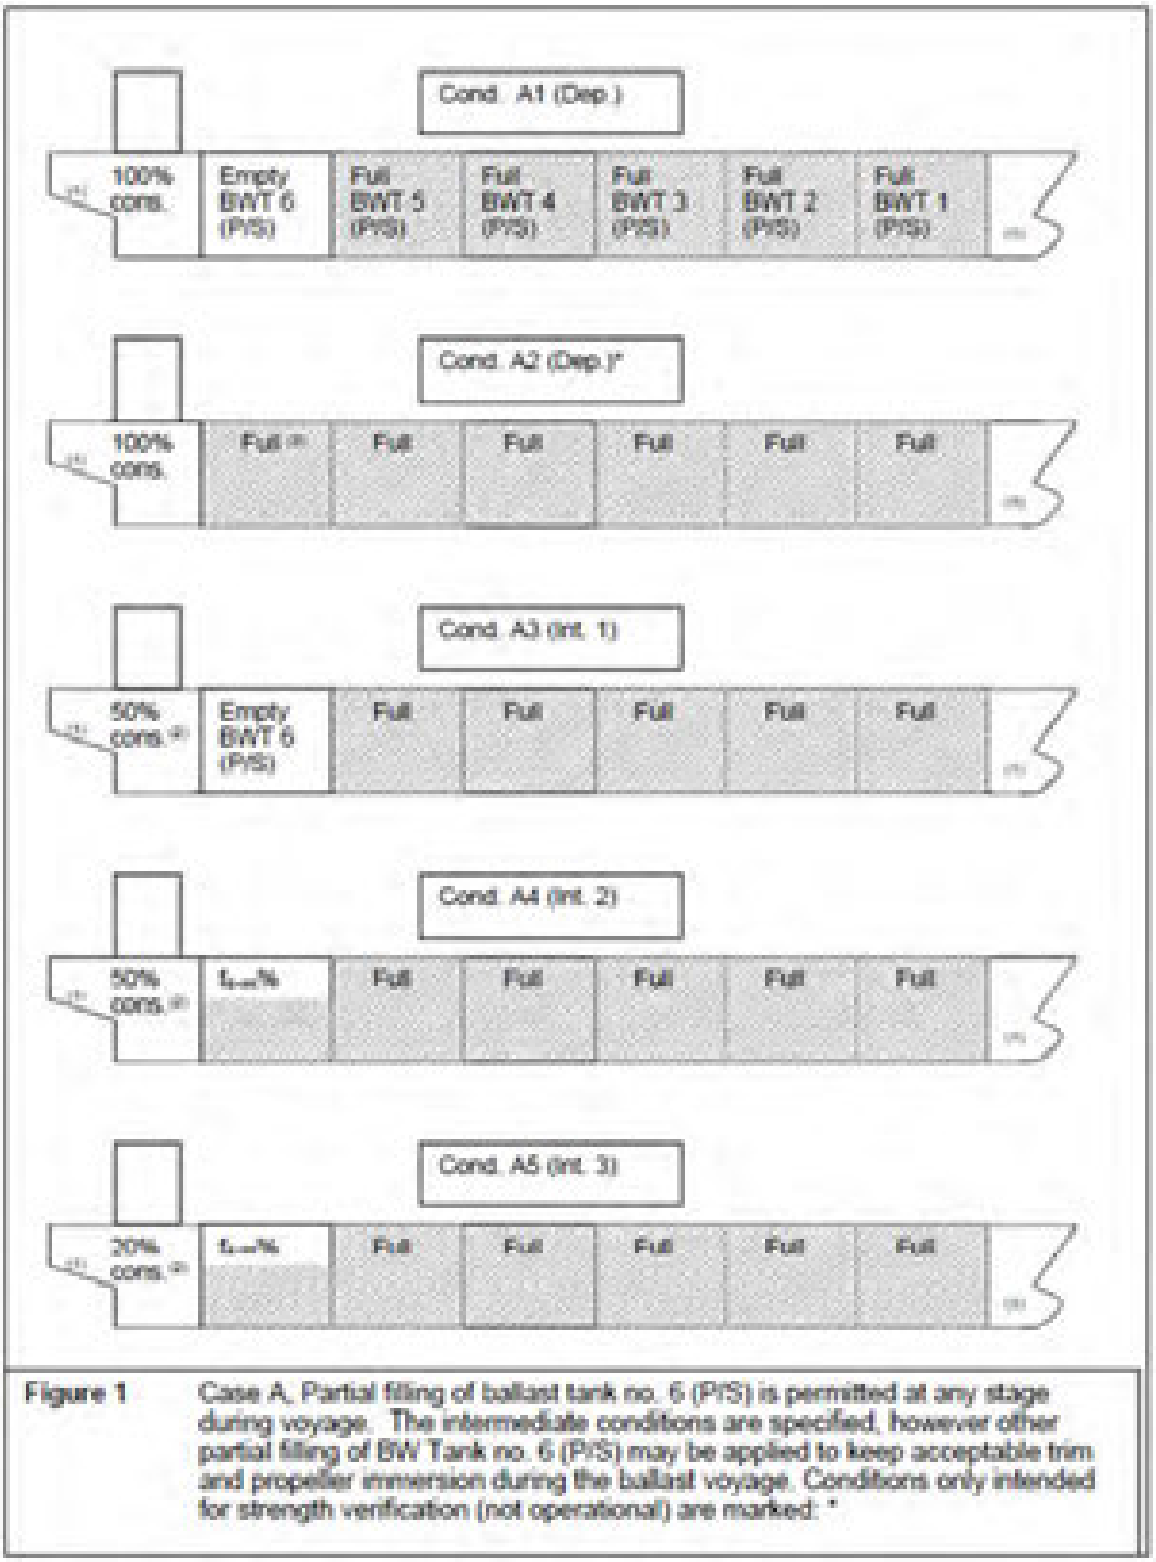

Figure 1 Case A, Partial filling of ballast tank no. 6 (P/S) is permitted at any stage during voyage. The intermediate conditions are specified, however other partial filling of BW Tank no. 6 (P/S) may be applied to keep acceptable trim and propeller immersion during the ballast voyage. Conditions only intended for strength verification (not operational) are marked: *

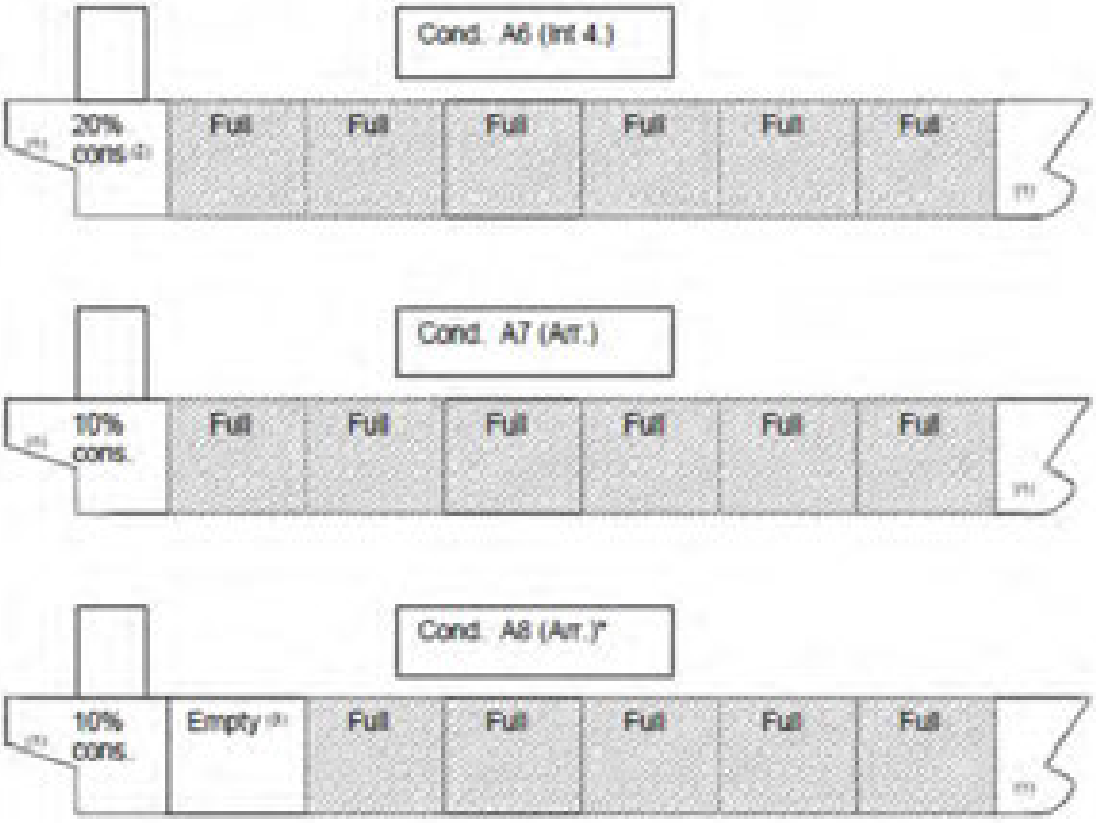

Notes

(1) For peak tanks intended to be partially filled, all combinations of full or partially filled at intended level for those tanks are to be investigated.

(2) The intermediate condition(s) to be specified incl. % consumables.

(3) For bulk carriers carrying ore and with large wing water ballast tanks full/empty may be replaced with maximum/minimum filling levels according to trim limitations given in 2.1.3.

Figure 1 (Continued)
Case A, Partial filling of ballast tank no. 6 (P/S) is permitted at any stage during voyage. The intermediate condition is specified, however other partial filling of BW Tank no. 6 (P/S) may be applied to keep acceptable trim and propeller immersion during the ballast voyage. Conditions only intended for strength verification (not operational) are marked: *

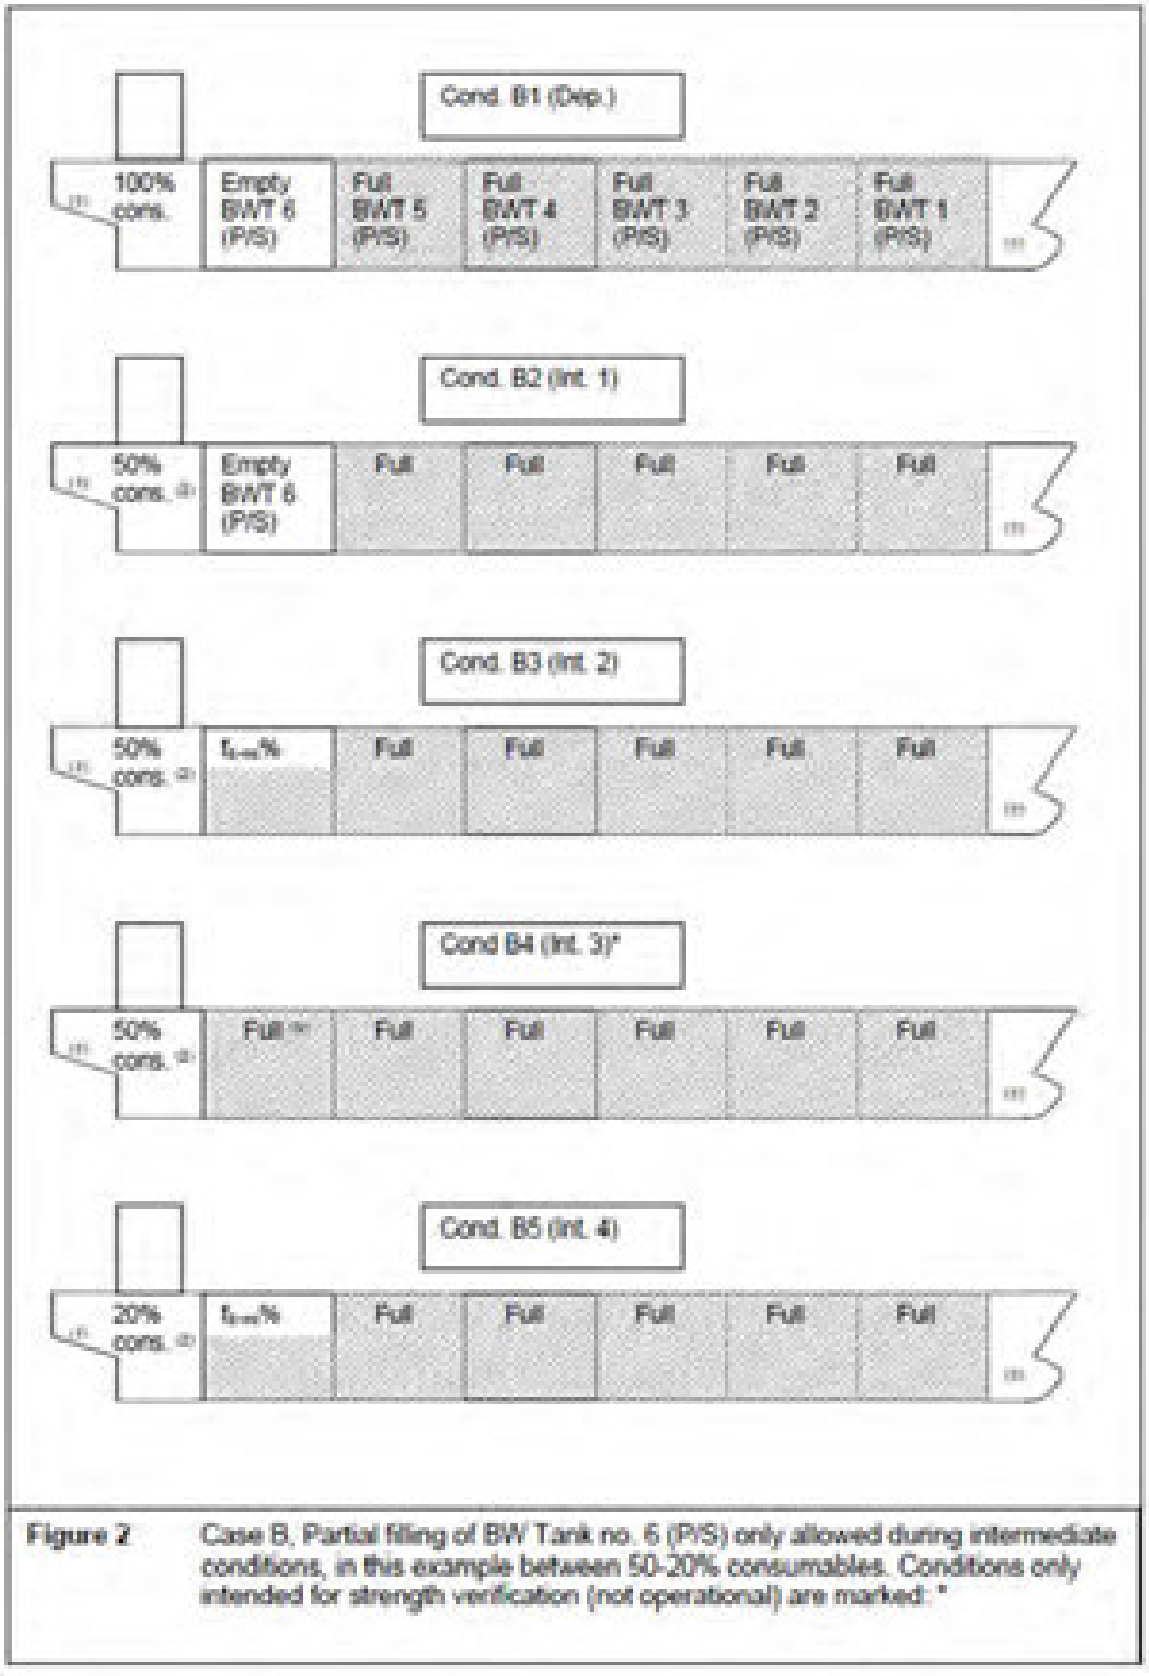

Figure 2 Case B, Partial filling of BW Tank no. 6 (P/S) only allowed during intermediate conditions, in this example between 50-20% consumables. Conditions only intended for strength verification (not operational) are marked: *

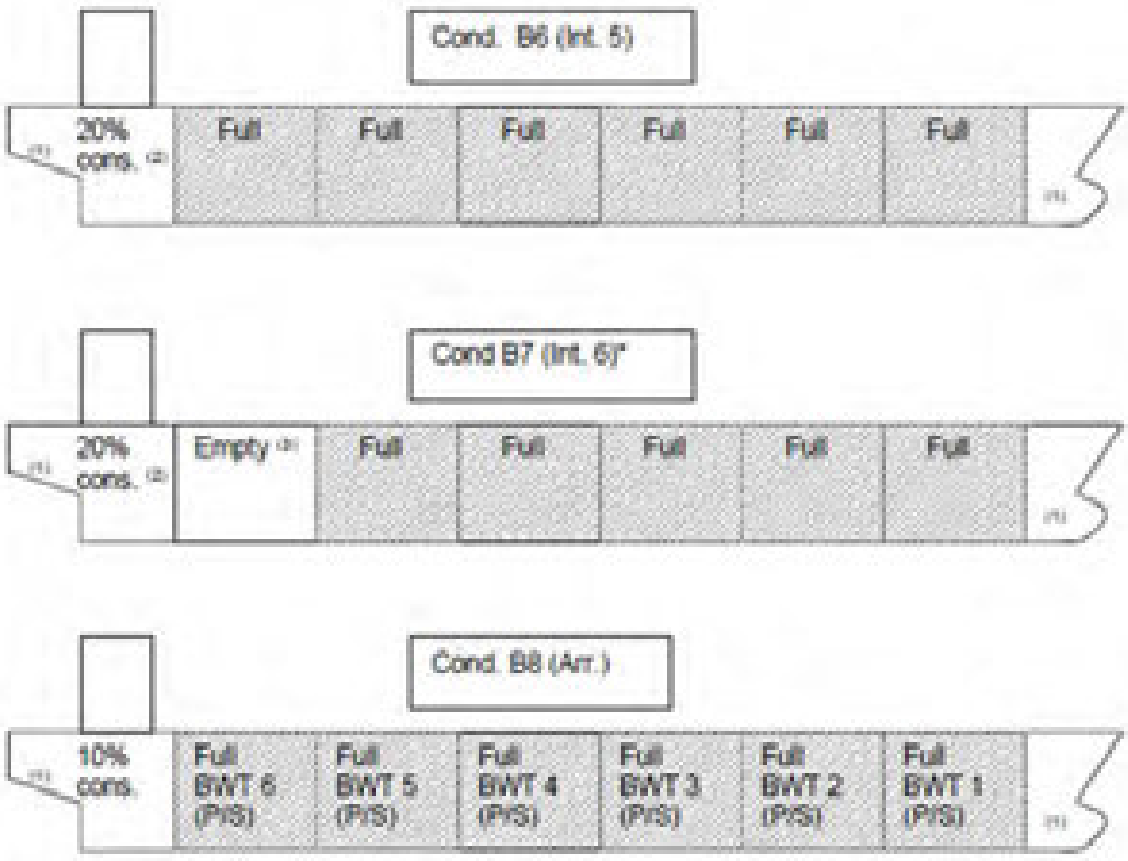


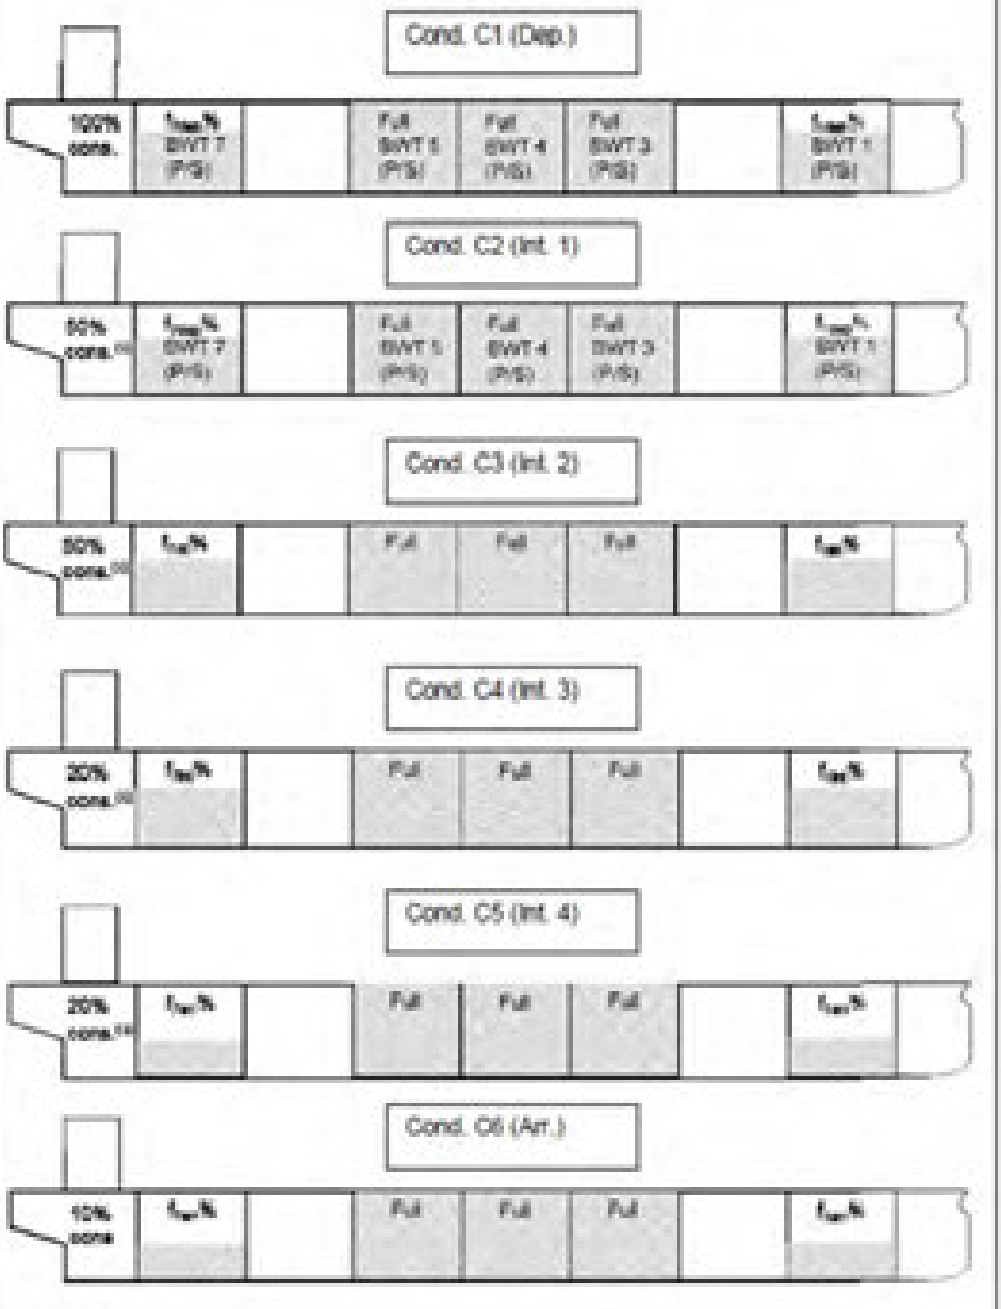
Notes

(1) For peak tanks intended to be partially filled, all combinations of full or partially filled at intended level for those tanks are to be investigated.

(2) The intermediate condition(s) to be specified incl. % consumables.

(3) For bulk carriers carrying ore and with large wing water ballast tanks full/empty may be replaced with maximum/minimum filling levels according to trim limitations given in 2.1.3.

Figure 2 (Continued)
Case B, Partial filling of BW Tank no. 6 (P/S) only allowed during intermediate conditions, in this example between 50-20% consumables. Conditions only intended for strength verification (not operational) are marked: *



Notes
(1) The intermediate condition(s) to be specified incl. % consumables.

4 *Hull girder ultimate strength check*

Section 1

Strength characteristics of hull girder transverse sections

Symbols

For symbols not defined in this section, Refer to Chapter 1, Section 2.

1.1 Application

1.1.1 The requirement of this section applies to steel ships, of normal form, proportions, speed and length L≥65[m]. However, ships having one or more of the following characteristics, will be specially considered.

- Proportion L/B ≤ 5 B/D ≥ 2.5
- Length L ≥ 500[m]
- Block coefficient C_b< 0.6
- Large deck opening
- Ships with large flare
- Carriage of heated cargoes
- Unusual type or design
- Unusual hull weight distribution

1.1.2 Scantlings of hull members contributing to longitudinal strength are to comply with the requirements given in this Chapter. These members are also to comply with the requirements of buckling strength given in Part 3, Chapter 9 and local strength requirements given in Chapter 7.

1.1.3 For ships with small block coefficient, high speed and large flare (in particular L>120[m] and speed V>17[knots]), the section modulus in the forebody is to be specially considered based on the distribution of still water and wave bending moments given in Chapter 5, Section 3.4, Cl.3.4.1 and Section 3.6, Cl.3.6.1 respectively.

1.1.4 For ships with narrow beams the combined effects of vertical and horizontal bending of hull girder may have to be specially considered as given in Cl.3.2.1.

1.1.5 For ships with large deck openings (Refer Cl.1.3.2) other than container ships the combined effects of hull girder bending and torsion related possible local bending and shear stresses may have to be specially considered as given in Cl.3.3.1.

1.1.6 Longitudinal strength requirements given in this section do not apply to Container Ships. Requirements given in Part 5, Chapter 5, Section 4 are applicable to container ships.

1.2 Longitudinal strength calculations

1.2.1 Longitudinal strength calculations are to be carried out for all ships where $L \geq 65[m]$, covering the design cargo and ballast loading conditions proposed, in order to determine the required hull girder strength. The calculations of still water shear forces and bending moments are to cover both departure and arrival conditions and any special mid-voyage conditions caused by changes in ballast distribution.

1.2.2 For ships where $L < 65[m]$, longitudinal strength calculations may be required, depending upon the design loading conditions or structural arrangement.

1.2.3 In general, where a long superstructure or deckhouse (*) of length greater than 0.15L is fitted, extending within the 0.4L amidships, the requirements for longitudinal strength in the hull and erection will be considered in each case.

*Note: For superstructure or deckhouses, if their contribution to be considered in longitudinal strength calculation, a finite element analysis of the full ship which takes into account the general arrangement of the longitudinal elements (side, decks, bulkheads) may be done.

In lieu of full ship analysis, the sectional area of effective continuous longitudinal members contributing to the longitudinal strength can be taken into account subject to the conditions given in Cl.1.2.3. Relevant parts of the shadow areas are to be deducted from sectional areas according to Figure 1.2.1.

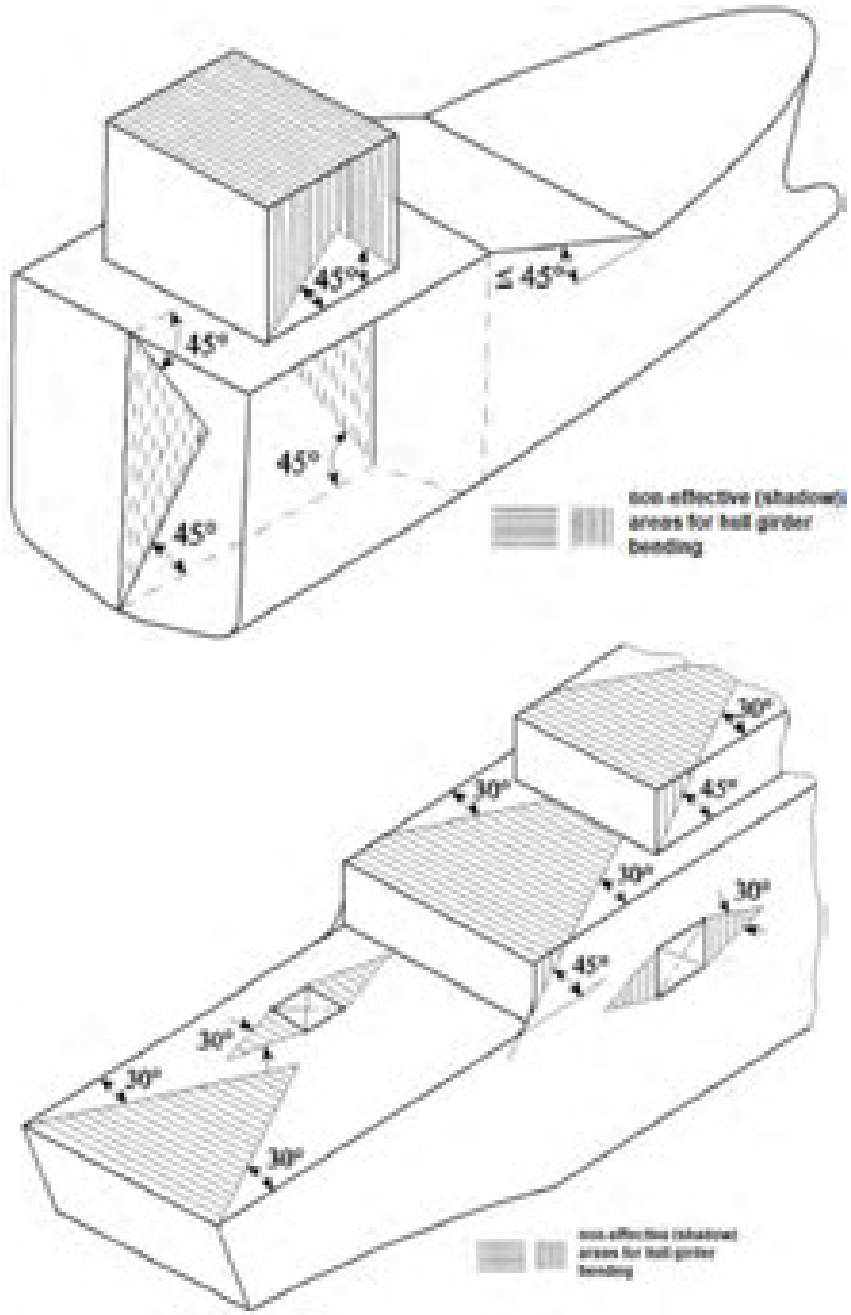

Figure 1.2.1: Representative figure showing shadow area concept for ship's hull and superstructures

1.3 Definitions

1.3.1 Effective longitudinal bulkhead

A longitudinal bulkhead extending from bottom to deck and which is connected to the ship's side by transverse bulkheads both forward and aft.

1.3.2 Ships with large openings in the strength deck

A ship is regarded as one with large deck openings in strength deck if any one of the following conditions applies:

$$\frac{b}{B_0} > 0.7$$

$$\frac{\ell_1}{\ell_0} > 0.89$$

$$\frac{b}{B_0} > 0.6 \text{ and } \frac{\ell_1}{\ell_0} > 0.7$$

where:

b = Breadth of the hatch opening, in [m]. Where there are multiple openings in the same hull transverse section, they are considered as a single opening, and b is calculated as the sum of the individual opening breadths. Refer Figure 1.3.2.

B_0 = Extreme breadth of deck measured, in [m] at the mid length of hatch opening. Refer Figure 1.3.2.

ℓ_1= Length of the hatch opening, in [m]. Refer Figure 1.3.2.

ℓ_0 = Distance, between centers of the deck strip at each end of the hatch opening, in [m]. Where there is no further hatch opening beyond the one under consideration, the point to which ℓ_0 is measured will be specially considered. Refer Figure 1.3.2.

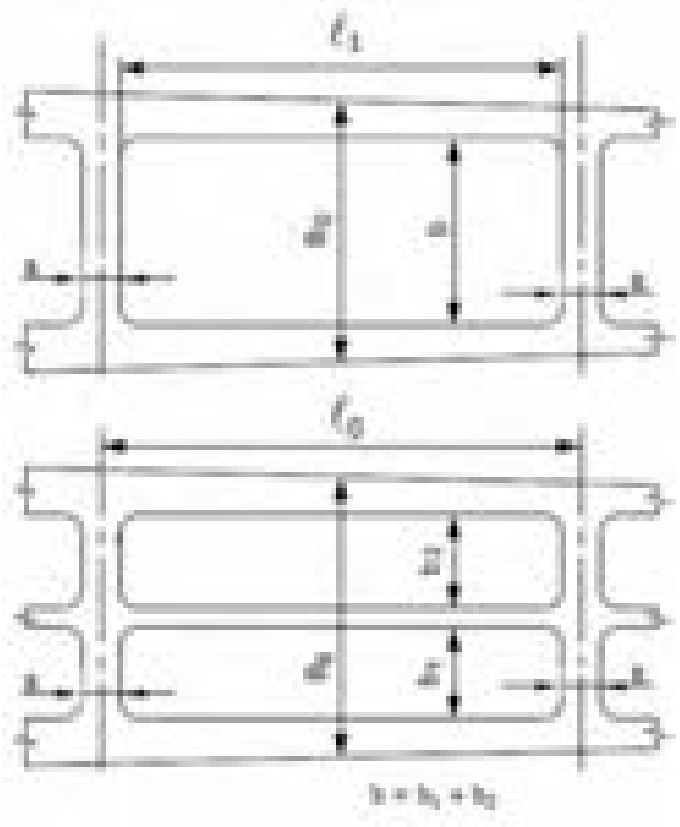

Figure 1.3.2: Ship with large openings

1.3.3 Strength deck

The strength deck is, in general, the uppermost continuous deck. In the case of a superstructure or deckhouses of length greater than 0.15L, extending within the 0.4L amidships, the strength deck is the deck of the superstructure or the deck of the uppermost deckhouse. Refer Cl.1.2.3.

1.4 Hull girder transverse sections

1.4.1 General

This section specifies the criteria for calculating the hull girder strength characteristics to be used for the bending and shear strength assessments, in association with the hull girder loads as specified in Chapter 5.

Hull girder transverse sections are to be considered as being constituted by the members contributing to the hull girder longitudinal strength, i.e. all continuous longitudinal members below and including the strength deck defined in Cl.1.3.3, taking into account the requirements in Cl.1.4.2 to Cl.1.4.7.

These members are to have:
- gross offered scantlings, when the hull girder strength characteristics calculated, are used for the yield checks as given in Section 2.

- net scantlings, when the hull girder strength characteristics calculated, are used for the ultimate strength checks as given in Section 4 and for calculating the hull girder stresses for the strength checks of plating, ordinary stiffeners and primary supporting members as given in Chapter 7.

1.4.2 Structural members not contributing to hull girder sectional area

The following members are not to be considered in the calculation as they are not considered contributing to the hull girder sectional area:

- Superstructures and Deckhouses which do not form a strength deck Refer Cl.1.3.3

- Vertically corrugated bulkheads, according to Cl.1.4.6.

- Bulwarks and gutter plates.

- Bilge keels.

- Sniped or non-continuous longitudinal stiffeners.

- Non-continuous hatch coaming.

1.4.3 Continuous trunks and continuous longitudinal hatch coamings

In case of ships with continuous trunks and continuous longitudinal hatch coamings their sectional area can be included in the hull girder section modulus calculations, provided that they are effectively supported by longitudinal bulkheads or primary supporting members. The section modulus at deck however, is then to be calculated as given in Cl.2.1.6.3.

1.4.4 Longitudinal stiffeners or girders welded above the strength deck

Longitudinal stiffeners or girders welded above the strength deck, including the deck of any trunk fitted as specified in Cl.1.4.3, are to be included in the hull girder transverse sections.

1.4.5 Longitudinal girders between hatchways, supported by longitudinal bulkheads

Where longitudinal girders, effectively supported by longitudinal bulkheads, are fitted between hatchways, the sectional area of these longitudinal girders are to be included in the hull girder transverse section. Refer Cl.1.5.1.

1.4.6 Longitudinal bulkheads with vertical corrugations

1.4.6.1 For longitudinal bulkheads with vertical corrugations, the vertical corrugations are not to be included in the hull girder transverse section. Longitudinal bulkheads with vertical corrugations are not effective for hull girder bending, but they are effective for hull girder shear force.

1.4.6.2 For the purpose of calculating the unit shear flow for hull girder vertical shear flow, q_{vi-gr}, as defined in Section 2 and q_{vi_n50}, as defined in Section 3 for vertical corrugations, the following reduction factor is used to obtain effective thickness of the corrugation:

$$C_{corr} = \frac{s_c}{a + c}$$

where s_c, a and c are defined in Chapter 3, Section 6, Cl.6.4.1.

But for the thickness used in the calculation of hull girder shear capacity as defined in Section 2, Cl.2.2.2 and in the calculation of shear stress as defined in Section 3, Cl.3.5.2, this thickness reduction is not applicable.

1.4.7 Members in materials other than steel

Where a member contributing to the longitudinal strength is made of a material other than steel having a Young's modulus, E different from 2.06×10^5[N/mm^2], the steel equivalent sectional area that may be included in hull girder transverse section is obtained, in [m^2], from the following formula:

$$A_{SE} = \frac{E}{2.06 \times 10^5} A_M$$

where:

A_{SE} = Steel equivalent sectional area in [m^2].

A_M = Sectional area of the member under consideration in [m^2].

1.5 Calculation of section properties

1.5.1 General

• When calculating the moment of inertia and section moduli, the effective sectional area (net area after deduction for openings as given in Chapter 3, Section 6, Cl.6.5.4 of all continuous longitudinal strength members is to be taken into account.

• The main strength members included in the calculation of hull moment of inertia and section modulus are to extend continuously through the cargo region and sufficiently far towards the ends of the ship. Longitudinal bulkheads are to terminate at effective transverse bulkheads and large transition brackets are to be fitted in line with the longitudinal bulkheads. Where significant changes in structural arrangement occur, adequate transitional structure is to be provided.

In case of ships, where longitudinal girders are fitted between hatchways, the sectional area included in the hull girder transverse sections is obtained, in [m^2], from the following formula:

$$A_{eff} = A_{lg} \times a$$

where:

A_{lg} = Sectional area of longitudinal girders in [m^2].

a = Coefficient:

= 1 for longitudinal girders effectively supported by longitudinal bulkheads or primary supporting members.

$= 0.6\left(\frac{s}{b} + 0.15\right)^{0.5}$ for longitudinal girders not effectively supported by longitudinal bulkheads or primary supporting members and having dimensions and scantlings such that $\ell_0/r \leq 60$.

= 0 for longitudinal girders not effectively supported by longitudinal bulkheads or primary supporting members and having dimensions and scantlings such that $\ell_0/r > 60$.

r = Minimum radius of gyration, in [m], of the longitudinal girder transverse section.

ℓ_0, s, b = Dimensions, in [m], as defined in Figure 1.3.2.

Section 2

Vertical hull girder bending and shear strength

Symbols

For symbols not defined in this section, Refer to Chapter 1, Section 2.

R_s = 1.0 for unrestricted service
= 0.75 for coastal service
= 0.65 for restricted service
= 0.55 for sheltered water service.

Q_{sw} = Permissible positive or negative still water shear force for seagoing operation, in [kN], at the hull transverse section considered, as defined in Chapter 5, Section 3, Cl.3.6.2.

Q_{sw-har} = Permissible positive or negative still water shear force for harbour/sheltered operation, in [kN], at the hull transverse section considered, as defined in Chapter 5, Section 3, Cl.3.6.3.

Q_{wv} = Positive and negative vertical wave shear force, in [kN], for seagoing condition at the hull transverse section being considered, as defined in Chapter 5, Section 3, Cl.3.7.2.

ΔQ_s = Shear force correction at the transverse section considered, in [kN], if applicable. as defined in Cl.2.2.5.

Q_{sw_lcd} = Vertical still water shear force for considered loading condition in seagoing operation, in [kN], at the hull transverse section considered.

$Q_{sw_lcd_har}$ = Vertical still water shear force for considered loading condition in harbour/sheltered operation, in [kN], at the hull transverse section considered.

Q_R = Total vertical hull girder shear capacity, in [kN], at the hull transverse section being considered as defined in Cl.2.2.2.

q_{vi-gr} = Unit shear flow for hull girder vertical shear force, in [mm^{-1}], for the plate i based on gross thickness t_i, in [mm] obtained from a numerical calculation based on thin-walled beam theory as given in Appendix A.

M_{sw} = Permissible vertical still-water bending moment in [kN-m], for hogging and sagging, in seagoing condition at the hull transverse section being considered as defined in Chapter 5, Section 3, Cl.3.4.2.

M_{wv} = Vertical wave bending moment in [kN-m], for hogging and sagging, in seagoing condition at the hull transverse section being considered as defined in Chapter 5, Section 3, Cl.3.7.1.

V_D = Vertical distance to the equivalent deck line, in [m], as defined in Cl.2.1.6.4.
